Mr. Green brings out forcibly the extent to which literature and science gradually undermined some of the assumptions on which the influence of Calvinism rested. Dates are in such a matter often more instructive than comment. Chillingworth was born 1602 and died 1644. In 1642 Hobbes published his *De Cive*. Locke was born 1634; Newton in 1642. Before the Puritans had accomplished their triumph the intellectual movement of the world had taken a turn which menaced the Calvinistic ideal of religion, and with it the Calvinistic ideal of government. One further date is of immense importance: the Peace of Westphalia was concluded in 1648. A year later Charles I. was executed. The Puritans achieved their triumph almost at the moment when the deadly struggle between Roman Catholicism and Protestantism, which almost gave life to the enthusiasm of Puritanism, ended in a drawn battle. The fervor of English Protestantism inevitably cooled when the perils and the triumphs of foreign Protestantism came to an end. A second consideration closely connected with the first is that the great Rebellion was a conservative movement which, mainly through the incapacity of Charles I., was turned into a revolution. This is the essential contrast between the English and the French revolutions. Englishmen took up arms intending, at least, to preserve existing institutions in church and state. Frenchmen rose against the monarchy because they detested every institution which existed. "They made," writes De Tocqueville, "the greatest effort which any people ever engaged in to cut, so to speak, the thread of their destiny in two, and to separate by an abyss that which they had been up to 1789 from that which they wished to be thenceforward." Neither nation entirely succeeded. Englishmen, while wishing to preserve, in reality changed far more than they intended the spirit of their constitution. France has retained until this day many of the principles of the Ancien Régime. What, however, is noticeable for our purpose is that the revolutionary element in Puritanism was foreign to the spirit of the national opposition to Charles. One fact, which no writer with whom we are acquainted has made so prominent as Mr. Green, curiously illustrates the conservatism of the movement. All parties, including even the Independents, wished to negotiate with Charles when a prisoner. The key to the curious intrigues while he was a captive lies in the wish of every party in the state to secure its objects by acting in alliance with the king. By honest adherence to any clear policy he might, probably, have saved not only his life but his throne; he perished not because he was a tyrant whom every one detested, but because he turned out a liar whom nobody could trust.

These general considerations go far towards explaining the weakness of the Puritan position even when it seemed strongest. Still, the question why a powerful government such as that of Cromwell could not conciliate, if not the good-will of the nation, at least the adherence of a party as strong as that which, after the revolution of 1688, upheld Whig principles till they became the principles of the whole nation, requires an answer. The reply which Mr. Green's history at least suggests is, that the political failure of Puritanism, though depending partly upon circumstances, such as the shortness of Cromwell's rule—the Protectorate lasted from 1653 to 1658—was mainly attributable to want of far-sighted statesmanship, and to the inherent weakness of a political system depending for support on religious enthusiasm.

Detractors of the Protector have in modern times done his reputation an unintentional service. To treat a man as a hypocrite and a buffoon who turns out when his character is fairly surveyed to have been zealous for the faith he held, and also one of the most eminent rulers who has ever governed a great country, is the sure way to raise up a class of worshippers who will deem him a saint and a statesman of heroic mould. With Cromwell's religious character we are not concerned, nor is there at this time of day much reason for rebutting the idle charge of hypocrisy. With his statesmanship it is more easy to deal, and here critics are apt to

* 'History of the English People. By J. R. Green. Vol. iii. Puritan England.' London and New York: Macmillan & Co.

overlook the fact that a man may be a ruler of men, may have insight into character, administrative capacity, the vigor which seizes opportunities for action or meets emergencies with energy and with coolness, and yet not possess originality of conception or statesmanlike foresight. It is here that Cromwell, compared of course, as he must be, not with ordinary but with extraordinary rulers, falls short of the highest standard. He was a great monarch; he was not a great statesman. He fined the malignants, but he did not confiscate their estates; that is to say, he kept alive bitter hostility without taking the means to conciliate zealous support. If the soldiers who were settled in Ireland had obtained lands in England, a certain number of Englishmen would have felt a hatred even more bitter than that which they in fact entertained to the rule of Cromwell; but the Protectorate would have obtained supporters who would have withstood a restoration to the death. Even if settling the army in England was in fact impossible, the policy of placing the most zealous soldiers of Puritanism in Ireland certainly is open to the gravest objections, if regarded as a measure for supporting the revolutionary cause. The war with Spain was the pursuit, no doubt, of a traditional policy, but it was a policy out of date and of dubious expediency. The attempt to form a great Protestant alliance seems also symptomatic of the adherence to ideas which were appropriate to the time of Cromwell's youth rather than to that of his power. The impatience of his dealing with parliamentary opposition when placed side by side with his obvious, and it must be added perfectly statesmanlike, desire to give a legal character to his rule, argues not indeed want of foresight but a lack of that perfect self-control which is the sure characteristic of a statesman. The most curious point, however, in Cromwell's whole conduct is the failure clearly to designate a successor, and the letting the government fall, under a doubtful nomination, into the hands of a son whom he had no reason to hold competent to wield authority. Unless, what is by no means impossible, he trusted to the last in Providence's extending his life, there is a good deal of difficulty in reconciling his conduct, in respect of his successor, either with statesmanship or with Cromwell's undoubtedly high public spirit.

If faults of policy, not only on the part of the Protector but also on the part of his republican opponents, afford one-half of the solution of the problem why Puritanism ended in failure, a large part, if not the whole, of the remainder of the explanation is supplied by the nature of religious enthusiasm. Cromwell has always been greatly commended, even by those who hate his name and disbelieve in his sincerity, for his insight in perceiving that the zeal of Cavalier loyalty could be met only by appealing to the still stronger sentiment of religious enthusiasm; and no doubt the commendation is deserved. The "New Model" routed the royal armies, and it may well be doubted whether anything but a force like the "New Model" could have ensured the victory of the Parliament But when the policy of Cromwell is commended, its defects, looked at as a mere stroke of statesmanship, must not be forgotten. Religious zeal is the strongest of all the forces by which men can be driven to action. While it lasts it is all but unconquerable. The enthusiasm, however, of religion has its own laws. It ebbs and flows in obedience to rules which are not the rules of earthly policy. The wind blows where it listeth. To say this is not to deny the reality of religious fervor. It is rather to assert that such zeal, just because it is true and genuine, cannot be permanently used in support of political schemes or constitutions. The spirit which at one moment impels an army to victory leaves them at another unable to resist opposition which seems the decree of fate or Providence. Bunyan will be for ever the type of the Puritan soldier, but the zeal of George Fox was no less sincere and no less overpowering than the zeal of Bunyan. The army of saints who divided the spoil at Marston Moor were of the same spirit, and in part the same men, as the soldiers who stood grimly on Blackheath to witness Charles II.'s return, and surrendered the control of the state without an attempt at armed resistance. In each case they obeyed the impulse of religion. It is hard to say whether they were more to be admired in their victory or in their fall. In both, however, they bore witness to the fact that the fluctuating sentiment of religious zeal is not a foundation on which to rest a permanent fabric of statesmanship.

THE COMÉDIE-FRANÇAISE.*

THE Comédie-Française and the scarcely more august Academy share the honor and the good fortune of being the only institutions of the monarchy which have survived the overthrow of their creator. The former is the direct descendant in unbroken line of the company of comedians which Molière led back to Paris, and which after his death, in 1673, drew to itself the two rival troupes. M. Francisque Sarcey, the acute dramatic critic of the *Temps*, and the author of 'Comédiens et Comédiennes,' contributed to the July *Nineteenth Century* an admirable article on the Théâtre-Français, in the course of which he asks:

"Do you know that between Got and Molière there are only seven or eight names of great actors? We have, so to speak, only to stretch out our hand to be able, across several generations, to find the first *Mascarille*. Got played a long time with Monrose, who had seen Dazincourt. Dazincourt appeared young by the side of Préville, already old. Préville had known Poisson, who is the last link of the chain up to Molière. In this way the tradition has been preserved alive from one great actor to another. One feels how such or such a rôle was played in the days of Molière, and when by chance the interpretation is changed by the caprice of an actor, as happened in the case of *Arnolphe*, whose character was modified by *le père* Provost, that change forms a date and the new tradition is established, unless the successors of Provost reject it. Here we see the distinctive mark of the Comédie-Française, which unites to tradition a wise spirit of innovation that corrects and harmonizes it to the tastes of the day, but at the same time, out of respect for tradition, it always puts the bridle on this taste for novelty. The history of the Comédie-Française is only a perpetual compromise between these two contrary forces."

During these two centuries of existence the Comédie-Française has always been a republic, a commonwealth having at times a protector imposed by the higher authority which had organized it. In Molière's day, as in Shakspere's, it was the custom for the chief actors of a theatrical company to share in the risks and profits of management. This custom the Théâtre-Français alone, of all French or English theatres, has kept up. A young graduate of the Conservatory, who has taken a first prize, has the right to an appearance on the stage of the Théâtre-Français. He is engaged at a salary by the year. If in time he should show marked ability and give promise of becoming capable one day of playing the best parts of his line of business, he may be elected an associate—that is, a sharer in the management, in the profits, and in the responsibilities of the enterprise. But there are always more sharers than there are shares: there are generally twenty-two *Sociétaires*, while there are never twenty shares available for this purpose. The young actor or actress begins, therefore, with an eighth or a quarter of a share, rising gradually as his value to the theatre increases and vacancies are made by death or resignation to a half, and finally to a whole share. M. Coquelin, the brilliant comic actor, was an associate for five years before he had a full share. Since M. Perrin has been the director of the theatre the yearly yield of a share has been rapidly rising; in 1878 each full share paid a profit of forty thousand francs. As, however, the theatre may not make money, and the shares may be of no value whatsoever, each associate gets an annual salary proportionate to his merits, but much smaller than he would receive elsewhere. After a certain number of years of service he may retire on a pension, varying in amount as he may have been of more or less value to the company. Certain of the profits are diverted each year to accumulate for the associate when he retires; M. Bressant, for instance, when he withdrew from active service received a lump-sum of eighty thousand francs, and is receiving an annual pension of eight or ten thousand more. The chance of profit is increased by the fact that the society has its theatre from the Government rent free, and its pensions are made certain by the ample Government subsidy and by slowly-accumulated reserve funds. Besides his salary each actor is paid a certain small sum every time he acts; thus the most useful and the most industrious are better paid than the lazy and less competent, and thus, too, the actor hesitates before refusing even an inferior part in a play which may be acted numberless times. In English and American theatres an actor is justified in refusing to play an unimportant part, as the public, seeing him in it night after night for perhaps six months, may forget that he is capable of better things; but at the Français the same piece is rarely played on two successive evenings and never on three, and the actor who plays a poor part to-night knows that the next night he may have a better, or perhaps the best. This feeling leads to a generally higher level of acting; it gets more good players into one piece than is often possible with us. The duties of the stage-manager, by the way, are divided among certain of the elder male associates, who assume them for a week at a time; and for thus acting as *semainier* they get additional allowances.

The influence of the pernicious "star system" is so strong with us in America and in England that the London papers, commenting on the recent performances of the Comédie-Française in London, again and

* 'Journal Intime de la Comédie-Française (1852-1871), publié par Georges d'Heylli.' Pp. xii. 566. Paris: E. Dentu; New York: F. W. Christern. 1879.

again spoke of Mlle. Sarah Bernhardt as the "leading lady," and of M. Febvre or M. Mounet-Sully appearing "in support" of her. No terms could well be less exact. Mlle. Bernhardt is not a superior, therefore her comrades do not appear "in support"; she is not even the leading lady: she is simply an associate of the Comédie-Française. On the playbills the names of the actors appear in the order of their election as associates, the salaried actors following their seniors; in "Ruy Blas," for instance, the name of Mlle. Bernhardt, who plays the *Queen*, is preceded by that of Mlle. Jouassain, who acts the far less important part of the *Duenna*, because Mlle. Jouassain was elected an associate in 1863, and so is the senior of Mlle. Bernhardt, elected in 1875. There are no stars at the Théâtre-Français, partly because the associates are all "stars," and partly because any individual prominence would break up the artistic unity which is the great beauty of the present organization. Rachel in her day was a "star," and the experience then gained will keep the Théâtre-Français from ever repeating it. As M. Sarcey says: "Rachel cost the theatre more than she ever drew, and she did more harm to art than she rendered it service. . . . The nights on which she played the receipts amounted to 10,000 francs, the whole of which went into her pocket. The next night the theatre was empty." M. d'Heylli gives us the annual gross receipts of the theatre for the past thirty years: while Rachel acted they varied from about 300,000 francs to 900,000 (in 1855, the exhibition year); from her death in 1858 to the war of 1870 they never fell below 800,000; after the war and the Commune they jumped to 1,262,000 in 1872, and rose steadily to 1,580,000 in 1877.

It will readily be seen that an institution as conservative as the Théâtre-Français is likely to take little initiative in bringing out new authors. Its function is not to discover new dramatists and lead in dramatic progress, but to consecrate and reward acknowledged merit. Many of the plays which it now presents with great success were originally produced at other theatres—among them are the "Ciguë" and the "Gendre de M. Poirier" of M. Augier, and the "Demi-Monde" and "Fils Naturel" of M. Dumas. These and many other plays of a literary character won success elsewhere—a success which the Comédie-Française ratifies by taking them to itself. Its company is so much stronger than that of any other theatre of Paris, or even of any two others, that it is sure to act the piece better than it was originally acted. It aims at a perfect performance of the masterpieces of French dramatic literature, old and new. The best plays of Molière, Racine, Corneille, and Beaumarchais are always in readiness, and are frequently performed. As the bill is changed nightly, a week rarely passes without one or more opportunities of seeing a classic drama, comic or tragic. A successful new play, like M. Augier's "Fourchambault" or M. Dumas's "Étrangère," is acted at first three or four times a week; then, as its attraction lessens, it is seen but twice or even once a week. It does not finally drop out of the bill sometimes for two or three years, and it may then at any time be revived for another series of performances. It takes much longer for a play to attain its hundredth performance at the Français than elsewhere, but there a good play is above the chances of ill-luck, sickness of an actor, temporary lack of public interest, and so on, which beset it at other theatres. As the new play alternates with the play of last year and of the year before, and as these alternate with the plays of two centuries ago, standards of comparison are supplied, and it is easier to judge a piece at its true value. The Théâtre-Français is, in fact, a museum of dramatic art, and as such it is fostered by the Government. The subsidy is intended especially to provide for the proper performance of the classic drama, which has rarely been able to attract paying audiences. But the present director, M. Perrin, has been skilful enough to make Molière and Racine fashionable, and, therefore, as profitable as the latest new work of M. Augier or M. Dumas.

M. d'Heylli's volume, which has served as the text of these remarks upon a subject made timely by the great attention justly paid to the Comédie-Française by the English public and press, and abundantly echoed by our papers, is a journal of the doings of the company during the Second Empire (1852–1870). The author, to whom we already owe an admirable edition of Beaumarchais's dramatic works and also model monographs on M. Regnier, M. Bressant, and Mme. Arnould-Plessy, published as they retired from the stage, begins by giving us a description of the Comédie-Française as it stood at the end of 1852, from which we see that M. Arsène Houssaye was then the director and that Offenbach was the leader of the orchestra—a post no longer in existence, as the theatre has now no orchestra. After this we then find, under dates, accounts of each new play with its cast, of each first appearance, of each revival, of each resignation or vacancy caused by death, supported by frequent extracts from contemporary criticism; Jules Janin, Théophile Gautier, and M. Francisque Sarcey being constantly drawn upon. In the course of the journal we have eclectic criticism and biographic details of nearly all the leading dramatists of France, and of all the members of the Comédie-Française. In an appendix are given a table of the performances in Paris of Rachel, a summary of the career of the theatre since 1846, with the gross annual receipts, and a description of the present Comédie-Française, interesting to compare with that which opens the volume. From these details it is evident that M. d'Heylli's book is valuable to the student of the contemporary French stage, and that it is useful as a work of reference to all who take any interest in the drama of the day. Its value for the latter purpose is greatly increased by an ample index of plays and persons, covering nearly eleven double-column pages.

PLANT ARCHÆOLOGY.*

II.

AS we have seen, the vegetable world has had an eventful history, and this history Count Saporta undertakes to reconstruct from ancient and authentic documents.

These documents have settled one point with certainty, viz., that the great changes in the temperature of the polar regions have not resulted from any change in the earth's axis of rotation, such as certain physical geologists have supposed. That this has remained steady throughout the whole period in question is as good as proved by the identity of the miocene and other tertiary fossil plants in all longitudes, from the Mackenzie River and Alaska round to Spitzbergen, Iceland, and Greenland—in part the same species, in all the same or equivalent combinations. Not indeed the same species in the same latitude any more than now, but such latitudinal distribution as to show that the curvatures of the miocene isotherms were quite analogous to those of the present age. Moreover, the monotony which characterizes the sub-polar vegetation of the present day—when the most of the species and the combinations of species occur all round the world—equally characterized it then when clothed with forest trees of a temperate zone.

Upon the data in hand, now much extended, and on the supposition that the same species of tree has not appreciably altered meanwhile in its relations to temperature, Heer long ago elaborately compared the miocene climates with those of our time, and Saporta corroborates his conclusions. For the northern regions the difference is said to be equivalent to 25 or 30 degrees of latitude—that is, we have now, say in Europe, in latitude 40° and 45°, and in Atlantic America, in latitude 38° to 40°, the temperature and the vegetation which then flourished at latitude 70° in Greenland. Grinnell Land, in latitude 82°, only two hundred leagues from the pole, had a forest of coniferous trees; among them—associated with a poplar-tree, a hazel, and a birch—was the silver fir of Europe, and the bald cypress of the swamps of the Southern United States. The same combination, minus the cypress, must now be sought in the more elevated parts of Central and Southern Germany. The sequoias and magnolias and persimmons of Greenland, in latitude 70°, mingled with maples, oaks, and grape-vines, have their representatives partly in Virginia and on the Ohio River, partly in California. The miocene of the southern shore of the Baltic had laurels, oleanders, and camphor-trees, but no palms, so far as is known, thus answering to the Mediterranean flora, but miocene palms reached to Belgium and Bohemia; and Provence, on similar data, had then about the climate of the coast of Zanzibar.

Another conclusion which Saporta confidently reaches—and which indeed is reached from all sides—is that of a very moist quarternary climate. Looking back to this comparatively recent period from our own, everywhere the streams have dwindled. Through great river-beds shrunken streamlets now meander in insignificant channels; springs reach the surface much lower down the valleys than of old; and the "rivers without water" of Egypt and Syria, and the reduced level of the Dead Sea, are so many evidences of a dryness supervening upon a general humidity greatly in excess of the present. These fuller water-courses of themselves indicate a more temperate or mean climate, a more equal distribution of heat and cold through the year. Was this equable climate frigid and rigorous or comparatively mild? Were Europe and the United States simply arctic and to be compared with present Greenland and Spitzbergen, as the school of Agassiz maintains? Or should the

*'Le Monde des Plantes avant l'apparition de l'Homme. Par le Comte de Saporta. Avec 13 Planches, dont 5 in couleur et 110 figures dans le texte.' Pp. 416, 8vo. Paris: Masson; New York: F. W. Christern. 1879.

comparison rather be made with Southern New Zealand, where tree-ferns almost overhang the terminal moraines of existing glaciers, in a climate which is neither cold nor warm? Saporta maintains the latter, and he is not alone. He insists that the high Alps and the Pyrenees are not the types of glacial Europe generally; that the arctic animals and plants, and the rigorous climate which we associate with these, belonged only to the close neighborhood of glaciers, but that the valleys below enjoyed a climate even milder than now, although vastly more humid. So, likewise, Mr. Ball (in a lecture recently delivered before the Royal Geographical Society of Great Britain) ventures to affirm that, even during the period of maximum cold, the highest ridges of the Alps were not completely covered with snow and ice; for we still see, by the appearance of the surface, the limit above which the ancient ice did not reach; and in the middle zone the slopes that rose above the ancient glaciers had a summer climate not very different from that which now prevails. And he concludes that the effect on the growth of plants in the Alps was to lower the vertical height of the zones of vegetation only one or two thousand feet.* This would seriously affect the forests of Europe, but would not permanently disturb the alpine and subalpine vegetation.

Yet cold it must have been when the reindeer and musk-ox roamed over the plains of Central Europe, and when the elephant or mammoth, and even the rhinoceros which accompanied them, were equally clad with a thick coat of hair. But, says Saporta, with the remains of these very animals from which a frigid arctic climate is inferred, occur also, in the alluvia of the Somme and the Seine, those of an elephant nearly related to the Indian species, the hippopotamus of the African rivers, and the hyena of the Cape; and the vegetable remains include the laurel of the Canaries along with the vine. The trees of the same epoch farther north were pines, lindens, maples, and oaks. So, according to Saporta, even the glacial period formed only a seeming interruption to the general course, the steady and really unbroken diminution of terrestrial temperature from the earliest geological periods to the present. This must be admitted if the two classes of animals and plants—those adapted to cold and those to warmer climates—were really contemporaneous. Our geologists have maintained that they were not, but that climates have oscillated, and that warmer periods than ours intervened between the glacial epoch and the present, or were intercalated in the glacial period itself. But is not the distinction of periods an assumption for explaining the two kinds of fossil remains?

We need not enter here into the discussion of the cause of the higher temperature of ancient climates, and of that peculiar and temporary state of things attending and originating the glacial epoch, with which Saporta concludes his third chapter. And no space is left us in which to sketch even the outlines of the second part and main staple of his book, the history of the vegetable periods, beginning with the "primordial marine plants" of the Laurentian and closing with the pliocene, in which existing trees are everywhere identified. The general conclusion of these very rich, elaborate, and well-considered chapters is that the vegetation of the earth has been continuous through all ages, and that the explanation of the present is found in the past. The history of the genus Sequoia—of the two "big trees of California"—as recently sketched by Heer in a popular journal, *Das Ausland*, is a fair illustration of this. The difference between these two trees is as notable as their resemblance and their isolation. They are the survivors of a numerous family, of wide distribution, which is first recognized in the cretaceous formation, in several species, and which reached its maximum in the middle tertiary, in fourteen recognizable species or forms. Almost from the first these separate into two groups, one foreshadowing the coast, the other the sierra, redwood, yet with various intermediate forms. These intermediate species are extinct, the two extreme forms have survived. The likeness of these two trees is explained by their genealogy, their marked difference by the extinction of the connecting forms which in earlier times bridged the interval.

* But Mr. Ball is fairly astounding when he assumes that our arctic-alpine flora may have been the flora of high mountains at low latitudes in the carboniferous period.

† 'The Rougon-Macquart Family. By Emile Zola. Translated by John Stirling.' Philadelphia: T. B. Peterson & Bros.

RECENT NOVELS.†

IT must be a robust admiration for M. Zola which survives the reading of such books as 'The Rougon-Macquart Family.' His own susceptibilities may endure the unrelieved odiousness of his characters, but his readers require some training for the steady contemplation of organizations only less guilty because more diseased, of moral baseness unvaried by even a gleam of rectitude, of evil inheritance which is fatal, the whole developing itself in a social condition which offers stimulus and means to the wicked, but neither help nor suggestion of anything better as possible. The old strife of Ormuzd and Ahriman is in the dim past, and the evil spirit has conquered. We are warned against judging the French people by their literature; what are we to infer when such an aspect of human life is the result of so able a man's observation and conviction? We see that some persons find the loves of Miette and Silvère a gleam of light across the darkness of the story, but considering Silvère's unhealthy excitability and the unsoundness, so to speak, of both, the light is faint. The book begins the history of a family who illustrate various vices and diseases in their own persons, and bequeath complicated evil to their descendants. These in their turn are specimens of what the coarsest vice can make of human beings, and from these threads M. Zola spins his web. The *Coup d'état* is copied in miniature in the little town of Plassons, and one cannot but suspect that the author has greater people in his mind as he describes in detail the falsity, the cowardice, the murderous gluttony of those who find themselves at the top, when all is quiet again.

A complete and, to many people doubtless, a refreshing contrast is M. Theuriet's last book. M. Theuriet is rather an optimist; his view of life suggests gay ribbons and holiday jollity in the main, and though it has its shadows they are not very sombre. But he is very much of a poet, and in an idyllic story like 'Young Maugars' is at his best. The love-making is very charming and done with great delicacy. It quite atones for M. Theuriet's *naïf* blundering in painting a villain of a deliberate and frank execrability with which M. Zola, who knows villains to their finger-tips, would never think of enduing his worst character. An exception to this criticism, however, which is worth pointing out for the subtle art with which a thoroughly corrupt nature is exhibited, is the scene between young Maugars and Mlle. Marcelle. Mlle. Marcelle is very real; you see the evil in her at the same time that you are conscious of her charm. The book is excellent for its contrast between the virtues of the peasants and the vices of the *bourgeoisie* in a small French town, and for its many pleasant pictures of out-of-doors. These, though they give a somewhat episodical character to the story, are in a subdued key, and, since they are by their author, they are admirable in technique.

'Left-handed Elsa' is an honest little story in excellent print. It has an odd mixture of reality and *diablerie;* but just that is attractive to some people, and homely honesty and truth at last win the day.

'The Breton Mills' comes near to being a really powerful story. The author calls it a romance, and therefore, we suppose, disallows beforehand being called to a strict account for knowledge of human nature or probable succession of events; but it is a pity, since he has experience and ability to do as well as he does in the earlier part of the book, that he should not have bestirred himself to do a really good piece of work. As it is, the story is like a chimera, which begins with a human figure and ends in arabesque. The Breton Mills are apparently woollen mills, owned entirely by one man. There are a thousand work-people in these mills, and the interest of the book consists in the exposition of the poverty of the operatives and the imperious will of the owner—one aspect of the strife between labor and capital. There are powerful pieces of description. The burning of the mill, with the varying instincts and influences acting on the operatives, who could have saved it but do not, is very dramatic, and the cautious endeavor to deal justly and kindly on the part of Philip Breton, when he inherits the mill property, with the early gratitude and subsequent discontent of "the hands," is well described; but the heroine of the love-story is an impossible creature, who elopes with an eloquent "workingman's orator," lives with him for more than a year, and then returns to her father's house to be as much as ever the "idol and the fancy's queen" of Philip Breton. He marries her with enthusiasm, in spite of the gravest doubts as to her reputation, and presently flings up all his plans, gets rid of his mills, and flees with his wife to Europe, since the speech and the looks of those around her express a surely justifiable contempt for her. This is a lame and impotent conclusion, resembling the fall rather than the rise of the rocket. Nevertheless, the book is worth reading for its insight into the life of the workers with their hands. There is exaggeration and incoherence in the style, but there is also some knowledge and some sympathy.

We have read six chapters of 'Cora Lynn,' two at the beginning of the book, two in the middle, and two at the end. Thereupon a proverb

'Young Maugars. By André Theuriet.' New York: D. Appleton & Co. 1879.
'Left-Handed Elsa.' Boston: A. K. Loring.
'The Breton Mills: A Romance. By Charles J. Bellamy.' New York: G. P. Putnam's Sons. 1879.
'Cora Lynn: A Novel. By John M. Hartley.' Philadelphia: Robert J. Hayward & Co. 1879.

suddenly recurred to our memory, which says "It is not necessary to drink up the sea to know that it is salt," and we joyfully ceased to read, having found nothing of interest or even of common sense in the portions selected.

'Money' is a harmless little story, quite free of offence, sketching a part of the lives and fortunes of a group of reasonably interesting French people.

'My Queen,' which is of the same series, is a love-story, with fabulous wealth and beauty on the one side, and a stern and haughty heroism on the other. That frequent modern resource—a desperate fever—brings the solution to the plot, and we leave the chief couple to live "rich, handsome, and happy" for the rest of their lives.

'Ruth Erskine's Crosses' is not a bad book; on the contrary, there is a great deal of goodiness in it. All the characters are constantly praying and reading the Bible, and the model girl thinks it the most natural thing in the world to ask a stranger at a first interview "whether she knows the Lord"; yet the impression left on the reader is that a great deal of false morality and worldliness is quite compatible with an uncomfortable amount of religious slang, which some of us have painfully learned.

'Somebody's Ned' is a shriek of a piercing kind against society for tolerating the making and sale of liquors, the sentencing of criminals to prison, and the contracting for convict labor. There are passionate appeals to "the great state," "the wise government" to prevent the inevitable consequences of various acts, and the opinion is manifest (as it is in sundry recent American stories) that it is the function of Government to interfere with more than paternal care in the lives of its subjects, to avert natural results, and provide constant stimulus and oversight for the weak and the wicked. The notion that Astræa Redux is to be handed in by some high Government functionary, seems growing in the American mind.

'The Last of the Kerdrecs' is published in London. It is a sketch of two Breton families who are involved in the cyclone of the French Revolution. It is difficult to write of that time without exciting some interest, at least of association, and that moderate degree belongs to this book. There is no harm in it, nothing incompatible with the facts of the case. We suspect it was easy to write, and it is not difficult to read.

'The Leavenworth Case' deals with all the most potent stimuli. Murder, law, love, and disinheritance are a good allowance for a single volume. The story is well constructed, and is much more comfortable reading than some of Gaboriau's law novels, with which one naturally compares it, as it is all told in the first person by the lawyer who officially watches the legal proceedings and assists in the subsequent investigations as counsel for the Leavenworth family. The motive-power of it all rests in the fascinations of Miss Mary Leavenworth, one of the two nieces who make the family of the murdered man; and the "moral to be deduced" is that young ladies should not be rash, scornful, or worldly-minded. It might also be wished that they should not appear before a considerable number of strange men in "wrappers," but we suppose this is too much to ask of American writers. It is difficult to say much of the book without exposing the plot, which would be most unfair, as the mystery is maintained with much skill to the very end of the book, and the reader is obliged at the close to reconsider his previous impressions as in real life.

We have made the most laborious efforts to read 'Under the Bells," but, having failed, we can offer a few extracts which may serve as a guide to some intending reader: "How could she ever have association in my mind with one who always delighted in bright apparel, attuning her presence with rare equity to the sunshine of her heart?" "The one a tall and graceful figure, replete with types of radiant loveliness that forced themselves unresistedly on the eye with full power of their engaging, alluring superfluity." Complete mental exhaustion is the natural consequence of forcing one's way through such verbal tangles.

First Blows of the Civil War. The ten years of preliminary conflict in the United States, from 1850 to 1860. A contemporaneous exposition. By James S. Pike. (New York: The American News Company.)—This volume is mainly composed of letters written by Republican politicians and editors during the ten years from 1850 to 1860. To these are added editorials from the *Tribune*, with which Mr. Pike was connected at one time as a correspondent, and letters of Mr. Pike from Washington to that paper on current events. Mr. Pike, who afterwards became minister to the Netherlands, was, earlier in his career, a slashing Washington correspondent, and among the "first blows" of the war his letters must not be forgotten. None of them are of much permanent value, except to the future historian, for whom they may throw light upon disputed points. They will certainly throw some light upon the condition of journalism before the war. They are of a kind that are not to be found now in the regular Washington correspondence of any New York paper. They are editorials, argumentative, laudatory, denunciatory, designed to cheer the faithful and defend the good cause, and lash the enemy to fury, and in their day they no doubt served their purpose. But their day is quite gone, and they are as hard reading now as old sermons. Among the private letters contained in Mr. Pike's collection the most entertaining are those of Mr. Greeley, Mr. C. A. Dana, and Count Gurowski. With the lively and irascible Count it was, it seems, Mr. Pike's custom to discuss "the sublime questions of ontology, trinity, general and special philosophy," though there is remarkably little trace of any such discussion in these pages. The book would have been much more interesting if the letters and editorials had been connected by the author by means of a running narrative. As it stands, it is rather a confusing jumble of "first blows," and a captious critic might perhaps find fault with the author's picture of the preliminary fray, on the score that the conflict is made to centre about the figure of Mr. Pike himself rather more than historical truth would warrant us in believing that it actually did. But time settles all questions of this sort in a way so mortifying to human pride, that authors must claim the right to manage their own perspective in their own way while it is still in their power.

Summer-Savory. By Benj. F. Taylor, LL.D. (Chicago: S. C. Griggs & Co. 12mo, pp. 212. 1879.)—This is an unusually miscellaneous bundle of papers; one may find among them descriptions of Western travel, of picnic parties, of the dog-days, of country ball-rooms, of thunder-storms, of retired farmers; besides short essays on Hats, on Winks, on Funeral Extravagances; and recollections of the author's childhood—none of them important subjects; yet neither did Elia choose important subjects always. Mr. Taylor's strong point, like Elia's, is his manner. A glance at his manner may be worth taking. We quote the first sentences of his book, the "specimen brick" in this case showing quite accurately what the house is like:

"The world is out of sight," says Mr. Taylor. "The high tides of midsummer have rolled over it. The green volumes of the maples, the chopping seas of the swath-ridged meadows have submerged and washed our planet quite away. The armed squadrons of corn are marching to the tune of 100° in the shade. . . . The English sparrow goes on with its saucy talk and its ceaseless paternosters of beaded eggs the year round. What a pugnacious, aggressive ounce of British bird it is! O for another Bunker Hill! And yet some cry, Spare, oh, the sparrow!"

'Summer-Savory' may be called a note-book of fancies—a poet's note-book, if you choose; in which every fancy that rises is set down without choice or pruning. They are not select enough for poetry, nor chastened enough for prose; they remind us too pressingly of Mr. Talmage's vivacities. But in all fairness let us read the best thing in the book; it is a description of what we see whenever we look out of a railway train going at high speed:

"A man hatched and reconsidered. There's a dot on the track about the size of a Darwinian primal egg. It begins to hatch! It develops legs and arms and feet and head. It is as tall as a pen-holder, a walking-stick, a man. It *is* a man; and the man stands not 'upon the order of his going,' but goes at once, bolts the track and makes for the fence. We pass him, and behold, he shuts up like a telescope and diminishes by swift degrees, and rolls back into an egg, a dot, a nothing. It is as if he had never been hatched at all."

'Money: A Tale. By Jules Tardieu.' Handy Volume Series. New York: D. Appleton & Co.

'My Queen.' Handy Volume Series. New York: D. Appleton & Co.

'Ruth Erskine's Crosses. By Pansy, author of 'Hester Reid,' 'Four Girls at Chautauqua,' etc., etc.' Boston: D. Lothrop & Co.

'Somebody's Ned. By Mrs. A. M. Freeman.' Chicago: S. C. Griggs & Co. 1879.

'The Last of the Kerdrecs. By William Minturn, author of 'Travels West." London: Samuel Tinsley & Co. 1879.

'The Leavenworth Case: A Lawyer's Story. By Anna Katherine Green.' New York: G. P. Putnam's Sons. 1879.

'Under the Bells: A Romance. By Leonard Kip, author of 'Ænone,' 'The Dead Marquise,' etc.' New York: G. P. Putnam's Sons. 1879.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*
Abbott (B. V.), Dictionary of Terms and Phrases used in American or English Jurisprudence, 2 vols	(Little, Brown & Co.)
Bacon (F.), The Essays, or Counsels Civil and Moral	(G. P. Putnam's Sons) $1 25
Champlin (J. D., jr.), Young Folks' Cyclopædia of Common Things	(Henry Holt & Co.) 3 00
Cowley (C.), Reminiscences of James C Ayer, swd	(Penhallow Printing Co.)
Dorr (Julia C. R.), Friar Anselmo, and Other Poems	(Charles Scribner's Sons) 1 25
Fothergill (Dr. J. M.), The Maintenance of Health	(G. P. Putnam's Sons) 1 25
Gladstone (W. E.), Gleanings of Past Years, Vols. v., vi., vii.	(Charles Scribner's Sons) 3 00
Inman (Dr. T.), Ancient Pagan and Modern Christian Symbolism, 3d ed.	(J. W. Bouton)
Jennings (H.), The Rosicrucians, 2d ed	" "
Longfellow (H. W.), Poetical Works, illustrated, Parts 7, 8, swd	(Houghton, Osgood & Co.) 50
Markham (Capt. A. H.), Northward Ho!	(Macmillan & Co.) 2 00
Monkhouse (W. C.), Turner	(Scribner & Welford) 1 25
Parkman (F.), La Salle and the Discovery of the Great West, 11th ed., revised	(Little, Brown & Co.)
Potter (Louisa), Lancashire Memories	(Macmillan & Co.) 1 75
Sheldon (E. E.), Short German Grammar	(Ginn & Heath)

The Nation.

NEW YORK, THURSDAY, OCTOBER 2, 1879.

The Week.

WE hope the statement of the *Commercial Bulletin* that the celebrated Silas B. Dutcher has obtained a month's leave of absence from Secretary Sherman "to stump the State for A. B. Cornell" is not true. If it were, it would indicate that Secretary Sherman had taken an amount equal to one month of Dutcher's salary out of the Treasury for electioneering purposes without warrant of law. It would, too, be a substantial violation of the civil-service order, and it would not be "civil-service reform." It would, moreover, fully justify a Democratic President in dismissing Dutcher when he came into office, and putting a man into his place who would stump the State for the Democrats. For these and many other reasons we cannot help believing that the *Bulletin* has been imposed on by one of Dutcher's enemies.

Harper's Weekly has at last recommended the scratching of the Republican ticket as the best means of defeating the Machine and saving the convention of next year from being managed by Conkling. In doing so it furnishes some striking evidence of the depth of the dissatisfaction felt by Republicans throughout the State over the doings of the Machine at Saratoga. We must now hope the *Times* and *Evening Post* will follow its example. The *Times* will have the less hesitation in doing so as it has notoriously lost the organship, which has passed to the *Tribune*. Mr. Cornell himself has accepted his nomination in a letter which has attracted the admiration of the Organ by its "modesty." But he could not help being modest; he has nothing to boast of that would bear the light. You surely would not have him tell the voters that during the past ten years he had controlled so many hundred primaries, laid so many miles of "pipe," pulled so many dozens of "wires"; had done so many days of log-rolling; had hung his banner so many times on the outer wall, wheeled so many times into line, and presented so many unbroken fronts to the enemy, and had been a true and faithful henchman. And yet it is of these things that his record is made up.

Apropos of all this, let us again call the attention of the Republican malcontents to the fact that the Independent Republican Committee which has initiated the scratching movement has been surprised by the magnitude which the movement has assumed, and needs money to meet the demands on it for ballots and correspondence and other details of organization. Those who are interested in "reform within the party," and wish to see New York appear in the Presidential Convention on the side of good government, and break up the Machine in this State, would do well to send it contributions, however small. Its post-office address is, we repeat, P. O. Box 4295, New York City. The number of scratches necessary to keep Mr. Cornell in his present position of political "runner" for Mr. Conkling are apparently now within reach, if they are properly sought for, in spite of his alliance with Kelly and Tammany, of which there is no sort of doubt. We would suggest to the Committee the propriety of adding the State-Treasurership to their list of blanks. A well-informed correspondent drew attention last week in our columns to incidents in the career of Wendell, the Conkling candidate for this place, which the Committee ought to examine before sending out their ballots.

The extraordinary General Term convened by Governor Robinson has granted the order, application for which we noticed last week, prohibiting Judge Westbrook from proceeding with the Nichols case, and Nichols will now have to take the usual course of citizens who seek redress for alleged grievances. As this postpones his reinstatement until after the election, if not for ever, Nichols ceases to occupy the prominent position in the public mind which he has lately held, and Tammany will probably take less interest in him as a martyr than it has done as a possible Police Commissioner. Judge Westbrook hastened on Friday to add another string to the Tammany bow, and issued an order summoning the Police Board to show cause why they should not be compelled to appoint the Tammany election inspectors forthwith, and restraining them from appointing any others in their stead until after the determination of the General Term, before which the order was made returnable. The effect of this was to enjoin the Police Board from doing what the Corporation Counsel had instructed them it was their duty to do. They could hardly be expected of their own motion to obey the implication of the order and appoint Tammany inspectors, and as the time for the appointment of inspectors was about to expire, a possible disfranchisement of the entire city was talked about rather wildly. But even Judge Westbrook saw that he had been led into hasty and ill-advised action by Mr. "Tim" Campbell and his friends, and on Saturday modified his order by vacating the injunction part of it. The matter was argued Monday before the General Term, which, of course, denied the application, expressing the opinion that it was the business of the Board to select inspectors, and advising them to make appointments without reference to the claims of any local factions. At the present writing the Republican inspectors and poll clerks have been appointed and half of the Democratic candidates, the latter from the Anti-Tammany list.

The *Times* does not produce or refer to the speech or speeches, or resolution, in which "the South presented in Congress the doctrine on which the theory of secession rested," and in which it declared its purpose once more to attempt the application of this doctrine to the administration of the Government. If the *Times* has no such speeches or resolutions to draw on for authority, it has been guilty in its own calling, for electioneering purposes, of a kind of fraud which is only excusable, if excusable at all, in a Machinist addressing a controlled primary. Leading journalists ought not to do this kind of work for "the party."

Mr. Field has replied to Mr. Tilden's elaborate and artistic "interview" in the *Times*, in a long newspaper letter which contains a little of everything save proof of his original charge that Mr. Tilden "sold him out" in violation of a distinct agreement. This, which Mr. Tilden denies, Mr. Field reiterates, which is perhaps less surprising than the fact that he adduces nothing to substantiate his assertion—nothing which would be valuable evidence in the event of the lawsuit which Mr. Field at first said some third person contemplated, but of which we hear nothing of late. We do not see how it is possible, with every desire of course to have something positively heinous fastened upon Mr. Tilden, to avoid the conclusion that Mr. Field exaggerated the strength of his case in his first statement. It appears now to have been reduced, as he says, to a question of veracity, which "the public must decide by weighing probabilities." Such a decision, he thinks, must be in his favor. "Is it likely," he asks, "that I would undertake a negotiation abroad with the full freedom of my associate to defeat it at home?" The answer to this is that this is just what Mr. Field appears to have done. There seems still an exasperating lack of proof that the "understanding" which Mr. Field speaks of was shared by his "legislative ally"; and the fact that he supposed the contrary is nothing against the wisdom of abandoning the proposed suit for damages, which we may now conclude has been determined upon. The second of the original charges is much better substantiated; Mr. Tilden has very little to say, nothing convincing indeed, in reply to the accusation of

having failed to call upon Mr. Field since the latter's return from Europe. Mr. Field rightly dwells on this charge, which has never been satisfactorily answered. He says that Mr. Tilden not only avoided calling at his house, but that being once in the next room, when "he had but to open the door and walk in," he instead "put on his hat and walked out." He does not "mourn his (Mr. Tilden's) absence," however, and contents himself with having his own opinion of the reasons for it.

There is one feature of the case which would possibly have been overlooked had not Mr. Field pointed it out as plainly as he does, and that is his motive in calling public attention to Mr. Tilden's delinquencies. His friends tell him, he says, that he is making a great fuss over "a very common form of sharp practice," and that "such things are done in Wall Street every day." He retorts to this, with eminent justice: "Yes, but they are not done by a President-elect of the United States," and very properly adds that "no matter by whom they are done" they display a low standard of commercial morality and business honor. Mr. Field thinks they show how "the greed for money has eaten like a dry rot into the very core of our national character," and feels that "it is time the thing was checked." "I mean," he declares, "to do my small part, by God's help, toward checking it." No better way of checking it occurs to him than that of "singling out the most conspicuous instance" of this greed for money that he has ever met. Hence his exposure of "the old humbug of Cipher Alley." What has seemed heretofore like an overflow of indignation at a private wrong now appears to be the performance of a public duty. This is the more creditable to Mr. Field since almost any other man would have been likely to entertain a personal feeling towards a "legislative ally" who had sold him out. His remark that the national standard in respect to the means of money-getting "will never be raised so long as men keep silent about it," is probably true; but if raising it depends upon speaking one's mind about Mr. Tilden the outlook for the future is bright with hope.

Mr. Tilden's vitality and continued hold of the Democratic Machine are made all the more remarkable by the rapid succession of the misfortunes which overtake his reputation. His refusal to pay the pedigree man in London for "a handsome family tree" until compelled by threats of legal proceedings, as reported by Mr. Field, was a great blunder; so was the disappearance of the books in his railroad suit. Now comes another in his moving for a bill of particulars in his income-tax suit. He said in his affidavit that he was ignorant of the particulars of the claim made against him, and therefore wanted to know what items of his income the Government thinks he concealed. But to this Judge Choate, in denying the motion, made the crushing observation that "he (Mr. Tilden) does not swear that he is ignorant of the particulars of his income during the periods in question." (The Court might have added that if he were, all he had to do was to apply to the New York *Times*.) Therefore the Government could not surprise him on the trial. If they alleged that he had received money which he had not received, contradictory proof could be easily adduced. Disapproving as one must do of this old candidate's conduct, one must acknowledge that he bears his load of opprobrium in a very gallant manner, and, though bowed down with iniquity, still gives full work to at least two dozen able-bodied Republican moralists, and nothing but daily exposure seems to be considered sufficient to keep him out of the White House.

Kearney has been twice refused a reception by General Grant on sending up his "card," and that, too, after a Chinese delegation had been respectfully admitted. The Sand Lots hero and his followers and patrons are also in deep trouble over a recent decision by Judge Deady, of the United States Circuit Court in Oregon. Judge Deady decides that the Oregon law which prohibits contractors from employing Chinese on work to be paid for by a municipality, is unconstitutional; the Burlingame Treaty conferred upon the Chinese the right to a permanent residence here, and this, according to the decision, involves their right to earn a living here, which right is invaded by such legislation as that in question. The new California constitution contains the same prohibition, which accounts for the alarm and indignation at the decision which finds vent in the San Francisco papers. One journal argues that the right to live in a country by no means implies the right to keep one's self alive in the said country, and that Judge Deady is not a good lawyer. He is nevertheless, it should be said, in full sympathy with the opponents of Chinese immigration, though he cannot avoid recognizing perfectly clear distinctions as they seem to require him to do.

A special reporter of the Chicago *Times*, who was sent to Yazoo City to ascertain the facts in regard to the killing of Dixon, has given a long and apparently conscientious account of the murdered man's history. It appears from this that Dixon, who was born in Virginia in 1847, and who ran away to join the Confederate army, arrived in Yazoo early in 1866 as a professional gambler, and presently opened a gambling-house, which he gave up only a short time before he ran as independent candidate for sheriff, and on the stairs of which he was lately assassinated. In 1872 or 1873 he openly shot down a negro to whom he owed money. In the political campaign of 1875 he became the head of a body of regulators called "Dixon's Scouts," among whom was Barksdale, and who passed their time in breaking up Republican meetings, terrorizing the colored population, and hanging such of them as were charged with crime or were otherwise obnoxious. One of these victims had $1,600 on his person, which he begged the "Scouts" to send to his mother in Ohio. Dixon demanded this money of the man to whom it was entrusted, and pretended that he paid it into the Democratic campaign fund, to be used "to stuff the ballot-boxes, if necessary"; but the Democratic Committee denied having received it, and the probability is that Dixon appropriated it for his own advantage. In January, 1876, on the eve of the Democratic return to power through the efforts of the regulators, the county treasurer's safe was robbed of $50,000, an act of which the outgoing treasurer could not be accused, for he had handed over his accounts, but which was publicly fastened upon Dixon by a fellow-gambler named Harrison. This led to frequent encounters between the two men, until Dixon had killed his accuser. He was tried, but was acquitted and escorted home with a brass band. Barksdale at this time was deputy-sheriff, and during the imprisonment an enmity arose between them which culminated in Dixon's death. Barksdale is said to have shot him not because he was trying as a negro candidate to divide his party, but because he had made the grossest and filthiest attacks on the character of his mother and sister. It appears, however, that Dixon was getting to be regarded as too dangerous a man to be tolerated any longer, and that there was some concert in his taking off. In spite of his many atrocities the negroes eagerly followed him as a political leader, and it is plain that the power of such a man in the community, with such a constituency, was as much to be dreaded as if he had been a Northern carpet-bagger.

During the week $8,577,000 more foreign specie arrived at New York, of which all except $720,000 consisted of gold. This brings the total specie imports since the resumption of specie payments up to $39,700,000, all of which, except about $4,500,000, has arrived since the first day of August, or during the months of August and September. The demand for currency on the New York banks from the interior has been very large; and during the week the banks which owed the Government for 4 per cent. bonds made their final settlements, so that with all the gold arriving the reserve of the banks was reduced. As the Treasury has drawn all the money from the banks which it can on account of 4 per cents., and as it has a fund of twenty-odd millions to pay out for called bonds as they are presented, and about $8,000,000 for October interest, the Treasury movements will help the money market during the remainder of the

year. All departments of trade are very active, but the healthful improvement in legitimate enterprises is endangered by the unwholesome and wild speculation at the Stock Exchange. Even the coal stocks and Erie have become respectable beside some of the new "fancies." Silver bullion in London ruled at 51½*d.* to 51⅝*d.* The bullion value of the 412½-grain silver dollar here was $0.8662.

The elections for direct electors to choose deputies to the Prussian Diet took place on Tuesday last, with a result, so far as is known at this writing, decidedly adverse to the Chancellor's pretensions. There are three parties in the field: the Conservatives, who are supporting Bismarck, and who maintain under his guidance that the issue is economical reform and the possession of the railroads by the Government; the National Liberals, who maintain that it is the preservation and development of parliamentary institutions, now threatened by the Chancellor; and the Ultramontanes, who maintain that it is the liberty of the Church. The last have been thrown into a state of great excitement by the formal announcement through the semi-official paper that all stories of negotiations between the Government and the Pope are false; that the nuncio, Roncetti, was never authorized to open any such negotiations, and has never opened them. Moreover, the new Minister of Worship has just returned an answer to the petition of the clergy of the dioceses of Münster and Paderborn which shows that Herr Puttkammer is not a whit more pliable than Dr. Falk. The petition claimed for the Catholic prelates the right of participating in the organization and inspection of the schools, and asked that the ordinances now depriving them of that right might be abrogated, and the exclusive state inspection and control modified. The Minister replies that the act they complain of is simply a new expression of what has always been the Prussian law, and that the situation is of their own creating, and that no change of any kind will be made. The *Germania*, the Ultramontane organ, therefore denounces him as Falk with a new name. But the Socialists have elected two members in Saxony, which is a severe blow to the Chancellor, and has made some sensation throughout the country.

The *Germania* also meets the National-Liberal cry for "war against Rome" by declaring that the real danger to Germany comes from the growing numbers and influence of the Jews, and makes four capital charges against them: (1) That they are appropriating an amount of the public fortune out of all proportion to the services they render to society, and make their money either without labor, or by very light labor, or by trickery; (2) that they mix themselves up in Christian quarrels for the purpose of rendering them more bitter, and attack Christianity itself; (3) that they labor systematically for the corruption of the Christian world by their sensational press, their immoral novels, and their indecent engravings; (4) that in all the political movements of the day they are among the most radical and revolutionary, and wage bitter war against all that is legitimate, historical, and Christian in the national life, and promote all upturnings, knowing that Judaism has always flourished on ruins. The Liberal papers make fun of this, but all acknowledge that Jews are taking possession more completely every day of the press, the finances and trade of the Empire, and playing a more and more prominent part in all fields of national activity. The returns show that the attendance of the Jewish youth in the secondary schools and universities is larger by far in proportion to their numbers than that of the youth of any other sect. The Rumanians, who are making desperate attempts to avoid literal compliance with the clause of the Treaty of Berlin which directs them to emancipate the Jews, have drawn attention to the Coney Island and Saratoga demonstration against them in this country as proof that the Jews are increasing in America to "an alarming degree." Nothing would do more to drown this prejudice than a movement among the Jews towards agriculture, but of this there is no sign. We doubt if a Jewish farmer can be found in either hemisphere. For their wonderful success in all other pursuits there seems to be only one remedy, and that is the slaughter of all Jewish children.

The conflict between the Opposition and the Ministry with regard to the Jews in Rumania continues. The Ministry wish to comply with the requirements of the Treaty of Berlin by naturalizing all really resident Jews, or "naturalizing by categories," as it is called, while the Opposition are only willing to naturalize select Jews by name. In Wallachia, where the Jews are mostly descendants of Spanish and Portuguese refugees, born and bred in the country, the question gives little trouble. In Moldavia, on the other hand, the Jews are mostly emigrants from Poland and Russia, and so numerous that they are said to make 75 per cent. of the population of Jassy, the capital. The Opposition maintain that the only bad consequence of refusal will be non-recognition of the Principality as an independent state by the Powers, and for this they do not care; but the Ministry fear that if there should be another outbreak of the Eastern Question the country might suffer in the settlement for its recalcitrancy.

The conflict between the Government and the clergy over the management of the public schools in Belgium grows more bitter. The bishops had already directed the priests to refuse absolution to the teachers of the primary schools, and to both teachers and students in the normal schools. They have now gone a step further and applied the prohibition to the parents of the children in the primary schools. These schools under the law of 1879 differ in no respect from those of this State, except in making more distinct recognition of religion. A place and hour are provided in them during which the clergy may give religious instruction to the children of their own denomination. If the clergy refuse, the teacher may, if he pleases, give children the elementary religious instruction prescribed for the purpose by their respective denominations, in the catechisms, if the parents desire it. But the Catholic clergy actually insist on having the appointment and dismissal of the teachers, the inspection and control of the instruction, and the provision of the books, and in default of this threaten every adult person connected with state education with eternal damnation.

A correspondent who knows what he is talking about discusses elsewhere the military aspect of the Afghan problem. The newspapers brought out by the last mails from England are full of its political bearings. The Liberals are trampling on their fallen foe by reproducing the past deliverances of the members of the Cabinet on the "Imperial policy," and in these, of course, Lord Salisbury cuts the worst figure. His despatch to Lord Northbrook, urging him to impose on the Amir by inventing an excuse for sending to Kabul an ostensibly temporary mission, to be subsequently converted into a permanent one, is—now that the Ministers have been guilty of so much other falsehood and evasion—curious reading. Lord Northbrook indignantly refused, and he was replaced by a showy novelist who knew nothing of the East. Lord Beaconsfield's contemptuous reply to Lord Lawrence, too, when the latter as chairman of the Afghan Committee sought an interview with him, is reproduced with damning effect; and so is Mr. Gladstone's solemn warning as to the probable fate of the embassy uttered in full debate. The French press is rubbing the poison in with its sarcasms. One paper, alluding to the rôle which two "second-rate novelists" (Lord Beaconsfield and Lytton) have played in the catastrophe, asks whether, if the Tory Cabinet should be reconstructed, "Ouida" and Miss Braddon would have places in it. Luckily for the Ministers Parliament is not sitting. The news from Afghanistan shows that every exertion is being made to occupy Kabul; but then all the world knows that this will not be the end of the trouble, but the beginning of it. The Amir has come into the camp with a small escort, which is a confession that he has lost whatever power he ever had. Behind this dismal collapse of the Imperial policy there is the growing distress, both agricultural and manufacturing, which must tell seriously on the revenue during the current year.

THE PARTY OF DISCONTENT.

THE fact that after a canvass of extraordinary vigor, aided by returning business prosperity and the apparently complete success of resumption, the Republicans of Maine were able to make no impression on the Greenback vote and came near losing the State, has a good deal of significance. So also has the fact that Butler, who last year with a very feeble organization came near equally dividing the vote of the State with the Republicans of Massachusetts, has this year returned to the charge, supported by some prominent Republican politicians who are noted for their love of being on the winning side, and has in his platform avoided all mention of national issues. In other words, he proposes to fight simply on economical questions and questions of local government, and he evidently believes that he will lose nothing by refusing to manifest any interest in the subject of "State rights," which was last winter the latest political "fancy" in Washington. In New York, although the Republican platform as drawn up at Saratoga was full of Washington troubles, and the Democratic platform had a fair allowance of them, both the candidates have avoided all mention of them in their letters of acceptance. No one would suppose from either Mr. Robinson's letter or Mr. Cornell's that the coming election was likely to determine the position of the State next year in a deadly conflict with the South over the very questions which brought on the war, as the Washington politicians would fain have us believe. Mr. Wheeler made a vehement "bloody-shirt" speech at the Republican Convention, but we believe it is undeniable that it was listened to with undisguised weariness. In California the Republicans have carried the State, but not in sufficient force to prevent Kearney's party from getting possession of the municipal government of San Francisco, and two out of the three railroad commissioners, who wield very great power under the new constitution. Whether the Republicans would have done so well if their opponents had not been split into so many sections—there were five State tickets in the field—is more than doubtful.

To appreciate all this correctly, it must not be forgotten that the elections which are occurring this year are the last before the meeting of the Presidential conventions, and their result is naturally regarded with extraordinary interest on account of the influence it is likely to have on the public mind in the intervening months, as well as on account of the indication it will afford as to the probable relative strength of parties a year hence. It must also be borne in mind that the Republican platforms and orators have generally evaded the remaining difficulty of the financial situation by treating gold and silver as of equal value and as likely to remain so—there being actually a difference of fourteen or fifteen per cent. between them—and by ignoring the fact that the redeemed greenbacks are reissued or held for reissue. Mr. Sherman, who is franker on this subject than most other speakers, endeavored to dispose of it in Maine by holding out the hope that we should before long have a bi-metallic convention with European nations, which would relieve us of our load of silver; but we verily believe that there is little foundation for this hope beyond a conversation of Prince Bismarck with Mr. W. D. Kelley, in which Bismarck, probably perceiving the mental condition of the person he was dealing with, served out to him the kind of talk he thought would be most likely to please and excite him.

All this—and we might, if we had the space, add a great deal to it—does not support the theory that the Greenback movement is dying out under the influence of specie payments and returning prosperity. The desire that the Government should not redeem the greenbacks, or that it should make fresh issues of irredeemable paper, probably *is* declining; but the Greenback movement does not depend on this solely. What it covers and represents is not simply a particular financial heresy, but a loss of interest in the questions by which the two great parties have been divided since 1856; an unwillingness to accept the new issues got up in Congress between the Brigadiers and the Stalwarts; and, finally, a widespread desire to discover some mode of improving the condition of the working classes, including the struggling farmers, through legislation. In fact, the name Greenbacker is a mere accident. The discontent may next year take another name, but it will continue. Many Republicans seem to take comfort in the fact that it now and then, as in Massachusetts and Maine, swallows up the Democratic party; but we do not see how this mends matters. The 110,000 who voted for Butler last year have to be met and overcome under the name of Butlerites as well as under the name of Democrats. They differ from Democrats simply in refusing to take any interest in the Southern question and thus present one issue on which they could be fought and beaten; but they are for this reason none the less formidable or difficult to deal with.

It would, in fact, appear as if Mr. Sherman's opinion, uttered in Ohio, that the great State-rights contention in Congress is "infinitely more important than money or bonds, or property in silver and gold" (in Maine he put "labor" on the list), is by no means shared by a large and increasing number of voters. The truth is that in this country, as in all countries in our time, questions of labor, of property, and of money underlie all other questions, and, though often kept temporarily in abeyance by the sudden and overpowering excitements arising out of foreign quarrels or quarrels over the seat of the sovereignty, such as the late rebellion, they form the deepest and most permanent interest of the bulk of the population. They furnish the source of industry, the raw material of morality, and the most powerful governing motives of the lives of the great mass of men; and any party which tries to ignore them, or which puts them for a long period in a secondary position, is sure to suffer for it. They are pushing their way to the front in the politics of all civilized countries, in spite of the efforts of kings, and princes, and chancellors, and managers to keep them out of sight. They are at this moment the impending questions of the politics of this country.

How closely and in what troublesome forms they are likely to press on us has been set out in the last number of the *Atlantic Monthly*, by the very able writer who has been during the last year contributing to that periodical a remarkable series of articles on the mental and moral condition of the working classes. His description of the views about the sphere of government which are making their way among the workingmen, and which are preached by the "sincere demagogues" who lead them, are worthy of the attentive perusal of all who desire to know the nature of the problems which American political parties will be called on to solve during the next fifty years. They are problems, too, which we shall not be able to deal with from afar, with the aid of "troops," collectors, and United States marshals, like the Southern question, but which every man will have to solve at his own door and in his own farm or store. That article not only goes far to explain the persistence of the Greenback movement, and the Butler movement, but prepares us for the appearance of others of like nature, possessing more coherence and a better organization. It explains, too, the growing difficulty of keeping people in Maine and Massachusetts, who have a hard struggle to get bread and education for their children, in a fever-heat of excitement because the civilization of South Carolina is still low, and because human life in Mississippi is less sacred than in New York and Ohio. It does, however, more than this. It indicates very clearly that any party which, like the Republican party, boasts that it contains the conservative intelligence of the country, and assumes the responsibility of maintaining and defending the existing social order, must devise for this purpose some better instrumentality than electing a dictator or keeping alive the dying embers of bloody strife. It must go back to the spirit as well as to the agencies of its early days, and begin the slow and perhaps dull process of educating the discontented masses, both Southern and Northern, into sound economic and social ideas, as it once educated them into hatred of slavery, by the lectures and speeches and books of men who love the party as the early Republicans loved it; not as the means of getting so many offices for so many "workers," but as the means of making the popular morality a sure and lasting foundation for rational political liberty.

THE FISHERIES QUESTION.

IT was hoped that the Halifax Commission and the enormous sum which we paid as its award had settled all disputes about the fisheries in Canadian waters for some years at least. But we now have the strange spectacle of our fishermen, who were supposed to be vitally interested in the right to fish inshore, memorializing the Government to abrogate the Treaty, our Government negotiating to surrender privileges for which we have paid five and a half millions, and the Government of Great Britain reluctant to do away with provisions which it had contended were detrimental to it to the extent of more than a million dollars a year. The causes of this anomalous condition of things are not hard to find.

In the first place, the local governments of the Dominion have statutes, to which, they maintain, fishermen from the United States as well as their own subjects are bound to conform, of a nature to impair greatly the value of our treaty rights. These laws prohibit seining herring or squid, which are the principal bait for cod, between the middle of October and the middle of April, making a close season of six months, during which the only way in which bait can be obtained is by the slow process of jigging or by purchase. Fishing for squid or herring on Sunday is also prohibited. There are also onerous restrictions as to the kind of seines to be used and the manner of using them. The superintendent of Canadian fisheries has issued a circular in which he interprets a provision against throwing overboard offal and dead fish as prohibiting seining for mackerel. The Government of Great Britain, in answer to remonstrances by our Government, say that they claim that aliens and subjects alike should obey the local laws of the jurisdiction within which they find themselves, but that "if a local law has been inadvertently passed which is in any degree or respect at variance with the rights conferred on a foreign Power by the Treaty, the correction of the mistake committed, at the earliest period that its existence shall have been ascertained and recognized, is a matter of international obligation." Meanwhile the laws stand, and our fishermen, though instructed that our Government does not consider them bound by those laws and will sustain them in their violation, not unnaturally are unwilling to risk the loss of their vessel and catch for the chance of reparation at some distant day, even if they were not forcibly prevented from fishing against the laws, as has been the case in two instances at least. A claim for $103,000 has been made against Great Britain for the trouble at Fortune Bay a year and a half ago. The natives of Newfoundland make a very good profit on the bait which they sell to our cod-fishermen, which may account for the violence of their indignation when their laws are broken.

Another reason why our fishermen are anxious for the Treaty to come to an end is because they, having expensive outfits and being obliged to go a long way from home, are unable, without a protective tariff, to compete in the markets with the fishermen of the Dominion, who go out for a day at a time in their small boats and are engaged in farming at other times. The result is shown in the diminished number of our mackerel fleet in the Gulf of St. Lawrence, there being said to have been not more than forty or fifty there this summer, as against about two hundred and fifty in 1873, and one hundred and sixty in 1874. With a duty which was almost, if not entirely, prohibitory before the Treaty, mackerel-fishing was barely profitable, and with free competition with the cheap labor and outfit of the Canadians it has ceased to be so at all. Probably less than a third of all the mackerel caught by our fishermen are taken in the grounds gained by the Treaty, and for the privilege of taking these few they are exposed to disastrous competition.

On the other hand the Canadians want reciprocity, of all things. Their market is this country, and if cut off from that they are crippled. When there was a heavy duty on fish they found it almost useless to try to compete, and many of their fishermen sailed in American bottoms to avoid the duties. Though by the present Treaty they have reciprocity only in fish and fish-oils, and though they not unnaturally feel aggrieved that this Government refuses to recognize cod-liver oil as a fish-oil (on the ground of its having been treated medicinally), and that a heavy duty has been imposed on the tin cans in which the fish are packed, still they know they cannot afford to lose even this limited reciprocity under which their fishing interests are reviving.

In this condition of things—when those supposed to be benefited by a treaty seek its abrogation, and those injured by it insist on its continuance—it is hard to suggest any remedy. Our Government has had a vessel with Commissioners in Canadian waters the last summer to collect facts to aid in negotiations with Great Britain. This Commission has not yet reported, and the result of its investigations is not known. If the Treaty is abrogated we are at once thrown back on the continual quarrels and complaints, on the one hand of infringements by our fishermen within the three-mile line, and on the other of illegal seizures and harassing searches and detention. These disputes must exist wherever we are excluded from fishing within an imaginary line, whose whereabouts must, in the very nature of things, be practically determined by a guess. And the guess of a Gloucester skipper is likely to be very different from that of the captain of a British cruiser. We cannot be free from trouble unless we have the right to fish inshore, and this right Great Britain will certainly not concede for a less return than she now gets under the Treaty. But what is meant by the right to fish inshore—whether it means for the whole year or for such part as the wisdom of the local legislature may decree, whether by such means and with such implements as are most suitable or with such as the local legislature shall allow—must be fully agreed by the Governments of the two countries. If we are carefully protected by mutual agreements in these matters, the provisions of the present Treaty seem as fair to both sides as any that can be devised.

VIOLLET-LE-DUC.

THE extraordinary popularity in this country of some of the works of Eugène Emmanuel Viollet-le-Duc is a sufficient reason for devoting to his life and labors an amount of space which our American journals seldom find it convenient to give to a writer in another tongue than the English. Born in 1814, Viollet-le-Duc was well launched on the sea of study and research, for his family counts many names not unknown in literature and art. His father, who lived until 1859, was peculiarly a student of early French literature ; and his uncle was E. J. Delécluse, a voluminous and valued critic and historian, who was called "le doyen des critiques français" when he died in 1863. Eugène, however, must have taken to his own especial task very early in life. It was at the age of twenty-six that he was employed on the Paris Sainte-Chapelle under the direction of others, and as director-in-chief of the elaborate and long-continued works of restoration and almost rebuilding of the nearly ruined abbey-church of Vézelay. He had previously prepared himself for practical work by extended journeys, and by an amount of labor and study in the presence of the monuments of Italy, Sicily, South Germany, and above all of France, of which we can best judge from the really amazing results embodied in books published long afterwards. Nor was his work merely preparation for the future : in Gailhabaud's 'Monumens Anciens et Modernes,' the monograph on the Campanile of Giotto is by him, we remember, and probably others are as well. From about 1836, for a number of years, he exhibited frequently at the Salon elaborate drawings of ancient buildings, as he found them, and as conjecturally restored. He taught at the École de Dessin until about 1845, and contributed freely to periodicals, while continually new architectural work was entrusted to him, generally in the form of repair, restoration, and completion of cathedrals and other edifices of the Middle Ages. During his first ten years of active work he was employed by the Ministry of the Interior upon public works at a dozen cities at once, especially at Carcassonne, at Sens, and at Amiens. In 1846 he was architect of the Abbey of St. Denis, and about the same time he was employed with Lassus, who soon after died and left him alone in charge upon the Cathedral of Paris, Notre Dame, where an amount of work was done difficult to conceive in view of the building as it stands to-day, and only to be partly estimated by comparing with it the photographs and drawings of forty years ago.

Viollet-le-Duc was set down by his contemporaries as wholly devoted

to mediæval art and building, as was natural from his early appearance as an advocate of the careful preservation and study of Romanesque and Gothic buildings. The interest in these forms of art was as strong in France as in England in those early days, and far more intelligent, though it led to no well-marked "Gothic Revival" in modern building. As the champion of mediævalism as a correlative study, too important to banish completely, as the Academic mind thought right, Viollet-le-Duc became a partisan perforce. No reader of his books needs to be told that he would have advocated just as eagerly the study of Greek art or of Roman building, had it been one of these which the Paris *écoles* and *ateliers* insisted on ignoring. But it was his mission to speak for the forgotten past of France, and he spoke for it and worked at its rehabilitation with an energy and a skill that put him at the head of his associates. The year 1854 or 1855 saw the completion of the first volume of his 'Dictionary of French Architecture from the Eleventh to the Sixteenth Centuries,' a book in ten volumes, which took ten years to complete. 1858 was marked by the first volume of the 'Dictionary of French *Mobilier* [a word easier to convey than to translate] from the Carlovingian Epoch to the Renaissance'; but this book was not completed until long afterward—after the French and German war, and great changes in our author's position in life. A host of pamphlets belong to the years 1856–1864, many of them afterward incorporated into his great works, but some of them more temporary in their nature, and nearly related to almost the only failure in Viollet-le-Duc's career.

He was closely allied to the Napoleonic court. The Minister of Fine Arts, a certain Count de Nieuwerkerke, of Dutch family, a sculptor of some reputation, who had come to the front during the Republic of 1848, seems to have had unbounded respect for him, and the immediate household of the Emperor is reported to have looked to him for advice and aid in their artistical vagaries—from decorations for fêtes to the collecting of works of art. In the autumn of 1863 a decree of the Emperor ordered certain important changes in the organization and system of the École des Beaux-Arts, the most marked one being an apparent substitution of the direct will of the Ministry for the influence of the Academy of Fine Arts in the guidance of the School. Five days afterwards the nominations appeared to the new offices. The director was to be Robert-Fleury, a painter of the old school; the three professors of painting were Pils, Cabanel, and Gérôme; the professor of engraving was Henriquel-Dupont, engraver of Delaroche's "Hemicycle"; the other professors were well-known men, and the chair of Æsthetics and the History of Art was filled by Viollet-le-Duc. The greater part of the new system was destined to be permanent; but in the case of Viollet-le Duc the rebellion of routine, old tradition, exclusiveness, and *esprit de corps* was too strong for him to subdue, and, after a scandalous uproar and a violent controversy in scores of journals, he resigned his chair, to which was appointed soon after a very different person—a writer of whom no one was jealous, an "available" candidate, as we should phrase it in America—M. Taine. Another result was, if we do not read amiss some undated prefaces and notes, the series of 'Entretiens sur l'Architecture,' a very important work, of which one-half has been translated into English by Mr. Van Brunt and published in Boston. These lectures seem to be what he would have delivered to his pupils, had they been willing to listen.

Vapereau's Dictionary, from which we have taken a date or two, says, by way of summing up, "Artiste ou Écrivain, il montre partout une sympathie exclusive pour le Moyen Âge." It is amusing to read this sentence just after the list of his exhibited water-color drawings of ancient buildings; but there is truth in almost all assertions—truth or the shadow of truth. As "artiste"—that is, as practising architect—nine-tenths of Viollet-le-Duc's work was in connection with cathedrals, fortresses, abbeys, and civic buildings, the slender remains, in France, of the Romanesque and Gothic ages. The other tenth we ask no one to admire. Skill and boldness in planning are not strange or rare among French architects, and a daring employment of new styles of design is not admirable unless the result is fine. It is hardly worth while to speak of his different designs, or of the books in which they can be found; for there is, we think, little disagreement among students as to their character. Intelligence there is in them, resource, dexterity, but scarcely a spark of genius, scarcely any evidence of power of artistic design. We name only, as an instance of the most complete failure when a great chance was given, the color-decoration of the chapels of Notre Dame, published in an accessible volume by M. Ouradou. The evidences of study of Gothic art appear in all the designs of our author, but seldom predominate in them. He might be called a very modern, a very realistic designer, taking his good where he found it, except that his designs are really of no great value.

His mission was to instruct, to criticise, to build up a whole system of study, and to set an example of constant, intelligent, and uninterrupted labor. His books are extraordinarily new, underived; they are the result of his own investigations. The great dictionary by which he is best known contains in its first volume the threefold essay "Architecture," civic, ecclesiastical, and military—three hundred and fifty pages long, or a volume in itself. This is succeeded, enlarged, supported, and verified by an essay nearly as long on Construction, in the fourth volume. Separate papers under different headings develop, as we go down the alphabet, the important parts of the study. Thus, by the time V is reached, there is a great deal to say, under "Voûte," about Roman, Romanesque, and Gothic vaulting which had not been said before. Now, of all this mass of fact, and of explanatory theory deduced from fact, there is scarcely a line that is not our author's own—the measurements and the knowledge of buildings are of his own getting, the conclusions are of his own drawing. Occasionally he refers his reader to another book than one of his own, but it is when M. Verneilh or M. Amé, or MM. Verdier and Cattois, have published drawings so accurate and complete of some building or detail that he thinks it unnecessary to give his own. The frequent use of pictures taken from ancient manuscripts and of passages from early French literature, which every reader will notice, may be the result of the aid of others; it is not impossible that secretaries and amanuenses have found and copied the latter and have hunted up the former for the author himself to copy. Moreover, his all-knowingness in mineralogy and in branches of mechanical science not necessary to an architect, such as dynamics, leads one to suppose skill in eliciting from specialists what he needed of their specialties. But the chief part of his varied knowledge is his own. It is true that he enjoyed extraordinary opportunities. He knew Gothic vaulting by heart; but then he had had to take down and rebuild Gothic vaults of all the epochs. He has been called the discoverer of the forgotten system of defence adopted in the fortresses of the later Middle Ages; but then he had been employed for years, and at good salaries, to rebuild Coucy and Pierrefonds, and the walls of Carcassonne. He gives us drawings of mangonels and balistas which, as he says, would really work and be formidable if they were constructed, instead of the absurd impossibilities of various iconographic works of our fathers. But, then, the Emperor had paid the cost of actually setting up one or more of them, for it had been his specialty, ever since he was Prince Louis, to study the history of artillery in all ages. In all these treatises, though Gothic art is his special subject in most of them, the taste of Viollet-le-Duc is generally catholic, and his power of discrimination active, and, indeed, his most marked characteristic. In the 'Entretiens' his subject is the architecture of all ages, and certainly in that treatise the analysis of each style and the comparison between styles is critical in the highest acceptation of that term. Oddly enough, the only exception, as it seems to us, is in the case of one of the Gothic styles: in his earlier volumes he is completely at sea about Italian-Gothic, missing in it what he especially admired in French work, and failing to see its one peculiar charm. In later essays we think he means to make amends for this error.

As for the immense number of illustrations which crowd his thirty volumes and pamphlets, it seems to be established that they are all his own—those which we have in wood-cut drawn with his own hand, the others engraved or lithographed directly from his drawings. All his life he lived "pencil in hand"; everything he saw he made a drawing of, and his drawings he always knew where to find and how to make use of. We shall be told here that his drawings of sculptural detail and of *meubles*, such as furniture and stuffs, are not accurate. It is true. Photographic exactness, such as Jules Jacquemart knows how to give when his subject admits of it, Viollet-le-Duc disregards. A curious instance of it has been pointed out; the two "chaires" given in the great 'Dictionary' as remaining in the cathedrals of Augsburg and Avignon are also given by Mr. Waring in his folio of etchings, and no one need doubt which is the more nearly correct of the two ways of reproducing them. We are inclined to regard this mannerism in representation as a necessary condition of doing such an amount of work. A swift and powerful draughtsman, profoundly impressed with his subject, may perhaps be allowed to put down his impression of a decorative object in twenty minutes rather than to give a longer time to careful elaboration. Exactness is dear to us. Whoever will bring out a new edition of the 'Dictionary' with photographic additions will render a great service. But we take what we can get out of a man who must die at sixty-five, and in this case are very thankful for it.

SOCIAL-DEMOCRATIC ORGANIZATION IN GERMANY.

LEIPZIG, September 8, 1879.

NEVER before has the hope of immediate political gains been so great as at present among the Social-Democrats. The election of Hasenclever at Breslau; the funeral of young Geib at Hamburg, where forty thousand Socialists marched to his grave, and especially the fact that the moderate wing has now chief control, have awakened confidence and activity. The Exceptional Law has acted most strongly against the immoderate wing; it has cleansed the party both from the faint-hearted and the insurrectionists; and Most, who has fled to London and is now publishing there his little sheet, characteristically printed in red ink, is now accused by the leading Socialists of being the tool of Bismarck. The opinions of Karl Marx, of London, the master-Socialist, have now full sway, while the general knowledge that his disciples, Liebknecht and Bebel, possess power as well as moderation, has allayed the fears of the middle classes.

It may be well here to give the present leading tenets of the Socialists, which I am enabled to do from long talks with Marx and Liebknecht. They hold that the industry of the world is ever tending towards a grander scale; that large industries are rapidly swallowing the smaller; that capital is passing ever into fewer hands; and that a time must come when the industry of each country will be controlled by a few persons. Then, and then only, the people will step forward and claim that to them —to the state—belongs all capital, and they will carry on all industries by democratic control. But before the state can govern industry centralization must immensely develop, and as this can only be accomplished by the concentration of wealth in a few hands, the bourgeoisie are but the necessary instruments for reaching a condition where Socialism is possible. Consequently there is no desire among Socialists to hinder the growth of the capitalists; the faster that growth the faster the approach of Socialism. They confess that in the present non-centralized condition of industry any attempt at state control would be futile and ruinous. But, while they are willing to let centralization take its course, it is their desire that the people shall so advance in education and independence as to be able at the proper time to control all industry. For the present, therefore, placing Socialism in the background, they aim only at the moral and intellectual improvement of the masses; and in their demand for a responsible government, for the reduction of the army, and for the abolition of indirect taxes, they differ in no respect from the advanced Liberals. Their demand for the state control of the sanitary condition of factories and workmen's dwellings is the only Socialistic tenet at present advanced. They are, according to their own statement, Democrats first and Socialists afterwards. Their Socialism depends entirely on industrial changes; and should experience show that capital is not tending towards fewer hands, then they are no longer Socialists. For the present, and even for generations, they are content to be only Democrats, and to let experience show them the proper course.

The expounding of the above opinions, combined with the general knowledge that had the Socialist leaders said the word they could for the moment have seized Berlin, Saxony, and Hamburg, has created among the Liberals a better feeling towards the Socialists. "By thus refraining," said Liebknecht to me, "we have shown that we are the party of peace and the Government the party of discord." It is this kind feeling of the Liberals that the Socialists are now striving for. The latter easily see that under the military rule of Bismarck there is no hope of propagating their Socialistic tenets, as their writings will be suppressed and they themselves imprisoned. Their first desideratum is liberty of speech and of the press. But this can only come through the help of the independent bourgeoisie, and as the Socialist leaders are thoroughly convinced that in a few years the bourgeoisie will make a revolution for such liberty, they are determined to unite with their former enemies, or rather bring them over to their own party. For the Socialist leaders assert that they alone have been consistent in their opposition to Bismarck, and, as the Liberals are now forced into the same policy, they must necessarily join the Socialists. These expectations, however, are far too sanguine, since the probable adoption by the Liberals of the Socialist stand of uncompromising opposition to Bismarck by no means implies their adoption of the Socialists as leaders, both on account of the superior numbers of the former and the social prejudices against the latter. Again, it is noteworthy that while all the Socialist leaders agree that the centralization of wealth is the necessary precedent to Socialism, the rich are nevertheless hated by both leaders and the ranks, and this must prevent a close union between them and the bourgeoisie. Still, it cannot be denied that the Social-Democrats have made, and will make, considerable gains among the middle classes, and such is the general confidence of the leaders that I have been informed, by those best capable of judging, that should a dissolution now occur in the Reichstag the number of Socialist members would be more than doubled.

The final victory of those advocating the Marx idea of letting industrial evolution take its course must have great effect on a party whose members obey so implicitly the commands of their leaders. There is much difference of opinion among the Social-Democrats, on account of the crude and undigested nature of their views, but seldom is there a lack of harmony in their action. The masses of the party have at last risen against the military system and have some independence, but a German independence only; centuries of hard discipline cannot be effaced in a decade, and the ranks of the Socialists march to the command of their leaders, like well-drilled and docile soldiers. The Marx idea, then, must drive all thoughts of immediate Socialistic attempts from the minds of the masses for years, and in the meantime improvement in trade and changes in industry may still further postpone pure Socialism.

The suppressive measures are still active, and in Dresden several young men have recently been imprisoned on account of their newspaper articles. Imprisonment in Saxony is by no means to be dreaded, as the privilege of books and writing materials furnishes the opportunity for a few months of quiet work. But in Prussia neither books nor writing materials are allowed. The letters of the Socialists are still opened by Government officials, and their houses are often searched. Their journals also have suffered; the circulation of the *Social-Demokrat*, their leading organ, of which Liebknecht is editor and which is now published under another name, has been reduced two-thirds, and this is a fair example. To counteract this, however, measures have been recently started for organizing a paper called the *Social-Demokrat* in Switzerland, and for sending the papers into Germany in sealed envelopes. Against this the Exceptional Law, which in its nature is more repressive than punitory, has no power.

In spite of the strictness of the police, party organization and electioneering have gone on among the Social-Democrats, who often poll votes of a magnitude surprising to their opponents. A good example is at Planitz, in Saxony, where an election for the Saxon Landtag is to occur in a few days. So sure are the Conservatives of returning their candidate that recently their leading organ congratulated its readers on the prospect of a non-contested election. The Socialists, however, have been working in secret and are confident of success.* A meeting, also secret, was recently held in Planitz, when Herr Puttrich, the Socialist candidate, gave his address. It differed from the Liberal platform only in advocating the abolition of the Saxon Senate and in promising reforms in the *Knappschaftskassen*, or mutual insurance fund for miners. This is of very ancient origin, and has long been established by law in every iron and coal mine in Germany. A certain portion of each miner's wages is reserved for this fund, while the employer must also contribute a sum not less than half the total payment by the laborers. From this fund a weekly allowance is paid to the laborer when injured, or to his widow on his death. The miners allege, however, that they have no voice either in the distribution or investment of the funds, which have been long mismanaged; and that, as never more than one-half the entire fund need be distributed, the employer, having the other half in his business, pays far less than the miners. Again, dismissal, which is in the power of the employer, deprives the miner of the benefit. The miners, therefore, demand a change of the law, and as Herr Puttrich's supporters would be mostly miners, he promised in his address such a change. The miners throughout Saxony are nearly all Social-Democrats, and are being rapidly banded together in trade-unions, both in order to unite politically and to oppose the masters. In fact, the present system of organization with the Social-Democrats in Germany is fast approaching a system of trade-unions in all departments of industry.

EGYPTIAN FINANCES.

CAIRO, September 8, 1879.

GORDON PASHA, the Governor-General of the Sudan, arrived here in the latter part of August after a rapid journey *via* the Nile from Khartum. Gordon was only twenty-three days *en route* between Khartum and Cairo, and brought to the Khedive the welcome news that the revolts of the slave-traders in Darfur and the Bahr-el-Gazal Provinces have been at length quelled by Gordon's lieutenant, Gessi Pasha. The crushing of this rebellion, however, involved a ten months' campaign with eleven

* They have, in fact, succeeded.—ED. NATION.

thousand men, and has made sad havoc with the Sudan finances, which are now in a worse plight than those of Egypt proper. The estimated receipts in the Sudan were $2,800,000. Scarcely $900,000 have thus far come in, and only the most sanguine hope that $900,000 more may be collected. The yearly expenses in the meantime have been $3,000,000, thus leaving a deficit for this year of $1,200,000 at least. Last year the result was but little better, for, although the deficiency was only $500,000, yet $1,000,000 of Abyssinian war-expenses being charged to the Sudan made a deficit of $1,500,000. Thus in two years the Sudan becomes indebted to Egypt for $2,700,000, or the amount of the average total receipts of the Sudan for one year.

These figures are the more significant if the fact be borne in mind that, when the slave-trade was in full vigor, the money over and above all expenses which was paid yearly into the treasury at Cairo was often not less than $2,500,000; and besides, this surplus was obtained at a time when the Sudan administration did not control one-half of its present extent of territory. Egypt has certainly paid dearly for the suppression of the slave-trade in her dominions, and the sincerity of Ismaïl Pasha's efforts to that end cannot be doubted. By this costly campaign of Gessi Pasha the slave-traffic has been stopped, but whole districts, once cultivated and thriving, have been laid waste, and are now little better than a desert. Villages have been destroyed, and the most enterprising inhabitants killed or driven away by want of food. The remedy has been as bad as the disease, and it is now probable that the larger part of Darfur, together with the Bahr-el-Gazal Province, will be evacuated by the Egyptians and left to their own fate; the cost of the proper administration of those countries being deemed too great for the existing state of Egyptian finances, and the hoped-for profits being too remote. Under these circumstances Gordon Pasha has resigned the Governor-Generalship of the Sudan, and the resignation will go into effect upon his return from Abyssinia in about two months.

Although the Darfur revolts have been put down, their moral effect is likely to be most mischievous. Scarcely had Gordon Pasha arrived in Cairo when an envoy from King John of Abyssinia also arrived, and demanded of the Khedive the restoration to Abyssinia of the port of Massowa and a large tract of fertile territory to the north and northwest of Abyssinia, known as the Bogos country. As King John is doubtless aware, such a demand could not have been made at a more unfortunate moment for Egypt, when there is not a piastre to spare from the treasury, and when the army has just been reduced to eighteen thousand men by order of the Porte. The Khedive informed the Consuls-General of France, Germany, and England of the demands of King John, and requested their advice. The result was that, after consulting their Governments, the Consuls-General of France and England drew up a joint-note forbidding the King of Abyssinia to make war upon Egypt, and Gordon Pasha, bearing this note, left here on the first of September for Abyssinia, where he will endeavor to cause the King to withdraw his inopportune demands. Gordon Pasha's mission is rendered more difficult by the fact that King John has reduced to submission two of his most rebellious chiefs, and has already promised them handsome portions of Egyptian territory. The Egyptian soldiers are, moreover, utterly despised by the mountaineers of Abyssinia, who have already exterminated two Egyptian expeditions, each of about fifteen hundred men, commanded by Europeans, and have driven from their country a third expeditionary force of no less than twenty thousand men provided with Remington breechloaders and batteries of Krupp guns, and accompanied by about thirty European and American officers. King John is said to be confident of obtaining his demands, and does not put much faith in any military interference on the part of England and France. Hence the result of Gordon Pasha's negotiations is looked forward to here with no little anxiety.

Much discontent has been caused here by the persistence of the French Government in forcing the services of M. de Blignières upon the new Khedive. Only a few weeks ago the Khedive said to the correspondent of the London *Times*:

"I am grateful to the Powers for much consideration they have shown me, but they are making a blunder in proposing the return of Mr. Wilson or M. de Blignières. Personally I am friendly with both, but they have been tried once and have failed. They cannot be the only men available. We should annul the past and start afresh. I say this openly now, because I never intrigue. If Europe insists I cannot refuse. I will welcome them as friends cordially, and as Khedive assist them; but I distinctly decline all responsibility for what I consider an unnecessary blunder."

Almost every European resident here holds the same views as the Khedive in this matter, and regrets to see the return of M. de Blignières to the post of French Controller-General, which will inevitably reopen many bitter personal wounds that would otherwise have been forgotten. The English Government had the tact not to send Mr. Rivers Wilson, but Major Baring, for whom the Khedive professed a preference. The French Government, on the other hand, seems to regard the return of M. de Blignières as a point of honor—a view which is not held by any one in Egypt, inasmuch as the deposition of Ismaïl Pasha is deemed an ample reparation for the slight offered to France and England by the dismissal of Messrs. Wilson and de Blignières. In a legal point of view the forcing of M. de Blignières into the position of Controller-General is an insult to Egypt, for by the terms of the decree of November 18, 1876, there is not the slightest doubt but that the choice of the Controllers-General rests solely and exclusively with the Khedive.

THE CATASTROPHE AT KABUL.

LONDON, September 16, 1879.

IN my letters to you on "The Results of the War in Afghanistan" I exposed the hollowness and unreality of the Treaty of Gundamuck and the perilous character of the engagements we had entered into with Yakub Khan. At that time I did not anticipate that retribution would overtake us so speedily as it has done; but during the few weeks that have elapsed since those letters were written the signs of an impending storm have been accumulating in Afghanistan. And so unmistakable had these become that just a week before the murder of Major Cavagnari I warned a leading Liberal politician that he must be prepared to hear of a catastrophe. The Ministry, in its foolish fashion, went on to the very last circulating optimistic accounts of the state of feeling in Afghanistan, as if the hostility could be conjured away by pretending that it did not exist.

The newspapers will have given you all the particulars which are as yet known of the manner in which Major Cavagnari and his comrades perished. I need not, therefore, repeat a story which all your readers will know already. The objects of my present letter will be (1) to delineate the military situation as it is at present, and (2) to attempt to estimate the future consequences of the catastrophe on Great Britain and our Indian Empire.

The first Afghan war was not less remarkable for its folly than for its iniquity; but the authors and advocates of that war had at least one excuse which cannot be pleaded by Lord Lytton: they did not act counter to the teachings of experience. The almost incredible vanity, ignorance, and unteachableness of Lord Lytton caused him to engage in this war in defiance of historic precedents and the warnings of every man of eminence who had acquired a thorough knowledge of the matter. In his despatch giving a history of his policy he says that "carefully-verified facts" had convinced him that all his predecessors in India were mistaken, and that he alone was the wise and discerning statesman who understood Afghanistan and its people. Among these "carefully-verified facts" was the ridiculous hallucination that the Afghans were so wearied of the oppressions and exactions of the late Amir Shir Ali that they would hail our advent in their territories as deliverers and friends; and in his despatch he says that the events of the war proved the anticipation to be correct. This statement is a good example of the romance-writing in which the Government, both at home and in India, sought to hide the actual facts of the war in Afghanistan. So far from being weary of him, the whole country remained loyal and steadfast to Shir Ali up to the day of his death. No rival competitor dared to show himself in the field; no tribe tendered its submission to the English invaders. On the contrary, we were everywhere encountered by unmistakable proofs of dislike. The flanks and rear of our columns were perpetually attacked; our baggage was always in danger of being plundered; neither officer, soldier, nor camp-follower could move beyond the precincts of the camp, except in parties and armed; and we did not hold a rood of territory on which our troops were not actually encamped. In the face of all these proofs of inveterate hostility, Lord Lytton chose to act as if the Afghans were entirely friendly. An undefended British envoy was stationed in Kabul. The Afghans waited until our troops had withdrawn within the new frontier—until the columns had been broken up and the baggage animals scattered—and then they massacred the envoy and his escort and declared war against the infidel.

The difficulty of carrying on military operations in Afghanistan is caused not so much by its physical character as from the want of food. The country is about the size of France, but the entire population is certainly not five millions. Only a small portion of these are agriculturists,

and they obtain from the soil no more than suffices for their own wants. These patches of cultivated land are divided by vast interspaces of stony waste, without inhabitants and productive of nothing on which human beings or animals can subsist. The consequence is that an army entering Afghanistan must carry its provisions. Hence the enormous trains of camels which are needed before a column can advance from its base of supply. But of all animals the camel is the most difficult to keep alive. A camel that is born and bred in a particular district, unless attended to with the greatest care, will sicken and die if he has to live outside of it. Camels that were born and bred on the plains of India dropped and died by the hundred as soon as they were transferred to the bleak highlands of Afghanistan. The official narrative estimates the number of camels which died during our recent raid at 61,000. The result is that the columns lately engaged in Afghanistan are at present almost entirely destitute of carriage, and until this want is supplied an advance on Kabul is impossible. How utterly destitute the troops are of carriage can be divined from the following circumstance : The news of the murder of Major Cavagnari reached Simlah on the 6th of September. Orders were immediately sent to Brigadier Massey, commanding at Ali Kheyl, to take possession of the summit of the Shutar Gardan. But though Ali Kheyl is distant from the summit of the Shutar Gardan only twenty-five miles, this advance was not effected until the 13th. Want of carriage was of course the reason of the delay. But if carriage is so scarce that a small force cannot be moved twenty-five miles, weeks—nay, months—may elapse before an army sufficiently strong to advance upon Kabul is provided with the baggage-animals necessary to enable it to move. These baggage-animals cannot be largely reduced in numbers by limiting the personal baggage of officers and men, because it is food which they have to carry—their own food as well as that of the men and camp-followers. But long trains of camels moving through a difficult country swarming with robbers require strong guards and numerous posts to keep open communications, and these again require to be fed. Thus it is that the preparations which have to be made in order to penetrate to the interior of Afghanistan are out of all proportion to the armed resistance which is to be expected.

But at the present time the transport difficulty is only one of many which have to be overcome before an advance can be made. A considerable time must elapse before a sufficient number of troops can be concentrated for a movement upon Kabul. In the late war the strongest columns of invasion entered Afghanistan, the one under General Stewart from Sukkur on the Indus, through the Bolan Pass, and so on to Kandahar; the other, under General Sir Sam. Browne, marched through the Khybar Pass on Jalalabad. Of these the first reached Kandahar with its transport train completely destroyed, and eight thousand men were immediately withdrawn to India, to rescue the army from starvation. About four thousand men, very scantily supplied with carriage, now hold the long line from Quetta to Kandahar. They cannot be reinforced from India, because the Sinde desert is impassable until the end of October, and also because Sinde has been swept so bare of camels that animals could not be provided for the reinforcements. Consequently, on the Kandahar side no movement in the direction of Kabul is possible. General Stewart will have done all that can be expected of him if, with his small force, he maintains his hold upon Kandahar during the long winter.

The troops under General Sir Sam. Browne, which maintained the line from the Indian side of the Khybar to Jalalabad, suffered grievously during the war from sickness ; and still more heavily when evacuating Afghanistan. Cholera and typhoid fever assailed the column on its march home with such virulence that many of the regiments are still quite unfit for active service. As with General Stewart, the transport train of this column was entirely destroyed from fatigue, exposure, and want of food, and there is hardly the possibility that a force can be organized to advance along this line in sufficient time to obtain possession of the passes between Jalalabad and Kabul before they are made impassable by the winter snow. The only hope, therefore, of a speedy occupation of Kabul depends upon the state of the troops in the Kurram Valley.

The summit of the Shutar Gardan is distant from Kabul only fifty-five miles. But the mountain is eleven thousand feet high, and the descent into the Loghur Valley is very steep and difficult ; indeed, impracticable for artillery. Moreover, the Kurram Valley, Khost, and the Shutar Gardan swarm with tribes bitterly hostile to the English invaders, and an advance to Kabul along this line could not be attempted except in great force. The number of troops reported to be in the Kurram Valley at the present time is 5,500, English and natives. I suspect that this includes native soldiers absent at their homes on furlough; and it is certain that there is a great deal of sickness among the English regiments. Any way, it is a force which would be exposed to much peril if pushed on unsupported to Kabul. Neither from the Khybar nor Kandahar could it look for support or co-operation, and by the beginning of November the winter snows would close its communications with British territory on the further side of the Shutar Gardan. It would have to pass the winter at Kabul, in complete isolation, surrounded by hostile tribes, without magazines, and with no crops upon the ground. It would, in fact, find it impossible to subsist, and fall a victim to famine, if not to the enemy. According to the last news, General Roberts has applied to have this force raised to twelve thousand, and his application, we are informed, has been granted. But it is very doubtful if such a force can be organized in time to advance before the setting in of winter. In the Kurram Valley, as elsewhere, there is a terrible want of camels. It is, besides, the sickliest period of the year in the Punjab. The regiments that might most speedily reinforce General Roberts are prostrated with fever ; and it is my impression that Kabul will not be occupied until the spring. There is nothing to be gained and much to be hazarded by attempting an earlier advance. The tribes are at present fired by religious zeal, and would be likely to offer an obstinate resistance. A British army, having to pass the winter at Kabul, would be exposed to very considerable danger; whereas, if we occupied the winter in getting together supplies and an adequate train of camels, we might next spring take the field in such force as to overawe all resistance and march unopposed upon Kabul.

But the situation is full of peril to our Indian Empire on other accounts than the campaigning difficulties. The unjust and arbitrary manner in which Lord Lytton treated the late Amir Shir Ali is not an exception to the general character of his administration. It has all along been harsh, unjust, and thoroughly unwise. The statesman who, despite all warnings and experience, plunged into this insane war, is not likely to exhibit sound judgment in other matters, and Lord Lytton has succeeded in creating throughout India an irritation and bitterness towards our rule which would speedily pass into acts of overt hostility if any disaster befell us in Afghanistan. The man ought to be recalled ; his capacities are well fitted for making complimentary speeches after dinner, or at the opening of a Fine Arts Exhibition, but for more serious business than this he is unfit. Assuming, however, that no new troubles occur, and that we obtain possession of Kabul without much trouble, what are we to do then ? It is extremely puzzling to find an answer to this enquiry. The ministerial journals are striving desperately to make out a case in favor of a return to the arrangements formulated under the Treaty of Gundamuck ; and this is a good sign, in that it evinces that the Ministry are aware of the insuperable difficulties in the way of annexation. At the same time it is quite impossible to fall back on the Treaty of Gundamuck, because the provisions of that treaty were based upon the assumption that a certain state of things existed in Afghanistan which never has existed there, and is now less likely than ever to exist in the future.

Since 1842 the constant endeavor of each successive Governor-General has been to draw closer the ties of friendship between ourselves and the rulers of Afghanistan. But the peculiar constitution of society in that country has made it impossible to establish intimate diplomatic relations with the ruler. Afghanistan is not the home of a nation, but of a number of tribes ; the Amir is not the ruler of Afghanistan, but of Kabul. His authority over the tribes extends exactly so far as he can enforce it, and no further. Consequently the Amir is nothing more than the chief of a party which the whirligig of fortune brings uppermost for the moment. At any moment his supporters may desert his standard to swell the ranks of a rival, and then his power is at an end. It rests upon force, not upon a national conviction of its legality. This circumstance it was which made Lord Lawrence so sedulous to avoid entanglement in the internal affairs of Afghanistan. He was the friend of the *de-facto* ruler of Kabul, but he steadily resisted all proposals to interfere with the free choice of the Afghans by the interposition of British troops. Until the tribes had, to some extent, coalesced into a single organized kingdom, he felt that his wisest policy was to win their confidence by rigorously abstaining from all encroachment on the wild freedom they so dearly prized. This policy of "masterly inactivity," as it came to be called, produced admirable results, and it was greatly assisted by the circumstance that at this time Afghanistan, under the conduct of two remarkable men —Shir Ali and his father, Dost Mohammed—made considerable progress towards the status of a nation. The internal troubles had given place to quiet and order, and a close alliance existed between Shir Ali and the British Government in India. Nothing was required of us but to afford Shir Ali every assistance in our power towards the completion

of the great work to which he and his father had devoted their lives. At the close of the year 1876 it was in these terms that the Government of India reported upon the rule of Shir Ali :

"Whatever may be the discontent created in Afghanistan by taxation, conscription, and other unpopular measures, *there can be no question that the power of the Amir Shere Ali Khan has been consolidated throughout Afghanistan in a manner unknown since the days of Dost Mohammed, and that the officers entrusted with the administration have shown extraordinary loyalty and devotion to the Amir's cause.* It was probably the knowledge of the Amir's strength that kept the people aloof from Yakub Khan in spite of his popularity. At all events, Herat fell to the Amir without a blow. The rebellion in Lalpoorah, in the extreme west, was soon extinguished. The disturbances in Budukshan, in the north, were speedily suppressed. *Nowhere has intrigue or rebellion been able to make head in the Amir's dominions.* Even the Char Eimak and the Hazara tribes are learning to appreciate the advantages of a firm rule. . . . But what we wish specially to repeat is that, from the date of the Umballa Durbar to the present time *the Amir has unreservedly accepted and acted upon our advice to maintain a peaceful attitude towards his neighbors.* We have no reason to believe that his views have changed."

In their mad pursuit after a "scientific frontier" Lord Salisbury and Lord Lytton destroyed in a month the labors of half a century. They brought Afghanistan back to the state of anarchy from which Shir Ali had succeeded in raising it. They rekindled old hatreds against ourselves, tore open the half-healed wounds we had left behind us when we abandoned the country in 1842, broke down all semblance of stable government ; and it is with this seething chaos that their supporters in the press tell us we can now establish permanent diplomatic relations, precisely as if nothing of all this had occurred. The notion is monstrous, absurd. We cannot establish stable relations with the Afghans, because there is neither a nation nor a central authority with which to establish them. The only alternatives possible are annexation or withdrawal from the country. In my former letters I explained the dangers of annexation, and will not repeat them here. I do not believe that we could retain India for thirty years after the annexation was consummated. There remains, then, withdrawal. It is hardly possible for the present Government to adopt such a policy without abandoning office and leaving to their opponents the task of carrying it into effect. I do not suppose they are likely to execute upon themselves a "happy despatch" of so meritorious character. But there are signs in the air that the nation is not unlikely to take the matter in its own hands, and declare emphatically that it will not submit to be burdened with the costs and incalculable risks of a policy of annexation. We cannot now withdraw from Afghanistan without a grievous loss of reputation; but it is the least of two evils. It ought to be done as a solemn national act, repudiating a policy which had been "sprung" upon the nation, but which it had never sanctioned and never approved.

Correspondence.

DUNKIN'S 'NOTICES OF ASTRONOMERS.'

To the Editor of The Nation :

Sir : In your notice of my little book, 'Obituary Notices of Astronomers,' given on p. 100 of vol. xxix. of the *Nation*, your reviewer, through a slip of the pen, has been very incorrect in his extracts of the number of pages occupied by the principal notices, on which the following sentence is founded : "The space devoted to the several notices shows that harmonious treatment is not attempted, as the importance of the work done by the subject of the memoir bears no relation to the extent of the notice." This sentence would read differently if the following corrections were made :

Sir John Herschel, for 7 pages read 39.
Sir William Herschel, for 39 pages read 30.
Laugier, for 30 pages read 8.
Le Verrier, for 8 pages read 34.
Littrow, for 34 pages read 7.
Main of Oxford, for 7 pages read 24.

In fact, considering that more than one-half of the book is devoted to Delaunay, the two Herschels, Le Verrier, and Main, you will see that "the importance of the work done by the subject of the memoir bears *some* relation to the extent of the notice." Your reviewer will, I am sure, acknowledge this.

I should not have troubled you with this letter if the preceding misprints had not unfortunately crept into your article. I may also add that the book is printed principally for private circulation, only a limited number of copies being offered to the public.

You will oblige me by sending this letter to the writer of the review, who I am sure would be the last to put into print what he knows to be erroneous. I am, sir, yours truly,

Edwin Dunkin.

14 Kidbrooke Park Road, Blackheath, London, Sept. 9, 1879.

[Mr. Dunkin's numbers are correct. Our own were obtained by *differencing* the pages in the table of contents, and are, we regret to say, wrong. But though they were chosen to *illustrate* an inadequate treatment, the notion of inadequacy was not founded on them. We still consider our strictures just.—Ed. Nation.]

THE ANCIENT RECORDS OF YUCATAN.

To the Editor of The Nation :

Sir: Your issue of the 17th of April last reached my hands only a few days ago. On page 265 I read a few lines signed "A. D.," kindly mentioning Mrs. Le Plongeon and myself. Permit me, through your columns, while thanking the kind writer, in her name and mine, for his appreciation of our labors among the ruined monuments of Yucatan, to answer some of his remarks.

In all my writings on the subject of American archæology, either to the "Congrès des Américanistes" that assembled in Luxembourg in September, 1877, or to the American Antiquarian Society of Worcester, Mass., or to the Biblico-Archæological Society of London, or in my letters to Mr. Stephen Salisbury, jr., or any other friends, I have been most careful not to advance a single theory of my own. I have simply narrated bare facts as presented to my eyes during my study of the ruined monuments, and the recitals contained in the books of the few chroniclers of the time of the Spanish conquest who have written with "connaissance de cause" on Yucatan and its inhabitants. Landa, Cogolludo, Lizana I have found among the best informed, if I have to judge from the ruined monuments and the remnants of ancient customs and traditions still extant among the aborigines.

I rejoice of course to see the few historical treasures discovered by me in Yucatan submitted to an honest and unprejudiced critical analysis, examined in the light of documentary evidence. Truth must spring from the shock of ideas, as sparks from that of hard bodies. But where is that documentary evidence to be found, unless in the study of the bas-reliefs graven on the monuments presented by me to the world in the shape of photographs, or of the mural paintings of Chichen, or in the books *pic-huun* of the ancient H' Menes ? These I would long ago have presented to the world had not my investigations been so arbitrarily interrupted by the unlawful acts of the petty officers of the Mexican Government, who, having robbed me of my scientific treasures, and scattered to the wind the few leaves of the pre-historic American history I was trying to gather to bind, have convinced me that, unless protected by the American Government, it would be even criminal in me to disturb the precious volumes, and exhume them from the hiding places where the wise men of Itsa concealed them, in order to save them from destruction at the hands of the Nahuas fifteen hundred years ago, lest they also should fall victims to the vandalism of the Mexicans.

We can scarcely admit as documentary evidence the writings of the chroniclers of the Spanish conquest as to what concerns the habits and customs of people who lived thousands of years ago, whose country had been invaded and devastated by different races (four of these are plainly discernible among the aborigines of Yucatan), and their modes of living consequently altered. True, some of the customs of these most ancient dwellers of the Yucatecan peninsula had survived the vicissitudes of time, invasions and revolutions. They were yet extant among the inhabitants of Mayapan at the time of the Spanish conquest, but somewhat altered, however. Just as the Chinese of to-day, whose reverence of the memory of their ancestors amounts even now to worship, have preserved the customs, the very dress even, of their progenitors, but somewhat altered, however.

Let "A. D." take my word for it—and by the study of my photographs and the perusal of my correspondence with Mr. S. Salisbury, jr., he will soon become satisfied of the truth of my assertion—that I have not advanced a single hypothesis or theory, but merely related facts, sustained even by the chroniclers. Let him also remember that the world does not possess to-day a single true description, scientific and critical, of the monuments of Yucatan ; and I hope, when I am able to publish my

notes, he will be convinced of that fact. What evidence has, then, the scientific world, in order to pronounce authoritatively on the subject? Nay, more; all the relations and descriptions published up to the present day are incomplete, many untrue, not a few futile, all unscientific, lacking even proper observation.

As to the suggestion to Mr. S. Salisbury, jr., and myself on the importance of gathering MS. relations, official documents, etc., etc., I beg to inform "A. D." that in Yucatan the work of collecting such papers will prove useless. I have attempted it without success. Nay, more; I may assert that such documents have long been used by the grocery clerk to despatch two cents' worth of rice or sugar. A member of the clergy, Presbyter Don Crecencio Carillo, of Ancona, a dear friend of ours, the founder of the "Museo Yucateco," has dedicated himself since many years back to the gathering of all papers, documents, MSS., relating to the past history of Yucatan. An able and fluent writer, he has published, at his own expense (he is not rich), all he could find concerning the history of the land of his ancestors. He has spared neither time, money, nor patience to secure every obtainable scrap that could throw light on the subject of his earnest enquiries. He may tell "A. D." about the results of his untiring work. Yet, if anybody was in a position to obtain such documents, Don Crecencio Carillo was the man. A member of the clergy, at one time a favorite—in fact, the confessor—of the ill-fated Empress Carlotta, he has had access to the libraries, private and public, of the state, those of the bishop's palace, of the churches, of the religious corporations; many of those of private individuals are open to him. Above all, he is a Yucatecan. Very meagre indeed has been his harvest.

The reasons assigned for this absolute lack of ancient documents and MSS. are:

1. The destruction of the Franciscan Convent of Merida and its contents, library, furniture, and all, by the mob headed by Don Juan Rivas Ortiz, then political chief of Merida, of the 30th of May, 1820. When the new constitution obtained by the patriots in Spain reached the colonies, books, papers, archives, documents, MSS, were scattered in all directions, as well as the three hundred friars inmates of the convent.

2. The complete devastation of most of the cities of Yucatan, their churches, convents, public edifices, with their archives, political, civil, and religious, by the half-savage and infuriated Indian population, at the time of its uprising in 1847.

3. Whatever paper, book, document, or MS. escaped the vandalistic fury of the mob in 1820, and the revengeful wrath of the Indians in 1847, has been used by the revolutionary rabble and soldiery during the many civil strifes which have devastated the State of Yucatan, since 1820 to the present day, either to wrap their powder in and make cartridges or to kindle their bivouac fires.

The hunt for such documentary evidence in Yucatan is, therefore, and must remain, useless. The only thing that remains in order to obtain a perfect knowledge of the habits, customs, and attainments of the people who dwelt in ages gone by on this continent is to disinter the libraries of their wise men. That I am at present most unwilling to do. I do not wish to lend my hand to help in their destruction. Let them remain in safety where they were deposited by their owners and authors until the American Government, answering to my claims presented by the Hon. Geo. F. Hoar, Senator for Massachusetts, to the consideration of the Senate, on the 7th of May, 1876, protects me and the books from the arbitrariness of the Mexican Government and its minions.

I remain, Mr. Editor, yours very respectfully,

AUGUSTUS LE PLONGEON, M.D.

COLONY OF BRITISH HONDURAS, BELIZE, Sept. 2, 1879.

Notes.

ROBERT CLARKE & CO. have in press 'The Mound-Builders,' to which is added an investigation into the archæology of Butler County, Ohio, by J. P. MacLean. The book will be copiously illustrated. They also announce a practical treatise on 'Etching,' by Louisa M. McLaughlin; 'Insect Lives,' by Julia O. Ballard; and the life of a Catholic Missionary to this country in the first quarter of the present century, the Rev. Charles Nerinckx.——A. S. Barnes & Co. issue immediately 'Ancient and Mediæval Republics,' with a review of the causes of their decline and fall, by Henry Mann.——Porter & Coates announce the 'Posthumous Memoirs of Prince Metternich, 1773–1815.'——Macmillan & Co.'s 'Poems of Wordsworth,' selected by Matthew Arnold, whose preface we lately remarked upon, on occasion of its separate appearance in a magazine, is a volume having all the beauty of the Golden Treasury Series in addition to the unimpeachable excellence of the editing. It is divided, by an arrangement not strictly progressive, into Poems of Ballad Form, Narrative Poems, Lyrical Poems; Poems akin to the Antique, and Odes; Sonnets; Reflective and Elegiac Poems.——'American Poems: Longfellow, Whittier, Bryant, Holmes, Lowell, Emerson, with Biographical Sketches and Notes,' is a small volume of 455 pages just issued by Houghton, Osgood & Co. It was prepared "with special reference to the interests of young people, both at school and at home," and well enough serves such indefinite purpose. No young person will, however, it should be said, get a just idea of any of the poets represented from its pages alone, since but a few of the poems of each are given, and these are selected not because they are specially characteristic, but on account of their length. Its aim is to supplement the many reading-books and popular collections in which only the shorter poems appear.——G. P. Putnam's Sons add to their 'School and College Classics' a compact and convenient edition (16mo, pp. 347) of Bacon's 'Essays,' with an introduction and notes by Henry Lewis, M.A., Principal of Culham College, England. The character of the introduction may be judged from this sentence: "No reader of Bacon's *Essays* would ever infer from them that he was a *good* man, but they bespeak a *shrewd* and *clever* man"; and of the notes from the following to the Essay of "Marriage and Single Life": "History, both national and domestic, records numberless instances in which wives and children have been the very opposite to *impediments*."——'Taghconic: the Romance and Beauty of the Hills,' by Godfrey Greylock, recently published by Lee & Shepard, is a somewhat desultory but sympathetic collection of the anecdotes and traditions in which Berkshire County, Mass., is particularly rich. It appears to be a venture of a literary aspirant in whom the "romance and beauty" of nature excite a desire to express the emotions which they stimulate, though it is far from a pretentious piece of book-making and is not without interest for persons who know Berkshire.——'A Sketch of Shakespeare' (Wheeling: Stanton & Davenport; Boston: A. S. Williams & Co.) is the substance of three addresses delivered by William Leighton, who has published several volumes of poems, to the Wheeling Shakspere Club. The author asks that "enthusiasm in his subject be permitted to stand, in some degree, as an excuse for the book," which is modest, but not unreasonably modest.——On p. 645 of the October number of the *American Naturalist* will be found an account of the latest Boston notion in regard to science-teaching in the public schools. Wealthy ladies furnished the funds, the Institute of Technology a hall, the Museum of Comparative Zoölogy hundreds of duplicate specimens, hotels "such parts of birds as were needed to illustrate one lecture," and as a consequence the audience of teachers have carried away with them or otherwise been supplied with seventy-five thousand specimens of minerals, rocks, plants, and animals, since 1871.——A German translation of Longfellow's 'Evangeline,' by Frank Siller (Milwaukee, 1879), may be recommended to American students of the German language as a very faithful and perfectly smooth version of the original poem.——Part VII. of Oncken's 'Allgemeine Geschichte' (B. Westermann & Co.) begins the history of Peter the Great, by Dr. Brückner, and brings it down to the year 1716. Four interesting historical portraits accompany the text. The nearly simultaneous appearance of the first part of Mr. Eugene Schuyler's life of the same ruler (in *Scribner's* for November) should not be overlooked.——Fresh English announcements are the 'Memoirs of Mme. de Rémusat' (1802–1808), by her grandson, Paul; the 'Life and Writings of Henry Thomas Buckle,' by Alfred Henry Huth; 'Witchcraft in Queen Elizabeth's Time in general, and in Shakspere's Plays in particular,' by T. Alfred Spalding; 'Jesus of Nazareth,' by Edward Clodd; 'Up the Amazon and Madeira Rivers,' by Edward D. Mathews; 'Up and Down,' by Capt. W. J. Barry, being personal experiences in Australia, New Zealand, California, the East Indies, etc.; and 'Branches from the Main Routes around the World,' by James Kingston.——The *Sanitary Engineer* of this city is about to offer prizes amounting to $500 in all for the best plans of a model school-house. Their competition for tenement-house plans has had a wholesome effect upon legislation, and is leading to practical results in the shape of building associations.

—The completion of 'The American Catalogue' deserves more than the passing notice which we gave it last week. Previous attempts at trade-lists of American literature have not been very successful. Roorbach's unsatisfactory volumes (1820–68) no doubt cost their compiler a certain amount of labor and were useful to the booksellers, but for literary and library purposes were provokingly, exasperatingly insufficient. Their omissions, their mistakes, their at best meagre information would excite the contempt of a German bookseller. The poverty of plan was

matched by slovenliness of execution. Kelly's two volumes (1861–71) were an improvement, yet left much to be desired. In this branch of bibliography we were worse off than the Germans of course, than the French, than the Dutch; worse off even than the English, which is saying much. But our reputation is now in part retrieved. We have not yet a bibliographical list of American literature that will compare with Kayser and Heinsius. And, in truth, the impression forced upon one in turning over these pages is that the greater part of American books do not deserve bibliographical description. But although we have not all that we could desire, we have a list, probably nearly complete, of books in print and for sale July 1, 1876, prepared with great trouble, and with as much fulness and exactitude as could be expected. That it is not better is not the fault of the compilers but of the American publishers, who are notoriously indifferent to the books they issue, except as articles of merchandise. This carelessness of publishers and neglect to reply to the circulars sent to them by the compilers has led to one of the serious defects of the book—the failure in many instances to give the date of publication. For all books issued too late to be found in Allibone, where is one to look for the time of original appearance—often a question of considerable interest in literary, scientific, and historical investigations? The compilers have not depended solely on the publishers, but have searched catalogues of libraries and other sources with a result, on the whole, satisfactory, both as to this and other matters of detail, and, so far as we have had the opportunity of testing the work by use, it has seemed to be printed with unusual accuracy. Yet, with commendable honesty, in each part a list of errata is given and a request to readers for more.

—A correspondent writes us from Boston under date of Sept. 22:

"'A.,' in last week's *Nation*, says you are 'very incorrect' in saying that the orderly sergeant does all the official work in the company, except certain official signatures and posturings. I was an enlisted man in the Army from 1857 to 1865. I knew of the company-writing in dozens of companies in the cavalry, infantry, and artillery. I wrote in the company, in the medical, the adjutant's, the commissary, and the quartermaster's departments. 'A.' says an officer keeps his own accounts. I never knew of an officer's doing it, and I never knew of an account's coming back. The officer only signs his name. This work is all done by enlisted men."

—In the *Athenæum* of September 13 Mr. Edward Scott prints a letter which he discovered while cataloguing the papers of Sir Edward Nicholas, Secretary of State to Charles I. and Charles II., and which, he considers, throws some light upon Milton's divorce from his first wife, Mary Powell. She was the daughter of a Royalist, Richard Powell, and married Milton in the spring of 1643 at Forest Hill, near Oxford; Charles was at Oxford during the whole of this year; and within three months after his marriage Milton divorced his wife. These circumstances, taken in connection with the letter, in which one William Garret sets forth that he "did often send Inteligence to your Honour at Oxon by the hands of Mr. Richard Powell," who, it is stated in a postscript, "lived at Forest-Hill neare Oxoñ," induce Mr. Scott to believe the Royalists at Oxford gained information of the Puritan movements through the brothers of Mary Powell, the new wife playing the spy, as she could have done to good purpose in so important a household as Milton's—whence the divorce. Mr. Scott also found an original draft of an answer in Secretary Nicholas's hand to Garret's letter, certifying to Garret's diligence and faithfulness "by giving frequent and good intelligence through my hands whilst his Majesty was at Oxford of the then Rebells movements and other matters." In the light of his surmise Mr. Scott has looked up passages in the 'Samson Agonistes,' from which he quotes at lines 382, 488, and 773 to show that blindness, abstemiousness, marriage with an enemy's daughter, etc., were not the only resemblances between Milton and his hero, and that to these should be added the betrayal of his secrets by his wife. The conjecture is certainly reasonable enough, though, beyond mere circumstantiality, the most that is to be said in its favor is perhaps that nothing is to be said against it.

—The *Catholic World* has long been noteworthy for the literary excellence it displays in circumstances often peculiarly trying. Its task has sometimes seemed similar to that of the Laputan scientist who sought sunbeams in cucumbers; but it has pursued it with a spirit of devotion and calm acquiescence in the dearth of temporary applause in a high degree admirable, and commendable to the imitation of heated and frivolous controversialists. Its view of literature is not wholly unlike the view of science taken in the recent Encyclical of His Holiness. Catholic literature does not indeed stop with St. Thomas Aquinas, as Catholic science is admonished to do in that document, but of other than Catholic literature the reviewers of the *Catholic World* have generally held the same opinion as that held of modern atheistical science by the Holy Father—an opinion expressed almost invariably in excellent English, though at times, it has seemed, with needless ferocity. Violence is, however, natural when one has to maintain a difficult position, and there have been evidences that the position which assumes distinctly Protestant and Anglo-Saxon literature to be of trivial import has at times seemed difficult to the *Catholic World*. The cordiality with which it welcomed Mr. Mallock, and the admiration with which it regards St. George Mivart, are evidences that it is glad not to be entirely shut up to the general run of contemporary Celtic and Catholic literature, varied now and then by Mr. Aubrey De Vere's verses. The best course is, however, often the boldest, and taking the bull by the horns is often the safest way of dealing with him. This is what has been done by a writer in the October number, who proclaims "The Need of a New Dunciad," and formulates the creed of the magazine with frank precision. "Whatever power, beauty, or strength the English language has," he thinks, "it owes in the main to the Latin element, as modified through the Norman-French." All the oratory and poetry of the language "belong to Erin and Caledonia." The Anglo-Saxon intellect is "slow, cautious, and prosaic," and its literary style is "a heavy and labored attempt to make its meaning clear." To Anglo-Saxons also are to be attributed "all the blunders in the use of figures cited in the school-books." "Shakspere himself," it is added, is not free from this Anglo-Saxon habit of making "false and absurd metaphors." No mention is made of the forgeries known as Sir Boyle Roche's speeches, but we are assured that "the most charming social and literary essays, *vers de société*, and the choicest *belles-letters* in our unmanageable tongue are the productions of Irishmen." In fine, we infer that if it were not for the Anglo-Saxon element in our literature, it would rival that of the golden age of Erin, when, in the words of an eloquent Celt, "Ireland was full of kings who ate off tables of gold and had libraries filled with thousands and thousands of volumes of the most beautiful poetry." It is possibly towards a renaissance of this era that the *Catholic World* labors so cleverly and consistently.

—A French critic, Arvède Barine, has been comparing the English and the American schools of fiction, and the result is not altogether favorable for either. In the first the critic finds, with a very few brilliant exceptions, fecundity and mediocrity; in the second, fervor, audacity, and a grain of poetry, qualities which might win a victory for the Americans were it not for one unpardonable defect—want of taste. He then analyses, as typical examples, Trollope's 'Eye for an Eye' and 'The Modern Mephistopheles.' The American romance (which, it is well to add, belongs to the "No Name Series") is highly praised, even for the tact with which some of the most famous scenes of the German poet are imitated, yet this fatal want of taste is declared to be, as it were, the trade-mark of an American romance. The phrase "a passionate perfume" and Gladys' taking hashish are the only instances given.

—M. Jules Simon and his associates in his opposition to the Ferry law restricting the liberty of teaching have received a weighty accession in the person of M. Littré, the veteran lexicographer and Comtist. In an article in a recent number of the *Philosophie positive* M. Littré defines what he calls "le catholicisme selon le suffrage universel," and which we may translate as Catholicism subdued (or attempered, or accommodated) to universal suffrage. The peculiar characteristic of this body, which he appears to regard as the *gros* or mass of the French population, is that while sincerely observant of all the church requirements as to attendance on preaching, the confessional, communion, the marriage sacrament, extreme unction, etc., when it comes to vote for deputies, counsellors-general, and municipal officers it is completely indifferent to the religious professions of its candidates, and is concerned only about their political opinions, its chief care being respect for the essential conditions of modern society as the Revolution established them. Hence, on the other hand, it votes to exclude from office everything clerical, ultramontane, or jesuitical—or, in other words, the avowed and implacable enemies of lay government. This qualified Catholicism has two sorts of foes, the Radicals and the Clericals. Against the Radicals, who would have no Catholics, its security is guaranteed by the Concordat, which the present Republican Government has inherited, and which it will be slow to terminate at the bidding of those who wish to suppress the budget of public worship, thereby seeming to declare war on the faith. As for the Clericals, they would, like the Radicals, if they could, use the temporal authority to crush what they deem a seditious revolt, not less hateful than Gallicanism; but perforce resort to spiritual weapons, relying especially on education to change the mind of the masses, and render them submissive to

the Syllabus. Should they succeed, the votes of the Catholics "selon le suffrage universel" would presently raise into power men profoundly hostile to Republican institutions, and ready to precipitate another 16th of May with increasing chances of success. This great danger requires the utmost vigilance on the part of the Government, and it can be met in one of two ways, viz., prevention or repression: by interdicting such and such associations, such and such modes of instruction, or by interference only when necessary, with a general reliance "for the defence of the dearest national interests on the lay institutions in their totality, vigorously sustained and developed."

—Of this latter policy M. Littré declares himself an adherent, and he justifies his position by prudential considerations, as that the Jesuits, if persecuted for teaching the doctrines of the Syllabus, which are held by a multitude in France and out of it, would find secret modes of propagandism which would quite compensate them for having their schools closed and teachers dismissed. He also argues frankly in favor of according toleration to those who do not tolerate, liberty to those who deny it to others, free permission to teach to those who "falsify history, disfigure morality, and pervert politics," opportunity to create in the midst of the nation a hostile nation bent on ruining the lay establishment, just as the monarchical parties are seeking to overthrow the present régime. Still, he would not *laisser faire, laisser passer* simply. He would have "the defensive organized with vigor, and perseveringly followed up." The programme of perfect equality for all beliefs in the eyes of the Government will in the long run, if faithfully carried out, be a persuasive advocate in the forum of individual opinion. Meantime, the moral forces of modern society will be more than a match for those of its opponents, and will have on their side the University, improved by competition, and free to teach all branches of knowledge independently of any prejudice or dogma. Once M. Littré agreed with Comte in desiring the abolition of the University; now he considers that time has proved both him and his master in the wrong. The measures immediately demanded are that the state should have restored to it the conferring of degrees, and should refuse henceforth to accept *lettres d'obédience* as equivalent to the examinations which lay teachers, male and female, undergo; and that, under one form or another, private courses should be authorized. Regarding the contest philosophically, M. Littré concludes that the creeds will gain but little upon each other, but that notable gains will be made by lay government upon theological government, the former everywhere approaching a uniform type, in which the social régime will be subject to sociological laws, studied, applied, and utilized in the same manner as natural laws.

—Few poets are more interesting as regards personal character than was Heine; and though his life was not eventful, it fell in such times and places that whatever observations he may have made could not fail to be agreeable reading. In his collected works are snatches of autobiography (as the famous passage in which he describes, in his boyhood, seeing Bonaparte ride up the Schloss-Allée at Düsseldorf); but, charming as these are, they are tantalizing from their brevity. It now appears that he wrote voluminous memoirs, which are supposed to be still in existence, but where and in whose custody is a matter of dispute. A person who calls himself "Ein Eingeweihte" writes to the *Deutsches Montagsblatt* that two volumes of the memoirs, covering the years 1800–1836, are kept under lock and key in the archives of the Finance Ministry in Vienna, and gives a curious account of how they came there. The poet had a brother named Gustav, who was a journalist of none too respectable a character apparently, in Vienna, where he throve both pecuniarily and otherwise. In 1852 Gustav Heine visited his brother in Paris, finding him, as usual, in great need of money. As security for a loan of 5,000 francs, Heinrich offered him the MS. of the memoirs, which thus changed hands and reached the Austrian capital, where Gustav was now editor of a semi-official paper, which he to this day controls. For reasons unknown, however, he did not care to keep the papers in his own possession, and therefore conveyed them to the Government, receiving in exchange the sum originally advanced. Soon after this he was made a baron. The discussion thus started by "Ein Eingeweihte" is taken up by Heine's friend, Alfred Meissner, who says Heine one day showed him a great pile of MS. which he said was his memoirs, to the writing of which he had given several years. Mr. Meissner, however, has strong doubts of the memoirs being in the possession of the Austrian Government, for why, he asks, should the Austrian officials think it worth while to buy the autobiography of a man of letters, in which Austria was perhaps not once mentioned? The answer to this argument is that Baron Heine had reason to wish his brother's memoirs out of the way, as well as to get back his money. Yet, as he held the MS. only as security for the payment of a debt, he could not sell it, much less destroy it, and so hit upon the plan of burying it, so to say, alive. The Government, on the other hand, presumably had grounds for wishing to please Baron Heine.

—Those who are interested in the famous mediæval romance of 'The Seven Wise Masters' will be glad to learn that the Syriac version has at last been published under the title, 'Sindban, oder die Sieben Weisen Meister' (Leipzig, 1879). The work contains also a German translation and introduction. Heretofore the oldest Oriental version of 'The Seven Wise Masters' has been the Greek 'Syntipas,' which the author, Andreopolus, says in his prologue he translated from the Syriac. The existence of the latter was doubted until it was made known by Rödiger in 1866. This work, now accessible in Baethgen's edition, is undoubtedly the original of the Greek translation. The Syriac MS. is unfortunately defective; in the body of the work the story known as "Balneator" is wanting, and the last three stories are lacking. The Syriac version in turn is only a translation from the Arabic, and its original is probably also the original of the interesting Spanish version, 'Libro de los Enganos de las Mugeres,' published by Comparetti in his 'Ricerche intorno al libro di Sindibâd' (Milan, 1869). As to the age of the Syriac version, it can only be said that it is of course older than 'Syntipas,' which Comparetti in the work just mentioned has shown was composed at the end of the eleventh century. As long as the Arabic version or Sanskrit original is not found, the Syriac version is, as the editor remarks, the oldest evidence of the Buddhistic work, which, according to Benfey in the introduction to his translation of the Pantchatantra, is, with Kalila and Dimna, of the greatest importance for the history of culture, and stands at the head of an extremely extensive and influential literary cycle.

—There are few more interesting questions in historical geography than the steps by which the petty states into which the Duchy of Lower Lotharingia was split drew together again, by their natural affinity, disjoined themselves by degrees from the German Empire and (in union with some cognate French states) formed themselves into "the Netherlands." The Duchy of Burgundy, built up chiefly by Philip the Good and Charles the Bold, was the principal agent in the work. The process was, however, going on before this, and an important stage in it has just been brought to light by Prof. Fredericq, of Ghent, in a paper entitled "Le Renouvellement en 1578 du Traité d'Alliance conclu à l'époque de Jacques Van Artevelde entre la Flandre et le Brabant," presented last November to the Brussels Société pour le Progrès des Études philosophiques et historiques. The title of the paper sufficiently shows its scope: the treaty concluded in 1339 under the inspiration of James Van Artevelde (Hainault soon acceded to it) created "a sort of confederation, which was the first germ of the Netherlands, such as the Dukes of Burgundy and Charles V. organized them afterwards." Thus Van Artevelde not merely established the liberty of his native Flanders, but was chiefly instrumental in bringing her from the union with France into the more congenial fellowship of the Lotharingian states. This alliance did not long survive its founder; but, as is shown by Prof. Fredericq, its memory was revived and it was made the basis of new action in the time of William of Orange.

THE RUSSIAN ARMIES IN TURKEY.*

ON the outbreak of the late Russo-Turkish war Lieutenant Greene was assigned by the War Department at Washington as military attaché to the Legation in St. Petersburg, for the purpose of observing the operations in the field from the Russian side. He proceeded without delay to St. Petersburg, readily obtained the Czar's permission to join the army on the Danube, reached the Imperial headquarters on August 5, 1877, and remained with the army throughout the campaign, and until peace was definitively assured by the Berlin treaties of July, 1878. He then returned to his post at the legation in St. Petersburg, where he collected and digested the official war reports, as well as the data for a study of the military system of Russia. The book before us is a reprint of his official report to the War Department. "This report aims to give, first, a concise but accurate description of the Russian Army; second, a narrative of the course of the campaigns in Europe and Asia Minor; and, third, a brief discussion of the use of temporary field fortifications in connection with the modern breech-loading musket." Of the four parts into which the work is thus naturally divided, the first (pp. 3–136) is a literal compilation (with brief résumés) from Russian official books on the

* 'The Russian Army and its Campaigns in Turkey in 1877–1878. By F. V. Greene, First Lieutenant in the Corps of Engineers, United States Army, and lately Military Attaché to the United States Legation at St. Petersburg.' New York: D. Appleton & Co. 1879. Text, 8vo, pp. xii. and 459; atlas, plates 26.

recruiting, organization, armament, administration, and tactics of the army; the third (pp. 377–418), a short sketch of the campaign in Armenia, based on no personal observation by the author; and the fourth (pp. 421–455), on the defence and attack of fortified positions, interesting only to specialists; the second part (pp. 139–374), on the campaign in Bulgaria, forms the main portion of the whole, the most valuable to the general public as it is the most extensive and interesting. It is this part alone which we will here consider.

Lieutenant Greene's opportunities for observation and study were ample. "The Russian authorities extended to all the foreign officers who came properly accredited to them . . . the most complete facilities for observing the course of events as they actually transpired." They were granted full permission to join whatever troops they chose, and to pass from one detachment to another. Lieutenant Greene, whose sympathies, like those of a large majority of his countrymen, were known to be on the side of Russia, while with the troops at the front usually received copies of the field-orders for every movement, and, after the issue, more than once obtained oral communications from the leading commanders which shed light on the reports for publication. Having arrived at headquarters after the first two defeats before Plevna (in the latter half of July) and the failure of Gourko's first expedition beyond the Balkans, he was personally present, August 23 and 24, in the battles of Shipka, where Suleiman Pasha recklessly threw away the chance of forcing the retreat of the demoralized enemy beyond the Danube; witnessed, September 11, the most terrible repulse of the Russians by Osman Pasha—their loss in those days exceeding eighteen thousand, according to their own reports; rode along the line of the Tzesarevitch's outposts and positions between the Lom and Yantra in October; passed the Balkans with Gourko's column during the winter, witnessing the battle of Tashkessen on the last day of 1877, and the fights near Philippopolis, January 15–17, which forced the bulk of Suleiman's army, under Fuad Pasha, to disperse and seek safety in the Rhodope Mountains; and then joined General Skobeleff, who had just decided the fate of the Turkish army at Shipka, and now commanded the advance guard, which in February arrived in front of Constantinople. Lieutenant Greene saw thus a great deal with his own eyes, and his personal experiences must have been varied and often highly interesting. These, however, he entirely passes over in silence, nor does he in the least indulge in pictorial descriptions of marches, assaults, or combats; of landscapes smiling in peace or hideous with thousands of mangled corpses; or of princely cantonments radiant with victory or dismayed by unexpected defeat. All these he has left to the Forbeses and MacGahans, and the other independent "Froudes and Macaulays" of the campaign; *his* account is an exclusively *military report*, the account of a military man addressed to his superior, on military movements and nothing else. In spite of this strict limitation, however, the narrative is highly interesting not only to those who study war as an art, but to all to whom the study of contemporary history is more than a pastime and worthy of serious application. Its attractiveness for this wider circle of readers it owes chiefly to its plain and good style, its lucidity of statement, and the clearness and fulness of the maps which accompany it.

To his narrowly limited programme the author adheres with the utmost—we must say, with excessive—strictness. He writes only on the army and war before him. The preceding history, the conditions and comparative resources of the warring empires, are not touched upon. We are not told why and how the war arose; the Herzegovinian insurrection of 1875, the Servian and Montenegrin wars of 1876, the dethronements in Constantinople in the same year, the diplomatic negotiations during these events, are totally ignored. More than that, the Montenegrin war of 1877, which so distracted Turkey during the whole course of the Bulgarian campaign, the simultaneous threatenings and disturbances on the Greek border, and even the new Servian campaign which opened on the fall of Plevna, and was actively continued to the time of the Russian armistice, are equally passed over in complete silence, barring a mere mention of Servia's declaration of war, and the statement that Suleiman came with his troops from Montenegro. The name Herzegovina does not occur in the whole book. The narrative is restricted to active operations, and chiefly tactical manœuvres; marches are only exceptionally described, and hardly anything is said about the Russian headquarters, camp arrangements, the commissariat, the engineering department, the quality of the regular supplies, the hospitals, the morale of the officers and men (apart from bravery and endurance), or the expenses of the campaign. Corruption in the army, as a source of delays, sufferings, and failures, is not alluded to. Nor are Russians, Turks, Rumanians, and Bulgarians contrasted with each other as soldiers or otherwise. The battling Russian army alone is considered. Its movements in important actions are most minutely described, and its courage, steadiness, and achievements heartily applauded. The omissions are generally to the prejudice of the Turk, but not designedly so, the Turk being only an indirect subject of the book. What also redounds to the prejudice of Russia's enemy is that the author has based his narrative mainly on Russian accounts, and "placed full reliance upon all the official reports"; only in a "few rare cases . . . the statement of relative losses seemed exaggerated." His pro-Russian bias, so natural under the circumstances, is most clearly betrayed in parallels drawn (pp. 367, 368) between the Bulgarian campaign and other late wars, where he declares that, "after all criticism has been made upon the faults of the Russians at the beginning of the war and around Plevna, still the campaign as a whole must be judged to be the equal in brilliancy and the solidity of its results of any in recent history," not excluding "the Franco-German war of 1870—the military marvel of modern times." Notwithstanding this bias, Lieutenant Greene evinces both candor and independence, and a modestly cautious judgment. In what vein he exercises his independence of judgment in regard to the high personages with whom he lately associated, may be seen from the following interesting fragment of the retrospect upon the disastrous repulse before Plevna, Sept. 11, 12:

"1. There was a certain lack of unity in the command of the army.

"The troops assembled at Plevna were under the command of Prince Charles of Roumania, as already stated; but this command was to a certain extent nominal, and the dispositions previous to the battle depended largely upon Lieutenant-General Zotof, who had commanded the troops before Prince Charles's arrival, and who was now his chief-of-staff. General Zotof was unfortunately not a general of the calibre to command eighty thousand men, but, even had he been a military genius of the first order, it would have been very difficult for him to gain a victory in the circumstances in which he was placed; for, a few days before the movement on Plevna began, the assistant-chief of the general staff, Major-General Levitsky, arrived at Poradim to explain to General Zotof the wishes of the Commander-in-Chief [the Grand Duke Nicholas]. On the day that the bombardment began the Commander-in-Chief arrived in person, and with him his chief of staff, General Nepokoitchitsky. He, of course, confirmed the dispositions already taken, but from this time forward he commanded. Although he rode over the field as far as possible, and even exposed himself imprudently to the enemy's pickets, yet it was impossible for him to be properly familiar with the ground before the assaults were made; so that while he commanded he had to rely upon the information and opinions of others rather than upon his own judgment. Finally, the Emperor was present, with the Minister of War and a large suite. The Emperor came merely as a spectator, to encourage his troops by his presence, and in the hope of witnessing their victory. But the Emperor of Russia is regarded by every Russian soldier, from the highest to the lowest grade, with a feeling which it is difficult to explain in other countries; *at all times* his will is law and his wish a command, and it is not possible for him to be a mere spectator. . . .

"The subject is a somewhat delicate one, and I have no wish to pursue it beyond a statement of the bare facts which were evident to every one present at headquarters who chose to see them. . . ."

The second reason of defeat was the Russian ignorance of the locality; "even the existence of the great Krishan redoubt, the key-point on the south, was not known" till the very beginning of the attack. The plan of battle, the product of divided and ill-informed authority, was thus a general idea of attacking on all sides, and "the Russians were defeated at Plevna, not because the position was impregnable, not because they did not have sufficient forces, but because they were ignorant of the enemy's position, and failed to concentrate their efforts upon the decisive points." Similar reasons are assigned, though only as current recriminations, for the equally disastrous failure of the previous attack on Osman in Plevna, at the end of July: "Shakovskoi [*sic* for Shakhovskoi] complained that Krüdener had not supported him, while Krüdener complained that Shakovskoi had not obeyed his orders. . . . Krüdener was the senior officer present, but Shakovskoi was also a corps commander, though he had only one brigade of his corps with him. Finally, the Grand Duke had given orders from a distance to attack a position of which he knew nothing." As to the first assault on Plevna, under Schilder-Schuldner, July 20, Lieutenant Greene is much more outspoken: "The almost criminal faults of this battle on the part of the Russian commander are so apparent that they hardly need to be pointed out." What, in spite of all these well-deserved failures, makes "the campaign as a whole" appear to our author so exceedingly brilliant is chiefly the double passage of the Balkans in the midst of winter, under Gourko in the west and Skobeleff and Mirski, of Radetzky's army, in the east, resulting successively in the dislodgment of the Turkish forces from the mountains before Sophia, the surrounding and capture of the Shipka army of thirty thousand men (Jan. 9), and the dispersion of Suleiman's near Philippopolis.

This vigorous advance he attributes to the influence of the Grand Duke against the counsels of Todleben, to whom again he gives all the credit for the plans which had brought about the fall of Plevna (Dec. 10). The insignificant operations of the Tzesarevitch on the line of the Lom he judges too favorably, considering them as originally designed to be purely defensive ; but this was hardly the case, as the repeated feeble attempts against Rustchuk show, which our author entirely ignores. Nor was Zimmermann's inactivity in the Dobrudja the result of design rather than of the paralysis with which the first disasters before Plevna struck all the operations of the invaders, and which lasted until the time when their forces, inadequate at the beginning, were by immense reinforcements made overwhelmingly superior to those of the enemy.

The plan of the work, as above stated, spares its readers the infliction of ghastly pictures of war horrors. Some of its plain statements, however, tell horrible tales : On Dec. 25, the 24th Russian division "had 6,013 men unfit for duty from frost-bites and sickness brought on by the terrible exposure." "At San Stefano, in the following May, . . . at one time 50,000, 45 per cent. of the whole force stationed thereabout, were in the hospitals." On Jan. 19 Skobeleff's men attacked an immense train of fugitives from the upper Maritza Valley—"over 20,000 wagons, containing 200,000 people"—escorted by several battalions of infantry. After a sharp fight the escort fled toward the mountains, "followed by the able-bodied portion of the immense caravan, who left the old, the sick, and the babes to perish in the snow. The train was so many miles in length that the Russians could not guard it, and the greater part of it was plundered by the Bulgarians of the neighboring villages, who also massacred the helpless Turks who had not strength enough to flee to the mountains."

FECHNER'S SECOND SOUL.*

NO one, with the exception of Helmholtz, has done more than Professor Fechner, of Leipzig, to put experimental psychology on a firm basis, and to raise it to the dignity of a true science. His epoch-making work on 'Psychophysik' is now indispensable to every student of modern philosophy, partly for its valuable researches on subjective sensations, and partly on account of the detailed examination in it of the so-called psychophysical law which expresses the relations between sensations and their objective causes, and, within certain limits, measures the intensity of the former by means of the latter ; thus refuting the notion of Kant, that psychology could never become an exact science because of not being subject to mathematical measurement. Professor Fechner has also made useful contributions to our knowledge of galvanism and the atomic theory, and three years ago he published his valuable 'Vorschule der Aesthetik,' in two volumes. Under the pseudonym of Dr. Mises he has issued a series of humorous and sarcastic essays, one of the objects of his sarcasm being Hegelism, which he correctly defines as "the art of unlearning how to form correct judgments."

Those, however, who would judge of the Leipzig professor by his scientific and literary work alone would be guilty of a serious oversight. Fechner, like Faust, though in a somewhat different sense, might say of himself :

> "Zwei Seelen wohnen, ach ! in meiner Brust,
> Die eine will sich von der andern trennen."

Of these two souls which struggle for the possession of him, one is responsible for his scientific work, while the second is identical with what Schopenhauer describes as the metaphysical instinct. This instinct has often led him to mount the philosophical Pegasus and soar away into regions where no telescope or other scientific instrument could follow him. He has written a book on the comparative anatomy of angels, and another on the souls of plants. He endeavors to make out that every diamond, every crystal, every plant, planet, and star, has its own individual soul, besides man and animals ; that there is a hierarchy of souls from the lowest forms of matter up to the world-soul—a sort of eclectic, semi-pantheistic nondescript ; and that the spirits of the departed hold psychic communication with souls that are still connected with a human frame—a point to which we may return on another occasion. What concerns us here is that in his last work, which he calls 'Die Tagesansicht gegenüber der Nachtansicht' (The Day-view versus the Night-view) he defends the crudest sort of absolute realism, which we had fondly hoped the critical labors of Locke, Kant, Schopenhauer, and the modern physiologists had for ever banished from the minds of trained thinkers. Professor Fechner frankly avows that he flings down the gauntlet to all philosophers of the day, be they idealists or materialists, Darwinists or anti-Darwinists, orthodox or rationalist. All these he throws together into one pot and labels them "Night philosophers," because, however great their differences in other things, in one point they all agree : they all teach that we know the external world not as in itself it is, but only as it appears to us through the modifying apparatus of our senses and brain, which themselves manufacture and project outwards the colors, odors, sounds, etc., that are supposed by ordinary people to be inherent *as such* in the objects themselves. This latter, naïve view of the people generally prevailed before the appearance of the critical school of philosophers; and now, with a strange perversity, Fechner comes forward, and, by a sort of metaphysical reversion or atavism, sets himself up as its champion. People are quite right, he insists, in maintaining that the sun emits actual light (instead of mere ether waves of unknown qualities), that the wings of a butterfly are gaudily colored, that flutes and violins give forth actual musical tones, whether there be any sentient organism to perceive these things or not. The sounds and colors exist, in the latter case, independently of sense-apparatus, nerve, and brain ; they exist in the universal consciousness which comprehends as constituent parts the consciousness of each individual brain. The belief that a nervous system is necessary for the manifestation of a soul is an antiquated superstition.

Were such views advanced by an ambitious youth of speculative propensities they would hardly deserve notice. But Fechner is one of the leaders of the small band of scientific psychologists, and it may be worth while, therefore, briefly to examine the motives which must have led him off the official highway. Evidently his "second soul," the unchecked metaphysical instinct, has led him into mischief, like so many of his countrymen who try to persuade themselves and others that they can still fly, in spite of the fact that Kant has cut their speculative wings : hence all the recent attempts to establish the Absolute, the Will, the Unconscious, the Imagination, and even the odorous effluvia of organic compounds, as the essence of the soul and the fundamental "principle" of the universe. Fechner deserves credit in so far as he has not committed the unpardonable mistake of adding a new quack "essence" to this list of metaphysical narcotics, and also because he lacks the sublime impudence with which, *e. g.*, Hartmann endeavors to persuade weak-minded people that *his* "essence," the Unconscious, is a panacea for all human ignorance. His own "principle," as already stated, is a mere compound of previous conceptions, and he is honest enough to admit—and this is a great advance in honesty on his predecessors—that he cannot prove his notions, but only make them seem more or less probable. Yet even this he has not succeeded in, although he secures the sympathy of the uncritical reader for his theory that the world unperceived is identical with the world perceived, by means of two ingenious, though of course unconscious, sophisms, which it is the duty of the critic to expose.

This can be done in a few words. The "Day-view," says our author, has at all times been the firm conviction of the unsophisticated people, and he cannot but think that such a primitive and wholesale conviction must rest on a good basis. This is an optimistic argument which takes no account of the innate ignorance, so to say, of the mass of mankind. Up to the time of Copernicus all the world believed that the sun and the stars moved about the earth ; and even nowadays, though we are all theoretically convinced of the contrary, it is not at all easy to throw off the old illusion and clearly realize that we are moving through boundless space at an amazing velocity, and on a little planet which, from a cosmic point of view, is a mere grain of sand. But while elementary astronomy is now part of every school-boy's education, the knowledge of the mechanism of our senses is of such recent origin that comparatively very few are aware as yet that what they suppose to be a direct and immediate perception of, say, a landscape, is, in fact, a most complex process of psychological chemistry, in which remembered impressions of touch and movement, associated with remembered impressions of sight, together with the fancy-work of the imagination, play as important, if not a more important part than the direct visual perception or sensation itself. This unconscious fusion of varied sensations and memories into one illusory picture makes it difficult for even a philosopher not to believe that his eyes are windows and his brain a mirror in which the external world is reflected just as in itself it is. The idealists of the last and present century tried very hard to eradicate this illusory belief ; but none of their *à priori* arguments had the convincing force of the facts brought to light by modern physiology of the nervous system, which has shown in an unmistakable manner that our sense-perceptions are cerebral, or a product of the activity of the brain, and from there projected into the external world, which furnished only the raw material for the sense-per-

* 'Die Tagesansicht gegenüber der Nachtansicht. Von G. T. Fechner.' Leipzig: Breitkopf & Härtel, 1879 ; New York : L. W. Schmidt.

ception, just as a sheep furnishes only the wool out of which our machinery weaves cloth of varied and complicated patterns.

And this brings us to Fechner's second sophism. He seems not to be aware that the epithet "Night philosopher" is an absolute misnomer, or what is known as a question-begging epithet. For these philosophers do not assert that the external world in itself is "dark," any more than they assert that it is light. They modestly confess that they know nothing whatsoever about it. A wave of ether enters the eye, passes the cornea, the lens, the aqueous and vitreous humors, passes through the ten layers of the retina, starts a current in the optic nerve which is conveyed to the brain; and not till it arrives there do we become conscious of it, as is known by experiment. But what we here become conscious of is evidently not the external agent, the unknown ether, but the nerve-current started by it. The resulting sensation is a joint product of the external stimulus, the complicated optical apparatus of the eye, the chemical constitution of the afferent nerve, and the reaction of a particular part of the brain. To say that a sensation is a real image of the external object which caused it is, therefore, like asserting that a ready-made suit grew on a sheep's back.

What makes it so difficult for the average intellect to assimilate this critical view of the external world is partly our unfortunate habit of using the word light to designate both the subjective sensation and the objective ether wave, and partly the absurd assumption of pure idealists, that since we can only *know* the world as perceived, therefore it can only *exist* in so far as it is perceived. With Fechner, however, the case is different. His revolt against critical agnosticism is due to the wild desires of his second soul to go beyond the limits of experience, and find out what lies beyond the Chinese wall which Kant has spitefully built up in front of the unknowable, or the "Ding an Sich." As the ordinary methods of inference—induction and deduction—do not suffice for this purpose, he resorts to analogy, and by way of securing the necessary physiological organism for his planetary soul he compares rivers to the circulation of the blood, day and night to waking and sleep, ebb and tide to the pulsations of the heart, the green covering of the earth to the human skin, etc. Such things are quite interesting from a poetical point of view, but in modern exact philosophy analogies are unfortunately of no more value than bows and arrows would be in a war between France and Germany. And here we wish to make a suggestion which it may be worth while for metaphysicians to ponder. We propose that metaphysics be made a branch of belles-lettres, and all works of the kind classed under the head of fiction. This would establish an absolute boundary line between it and psychology as an exact science; and it would relieve metaphysicians of the disagreeable necessity of trying to persuade themselves and others that they really believe what they teach. They would then have a full right to their favorite maxim: "If facts do not agree with our theories, so much the worse for the facts." As works of fiction metaphysical treatises would have to pay a little more attention to language and form, and a new Hegel would hardly be read even by the proof-reader.

Difficile est satiram non scribere; but we are perfectly in earnest. The metaphysical instinct is ineradicable from the human mind. In the way in which it still manifests itself it is injurious, because it discredits all philosophy. When, for instance, a speculative pessimist in all soberness describes how the world is destined to come to an end by a general consensus of all mankind to cease to "will" at a given moment, one wonders whether he thinks all his readers are idiots, or whether he himself is not rather a fit subject for pathological treatment. Such tomfoolery in the last half of the nineteenth century is an insult to every rational being. But on the other hand the metaphysical craving to know ultimate truths and the essence of all things has been at all times a great stimulus to investigation of mind and nature, and its presence is usually a sign of a gifted mind. For, if anything can be worse than the logical jugglery of full-blown metaphysicians, it is the cow-like indifference to the countless mysteries surrounding us that characterizes many people. To such people everything seems self-evident, whereas in truth nothing is self-evident, not even the fact that a stone should fall downwards instead of upwards; and all our "knowledge" is therefore a mere classification of mysteries. Now, the value of metaphysical theories lies in the fact that a critical study of them first makes us aware of this fact, and therefore, as it were, awakens us from a dream in which everything, even the most improbable, seems self-evident, because we do not reason about it. For this reason it is irrational to condemn metaphysical speculation unconditionally, as is often done nowadays. Ingenious imaginary excursions from the known to the unknowable, described in poetical language, would possess both an intellectual and an æsthetic value; and we shall welcome and commend all works of this kind as soon as we shall find them in the catalogues under the head of philosophical fiction.

It would be unjust if these remarks conveyed the idea that Fechner's work consists merely of speculation, and has, therefore, only an æsthetic value. Far from it. In spite of its weak backbone it is yet a strong book, which well deserves reading and even re-reading. We have never seen such a piquant and striking characterization of materialism, pessimism, pantheism, monadology, and dogma as is given on pp. 90, 91; and the chapters on teleology, causality, determinism and free-will, monism and dualism, pessimism and optimism, or the quantitative measurement of pleasure and pain in the world, contain a great deal that is new and suggestive. In the last chapter, which treats of modern spiritism (spirit-rapping), the ominous "second soul" again makes its appearance. Fechner believes in the reality of the manifestations attributed to the agency of invisible beings, and he advances several ingenious theories to account for certain anomalies in these manifestations. He belongs, we need hardly add, to the trio of distinguished Leipzig professors who, a year or two ago, so scandalized German society by entering the ranks of the spiritualists. In regard to Zöllner's notion of intelligent beings occupying a fourth dimension of space, whence they occasionally make their appearance to us, he has not yet made up his mind.

The Great Speeches and Orations of Daniel Webster. With an Essay on "Daniel Webster as a Master of English Style." By Edwin P. Whipple. (Boston: Little, Brown & Co. 1879.)—No design could well be more commendable, either from a patriotic or a purely literary point of view, than that which the publishers profess in issuing this volume—the popularizing of Webster, namely. The ordinary reader knows of Webster's fame and the grounds of it in a general way, but the only means he has of becoming familiar with Webster is the Everett edition in six volumes, which is both too bulky and too expensive to be popular. An edition such as this, containing a selection of over forty of his best speeches, complete in one volume, with clear type and good paper, and published at a reasonable price, was certainly worth printing. The publishers have adorned it with two steel portraits of Webster, and have prefaced it with an essay on "Daniel Webster as a Master of English Style," by Mr. E. P. Whipple. Nothing in the contents of the volume needs special remark at the present time, of course, except this last; but this, since it is a popular exposition of Webster's oratory, prefacing a popular volume, and addressed to plain people, is worth attention. We wish we could add that it merits praise as well as attention, but any one unacquainted with Mr. Whipple's reputation might reasonably say that it is so ill written as to raise a presumption against the ability of the writer to write about Webster or style at all. It is almost comically unconvincing, for example, to find a writer writing of Webster's simplicity in a highly inflated style; of his power of "organizing" his orations, in an utterly disorganized essay; of his directness, with circumlocution; of his "sincerity of imagery," with far-fetched illustration and garrulous digression: of his compactness, with diffuseness. This carries its own antidote with it, in general, of course; but plain people, ignorant of Webster, cannot be presumed to see that Mr. Whipple has only a general and sentimental admiration for him, without any serious intellectual sympathy with him; that he conceives Webster in the loosest sort of way, much as a small boy conceives the "head of the school," and does not depict him with any firmness of outline whatever. Plain people are not even accustomed to reflect that commonplace has not only the disadvantage of being colorless, but the defect of becoming, on the most unexpected occasions, paradoxical.

Mr. Whipple begins with an account of Webster's school-days, and relates how he escaped the falseness of thought and feeling characteristic of school-boy "compositions" by cutting loose from all prevailing restraints and rules and expressing himself naturally in his own way. Two pages of his forty-three are devoted to this episode, and he uses it to show that the "sophomorical" style is bad and can be best avoided by being natural. Of course this is in the nature of commonplace, but, like commonplace, it loses sight of a vital qualification; and it is perhaps Mr. Whipple's fundamental error that in concentration upon the truth here involved he insensibly ignores the other truth, that it depends entirely upon what one's nature is whether he should be "natural" or not, and that one of the chief uses of education is to guide, restrain, and discipline "naturalness." Mr. Whipple's uncurbed naturalness is the worst thing in his essay; it prevents his displaying any of the measure, proportion, and propriety essential to an essay on "style." When he has occasion to al-

lude to Milton, for example, he speaks of an "almost seraphic soul"; mentioning the New England phrase, "the neighbors," he says "Webster knew it in all the intense significance of its meaning"; a cross-examination by Webster "rivalled in mental torture everything martyrologists tell us of the physical agony endured by the victim of the inquisitor when roasted before slow fires or stretched upon the rack"; during the Dartmouth College speech "Chief-Justice Marshall's eyes were filled with tears, and the eyes of the other justices were suffused with a moisture similar to that which afflicted the eyes of the chief." Mr. Whipple speaks of earning the right to use words, and then uses them in this way: "Imagery makes palpable to the *bodily* eye the abstract thought seen only by the eye of the mind," and "the florid *foolery* of his early rhetorical style." He speaks of Webster as a poet, and says his imagery was of the same sort as that of the farmer who called a drought "God's flat iron," and that of a comparison of slowness to "cold molasses," which latter, he observes, "perfectly answers to Bacon's definition of imagination." It is probably his "naturalness," too, that is responsible for "He could not take a glass of wine without the trivial fact being announced all over the country as indisputable proof that he was a confirmed drunkard, though the remarkable characteristic of his speeches is their temperance"; and for this, which we are inclined to call the prize sentence of his essay: "He passed through life with his head enveloped 'in a cloud of poisonous flies,' and the head was the grandest-looking head that had ever been seen on the American continent." Mr. Whipple's literary instinct is never, indeed, particularly happy. He singles out Webster's use of "interesting" and "respectable" as parallel to Chaucer's use of "greenness," Barrow's of "rest," and Edwards's of "sweetness," merely because Webster uses them, and without suspicion that Webster's poetic sense is sometimes quite amiss. Indeed, he finds no blemish in his subject, and one feels that there is no trait of Webster's style which does not seem to him a beauty. Hence his treatise not only loses in reality on account of its lack of light and shade, but it loses in truthfulness. It is, in fact, a eulogy rather than a critique, and its criticism is only a semblance of criticism. It is, however, deliberate and detailed, and will pass as criticism with plain people who are unfamiliar with elementary text-books on rhetoric, and have no means of distinguishing between criticism and an employment of certain rhetorical terms. But a popular introduction to the writings of such a man as Webster ought surely to differ more widely than Mr. Whipple's differs from an unrevised essay by a student of Blair or Whately.

The Roman System of Provincial Administration, to the Accession of Constantine the Great. Being the Arnold Prize Essay for 1879. By W. T. Arnold, B.A., formerly Scholar of University College, Oxford. (London and New York: Macmillan & Co. 1879. 8vo, pp. 240.)—Mr. Arnold's essay upon the Roman provinces is an excellent discussion of this important topic. It consists of six chapters; the first is introductory, three are historical (devoted respectively to the Republic, the early Empire, and the later Empire), and two treat of Taxation and the Towns. All parts of the book are well written and scholarly, but the last half, covering less familiar ground, appears to us to have on the whole the most merit. It is not only comparatively new but very important ground, inasmuch as it is in the period of the later Empire, and especially in its financial and municipal systems, that the most important points of connection between ancient and modern institutions may be traced. We should, indeed, have been glad of even more elaboration here; a fuller statement of the distinctive features of the several provinces or groups of provinces, in view of the several nationalities which were afterwards built upon them, would have been very acceptable. But the limitation "to the accession of Constantine" cuts off many points of great interest.

Mr. Arnold has made good use of the labors of previous explorers. In this field, more than in any other, the materials are largely epigraphic, and the work is of such a nature that every new laborer must, in the fullest degree, enter into the labors of those who have gone before him. Marquardt is, of course, the authority upon whom he builds from first to last; besides him, Mommsen, Zumpt, and others; and he is evidently a careful student of inscriptions at first hand. We are surprised to see no use made of Emil Kuhn's 'Entstehung der Städte des Alterthums'—a work which one would have supposed indispensable for the preparation of the chapter upon the Towns.

We do not know any English writer who has firmly grasped the notion of the Greek and Roman town—*πόλις*, *civitas*—in which the contrast of *urbs* and *rus* is purely local and social, the *rus* being as integral a part of the *civitas* as the *urbs*, and the proprietors of the *rus* being dwellers in the *urbs;* for a clear statement of the institution we must go to writers like the German Kuhn or the French Coulanges. So that, while we cannot point out any real error in Mr. Arnold's account of the towns, it is yet felt to be inadequate. For example, in the valuable sketch of the towns existing in the several provinces, we find the statement (p. 205): "Pompey made out eleven towns in Pontus, and twelve in Bithynia; other places were villages." The statement, like most of those in this paragraph, is taken from Marquardt (vol. i. p. 198), whose expression is "*war . . . getheilt*"; but Mr. Arnold overlooks his previous expression (p. 192), "*welchen Pompeius in* 11 *Stadtgebiete theilte.*" (The word used by Strabo is *διεῖλε*.) The expression "made out" is, therefore, strangely inaccurate. Now, Kuhn gives nearly three pages (pp. 390–2) of commentary to this passage of Strabo, establishing in detail what the eleven cities were, so far as it is possible to determine them. And these eleven cities comprised the entire territory in question: they were not eleven cities *in* Pontus, and the rest villages; the villages were a part of the cities, and there were no "other places." Again, Kuhn's account of the establishment of cities in Gaul (pp. 434–453) would have been precisely to the point for Mr. Arnold's purposes.

We find a slip on page 71, where Publius Rutilius Rufus is called "governor" of the province of Asia; he was only *legatus* to Quintus Scævola. On page 115 is the surprising statement that governorships were sometimes "given to centurions, or even to ordinary veterans." The references are far from supporting this. The centurions who "governed" the Frisii and Batavi were simply officers detailed to govern a district; the Frisians and Batavians were not *provinces*. And the "ordinary veteran" turns out to be Pomponius Flaccus, governor of Mœsia, whom Tacitus (Ann. ii. 66) calls *veterem stipendiis* (referring to previous service *in Mœsia*), but who had been consul two years before (A.D. 17). A misprint (p. 41) is 179 for 197, and (p. 175) *reign* for *resign*.

An excellent discussion of the condition of the subject countries, and the degree of their self-government, at the time of their conquest by Rome, is found in the first chapter; and the nature and limitations of their self-government under the Empire are admirably brought out in a paragraph (p. 120) ending with the words: "The weakness of those who have conquered and ruled with eminent success is to be sceptical with regard to the fitness of others to do a similar work; and a Roman governor would probably be as incredulous if you spoke to him of a genuine parliament at Lyons or Corduba as an Indian official would if you suggested a Hindu parliament at Delhi."

Upon the difficult subject of the origin of the *coloni* we should not accept Mr. Arnold's statement (p. 162) that the view suggested by Savigny (that they were derived from barbarians transplanted to the soil of the Empire) is unquestionably correct, except as to the way in which a portion of the class originated. And when he goes on to identify the Bagandæ with the *coloni* he is no doubt right; but it was not Savigny's *coloni*, but a totally different set of persons. The peasantry of Gaul were serfs, or, as he calls them, villeins—that is, *coloni*—even before Cæsar's conquest.

Chapters three and four contain an excellent historical sketch of the condition of the provinces under the successive emperors; and the sketch of Diocletian (following mainly Preuss) is particularly full and instructive. We could call attention also to the summary of the epigraphical information about Britain on pages 133 and 134.

Life of Victor Emmanuel II, First King of Italy. By G. S. Godkin. In two volumes. (London and New York: Macmillan & Co. 1879.)—The writer's admiration for the truly kingly qualities of Victor Emmanuel amounts almost to the loyalty of a subject, which an evidently long residence in Italy has fostered. The English audience whom she had in mind, and whom she frequently directly addresses, will find this sentiment not unnatural, and will also take kindly to her pronounced anti papal if not to her equally decided anti-Mazzinian views. Sometimes the reader almost suspects that she may have intended to interest the young in the example of the *Rè Galantuomo;* but this comes rather from the simple and familiar tone of the narrative than from any disposition to keep out of sight the blemishes in his conduct. The chief defect of the book, which for the present takes the place of any critical biography in English, is in chronological distinctness. Of this as good an instance as any is chap. xxx., which embraces without either pause or transition the Œcumenical Council of 1867, the Barsanti incident (March 24, 1870), and the Franco-Prussian war. Finally, to the author's absence from

England may be attributed several printer's errors, such as *Gardic* for Sardic, *Carioli* for Cairoli, etc.

The permanent value of this biography lies in its extracts from the chief Italian memoirs on the period under survey and in its translations of speeches from the throne, orders, letters, etc.; while its interest is secured by a good assortment of anecdotes, of which the following, from chap. xxxiii. (p. 217), is a sample :

"Just at the beginning of the war of 1859, Signor Plezza was appointed governor of Alessandria ; but, on hearing that the Emperor of the French was expected to call there, begged to be excused on the plea that he was unfit to receive a foreign sovereign. Count Cavour said he had need of him in that post, and refused to cancel the appointment. Plezza then appealed to the King, saying that he understood nothing of etiquette, and could not represent his sovereign.

"'Is it possible ?' said Victor Emmanuel.

"'It is true, your majesty ; I never came to court but on public business, and I am quite ignorant of the etiquette necessary for such occasions.'

"'You understand absolutely nothing of etiquette ?' asked the King again.

"'Nothing, sire'

"'Then, since it is so, give me your hand. You are entirely fitted to represent me, for neither did I ever understand etiquette.'"

Leaves from a Lawyer's Life, afloat and ashore. By Charles Cowley, Judge-Advocate S. A. B. Squadron. (Lowell : Penhallow Printing Company. Boston : Lee & Shepard. 1879.)—Mr. Cowley, who served on the staff of Admiral Dahlgren, made it his custom, as he says in his preface, to keep a record of all important events which happened in the squadron under that officer's command. He also noted the events that had taken place in Admiral Dupont's time as they were related to him by eye-witnesses. This record he has made use of since his return to civil life for the purpose of correcting the errors committed by historians of the war. These he has found to be numerous, and for future editions of the histories in question his corrections ought to be of value. His narrative of the events which took place under his eye is too dry to be interesting as literature, though it cannot fail to have some historical value in the manner just indicated. Of the attack of the Confederate rams on the Federal gunboats off Charleston (Jan. 31, 1863) he gives a very clear account.

*** Publishers will confer a favor by always marking the price of their books on the wrapper.*

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*

The Young Folks' Cyclopædia of Common Things.

By JOHN D. CHAMPLIN, Jr., late Associate Editor of the 'American Cyclopædia.' Large 12mo, illustrated, $3.

The object of this Cyclopædia is to cultivate in children the important habit of consulting works of reference, and to answer many questions which are constantly arising in the studies and daily experience of youth, without trouble to parents or teachers—to say nothing of numerous questions put by children which many adults would find it difficult to answer without reference to books. The language of the articles is simple, and illustrations are used where thought necessary, while the arrangement of the contents is the same as in other cyclopædias.

"It is a thoroughly excellent thing thoroughly well done. . . . We regard the publication of this 'Young Folks' Cyclopædia' as an occasion of rejoicing, and in the interest of education we commend it with all possible earnestness to every parent."—*N. Y. Evening Post.*

HENRY HOLT & CO., NEW YORK.

The Golden Age of Engraving.

An Introductory Essay on the Old Engravers. With thirteen fine Illustrations. Price 15 cents.

"To those who wish to gather in a few minutes' reading a fair, clear, and not inadequate conception of the Art of Engraving and its Great Masters, the perusal of Mr. Frederick Keppel's article on the subject will prove very satisfactory."—*Insurance Times.*

Sent by mail, on receipt of price, by Frederick Keppel, 243 Broadway, New York.

Chautauqua.

New scheme of home study. The C. L. S. C. ("Chautauqua Literary and Scientific Circle"). Four years' course. Forty minutes' reading a day. Annual fee, Fifty Cents. The scheme approved by eminent educators. The year begins in October. Persons may join up to October 31.

For circulars address

DR. VINCENT, Plainfield, N. J.

NEW BOOKS.

THE BODLEYS AFOOT. A fresh "Bodley" book, by the author of all the other popular Bodley books. Profusely illustrated with charming pictures, and ornamented with covers that are attractive outside and inside. 1 vol. 4to, $1 50.

THE LITTLE CLASSICS. A new edition of the *original* Little Classics, in eight volumes 16mo. Uniform with the "Riverside Classics." *Sold only in sets.* $12.

A very desirable edition of this widely-popular series of short Stories, Sketches, and Poems.

THE GLOBE COOPER. The Works of James Fenimore Cooper. New Globe Edition, uniform with the Globe Waverley and Dickens. *Sold only in sets.* 16 vols. 16mo, $16.

PARNASSUS—Household Edition. A new edition of this notable volume of poetry selected and edited, with a Preface, by Mr. Emerson. It is uniform in style with the Household Whittier, Holmes, etc. 1 vol. 12mo, $2.

BREATHINGS OF THE BETTER Life. Edited by Lucy Larcom. A new, revised, and enlarged edition of this sterling book. "Little Classic" style. Price reduced to $1 25.

TALES OF A GRANDFATHER. By Sir Walter Scott. New edition, uniform with the Illustrated Library Waverley. 3 vols. crown 8vo, $4 50.

**** For sale by all booksellers. Sent, post-paid, on receipt of the price, by the publishers,

HOUGHTON, OSGOOD & CO., Boston.
21 Astor Place, New York.

CHOICE BOOKS FOR LIBRARIES.—PORTER & COATES, S.W. corner of Ninth and Chestnut Streets, Philadelphia, have now, in their new and greatly-enlarged premises, the most extensive and complete collection of Choice English and French Books for sale in this country.

Collectors of Choice and Rare Books are invited to examine their stock. Their priced list of selections from their importations and purchases is sent monthly to any address.

"No religious works of the present season are likely to be more popular than Canon Farrar's 'Life and Works of St. Paul' and Phillips Brooks's 'The Influence of Jesus.'"

The Influence of Jesus.

By the Rev. PHILLIPS BROOKS, D.D.

Fifth thousand. 16mo, 274 pages.....$1 25

"These pages speak from man to man ; honest, individual, and sympathetic. It may be safely assumed that most of our readers will peruse this volume themselves, if they have any interest in fresh, applicable thought on deathless subjects."—*Boston Transcript.*

"The ringing key-note is the Fatherhood of God to all mankind, the favorite idea of this distinguished preacher, and one which he here develops with all his characteristic energy, eloquence, and hopefulness."—*The Literary World.*

"The lectures belong to no sect and no Church, but are good for every man and woman who wants to make life better and braver, and to feel sure that God is a Father in heaven."—*Boston Advertiser.*

THE

Life and Work of St. Paul.

By the Rev. FREDERICK W. FARRAR, D.D., author of 'The Life of Christ,' etc.

Two vols. 8vo, 1,380 pages, with 4 Maps..... $6 00

☞ The first edition was exhausted in the first week ; the second will be ready October 6.

"The same extensive range of reading, the same eloquent and picturesque style which made his former work so popular, are conspicuous in these volumes, and will no doubt ensure for them a similar acceptance. In one remarkable feature Dr. Farrar's is unlike all previous lives of St. Paul. Into the body of his biography he has woven, in chronological order, the history of the Epistles, the circumstances of their composition, and a critical exposition of their meaning. In this way he offers a definite and intelligible account of the Apostle's teaching, of the controversies he had to meet, of the inmost heart of his theology in all its phases."—*London Bookseller.*

**** For sale at the bookstores, or sent by mail, postage paid, on receipt of price.

E. P. DUTTON & CO., Publishers,
713 Broadway, New York.

THE MOTHER'S REGISTER : A Tabular Record of the Health of Children, from Birth to Maturity. From the French of Prof. J. B. Fonssagrives. "The Mother records for the Physician to interpret." Cloth, 12mo. A separate volume for Boys and for Girls. Price, singly, 75 cents ; for two, $1 25. Sent, post-paid, on receipt of price, by the Publisher of the *Nation.*

The Nation.

NEW YORK, THURSDAY, OCTOBER 9, 1879.

The Week.

THE enormous speculative transactions at the Stock Exchange have at length begun to attract general attention. The business in shares alone has averaged over 400,000 shares each day, and on one day the aggregate was 489,000 shares. All stocks are dealt in on a par of $100, and brokers' commissions are one-eighth of one per cent. on this par. A remarkable feature of this business, which averages over $40,000,000 per day (par value), is that less than one-fourth of it is in stocks which pay any dividends. The fluctuations in prices, too, are as remarkable as the great number of shares which change hands. Although speculation is wild, and such reasons as there are for a recovery from the depression of the last five years are greatly exaggerated, yet the speculation is not unaccountable. The resumption of specie payments enlarged the currency, inspired confidence, and put the money market on the same basis as foreign money markets. Then the refunding of the public debt turned out of (5 and 6 per cent.) U. S. bonds a great many millions of dollars, part of which returned to 4 per cent. bonds, and a part went into other securities paying higher interest. During the transfer there was a strong inducement for all who had speculative ventures to float to bring them out in the most attractive way. Refunding of the debt induced the Treasury to use its influence to keep money very easy, which helped outside speculations as well as the Government bond market. Following this refunding, with its direct and indirect influences, came the good harvests in this country and the short crops throughout Europe, and as the logical result of this came the importation of gold. Since August 1 nearly $39,000,000 of foreign specie, almost all gold, has arrived, and about $15,000,000 more is afloat bound for New York. Except for these specie imports the speculation which had been built on the favorable events of the early part of the year must have broken down for want of money facilities; but the gold imported has been sufficient to move the crops, to carry the new securities which have come into being by the million, to sustain the advance in the price of old securities, and to furnish bank facilities for the enlarged volume of mercantile business. It has, however, been barely sufficient; there has been nothing to spare. These are the main reasons why Wall Street and other departments of speculation are wild.

The notable events of the week were: the gold imports above alluded to; the final settlement of the 4 per cent. bond account, which was completed without the loss of a dollar to the Government; the speculation in Erie, which, with the aid of reports that Vanderbilt is seeking a controlling interest, carried the price of the common stock up to 42 from 32¼, and the other share and bond issues in proportion; the rise of 3 to 8 per cent. in the coal stocks, on the hopeful attempt to form a new combination; and the rise in United States bonds on the final closing up of the Syndicate accounts and the discovery that there are yet outstanding somewhat over $25,000,000 of called bonds, a good part of which must eventually be replaced with 4 per cents.

The *Times* has at last produced its authority for the assertion that "the South had presented in Congress the doctrine on which the theory of secession rested, and declared its purpose once more to attempt the application of this to the administration of the Government." This doctrine was, as we pointed out, the doctrine that the Constitution was a treaty between independent States, from which any one State could withdraw at pleasure, and in which, *à fortiori*, any State could, *by State legislation*, forbid the execution of any federal law within its borders. We pressed the *Times* on the matter because the revival of Stalwartism and the preparation of the public mind for "a strong man" in the White House, which are exercising such a debauching influence on politics, have, in our opinion, been largely brought about by the wild and reckless exaggerations and distortions of the newspapers as to the Southern position in the last session of Congress. The *Times* has done more mischief in this way than others, because it has an air of independence and a certain moderation and precision of statement, when not telling stories of "outrages."

It now confesses "that the South has not formally proclaimed its determination to try the experiment of rebellion a second time, if its pretensions to supremacy be not forthwith recognized." It has felt justified in announcing the revival of the Calhoun doctrine because Mr. Blackburn, of Kentucky, made "a sweeping declaration which, in substance, was that the South meant to wipe off the statute-book the Republican legislation of the war and reconstruction eras." What Blackburn said, therefore, was, in plain English, that he would, if he could get a majority of the House and Senate to agree with him, repeal certain acts of Congress. Now, when, Esteemed Contemporary, did it become "secession" and "revolution" to predict that a majority of both Houses of Congress would repeal laws passed in the same body? We ought to add that the *Times*, feeling that this was a little weak as an account of a "presentation" and "declaration" of the doctrine of secession "*in Congress*," proposes "to take in connection with it" "the virtual nullification" (where and by whom?) "of the three Constitutional Amendments," "open disregard" of certain laws, "and hostility toward local Republican governments." But when "taking things in connection," why not do it largely and liberally? Why not "take in" the widespread habit of alcoholic intoxication, the practice of carrying deadly weapons, and the cheating of the cross-roads grocers at the South?

The Organ is evidently greatly troubled in mind about "the mania for scratching" which he says is spreading, but he is evidently puzzled to know how to deal with it. On Friday he approached "the young men," who, he says, are afflicted with it, in the character of an Indignant Moralist, and solemnly warned them that "they were working for the Democratic party." Turning to Governor Robinson, he declined "to speak harshly of him," but predicted that within a few weeks he would be tormented by "bitter self-reproach." On Tuesday he took up the rôle of a very Wise Old (but saddened) Man who had seen and suffered a great deal, and knew the hollowness of youthful joys. He recalled to the young Scratchers the delusion of the "large-eyed boys" about the "tree-tops on the far horizon touching the sky," and about "the mirage"; and mentioned somewhat obscurely that, while the Wise Old Man "skirted the shores of what he hoped he had learned," "the barks" of the Scratchers "sat lightly on the furthest verge of what they thought they knew"—which sounds unpleasantly like a conundrum. He then went on to intimate to them that he had almost every variety of human experience and knew that "scratching" was vanity, that no good and some harm might come of it, and that when they had lived as long as this Wise (but sad) Old Man they would see this themselves. But we cannot help believing that he is not nearly as old as he says he is, and has not been through nearly so much as he says he has, or he would know that no young man was ever yet prevented from trying a thing by an old man's warning that there was no fun in it. In fact, the cases in which one man's experience has been useful to another man at any age are very rare. These young Scratchers will not be stopped from scratching by hearing that the venerable editor of the *Tribune* has tried it and thinks it foolishness. Nor should they. They will probably care

nothing for scratching when they are as old and weary as he is; but why anticipate the melancholy period when they will be, like him, "skirting the shores of what they hope they have learned"? Our advice to them is, after having read carefully the Organ's opinion, to scratch while they are young—and we venture to assure them that better scratching than Cornell they will never meet with. One of his attractions is that he is a powerful conductor—that is, that every scratch he gets will send a most uncomfortable thrill through the frame of every political trickster and wirepuller in the United States.

After a stormy week the police troubles have at length come to an end, and, on the whole, in a way which is more satisfactory to everybody interested in a fair election than seemed probable a month ago. The struggle for the last few days has been over the appointment of the fourth set of inspectors "claimed" respectively by Tammany and Anti-Tammany. These, not having been appointed on the 1st of the month, it was clear that the Police Commissioners must be mandamused to appoint them by the General Term, or they must be removed by the Mayor, or both. On the 1st, therefore, the Mayor notified Messrs. MacLean, French, and Morrison that they were charged "by and before" himself with not appointing inspectors of election, and that they would have an opportunity to be heard the next day in their defence. These new "charges" created the utmost consternation among the Tammany politicians, but they were met by an application to the General Term for a mandamus. Meanwhile in the Police Board matters had arrived at a deadlock amid scenes of great noise and confusion, the Republican Commissioners making a stand for Tammany inspectors, which the *Tribune* says was a sacrifice of themselves for the public good that can never be forgotten. On Thursday Messrs. French and Wheeler withdrew formally from the Board, on the ground that it was evident that nothing could be accomplished. The Mayor meantime postponed action on his "charges" until the matter of the mandamus could be determined by the Supreme Court.

On Friday matters came to a crisis in the shape of an argument on the application for a mandamus. At the conclusion of the argument the Court announced that they had arrived at a unanimous conclusion as to the true interpretation of the election law; that they still thought, as they had previously announced, that the duty of the Commissioners was to consider the Democratic party as an entirety, with a view only to its relations to State issues, and without regard to local organizations. But the Board had actually appointed inspectors from one faction without considering another faction. Two-thirds of the party in the city had been left unrepresented. The Board must select, if from either, then from both, and the court, therefore, considered it the duty of the Board to select the remaining inspectors from Tammany Hall. This announcement was followed by immense applause, and the judges adjourned the matter to give the Commissioners an opportunity to act without being actually mandamused. The decision of the General Term was speedily followed by a mandamus, and this by the appointment of the remaining quarter of the inspectors from Tammany Hall.

The result, therefore, is that the Republicans have two inspectors, anti-Tammany one, and Tammany one, at each place of registration and each poll. Among "practical men" the effect of this division upon the result of the election is variously estimated. Some "practical men" think that the Tammany inspectors will all be seduced to the Robinson side before the critical moment comes; others believe that the two Republican and the one Tammany inspector will unite for a campaign of fraud, and that no power can stop them. These three can select a chairman at each poll, and a chairman of inspectors is known to be a very important person. At the same time, if we do not assume that the object the inspectors have in view is to enable one or other party to cheat, a representation of all factions at the polls seems a tolerably just way of securing that sort of inspection which the election law seems to contemplate as a safeguard against cheating. But the mandamus has one extraordinary feature which ought to attract the attention of lawyers. It not only directs the Commissioners to exercise their discretion by choosing inspectors, but points out the particular body of persons from whom they are to choose, which, if we are not mistaken, is an unprecedented use of the writ.

Town elections were held and two constitutional amendments voted upon in Connecticut on Monday. The amendments, one of which substituted biennial for annual sessions of the legislature and the other fixed the expiration of the Supreme and Superior Courts' judges' terms at seventy-five years of age, instead of seventy as heretofore, were both defeated by large and in some places, such as New Haven, unexpected majorities. The town elections resulted generally in Republican successes. The "issues" were various in different sections. In New Britain, for example, there was unusual excitement over the choice of members of the School Board. It seems that in 1862 the board were persuaded to allow the Roman Catholics, who formed then and do now a large portion of the population, to erect and support a town school, with the restriction that there should be no religious teaching during school hours. Since then no Protestants have sent their children thither notwithstanding its nominally unsectarian character, and recently the Roman Catholic priest of the vicinage, who is a member of the board, asked town support for a convent just erected, and for permission for the nuns to teach in their ecclesiastical robes. The board granted his request, but their action roused such a storm of popular indignation that they had to rescind it. Eight of the twelve members were Republicans, but the successors of four of these were to be chosen Monday, and it was feared the Democrats might get a majority and assent to "Father Carmody's" demands. The Republican candidates were, however, elected, and for the present, at least, New Britain seems saved from the dominion of the Romish hierarchy. The incident may, nevertheless, be taken as evidence that the Roman Catholics by no means regard New England as sacred territory, and are indeed making headway in a region not many removes from the Puritan "burying-grounds" of Saybrook. We beg to call the attention of the female voters of Massachusetts to this matter.

The Chicago *Tribune*—whose condition for the last few years has caused so much regret to the friends of rational journalism—has apparently been roused almost to madness by the "beat" inflicted on it by the Chicago *Times* in its recent letters on the Yazoo trouble, which the *Nation* condensed. It ascribes to us "the opinion that murder is a proper check on the practice of inciting negroes to exercise their Constitutional rights in a lawful manner," and accuses us "of virtually declaring that Northerners in the South ought to be killed." To which we reply that the editor of the *Tribune* has apparently had no vacation this summer, and that he ought to take a long one and take it at once, and, if possible, in a foreign country where the noise of American politics would not reach him.

A new Indian war broke out during the week among the Utes, whose reservation is on the extreme western confines of Colorado. The immediate cause of it was an appeal from the White River agent, Mr. N. C. Meeker, for protection against a portion of his charge, who had forcibly resisted his attempts to plough a certain field, and had actually assaulted him and driven him out of his house on September 8. On the 16th Major Thornburgh, with three companies of cavalry, was ordered to the rescue, and on the 29th, when near Milk Creek, fell into an ambush of which he and eleven of his command were the first victims, while a large number were wounded. The troops, under Captain Payne, were driven back upon their wagon-train, and having entrenched themselves near water and sent out a runner with tidings of the disaster, maintained themselves as best they could. The news reached Omaha on October 1, when reinforcements were instantly hurried forward, and at this writing are said to have joined the besieged. It is reported,

and believed, that all the white residents at the Agency have been massacred, including Mr. Meeker's daughter and other members of his family.

The remoter causes of the outbreak are variously stated. According to the Western view, the Utes are "lazy, thieving, murdering vagabonds," "peaceable in so far as they are not in organized insurrection, but as individuals constantly committing depredations of the most exasperating character." The Eastern opinion, on the contrary, is that the tribe has the reputation of being very peaceful and friendly, and their present discontent is attributed to their not having received their pay for the San Juan mining district ceded by them in 1873; to the fact that the Unitarian Missionary Board had no hand in the naming of Mr. Meeker, as of previous agents under Grant's policy; and to Mr. Meeker's ploughing up land which he had no right to cultivate without the owners' consent. It appears that collisions during the past summer between the miners and the Utes have been frequent, that the Utes have extensively burned woods and slaughtered game, and terrified the settlers in North and Middle Parks by incursions from the reservation, and that fancied injustice or fear of mining encroachment has at last stirred them to revolt.

The Supreme Court of Pennsylvania has rendered a decision holding the County of Allegheny in that State responsible for losses occasioned by the Pittsburgh riots of 1877. The suit was brought to recover the value of whiskey shipped at Cincinnati for Philadelphia, and destroyed *en route*. The Legislature of Pennsylvania in 1841 passed an act making the counties of the State responsible for all losses by mob or riot within their borders, and it is on this act that the decision is based. The counsel retained by the county made the point that the disturbances through which the loss was caused were not such as were contemplated by the law, but amounted to an insurrection spreading through several States. The court, however, disposed of this very speedily, and no one who remembers the disgraceful circumstances connected with the Pittsburgh riots can fail to recognize the justice of its remarks:

"We see no evidence of any serious attempt upon the part of the local authorities to suppress it. At the time of its commencement a feeble attempt was made by the sheriff, resulting in the enrolment of some half-dozen deputies. But there was no proclamation calling upon the body of the county to come to his assistance in preserving the peace. No one doubts at this day that if a proper effort had been made at the proper time the mob could have been held in check."

It must be said, however, that the Alleghenians may fairly retort that if the State militia had not been in a very ineffective and demoralized condition the riots would probably never have taken place at all, and that the sheriff and his "posse," which is all the means that a county ordinarily has at its command to suppress disturbance, are of comparatively little use when the sheriff is an elective officer, dependent on the votes of the people whose outbreak he is to be called upon to quell, and the "posse" are longing to join the rioters. In one case in Pennsylvania, we believe, the sheriff was obliged to hire a "posse" at ten dollars a head, but even then when the pinch came these volunteers at the call of duty were not to be found. The only field in which the *posse comitatus* really rallies about the sheriff and disperses rioters and restores quiet is the imaginary *civitas* of the Southern Democratic orator. In actual life mobs are put down by soldiers with breech-loaders, or else they are not put down; and as a matter of fact this is what happened at Pittsburgh, where the mob took possession of the city and held it for some time against all comers.

The returns of the Prussian elections put the Liberals in a decided minority. The Liberals and Progressists together elected thus far number 135, while the Conservatives and Ultramontanes together number 246. There are about 25 nondescripts outside these divisions. A majority made up of Conservatives and Ultramontanes may not be very manageable, but in one way or another Bismarck will make it serve his purpose. He promises a reduction of direct taxes, the purchase of the railroads by the state, and a subsequent reduction of fares and freight charges by a reduction in the expenses of management. His visit to Vienna has been a great success. He was well received by everybody, and is said to have come to a thoroughly good understanding with Austria as to the course to be pursued in case of any further trouble in the East on the part of Russia.

We have discussed elsewhere the discontent of the Irish tenant-farmers, which seems to be becoming more and more formidable. The tenants in several large districts have refused to pay unless they get a large reduction—in one case they refused to accept 30 per cent. reduction—and, if they stand together, it is difficult to see how they can be made to pay. Wholesale eviction is simply impossible, and so is wholesale seizure of personal property. The Government are sending cavalry over, but cavalry can do nothing against general passive resistance. The worst of the situation is that a heavy lowering of rents under pressure of this kind must almost inevitably lead before long to the total abolition of rents by a similar process. The moral sanction under which Irish tenants pay their rent is so feeble that the discovery that they could not be legally compelled to pay would at once destroy it. Mr. Parnell is working for the holding of a convention of three hundred in Dublin to discuss Irish questions, but the other prominent Home-Rulers oppose it. Such bodies were illegal until a few years ago, when the Prohibitory Act, which probably kept scores of conventions from meeting, was repealed.

The news from Afghanistan, which now comes exclusively through military channels, press correspondents not being allowed to accompany the forces in the field, is varied. General Roberts is pushing on with a small and lightly-equipped force for Kabul, which he hopes to take by a *coup de main*, and was to have been before the place by this time. If, however, he should encounter an obstinate resistance, which is not likely, he would be in an awkward position, as his communications by the Shutar Gardan Pass are already difficult, and indeed interrupted, and the Khybar Pass line does not seem to be yet thoroughly open. At the Aylesbury dinner Lord Beaconsfield did not make the slightest allusion to Afghan affairs, which were then filling the public mind with the deepest anxiety, but continued his chatter about the three charges on land, a notion for which he seems to have a childish fondness. He seems to find it impossible to get it into his head that land might so fall in value that the man who bought it would lose his purchase money, and that it would only pay the laborer who tilled it. He thinks, apparently, that land produces rent, or a fund answering to rent, by a natural law.

There is little or no progress visible in the discussion of the land question by the politicians in England. The Liberals promise to take it up whenever they get into office, but nobody of note is willing to say what they ought to do. The discussion in the press seems to point to legislation removing some or all of the present legal restrictions on absolute ownership—that is, putting an end to entails under marriage settlements and wills, and perhaps forbidding mortgages; or, in other words, obliging a man when he wished to raise money on his land to sell some of it. This would gradually, no doubt, effect a great change of ownership. Land would pass rapidly from the possession of needy, indebted men into the possession of men who could pay cash for it. But who would these men be? The Conservatives maintain they would be rich men owning large estates, because poor men could not afford to own property yielding so small an interest, and the Radicals that they would be peasants seeking small holdings. The Conservative view assumes, probably falsely, that land would not fall heavily in value if it were no longer possible to use it as an inalienable basis for family influence, social and political. If it did fall heavily it would pay a very good interest.

THE REVIVAL OF THE GRANT "BOOM."

SINCE the arrival of General Grant in San Francisco the phenomenon known as the "Grant boom" has again begun to show itself—that is to say, the conviction has again begun to find expression in the press that he will be the nominee of the Republican Convention. The enthusiasm about him which prevails among the Republicans in all parts of the country, since his foreign tour, cannot be prevented, it is believed, from making its way into the Convention, and the tendency to nominate him under the influence of that enthusiasm, "by acclamation," will be stimulated by a variety of agencies. In the first place, there will be a numerically powerful body of delegates from the Southern States, who will be troubled by no sense of responsibility, inasmuch as they know they can supply no votes for any candidate at the election, and will therefore come to the Convention in the generous and reckless spirit of men who are about to spend other people's money freely. They will, therefore, support General Grant vigorously because they liked his ways when he was in power, and would be glad to be once more under his rule, and the difficulty of electing him—if difficulty there be—will not be their affair, but the affair of the Northern States. Thus they will do all that noise and numbers can do to carry his nomination by afflatus. In the second place, those Northern delegates who may doubt the wisdom of bringing him once more into the arena will be discouraged by the fact that they have nobody of mark to oppose to him. None of the prominent competitors, Blaine, Conkling, Sherman, and Edmunds, is very weighty, and only one of them—Blaine—has any "magnetism," and his "boom" is "sicklied o'er" by the probable difficulties of his canvass. Every one of them, too, would sooner see General Grant nominated than any of the others, and would probably work in that sense at the Convention. In fact, General Grant would be the only one who would have really ardent supporters. In the third place, the difficulties with which the Republicans find themselves contending in the various State elections—for we take it for granted that, even if they win in Ohio and New York, the victories there will not be much more inspiring than that in Maine—in a measure force them to take up the man who, whatever his faults, they think likely to get them most votes, and Grant is apparently that man. Some of them still, on third-term and other grounds, make a show of hesitating about him, and say they will not nominate him unless "the policy of fraud, intimidation, violence, and murder is to prevail at the South; unless the Constitutional Amendments are to be nullified and defied," etc., etc.

We need hardly say, however, that if they think it desirable to nominate him on other grounds there will be no lack of unanimity in declaring that all these necessary contingencies have come to pass. It is observable already that as the struggle draws nearer the case of the South becomes blacker and blacker. The crimes which are committed here and there over its whole area, which, atrocious as they may be, are but the natural and normal products of its social state, are treated as reasons not for the more perfect working of the old American mode of producing peace and order, but as arguments for a resort to a kind of veiled Cæsarism. If you ask them what Grant will do to convert the Southern Barksdales and Dixons into respectable citizens, they turn the conversation towards the necessity of "bringing public opinion to bear on these fellows." In fact, the Grant movement has all the strength of a foregone conclusion. It is very much like the Duc de Broglie's reason for converting MacMahon into a dictator. His account of the designs of the Republicans was always very dark, but when pressed for a bill of particulars he never got beyond a charge of "latent Radicalism," and of a desire to "destroy all the institutions of the country." Our Conservatives in like manner scent latent murder, secession, repudiation, arson, rebellion, and State-rights on every breeze from the South.

It is a curious fact, and one which well illustrates the immoral thoughtlessness which underlies the movement, that in two Republican States at this moment the best class of Republicans are fighting desperately against two of General Grant's most prominent favorites and confederates when in power, Butler and Conkling—men whose political influence was built up by the control of the Federal patronage in their respective States given them by the late Administration—and that no supporter of the movement has thought it necessary up to the present to give any reason for thinking that should General Grant be again elected these men will not resume their old places. That Conkling believes he will resume his, he does not in the least attempt to conceal. That General Grant has in a two years' tour in foreign countries, of only one of which he understood the language, at the ripe age of fifty-seven learned to distrust his old advisers, is a purely gratuitous assumption. His nomination after his return, by his old party, before he had opened his lips about his plans or intentions, would of course be to him, as to any man in like circumstances, a solemn and emphatic assurance that he did right in trusting them, and ought to do it again. He could not have a more distinct approval of his past style of administration, and it would be an approval against which the wisdom acquired in foreign hotels and at foreign dinner-tables would naturally and properly count for nothing. Another example of the spirit in which his "boom" is being propagated was supplied the other day in the sapient speech of a prominent converted "Liberal," that he had gone back to the party because Mr. Hayes had destroyed the Republican majorities, showing that the man's memory did not even go back to 1874 and 1876, when, under the inspiring influence of General Grant's Administration, the Republicans lost both houses of Congress, and but for the Returning Boards would have lost the Presidency.

That, if General Grant should be nominated in the manner we have described, his election would be made difficult by anything the Democrats will do, seems very unlikely. Even if they had any wisdom to show in their nominations, the opportunity of showing it would probably be denied them by the hold which Mr. Tilden has got on them, and which seems in the present state of political science to be unshakable. He has, as we pointed out some weeks ago, the only Democratic Machine in existence, and, however much individual Democrats may kick or complain, and however often the Republican moralists may expose him, the chances are that his forces will appear at the Convention practically unbroken, and that he will once again be a competitor for the Presidency—this time with the aureole of a defrauded martyr round his head. The alternative which this would present in 1880 to the friends of good government would not be a pleasant one.

To have to choose between Grant and Tilden at a crisis which, more than any other in American history, called for purity in administration, and for patient and steady reliance on the authority and the working of the law (rather than on any man's personal qualities) to wipe out the traces of the civil war, and enable conflicting races and classes to live together in peace and prosperity, is something from which every right-minded and intelligent voter must shrink in the quiet of his own home, if not when shouting at public meetings. The way to escape it, however, is not to keep quiet between now and next June, and treat the Grant "boom" or any other "boom" as a visitation of Providence which may not be pleasant in its outward aspects, but must be accepted and endured. A "boom," like other follies in a free state, is not impregnable to discussion and opposition. Behind all "booms" there lies the sober second thought, if not of the central mass of the party which votes the ticket in all weathers, of that large and growing body of independents without whose aid in the present state of politics neither party can elect its candidate, and which has only, as we now know, to show itself in time to inspire caution in the people who control primaries and manage conventions. The revival of the "boom" ought to show this class, which is now engaged in resisting the trickery and usurpation in this State of the leading boomster, the propriety of converting themselves between now and next summer into something like a permanent organization, through which the loose vote might threaten and restrain the sages who provide the parties with candidates, and give something and somebody to rally about, if necessary, after the conventions had acted. If

such an organization could do nothing else it could remind the Republicans that the nomination of a saviour of society is a desperate game, in which a political party stakes its very existence. A party which confesses it has nobody for its highest office but a soldier who has already more than failed as a civil functionary, virtually agrees to dissolve if it cannot elect him.

ENGLISH AND IRISH LAND AGITATION.

THE success of the Home Rule party in the British House of Commons in compelling the Government to pass the bill founding a new university in Ireland in a shape to suit the Catholic clergy, and in modifying the Army Discipline Act, combined with the fact that in many of the English boroughs the Irish voters now hold the balance of power, has given Irish discontent a weight which it has not had in English eyes since the death of O'Connell, and a respectability which it has not had within this century. For many years Mr. Isaac Butt was the soul and centre of the Irish party, and his talents and tact, and his Protestantism, did a great deal to secure it consideration. At his death it was supposed it would fall into contempt, but Mr. Parnell, also a Protestant in good social standing, has, after incurring boundless odium as an Obstructionist, achieved sufficient success as a parliamentary tactician to make him loom up very formidably as Butt's successor. He came out of the last session with considerable prestige, having distinctly got the better of the Ministry on several occasions, and has gone over to Ireland to engage in a land agitation, in which he appears as an agrarian of the most pronounced kind. His remedy for the troubles from which the Irish farmers in common with the English are suffering, is total refusal to pay rent, or what he calls passive resistance. If this policy were carried out, he thinks the landlords would either be content with a very low rent and concede absolute fixity of tenure, or else they would be willing to sell the land outright to the tenants for a trifle and take their departure. Talk of this kind makes one curious to know what Mr. Parnell is doing for his own tenants, for he too is a landlord; but we find no mention of this or even allusion to it in the English or Irish newspapers. If he is collecting his rents and holding on to his land like the others whom he is denouncing, it will be one more illustration of the facility with which popular agitators keep their private affairs separate from their politics. There is no more bitter enemy of capitalists and of luxury than General Butler, but he continues to be nevertheless a very grasping capitalist himself, and makes no scruple about keeping a large yacht. This contradiction between principle and practice is easier in Ireland than here, as a leader is there the object of much deeper homage. His followers, no matter what the nature of the gospel he preaches, think nothing too good for him in the way of material enjoyment, and it is not unlikely that Mr. Parnell's are quite prepared to enjoy the ministrations of a prosperous landlord who fiercely denounces landlordism.

The proposal to bring the landlords to terms by passive resistance is probably a reminiscence of the resistance to the tithes of the Established Church, which was completely successful. The Catholics refused to pay, and when their cattle or goods were seized and put up at auction by the tithe proctor such angry crowds attended the sale that no man dared to bid. This system of raising ecclesiastical revenues accordingly perished before Parliament had time to abolish it. But it was, after all, a trifling matter compared to the rent question. The tithes concerned no one but a handful of Protestant ministers. Rents concern everybody in Ireland who owns anything. Enormous amounts of money have been invested in or lent on land since 1847, and there are the same charges on it as in England in the shape of jointures and other annuities. Any serious interference with the landlord's title which did not involve full compensation would shake confidence in all owners of property to a degree that would be ruinous to the country. People are, in fact, already talking of the shrewdness of Sir Robert Peel in forbidding in his will the investment in Ireland of any portion of the fortune bequeathed by him. The plan of giving Irish discontent a final quietus by having the state buy the landlords out and resell the land to the tenants, who should repay it the purchase-money in instalments, is open to the probably fatal objection that the tactics which had succeeded against the landlords would be tried against tne Government, and successfully—that is, an agitation would soon spring up for the total remission of the debt, on the ground that the farmers could not pay it, and if they could that it was but a small portion of what had been wrung from the Irish peasantry by English oppression. In fact, it is all but certain that no ministry would ever be strong enough or brave enough to enforce the law against general opposition.

It is difficult to say how widespread the anti-rent agitation now raging is. It is probably as yet confined to districts in which the farmers have suffered to an unusual degree from the bad weather, and may subside as the times improve. The Catholic clergy, too, will discountenance it, as they discountenance all subversive schemes. But the failure both of Gladstone's Land Tenure Act, which practically protects the tenant against arbitrary eviction and gives him security for his improvements, and of the disestablishment of the Protestant Church, which constituted for two centuries the great sentimental grievance of the Irish Catholics, to root out Irish discontent, especially when taken in connection with the fact that the Irish are now a power in many English constituencies, is evidently making Irish politics a source of more anxiety in England than it has been since 1782. A land question in England threatening the English landlords with some sort of huge disturbance—nobody as yet knows what—is something to which no English politician looked forward as one of the possibilities even of the coming century. If any politician had foreseen it he would have predicted that it would infuse fresh gravity into Irish difficulties, as certainly as George III. predicted that the success of the American revolt would produce one in Ireland. If the Liberals take up the English land tenures as a party question, as now seems likely, they must inevitably give a strong stimulus to the restlessness of the Irish tenants, and these for half a dozen reasons cannot be satisfied even with twice what will suffice to content the English tenants. They have different memories and different traditions, and different legal ideas, and have never been in the same kindly relations with their landlords.

The *Pall Mall Gazette* tries to meet the trouble by asking whether Englishmen have not been sorry long enough for their bygone ill-treatment of Ireland, which was, after all, only a bit of retaliation inflicted on the Catholics for the cruelties which the latter were inflicting on the Protestants all over Europe, and whether, therefore, it is not high time to shut their ears to Irish agitation and act as if Ireland had nothing to complain of. But this, of course, could be readily disposed of by any reader of the history of the eighteenth century. Ireland was on the fair way to a considerable degree of prosperity by the growth of her trade and industry, after the overthrow of James II., in spite of the Penal Laws, when she was flung back into hopeless poverty by the barbarous restrictions placed on both by the English Parliament on the demand of English merchants and manufacturers, who began on Ireland the experiment which toward the close of the century resulted, when tried on this side of the Atlantic, in the loss of the American colonies. This legislation had nothing to do with religion. It was aimed at Protestant settlers of the English race as well as Catholics of the Celtic race, and not out of hatred—whether justifiable or unjustifiable—of Popery, but for the common and familiar purpose of making money by keeping rivals out of the market. The result was to prevent the recovery of Ireland after the civil war, to fling the people back on rude agriculture—without a foreign market—as their only resource, and to prevent the growth of the habits of order, industry, and mutual forbearance and moderation which successful trade brings with it. It kept the peasantry in the position of degraded but ferocious serfs, and the gentry in that of lawless and overbearing masters of serfs. It is the effects of this devilish policy on the national character which, more than anything else, to-day makes Ireland difficult to

govern, and the problem cannot be solved now by a determination on the part of Englishmen to forget Irish history.

It must be said, on the other hand, that with the best will in the world Englishmen have never succeeded in governing any other community than England in a manner satisfactory to the members of it. To what defect of their mental or moral constitution this failure is due we shall not enquire here. The fact is notorious, and the government of Ireland by the House of Commons is really the government of Ireland by Englishmen. For this Englishmen of this generation are not altogether to blame. They have got out of the difficulty as regards Scotland, with much good sense, by letting the Scotch members of the House of Commons practically settle all Scotch legislation. The difficulty of pursuing this course with regard to Ireland is, that the Irish members virtually represent two nations divided, if not by hates and prejudices, by widely-differing traditions, faiths, and political and social ideals, and cannot be got to agree on anything; so that Englishmen, if anything is to be done for Ireland at all, have themselves to settle what it is to be. But Ireland, as she stands to-day, is what England has made her. England keeps her because she is useful to the Empire, and must make the best of her, along with the weather and the American competition.

THE GRAPHIC METHOD.

BERLIN, August 20.

THE origin and nature of our knowledge of motion has become a question of the first importance for philosophers of all schools. According to Trendelenburg, logic requires us to make movement the ultimate explanation of all things. From the standpoint of evolution, Spencer argues that there is a direct and universal relation between quantity and heterogeneity of motion and the degree of development of nervous centres. Even according to Haeckel, soul-life, whatever be its nature, seems to begin at least as low down as in contractile tissue. Vierordt holds that psychologically motion is not a perception but an immediate sensation, and that thus the muscle-sense is absolutely unique, in that the incommensurability between the objective thing and the subjective knowledge of it, found in each of the five old-fashioned senses, does not exist here. From the standpoint of the theory of knowledge (*Erkenntnisstheorie*) Helmholtz argues that sensations are nothing but guides for movements, and that, apart from the practical use we can make of a thing, all other conceptions of it are as impossible as the blind man's notion that sounds are colored. The same drift may be seen in Wundt, Exner, and others. Partly influenced by such conceptions, and partly by the intrinsic richness and suggestiveness of the field, myology is now considered by many as a branch of psychology scarcely less important than the study of the senses, connected as it generally is, through the doctrine of apperception, with the study of the will itself, and throwing light on its education, its nature, and its freedom.

It is in this connection, in recording movement as a function of life, that the graphic method so well described in epitome by Marey* has achieved its greatest triumphs. Every one knows how apprehensible and compendious statistics of all sorts—winds, produce, the business of railroad lines, electric tension, temperature, national debt and credit, insurance probabilities, etc.—may be made by representing them as the product of two variables laid off as right-angle co-ordinates, each as function of the other, with curves tracing their relation on a surface (for example, age and death-rate), or adding the representation of a third dimension by colors or shades, as census-tables of population, altitude, etc.—a method which Quetelet has introduced into political and anthropological science with such interest and success. The results of long and tedious investigations, such as the direction of aerolites; the periodic tides of lakes; the sensibility of the different zones of the retina to different colors; the trajectory of a balloon; the relative growth of the different sexes in childhood; the solubility of different salts at different temperatures; weight and cost of bridges of different materials; the growth of different plants under different chemical, thermal, and luminous conditions; phases of the solar spots; the elasticity of nerves, etc., may thus all be comprehended at a glance even by a tolerably inexperienced eye. It is superior to all other modes of describing many phenomena. Language was born before science, and even its technicalities are often ambiguous. The senses, too, are often deceived. The persistence of after-images produces confusion in the eye, to which latter the whole science of astronomy gives the lie. But the graphic method is fast becoming the international language of science, remarkably accurate in seizing subtle shades of change, and adapted equally to investigation and to didactic purposes. In Germany, where it is most developed, it has revolutionized certain sciences by its unique logical method, and in one or two cases at least has converted the lecture-room into a sort of theatre, where graphic charts are the scenery, changed daily with the theme, and where the lecturer is mainly occupied in describing his curves and instruments, and signalling assistants, who darken the room, explode gases, throw electric lights or sunbeams, simple or colored, upon mirrors or lenses, or strike up harmonic overtones, as the case may be.

As a microscope of time and space this method has achieved its most remarkable triumphs. By a mirror mounted on a syren, and rotating in a sunbeam with a rapidity determined by the pitch, the ten-thousandth part of a second may be easily and accurately measured, and thus the horizontal line on which time-measurements are laid off may be divided to represent, if necessary, even these small durations. By a method which he does not reveal, Nobert has succeeded in dividing a millimetre, or the one twenty-fifth of an inch, into thirty-five hundred equal parts, each somewhat smaller than a powerful microscope enables one to perceive. Each of these can be laid off on a perpendicular line at right angles to the first, and their concomitant variations can be traced by a curve. Although capable of such minuteness for tracing out a "cosmos in the microcosm," it need scarcely be said that every inch may just as well represent millions of years or miles as infinitesimals. Armed with this method, it has been recently proved that the quickest and slightest motion of the finger which a pianist can make is not a simple but a compound and prolonged act of the will; each of the six different gaits of a horse may be minutely described in as many different lines; the frequency and exact direction of the motion of the wing of a flying insect may be traced directly upon smoked glass, and if required, according to the practice of some popular lecturers, shown the next minute to an audience magnified upon the screen of a magic lantern; the one-tenth of a second intervening between an impression upon one of the senses and the quickest possible reaction (known as the personal equation) may be analyzed, as by Donders, and apportioned, in its twelve distinct elements, among sensory organs, ganglion-cells, nerve-tracts, latent muscular time, etc., the action of each occupying its own fixed fraction of a second. By immersing the hand in a closed cylinder of water ending in a small perpendicular tube, on which floats a pen that writes on a revolving drum, not only is every heart-beat shown to swell the hand appreciably, but even fear, anxiety, hunger, different drugs, pressures, etc., all record their own characteristic forms of pulse-curves.

But it is not my object—indeed it would require far more space than you would allow me—even to name the achievements of this method, nor do I care here to urge its more extended use in schools, by the daily press, etc., as is often done in Germany. I would rather raise an ulterior, and even in some respects, perhaps, premature, question as to its capabilities and the sort of value attaching to it. First, though it *may* be possible to reduce the syllogistic logic to graphic symbols and equations, we are not yet able to believe that thought will ever find here an adequate general vehicle for its inscription which will supersede the old Cadmic method, as an enthusiastic young professor here has lately argued, any more than Aryan myths will be better told in the purely hypothetical old Aryan tongue. Words may be recorded in phonographic type, or in overtone series on a musical bar, as by Helmholtz, or in lip curves, as by Brücke, or in symbols of the position of the organs of speech, as by Graham Bell, etc., but the alphabetic method will no more be superseded than words themselves will be resolved into more radical expressions of psychologic tension. This, almost as a matter of course, I think. Again, I cannot believe that physiological phenomena will be ever to any great extent reproduced from any combination of the various curves they trace, as sound is reproduced from the curves inscribed in the tin-foil of a phonograph; yet even this is sometimes strongly urged. Once more, it is chiefly argued that the movements are absolutely regular and constant under the same conditions. This idea has stimulated very many to study the methods of analytical geometry, and has done much directly and indirectly to develop the application of mathematics to curves of all sorts of co-ordinates. Whether this can ever be done for organic, as it is for inorganic, structure and forces, is perhaps the most modern phase of the old question between mechanism and teleology, which I have no wish to discuss, and which may not, indeed, reach the discussable stage for many decades. Not that I am without impressions and prejudices enough, but because it seems to me one of the questions respecting which it is most

* 'La Méthode Graphique dans les sciences expérimentales. Par E. J. Marey.' Paris. 1878.

philosophic to cultivate equanimity in suspense. On the one hand, the near and constant approximation to exact proportions, and on the other the invariability of the residual deviation, are equally surprising. While the equations for the curvature of the cornea, the rotation of the eyeball, the superposition of muscular and sensory irritation, etc., are pretty well developed, there is no single cornea, eyeball, or muscle curve, and no measured and averaged series of such, that gives the precise curve ; and thus the latter remains like the ideal head or arm which sculpture can create, but nature, so far as observed, has not created. Hence, it is said by some that the conditions of observation are not fully controlled. This the complexity of everything organic makes extremely plausible. Others assert that the statistics must be universal before the perfect mechanical cosmos is unveiled. This is certainly beyond the present reach of contradiction.

One of the impressions of Theophrastus Such is, that as the sum of human knowledge is reduced to motion in time and space, and as it becomes possible to conceive of self-reproducing machines which can give readings for the whirl of molecules engaged in composing an epic, etc., consciousness will become extinct, since molecular combinations will persist as the most fitting survivals ; in a word, all will be action, while knowledge, and even sensation, will be superseded. I instance this as a purely theoretic fallacy quite current among scientific laymen. It is logically and psychologically wrong. Both the tendencies and disciples of every theory of the unconscious are mystic and strongly teleological. Again, mechanized knowledge is now simply the most organized and known form of knowledge. Hypothetical mechanism is often merely the best and most serviceable sort of *memoria technica*, and is quite consistent with the philosophical faith that all mechanism is a form of knowing, now very practical but perhaps transient, and in no sense a *Ding an sich*. As science advances in the study of consciousness, its highest problem, it will perhaps find it no less serviceable to resolve all knowledge into the forms of self-knowledge, interpret force as will, etc.; and its ideal future, if it trouble itself to note its own dreams, may be rather more like the Hegelian millennium of all-consciousness than the actualization of a universal self-mending, self-governing, self-reproducing, self-knowing machine.

Correspondence.

SOUND MONEY.

To the Editor of The Nation :

Sir : The term "honest money" is a dissolving view under the depraving influence of legal-tender notes. The letter of M. L. Scudder, jr., Secretary of the Chicago Honest Money League, in the *Nation* of the 18th, defines sound money, as viewed by that association, by stating that "in the opinion of those most active in its organization the object of its existence is nearly accomplished"; for that "It is plain that the American people cannot be successfully marshalled to demand an irredeemable currency or a debased coinage," and that the League looks to see the result of the Ohio election demonstrate that its work is finished.

By this the League accepts as a sound-money situation the standing issue of 346,000,000 of legal-tender notes, with any reduction of their volume forbidden, even if there should be a run for redemption, and with the Secretary of the Treasury required to sell bonds to get coin to redeem the notes to be shoved out again, continually increasing the interest-bearing debt. It accepts as honest money a perpetual issue of legal-tender notes which, if constitutional, makes the Constitution a thing of straw ; an issue whose volume will ever depend on the party necessities of Congress, and will be the football of the elections ; an issue whose existence will keep ever to the front the question why Congress does not dispense the whole of the paper money beneficence, instead of granting the privilege of the rest to the banks—a question which can never be satisfactorily answered to the common mind.

The League regards its honest-money mission as almost finished, and lays to itself the unction of the ancient Simeon, while a standing volume of three hundred and forty-six millions of greenbacks furnishes a legal-tender redeeming medium for three hundred and thirty millions of bank-notes, with the free privilege of unlimited increase, which notes by one exchange come upon the coin in the Treasury, making a volume of paper money which altogether is now near seven hundred millions, and is rising, all resting at last on the coin in the Treasury—and certain to draw upon it when that inflation of prices which is inevitable from such a volume of currency shall again raise our imports to excess, as it is sure to do in spite of our abundant farm crops.

The League is ready to retire on its laurels while a law stands which compels the coining of two millions of silver dollars a month, worth only about eighty-six cents, but full legal-tender for private and public debts. If paid out as the spirit of the law requires, these would soon reduce our revenues to silver, would expel gold from the country, and degrade our public credit to the fallen silver standard. Only the disregard of the silver law by Secretary Sherman, in locking up these silver dollars, prevents their debasing our money and revenues and dishonoring the public credit. But he cannot continue this locking up of two millions a month much longer. The Opposition will attack it, his own party does not support it, and his own political welfare will constrain him to force out this "debased coinage."

The result of the Ohio election will be no demonstration that the people "cannot be successfully marshalled to demand a debased coinage," if what is called the remonetization of silver be the debased coinage. And this, as it stands, is an argument for going to the logical end, by unlimited coinage and issue of silver, which means the single silver standard, and the dropping of our money and public faith fourteen to twenty per cent. And the Honest Money League thinks its mission almost finished at a time when inflation doctrines are more rampant and more presumptuous than ever, because now they have what is called the specie basis ; when the sound-money party and its Administration are proclaiming "an inflation of sound money"; when the doctrine is universally accepted in politics that the true aim of a sound-money system is the largest volume of paper money that can be "floated" on confidence in the promise to redeem in specie—a doctrine which is the opposite of all that was ever before called sound in money. S R. R.

Cincinnati, September 29, 1879.

PRINT, PAPER, AND SCHOOL-BOOKS.

To the Editor of The Nation :

Sir : While you are upon the subject of glaring white paper and the injury it must do to the eyes of children, you would, perhaps, help both schoolmasters and pupils by calling the attention of the former to the great advantages of manila paper. I find it pleasant to the eye, cheap (either in the form of blank books, or arranged as a "pad" or tablet), and beyond comparison superior for school work or for literary men.

J.

Norwalk, Conn., Sept. 26, 1879.

To the Editor of The Nation :

Sir : The letter and comments in your last issue on "Glaring White Paper" recall an effort made a few years ago (though without success) to interest the Social Science Association, as well as various chemists here and there, in what still seems to me a reform of the utmost importance as affecting *all* the reading world, whether old or young. My own attention was called to it by an article in a Boston medical paper (January, 1872) by a man almost blind, detailing his experiments while gradually losing, and, as he hoped, gradually recovering, his sight. My own subsequent, somewhat careful, investigation of the subject confirmed his views, and I tried to influence scientific and practical men to work the subject up. Failing in this, and other interests intervening, I had lost sight of the subject temporarily till a paragraph in a recent paper stated that "a Russian physician, M. Malarevsky, struck by the prevalence of short-sightedness among literary men, proposes that books should be printed in white ink on black paper, and he has made experiments with fifty persons which tend to confirm his view." This is the reform: no less than the reversal, or interchange, of the present colors of the written or printed page, so that, whatever colors (black and white, black and gray, blue and orange, or others) shall upon trial prove to be most desirable in themselves and as related to each other, *the ground shall always be darker than the letters.*

I cannot encroach on your space to show in detail the evils of the present system, nor to discuss what may be called the physics and chemistry of the question, or the difficulties, mechanical and financial, to be overcome in bringing about such a reform. Strange as it may seem at the first blush, our present system is based upon a physical paradox. We see objects only as they are lighted up—*i.e.*, reflect light to the eyes. When we read our present books or papers, then, we see everything but the very things we want to see—namely, the letters. We think we see the letters, but this is only because of the absence, just there, of a positive

impression on the retina; and, startling as it may sound at first, we read the letters *by not seeing them*. We see the bright margin and the bright spaces around and between the letters; the letters themselves we do not see. This negative sight is accompanied by serious evils. One might ask, What difference, practically, if we do virtually see the letters and draw a sense from them?

Two points are to be noticed in reply: 1. Light, up to a certain degree, is a healthy stimulus to the eye; but light which pours in from the margin and other spaces of the present page upon the eye already strained in attention to the meaning of the letters, is in excess and must affect the eye somewhat as ardent spirits do the body, when an attempt is made to goad thus the weary body to new exertions. 2. Even the negative picture of the letters on the retina is blurred and obscured by the rays which enter the eye from various portions of the page, just as the shadows thrown on the ceiling by a chandelier are all rendered obscure and ill-defined by the *cross-lights* from the several burners.

Which is more grateful to the eye, a silhouette, by Konewka even, or the same sketch, equally well done, on a black slate? A bronze bust against a white wall, or the same in white marble against a blue or black shield? But I must pause, only noticing that consciously or unconsciously the reform is making gradual headway, for we see the street signs multiplying which present gilt or white letters on a ground of black or blue, and block-advertisements in which the ground only is printed and the letters left of the color of the page. If this reform could be carried out, diamond types be "anathema," and the present hair-lines in the lettering abandoned, which leave vacant places as the types grow worn, we might all hope for a longer lease of reading life, while many who now cannot or dare not look at a book could be restored once more to this precious enjoyment. What publisher, calling to his aid the paper-maker and ink-maker, will be the first to give us this great boon?

H. D. C.

New York, Sept. 26, 1879.

[Several questions are here suggested.

1. As regards distinctness. For the purpose of testing this point Professor Henry P. Bowditch, of the Harvard Medical School, prepared some words in black on a white ground, and some in white on a black ground, using stencils to ensure evenness and equality. The class of students were then asked to state which they distinguished most readily. It was found that the number of those preferring white letters on a black ground was slightly larger than of those preferring black letters on a white ground; but not so much larger as to form a basis for inference. We have before us a MS. in white ink on lustreless black paper; it reads with distinctness but is not perceptibly clearer than that written with a similar pen in the ordinary way. The effect of the white ink is startling and almost dazzling, owing to the purity of the color. A white letter on a *blue* ground might be equally distinct; such a combination is preferred, on grounds of legibility, for the names of streets in the city of Paris.

2. Our correspondent observes that we do not literally see the black letters. This is true in a certain sense, but not in a sense which can be made a base for argument; for what the eye requires in order to perceive form is simply a difference in color—a difference equally present in both the cases supposed. If argument *à priori* be justifiable, we may remark that a black page containing white letters forces the eye and the mind to concentrate their perceptive efforts upon small white objects; the macula lutea, or most sensitive central portion, being taxed to appreciate a brilliant object instead of a black one. It is certainly trying to the eye to look for light-house lights, or stars; and to an unaccustomed person the use of pure white letters on black paper seems a little dazzling. It is, nevertheless, true that a good many eyes, suffering from overuse, are pained by a moderate amount of light; and to these a pure white paper and wide margins are abominations. A paper of neutral color, neither black nor blue, will probably prove the best basis for experiments in white-letter printing.

3. As regards methods, improvement is to be desired. Our copy of *L'autre monde, journal des trépassés*, printed white on black paper, has lost a good deal of its clearness by rubbing off of the ink; it still presents an agreeable surface on the inside. The white writing-ink is prepared with bismuth, a very heavy substance, and requires constant shaking up.—Ed. Nation.]

To the Editor of The Nation:

Sir: In reading what you said of school-books in your issue of September 25 I could but wish you or some one who is able to affect public opinion would speak out against what, for the lack of a better name, might be called our "school-book burden." And I call it a "burden," for a burden it has become to the parents of this land to supply their children with the requisite number of school-books now thought necessary for a child to have. It is no uncommon thing for a pupil at the beginning of a school year to come home with a list for five dollars' worth of books; and in poor families where there are three or four to provide for one can well see what a burden it is—in many instances quite sufficient to prevent parents from sending their children to school. We glory in our "free-school system," and well we may; but it is doubtful if the extra cost of school-books at the present time does not more than overbalance what it used to cost for schooling before the free system came into operation. Everything pertaining to school-books looks to the interest of the book-publisher, and nothing to the interest of the pupil or parent. Every study must have its "series." A child, in order to learn to read, must have five or six readers, at a cost of four to five dollars, and three or four arithmetics, at a cost of three dollars more, and two geographies, at nearly three dollars more. And so of every study. The chief thought now seems to be to see how many books can be introduced into a study, or into how many books a study can be cut up, in order to furnish business for the book-publisher. Now, if there was any corresponding benefit to the pupil from all this, one might bear it; but there is not. After some attention to the matter, I am disposed to believe that the average pupil of thirty years ago at sixteen was quite the equal of the pupil of to-day at the same age, with all his "modern improvements." He had not so many helps, as they are called, but he had more ability to think out things for himself. And yet compare the books of the boy of thirty or thirty-five years ago and of the boy of to-day.

Take the case of a boy in a country school in York State thirty-five years ago: One speller, which answered the purpose of a primary reader as well as speller, cost 12½ cents; one English reader, 37½ cents; one Hale's 'History of the United States,' which answered not only as a reader but a history, $1. Here is a dollar and a half for his spelling, reading, and *history*. Now his readers alone (Sheldon's) will cost him $4 25, history $1 75, and speller 25 cents = $6 25 for what then cost $1 50; and the same difference in number and cost of arithmetics, while there is no corresponding difference in the scholarship and knowledge of the two. This school-book matter is certainly a crying evil, and an almost intolerable burden to large numbers of our people, and it is only their very great patience that causes them to bear it—not in silence, however, as our school-book publishers may find out to their grief some day, unless a change is made. I would that some of you who have the public ear, and have the interest of the people at heart, might speak out in this matter.

D.

Illinois, Sept. 29, 1879.

ARMY RANK AND PROMOTIONS.

To the Editor of The Nation:

Sir: I am glad to find that you discuss so freely the question of civilian appointments in the Army, for the following reasons:

No radical change can be effected in the Army by the powers inherent therein. The system, the education, the regulations, the custom, all go to preserve intact its virtues and its faults; and nothing but the strongest outside pressure can make alterations possible or probable. The *Nation* is extensively read in the Army, and its criticisms respected, if not followed. The presumption is, that radical needs shown by it to exist will be a matter of correspondence, possibly of legislation; and I repeat, therefore, I am glad it has shown an exact appreciation of a great need —somewhere.

I think, however, that the true secret of "something wrong" is not as yet clearly apparent to you. There is in the Army a great gulf, introduced into it from the English service, favored by the laws, and religiously preserved by custom. The difference in rank, pay, and, above all, social status, between the highest non-commissioned officer and the lowest commissioned one is vast, and cannot be appreciated by the average civilian. It may not be advisable to discuss the reasons for its existence,

or the methods of its correction, but the fact is there, and it is the cause in great part of the difficulty of promoting from the ranks.

In no institution, corporation, or firm in the land does there exist such an anomaly. In no railroad system of officers and employees can you point to a line up to which the mass of employees may hope to reach, and beyond which outsiders may be called upon for suitable persons to fill the higher duties. In the complex and omnipresent Western Union Telegraph Company promotion may easily take place from one grade to another, and the managers are *promoted*, not *selected* from the country at large. In fact, no one can fail to see how foreign to the spirit of our institutions, how hurtful to the general service, how unaccountable (except by referring to the English service) is this same unnecessary and important gulf between the "rank" and the "file."

When intelligent legislators will admit that the Army and its concerns are not necessarily an occult science, I doubt not some way may be found by which it will be made desirable for men of the middle class to enter the Army as well as the militia; possible for each one so entering to look forward to advancement; desirable for the commissioned officers to watch over and further such promotion to the really worthy; necessary for the highest military authorities to look to the character of the "file" as well as the "rank"; and a matter of general pride and satisfaction to the country to have a body of men which, from top to bottom, is zealous, capable, and progressive. But so long as the Army is essentially divided into officers and men, the one superior and the other without hope, there will always arise such difficulties as you now perceive exist.

Yours truly, R.

["R." overlooks the fact that our Army and the English are the only ones in which the ranks are filled exclusively by volunteers, and therefore by men who as a class may be said to have failed, or to have despaired of success, in civil life. This fact renders discipline more difficult in these armies than in any other, and necessitates a sharper line of division between commissioned officers and privates, and from the privates the non-commissioned officers come. No change in the regulations will send into the Army as privates the kind of recruits from which civil "institutions, corporations, and firms" draw their servants for the lowest grades. It may be asserted as a general rule that young men who in this country choose soldiering as a calling are restless and adventurous spirits who could not get employment from the telegraph or any other company, or, if they could get it, would not possess the qualities which bring promotion to responsible positions. We do not mean to insinuate by this that the quality of the rank and file cannot be improved, but in discussing the ways and means of doing so no good can come from deluding ourselves into the belief that the Army can go now, or will ever be able to go, into the labor markets on equal terms with commercial corporations.—Ed. Nation.]

Notes.

THE private library of the late Caleb Cushing is to be sold in Boston, at the auction-rooms of Sullivan Bros. & Libbie, on Oct. 22, 23. The collection is in many ways remarkable, but its peculiarity consists in the large number of works in Spanish and pertaining to China, apropos of the owner's two missions and his part in the Mexican war, and on international law. It is the library of a statesman and not of a littérateur or general student. We notice that the author of a squib in which "Cushing" was made to rhyme with "pushing," Miss Hannah Gould, has her three volumes of poetry "uncut."——Another opportunity for book purchasers is held out by the "Catalogue of a Collection of Eight Thousand Volumes of Books in all Departments of Literature," for sale by the Mercantile Library Co., of Philadelphia. Duplicate works of fiction naturally abound in this collection, but the majority of the numbers represent a wide range of subjects and authors, and some are scarce or rare.——The salient features of the early history of Fairfield, Conn., will be found spread on fair paper in open type in the report of the centennial commemoration of the burning of that town by the British, July 8, 1779 (New York: A. S. Barnes & Co.)——A Connecticut man's career is instructively told by Judge Cowley in his 'Reminiscences of James C. Ayer and the Town of Ayer' (Lowell: Penhallow Printing Co.) The moral is not always that pointed by the author, but it is generally unmistakable. Dr. Ayer's achievements as a mechanical inventor will be new to many readers, and his exposure of the weakness and abuses of joint-stock corporations and efforts to reform them, should not be overlooked in passing judgment on his character.——The Fine Arts Publishing Co., of this city, announce for speedy publication the 'Doré Bible Gallery,' containing in a quarto volume one hundred of that artist's best illustrations of the Scriptures (reproduced, we suppose, by "process"), with explanatory letter-press and a portrait.——On the first of this month appeared in Paris the *Nouvelle Revue*, a rival of the *Revue des Deux Mondes*, with E. About and other disaffected writers—John Lemoinne, F. Sarcey, G. Flaubert, etc.—among its contributors.——Henry Holt & Co. have in preparation a new revised and enlarged edition of the poems of Arthur Hugh Clough, with a memoir by Prof. Norton, of Cambridge.

—The eleventh edition (in as many years) of Francis Parkman's 'Discovery of the Great West' now appears, bearing for its principal title 'La Salle' (Boston: Little, Brown & Co.) This is a proper indication of the essential unity of one of the most dramatic and enchaining historical narratives in the language, and gives a just prominence to the intrepid character who first traced for Europeans the water way from the Great Lakes to the Gulf. The work has been thoroughly revised—with the conscientiousness of a stylist as well as of an historian. After a careful comparison of this last with the original edition, there are barely four chapters out of twenty-nine which are seemingly untouched; and even in these might be discovered some verbal alterations, were they merely rhetorical, such as abound among the weightier corrections, additions, and retrenchments elsewhere. Chapter vi. absorbs the old vi. and vii.; chapter xxii. is interpolated. The chief cause of the changes is the new information about La Salle furnished by M. Margry's recently printed collection of original documents called 'Découvertes et Établissements des Français dans le Sud de l'Amérique Septentrionale.' Not only has it supplied a number of important details about La Salle's movements, but it has shed so much light on his temperament as to affect considerably the final summary of his character, and to mitigate some judgments pronounced upon those who fell out with him. Thus, much more is known and can be told of his difficulties with Beaujeu, greatly to the bluff old sailor's advantage, and with a distinct gain in interest to the tragedy in which Beaujeu's rôle is so much exalted. More graphic than before and more minute is the account of La Salle's failure to make the mouth of the Mississippi, and of the first adventures after the landing in Texas; Joutel's memoir is quoted more freely verbatim, where abstracts were previously given, and this is true generally also of La Salle's own reports already made use of in the first edition. But a word or two appears to have been altered in the faultless humorous episode of Father Hennepin: but Margry supplies on p. 262 a capital description of the boastful friar in La Salle's own words; "Il ne manquera pas d'exagérer toutés choses, c'est son caractère . . . il parle plus conformément à ce qu'il veut qu'à ce qu'il scait." Of Tonty, too, we learn nothing new. La Salle's confession of a natural timidity and solitary disposition which made life in the wilderness more congenial to him than any European employment, and a glimpse of a love affair in one of his letters, are perhaps the greatest novelties in the freshly-acquired data concerning him. So far as regards its hero, this admirable work of Mr. Parkman's seems likely to be undisturbed by future revelations.

—The result of the recent examinations for private collegiate instruction to women at Cambridge is that twenty-eight ladies have begun to study under the professors of Harvard College, four having passed the examinations requisite for entrance upon the full course of four years, and the others taking from one to four special courses each. The number entering for a four years' course would have been greater had there been time after the announcement of the plan for preparation. One of those who entered was from the Boston Girls' Latin School, where others are preparing for next year. Twenty-four courses have already begun, under eight professors, seven assistant professors, and eight tutors. The students are distributed among the different studies thus: Greek 6, Latin 8, Sanskrit 1, English 5, German 5, French 6, Philosophy 4, Political Economy 5, History 4, Music 2, Mathematics 7, Physics 3, Botany 5. Among the students are graduates of Smith and Vassar, students from some of the best public and private schools of New York and New England, and one lady from Missouri. One has passed the Harvard Examinations for Women, and others have been helped by the Society for the Encouragement of Studies at Home. The examinations were made as nearly as possible like those which the candidates for the college were undergoing at the same hours. The professors enter upon the work with evident interest, and the ladies are in earnest. None seem to have come

but with the most praiseworthy motives; none because it is "the thing" to go to Harvard.

—The trustees of the Peabody Educational Fund held their thirteenth annual meeting in this city last week. Dr. Sears, the general agent, reported, among other details, the success of the recently-adopted policy of devoting the larger part of the income of the fund to the promotion of normal schools and the establishment of scholarships in connection with them; there is an evident interest taken in many of the Southern States in supplying the urgent need for trained teachers. Nevertheless, "to the poverty of the Southern people," he said, "must now be added the necessity generally felt of settling without further delay their State debts," which is a polite way certainly of stating a grave difficulty. The income of the Fund has depreciated from about $120,000 to about $83,000, owing to the reduction in the rate of interest on Government bonds, and "from the changes which have been enforced on our treasurer in many of our State securities." Mr. Winthrop, who presided at the meeting, intimated that Mr. Peabody's confident expectations in regard to the Mississippi bonds of the Fund had not been exactly fulfilled, which he regretted, as a little more money would be of the greatest advantage at this moment. One's inference from the entire report is that several at least of the Southern States by their course in regard to their securities are crippling the efforts of their benefactors to assist them, as well as "getting even" with the carpet-bag rings. Dr. Sears's recommendation, that the national Government should make an appropriation for the education of the blacks of the South, was approved and emphasized by Mr. Winthrop.

—The vogue of the Positive Philosophy is nowhere now, perhaps, so great as it was some years ago. In England since the death of the late Miss Martineau it has been said that Comte had but three followers, Professor Beesley, Mr. Congreve, and Mr. Frederic Harrison; and though these have done yeoman service, it has seemed of late as if the shade of discouragement betrayed by them now and then were excusable. In his latest public utterance Mr. Harrison alluded with some bitterness, if we remember aright, to the idleness of talking about Comte to a British audience, and, considering the kicks and cuffs bestowed upon scientific religion on all hands, his feeling is easy to understand. When one has perceived the strength and weakness of both science and religion as hitherto practised, and suddenly discovers that a way to reconcile them and preserve the best of each of them has been invented, and thus a new religion elaborated with, as Mr. Harrison says, "precision and minuteness," it is surely disheartening not only to have Prof. Huxley call this "Roman Catholicism minus Christianity," but to have Roman Catholics themselves and most other people placidly agree with him. It is not surprising that Mr. Harrison should have turned to the Gentiles and determined to preach his gospel to Americans in an article on "Science and Humanity" in the current *North American Review*—a periodical whose recent numbers have been a series of successive detonations, startling us with the fruits of enterprise and vigilance in all fields of intellectual effort. We are not wholly unprepared for Mr. Harrison's paper. Any one who recalls the brilliant but brief career of that stately magazine, the *Modern Thinker*, will remember that we have ourselves accomplished something in Mr. Harrison's line. We are familiar with the "conception of humanity"; we know how it lights up "feeling, thought, and activity"; how it replaces the old anthropomorphic notions of God on the one hand and "the sand of elastic emotion" on the other. That theology is not what it used to be, and now can only "attenuate itself to a pious wish" and "has nothing whatever to say except 'Set not your thoughts and affections on this world'"; that "the heavens no longer declare the glory of God: they declare the glory of Kepler, Galileo, Newton"; that religion hitherto has failed "both to assimilate science and to moralize industry"; that to "ejaculate: 'Lay not up for yourselves treasures where moth and rust doth corrupt' . . . is to outrage the intellect of man," and to debase man to the position of "an idle, hysterical, ignorant mystic"; that what we ought to love and venerate is "the vast and overwhelming consensus of all human lives, the complex movement through the ages of human civilization and thought"—all these stern facts were not only stated long ago in the pages referred to, but set forth with all the beautiful persuasiveness of colored inks and paper. Mr. Harrison in this paper is merely going over what is even to us old ground; we deserve that he should have begun further on; further on he could not have avoided being instructive, since most people have long been fully convinced that, as he says, "the scheme of positivism would not be the solid thing it is if it could be understood without a mass of labor."

—The Ferry laws have met with so much hostile criticism outside of France, and especially in the English press, that it is not surprising to find M. Edmond About writing in the September *Nineteenth Century*, and M. A. Talandier in the October *International Review*, in their behalf. M. About's paper is called "Clerical Education in France," and is formally a reply to a recent article by the Abbé Martin in the same magazine. M. About is experienced in discussions concerning the claims or pretensions, as one chooses, of the clerical party; he is indeed so much at home upon all details of "The Roman Question" that he can write of them quite without violence and ill-temper, and hence with the greater persuasiveness. He explains of the Ferry Bill that only one of its ten articles is strongly objected to, and that that is substantially identical with one voted unanimously in 1844 by Louis Philippe's House of Peers; that only the unauthorized congregations are prohibited from teaching, which is a very different thing from prohibiting religious instruction; that the authorized religious communities give instruction to 1,650,000 children, of whom 1,180,000 are girls; and that the Republic "not only allows bishops, priests, and religious orders to establish as many schools as they like, but it opens to them its own schools, without verifying their qualifications, without testing their competency." There are now in France 22,216 male members of recognized religious bodies, and 113,750 female members; there are, on the other hand, 13,730 monks and 5,899 nuns unrecognized. The 200 Jesuits in 1845 have become 1,509; they own seventy-four houses and various mansions and estates. They are in no sense French, says M. About, yet they have killed the Gallican Church, crushed the Liberal-Catholic movement, and overawe now the bishops and the whole of the lower clergy. They have 9,000 pupils, and these they imbue with "the purest monarchical spirit," and teach hatred of "our very manners, of our institutions, of our laws, of the Civil Code." In fine, as other unauthorized congregations have 7,000 pupils, it appears from M. About's article that the obnoxious Ferry Bill is designed to prevent 16,000 youth from being taught contempt of the Republic; and, he concludes, "It is in the name of liberty that people now seek to shield the implacable enemies of every French liberty from an application of the law." M. Talandier is considerably more radical, and regrets that M. Madier de Montjan's amendment, applying "Article 7" to the authorized bodies, was not adopted. His objections to the Jesuits are chiefly uttered in the interests of morality, and it is not to be denied that some of them are pointed. If the Ferry Bill should be defeated in the Senate, which he thinks not improbable, the very moment of its defeat will be the moment of real danger for the Jesuits, as the disclosures of the "profound immorality of their teaching" made in the debate cannot now be forgotten. From both articles foreign readers will get the notion that the proposed legislation, whether just or not, is by no means as revolutionary as it has been supposed to be.

—The regular season of orchestral music opened on Tuesday night with a concert in Steinway Hall. The occasion was looked forward to with considerable interest, as Mr. Theodore Thomas, after a year's absence, was to make his reappearance before a New York audience. He was warmly received by his numerous friends and admirers, and the concert would have had the character of a quite festive occasion had the performance been one of artistic merit. This was, however, not the case. In the first place, the programme presented no feature of novel interest. Every number but one has been heard in our concert halls over and over again during the past few years, and only a performance of unusual excellence could make amends for the absence of compositions of more striking and novel character. Throughout the performance it was evident that Mr. Thomas had not yet regained the full control over his musicians which is necessary for that perfect smoothness and evenness of interpretation for which he has earned so well-merited a reputation of late years; it was equally clear that the gentlemen who compose his orchestra have not played together for some time, for the greater part of the performance was wanting in spirit, unison, and precision. The first number was Beethoven's Symphony in D No. 2, Op. 36. The rendering of the first two movements was weak and uninteresting. The last two parts, the scherzo and the bright and spirited finale, were given in better style. The air from Bach's suite in D, with which Mr. Wilhelmj made us so familiar during the last season, was played *unisono* by the first violins on the G string, having been transposed one note below the original key, which is D major. The only novelty of the evening was a Slavonic Dance (*tempo di menuetto*) by Anton Dvorak; but even that proved commonplace. It made no impression on a first hearing and deserves only a passing notice. The gem of the evening was Wagner's "Siegfried Idyl," written on the occasion of the birth of the composer's first

son. It is a charming, tender fantasy on quaint old German cradle-songs put to exquisite harmonies and with truly artistic instrumentation. Mr. Rummel was the pianist of the evening. He played Schumann's ever-welcome Concerto in A minor, Op. 54, and Liszt's romantic Fantasia on Hungarian airs. In both numbers Mr. Rummel has been heard before, and been heard to greater advantage. He was unfortunate in the support of an orchestra which was sadly at fault sometimes, particularly in the Hungarian Fantasia. To judge from Tuesday's programme and from that advertised for to-day we are led to believe that Mr. Thomas intends these concerts to be of what is called a popular character, and we take last Tuesday's performance by no means as a type of the more serious work which we anticipate from him as conductor of the Philharmonic Society.

—The Indian Summer this year promises to be of unusually long duration, for of its two boundaries, the September rains and the November Atmospheric Wave, the former has occurred uncommonly early. The prevailing uncertainty regarding the date of the Indian Summer results from the variability of its termini; since the rains which precede it, often called the Equinoctial Storm, or the fall rains, are sometimes concentrated within the last fortnight of September and sometimes scattered throughout that month and October, while the November Cold Wave, averaging the first week in November, is sometimes several weeks late and sometimes falls on the last week of October. Last year it reached New England on the first day of November.

—We doubt if the contrast between Old and New Japan could be more strikingly conveyed, in as many words, than by the title of a large pamphlet which lies before us: 'Memoirs of the Science Department, University of Tokio, Japan. Volume I. Part I. Shell Mounds of Omori.' But there is even a still greater significance in this publication, for the paper on which it is printed is of Japanese manufacture; the composition and press-work were done in a Japanese office, "the compositors not being able to speak a word of English"; and the plates were drawn by Japanese artists, unfamiliar with "the art of drawing in foreign style and the art of lithography." Finally, Japanese scholars, members of the Tokio native Archæological Society, and students of the University have liberally aided in furnishing the material which our countryman, Edward S. Morse, Professor of Zoölogy at Tokio, here discusses. As a native production, then, this *fascicule* is both curious and highly creditable. Professor Morse's part is as excellent as was to be expected from his gift of research and of description, joined to a wide experience in this special field in two hemispheres. The value of his account of the Omori shell mounds is greatly increased by his comparative treatment of their contents, which he places beside those of similar accumulations in New England, Florida, Denmark, and other portions of the globe. They lie at a distance of nearly half a mile from the shores of the Bay of Yedo, and of six miles from Tokio, being cut through by the railroad from the capital to Yokohama. They are remarkable for the vast quantities of pottery, of many shapes and "an almost infinite variety of ornamentation"—with evidences, nevertheless, of economical patching and mending; the paucity of stone implements and total lack of stone arrow-heads, spear-heads, etc.; the total lack also of flint implements—even so much as a flake or chip; and the presence of tablets of clay of extra fineness, comparable to the Cincinnati Tablet of 1841, but of unknown use—whether as quoits, insignia of rank, or amulets. Evidences of cannibalism, of which there is no tradition or record in Japan, exist, as they do in the mounds of New England, Florida, and elsewhere. The pottery never imitates any natural object, never has legs or knobs for support from below, bears the impress of cords and the human hand, and shows no trace of lathe-work. Only one piece—a clay bead—for personal ornament has been found, but this is gracefully decorated by incisions. Implements made of deer's antlers are common; "not a single worked shell, either as an implement, utensil, or ornament, has yet been found." Bones of man, the monkey, deer, wild boar, wolf, dog, and possibly a large ape, occur with the other remains. The lateral flattening of the human tibia exhibited elsewhere by pre-historic man is here the rule, and there are some marked instances of it—one having an index of 0.502 (Broca's Cro Magnon tibia being 0.60). As was to be anticipated, the ancient molluscan fauna differs widely in abundance and in the size and relative proportions of its shells from the same species still extant in the neighboring waters. Part II. of these Memoirs will present the pottery of the shell mounds of Yezo, Tokio, and Higo.

—The recent order of the French Minister that titles of nobility are not to be recognized in official documents unless supported by documentary evidence of genuineness, is likely to cause a great deal of ferment in conservative circles, owing to the very large number of false barons and viscounts, and still larger number of "false nobles," or persons wearing the noble particle "de" on their names without having any legal or moral right to it. Prince Napoleon, in one of his conversations reported by Mr. Senior, asserted that very few of the titled Legitimists of the "noble faubourg" had any claim to the names they bore, which no doubt is strictly true, though of course this only makes them cling to them all the more tenaciously. All threats on the part of the Government to enquire into them or disallow them have hitherto been met by the fiercest resistance, on the plea that the owners could not prove them owing to the loss of their papers in the Revolution. Mr. Hamerton, in his charming picture of French life, 'Round My House,' gives an account of the way in which the false nobles get hold of the "de," which, although it has no political value whatever, has immense social value, particularly when a man is going to marry. The canniest bourgeois father is so tickled by it that he will often give his daughter to a man who has it and nothing else rather than to one with a plain name and a large fortune:

"The most convenient and simple way of assuming the 'particule' when it does not belong to you is this: You buy a little property somewhere in the country which has an old, romantic name—there are thousands of such properties in so old a country as France. Let us suppose, for example, that the name of the property is Roulongeau. Here I may mention a real instance as an example of how the thing may be done. A friend of mine, a notary, came into possession of a ruined castle, which we will call Roulongeau, which was handed over to him in payment of a bad debt. Here was a capital opportunity for self-promotion into the ranks of the nobility. The notary was too honest a man to avail himself of it, but what he might have done very easily is this: he might have begun in the usual way by signing himself by his old name with the territorial designation in brackets after it—thus, Machin [*de Roulongeau*], which has quite a modest appearance, because it only looks as if this Machin wished to distinguish himself from the other Machins, to avoid confusion. The reader sees how easy the upward progress becomes when once this first step has been taken. The brackets are dropped first; then Machin is abandoned as unnecessary, and so you have Monsieur de Roulongeau, which sounds all the more respectable because there really was such a family in the Middle Ages. After that a rich marriage is easily arranged, and why not revive the old barony? Three generations are enough to accomplish the whole evolution; but it needs some courage at first and a little persistence afterwards."

—Any one who looks at a list of French names belonging to the richer bourgeoisie, such as a division list in the Assembly, will be sure to see several in the first stages of the process, with the brackets. Paul de Cassagnac is often in trouble with his "esteemed contemporaries" on this score, as they sometimes refer to the fact that his father is Granier de Cassagnac, and insinuate that his grandfather was Granier (*de Cassagnac*), while Paul himself is De Cassagnac *tout bonnement*. But we must not suppose that this manufacture of false nobles is of recent or post-revolutionary origin. It has been going on for centuries. It was in full blast in Montaigne's day—that is, the early part of the sixteenth century:

"It is a bad custom," he says, "and of very ill consequence, that we have in France of calling every one by the name of his manor or seigneury, and is the thing in the world that confounds pedigrees the most. A younger brother of good family, who has had a manor left him by the name of which he has been known and honored, cannot handsomely quit the name; ten years after his decease it goes to a stranger who does the same; only judge how we shall know these men. There is so great a liberty taken in these changes, that I have not in my time seen any one advanced by fortune to any extraordinary grandeur, who has not speedily had genealogical titles added to him, new and unknown to his father, and who has not been inoculated into some illustrious stem. By good luck the obscurest families are the most proper for changes."

—It is now some three years since Professor Mommsen loudly called attention to the prevalence in Germany of diplomas issued by unknown American faculties, and of degrees obtained in Germany, but which were to an equal extent a fraud upon the public, either because granted "in absentia" or because the theses written to secure them were not original with the candidate. Prof. Mommsen advocated the universal adoption of the rule obtaining in the Prussian universities forbidding the granting of degrees in absentia, and also measures to put a stop to the sale and use of theses. In accordance with these recommendations an example has just been made by the University of Leipzig. It seems that last June a student there handed in a thesis, accompanied by the usual declaration in writing that it had been written without assistance, which was found by the faculty to have been compiled from easily accessible authorities, and to be quite without original thought, on which account the professors charged with examining it refused to accept the work. But before the decision to this effect had been published the authorities of the University of Berlin received a communication from the Government attorney

for that city, containing proof that the thesis in question had not been written by the student who presented it, but by one Dr. R. in Berlin, in consideration of the sum of 450 marks, which, however, had not been paid. These circumstances were forthwith made known to the Leipzig faculty, and the student, being confronted with the evidence, at once confessed. Expulsion from the University followed, an act which entails exclusion from every official position within the Empire.

MORLEY'S BURKE.*

"I WAS not, like his Grace of Bedford, swaddled and rocked and dandled into a legislator: *Nitor in adversum* is the motto for a man like me. I possessed not one of the qualities nor cultivated one of the arts that recommend men to the favor and protection of the great. I was not made for a minion or a tool. As little did I follow the trade of winning the hearts, by imposing on the understandings, of the people. At every step of my progress in life (for in every step was I traversed and opposed), and at every turnpike I met, I was obliged to show my passport, and again and again to prove my sole title to the honor of being useful to my country, by a proof that I was not wholly unacquainted with its laws and the whole system of its interests both abroad and at home. Otherwise, no rank, no toleration even, for me."

These are the words in which Burke describes one aspect of his career, and no one who studies Mr. Morley's admirable biography, by far the best life of Burke which has yet appeared, can doubt that Burke uttered the plain and unexaggerated truth. Throughout his career he was dogged by suspicion and calumny. For one part of his life he was hated by Tories as an out-and-out Whig; for the remainder he was detested by Whigs as a traitor, who, after he had ruined and deserted his party, procured a pension from the court which throughout the whole earlier part of his life he had assailed with unceasing invective. Moreover, no admiration for his genius can blind any one to the fact that the dislike to Burke entertained by many of his contemporaries had a peculiar character. It was not so much hatred as suspicion, nor can it be said that even his friends appear to have been free from a sentiment of distrust. Johnson, who, in favor of Burke, relaxed his prejudice against Whigs, believed him to be the author of Junius—that is, thought it possible that he might be a masked calumniator. The very men whose main title to fame lies in Burke's eulogies rewarded his indefatigable labors with niggardly recognition. The high places of the Government were for Rockingham, for Portman, for Cavendish, or for Fox, whilst the statesman of genius whose eulogies alone keep alive the memory of any one of the Whig magnates, except Fox, had to be content with inferior posts and pecuniary advantages. No doubt one of the grounds why the Whigs did not even think of Burke as a leader was the animosity which his name would have excited. But if this fact is palliation for the neglect shown by men of very moderate calibre towards a statesman of transcendent genius, the question still remains, What was it in Burke that aroused the sentiment that there was to be for him "no toleration"?

The enquiry is worth some consideration, because the answer to it not only throws a curious light on Burke's history and on the sentiment of the time in which he lived, but also, if we are not mistaken, calls attention to a peculiarity in the character of his genius. The causes of the dislike to Burke which made him throughout his career the object of suspicions, calumnies, or slanders, the echo of which has even now hardly died away, are at first sight not very clear. He was obviously adored by his friends. The pathetic parting from Johnson, the unbounded admiration of Fox and Windham, the genial satire of Goldsmith, the warm friendship of Elliot, all testify to the fact that Burke was made to be loved and in many cases received the affection he deserved. His generosity to Barry, his zealous patronage of Crabbe, his fervent benevolence towards miserable outcasts, are all proofs of the warm-heartedness which is almost certain to be repaid by fervent attachment. Of his hatred of oppression, of the desperate struggles in which he engaged for the benefit of men and of nations which could never repay his services even by gratitude, it is needless to say anything, for they form the most salient features in his life. His genius was, moreover, of a kind which early obtained recognition. It was a light which could not be hid, and was discerned as clearly by foes as by friends. Yet admitted virtues and the acknowledged possession of transcendent talents seem in Burke's case rather to have provoked than to have disarmed enmity.

Burke, it may be said, was always a party man, and the hatred he incurred was the natural result of party spirit. But this explanation hardly hits the mark. The tone of the time was rather violent than bitter. Invective was admitted to be what Lord Beaconsfield has termed it, the ornament of debate, and men might speak of one another as scoundrels and even, if occasion called for it, give each other the satisfaction due to a gentleman, without any serious feeling of hatred. North shook his sides with laughter at the philippics of the Opposition, and the Opposition, who had for years spoken of North as a criminal who deserved impeachment, found no difficulty in sitting side by side with him in the same Cabinet. If there was any one whom Johnson might be supposed to abhor it was Wilkes; but Johnson found it easy to bandy compliments and repartees with the great agitator over Mr. Cave's dinner-table. The generation who devoured the letters of Junius liked a good hater, and it may well be doubted whether mere partisanship was thought, even by Burke's detractors, to be any very grievous fault in the man they abused. A reader, in short, who ponders over Burke's virtues and talents is nearly driven to the conclusion that goodness and wisdom in Burke's case excited of themselves the enmity of a wicked and foolish generation, and that his career was marred by that hatred of bad to good which is at least as strong and as natural as the "strong antipathy of good to bad." Yet this is an explanation in which no thoughtful mind can ever permanently rest. No doubt Burke's virtues did excite hostility. Nabobs rich from the plunder of India were not likely to pardon the prosecutor of Hastings. Court minions who battened on pensions were certain to loathe the advocate of economical reform. But it is vain to suppose that virtue alone is the cause of calumny; it is childish to believe that a whole generation is vicious rather than to admit that a hero is not faultless.

Reflection on Burke's life, as told by Mr. Morley, will convince any impartial judge that a good deal of the hostility which Burke aroused arose from a peculiarity in his position which it is a little difficult for modern readers fully to appreciate. Burke was an adventurer. By this we do not mean that he was a man of low principles, or a person who pursued low aims. It must take a very dull critic not to see that Burke's moral and political ideal was far higher than that entertained by the politicians of his age, or indeed by most men, politicians or not, in any age. It would further argue stupidity not to perceive that Burke made great sacrifices for the sake of his principles. Had he turned to the court at the earlier part of his career, place, pensions, and power would have been soon within his grasp. With a little of the suppleness of Bacon he might easily have gained the outward success which, if it added to the lustre of Bacon's life, has injured his permanent fame. But Burke deliberately attached himself to the body of statesmen whom he deemed, whether rightly or not, the most virtuous men of their age. Yet for all this he was an adventurer, though, strange as the combination of terms now sounds, an adventurer not only of genius but of principle. The circumstance which makes him an adventurer is that he took to politics as a profession, and indubitably also intended to make, and more or less succeeded in making, a fortune. Whoever will read Mr. Morley's second chapter will see all that can and all that need be said on this subject. Burke belonged to something like a clan of adventurers, some of whom, it may fairly be supposed, were not as high-principled as himself. "What cannot," writes Mr. Morley, "be denied is that an unpleasant taint of speculation and financial adventureship hung at one time about the whole connection, and that the adventures invariably came to an unlucky end." With this must be combined the fact that Burke was not only an adventurer—that is to say, a person who, embarking in politics as a profession, began life with nothing, and within a few years became the owner of an estate and had pecuniary means for the existence of which it was not easy to account—but was not unnaturally suspected to be a Roman Catholic adventurer. We agree with Mr. Morley that there is no real reason to think that Burke was a Papist, but we are inclined to hold that Mr. Morley passes over too lightly the element of truth which lay at the bottom of the charge of Catholicism. Burke, as has been well remarked by Mr. Froude, was, though not a Catholic, in no real sense a Protestant. He hated dissent, he had but little sympathy with the Reformation, he overrated the virtues and underestimated the vices of the French priesthood. As sometimes happens, a misconception represented what was substantially true. Burke's sympathy for Catholicism was a real and substantial objection to his leadership of an English party. No wise Frenchman would place an Ultramontane at the head of the Republic. Burke's religious sentiments made him a most dangerous guide in any policy which concerned either English Dissenters or French Revolutionists. In the later period of his life he clearly delighted in identifying the cause of Dissent with the cause of Jacobinism.

Burke's attitude towards Dissent is an example of the trait in his character which, after all, had a far closer connection with the malevolence

* 'English Men of Letters. Burke, by John Morley.' London: Macmillan & Co.; New York: Harper & Bros.

that he aroused than have the external circumstances of his career. The defects of the associates to be met with at his home, his rise from poverty to comparative wealth, the curious obscurity which shrouds the opening years of his career in England, the suspicion that he was a Papist and his brother a monk, might influence his contemporaries, but have long ago been forgotten by a generation who know Burke by his works only, and are entranced by utterances of supreme political wisdom clothed in the most perfect language. Yet candid admirers will confess that whenever they disagree with Burke's views there is something which excites irritation in the mode in which the views are put forward. One may, perhaps, go further and say that, except when dealing with American questions (as to which Burke has the calmness which arises from the sense of being absolutely in the right), he never entirely carries even his admirers with him. You feel that an unknown something spoils what would otherwise be perfect. This "something" is a want of justness of mind. Burke was an enthusiast for justice. He would have sacrificed everything on earth to put an end to any act of oppression, but he was not a just man. The calmness requisite to balance one side against another, the attempt to realize what were the strong points of an opponent's case, the faculty even of showing that kind of appreciation of an enemy's position which is requisite if one is fully to expose its weakness, was the one moral or intellectual gift which Burke did not possess. Hence the persons he assailed suffered from a sense of unfairness which was the greater because of the indubitable force of the assault. Not a single weak point in the position of the French Revolutionists escaped his glance. We doubt whether modern critics have discovered a single revolutionary error or fallacy which he overlooked, but to the good or the better side of the revolutionary movement he was as blind as the stupidest of Tory squires. Hence, though a generous man, he displayed in dealing with his opponents a curious lack of generosity. Of George III., during his first attack of madness, Burke used in private expressions which even now shock humanity. He reflected on Lafayette, a man as high-minded as himself, at a time when even a personal foe would have felt attack to be unseemly. His whole attitude towards the Dissenters showed how little he sometimes entered into the grievances of men with whose opinions he did not sympathize. His breach with the Whigs was inevitable ; but what was not inevitable was his attempt to turn the whole force of popular feeling against men like Fox, whose virtues he had known, admired, and eulogized. A curious quotation from Miss Burney's writings which our readers ought to study, in Mr. Morley's book, throws more light on Burke's one great deficiency than a hundred criticisms. It tells how even the rhetorical effect of his splendid diatribe against Hastings was gradually injured by its obvious want of justice to the accused. The answer to the question, in short, why there was no toleration for one of the best of men, and, in many respects, the very wisest of English statesmen, is to be found in the two facts that his career was in some respects that of an adventurer, and that his astounding genius lacked the one great quality of justice.

RECOLLECTIONS OF ENGLAND AND ITALY.*

MME. CRAVEN is well known for her 'Récits d'une Sœur' and a number of later works, in all of which her main purpose is to set forth the beauties of the Roman Catholic faith. This she does with considerable literary skill, a culture that belongs especially to her own old Legitimist world, and with great zeal. She has apparently at last exhausted the saintly characters within reach of her home-circle, and now gives her own personal reminiscences, beginning with a pleasant account of two English homes and the families that occupy them. Broadlands was Lord Palmerston's place in the country, and Mme. Craven was a welcome visitor there in its palmy days, when Lord and Lady Palmerston entertained as became the Prime Minister and his wife. Mme. Craven has seen it, too, under its new owners, the Cowper-Temples, who have substituted prayers for politics, and religion for worldly amusements. Even more interesting is her description of Bridgewater House and the home-life of the Ellesmeres, the Leveson-Gowers of earlier days, where art and literature were the main delight of the family. Broadlands, as Mme. Craven describes it, was a comfortable house, spacious, cheerful, elegant, and attractive, with its two great drawing-rooms, large dining-room, and room between them filled with flowers, on one side the great hall, and on the other side a billiard-room and a library rich in books and pamphlets and newspapers. All the notable men of the day, English and foreign, were in rapid succession guests of Lord Palmerston, while Lady Palmerston received the leaders of the fashionable world over which she had presided from her eighteenth year. The sister of Lord Melbourne, she shared with him an inheritance of tact and intelligence in great questions, which he freely discussed with her, and the charm that made her the recognized leader of fashion served to strengthen the political party that maintained such a long and absolute hold of power during the ministry of her brother and of her husband. Lady Granville and Lady Palmerston were the mistresses of the two great houses in which liberal opinions were at home, in London, but in which also representatives of all political parties, and men and women of genius of all nations, were heartily and gracefully welcomed. Lady Palmerston was blessed with two daughters (by her first marriage with Lord Cowper), Lady Shaftesbury and Lady Jocelyn, who shared their mother's kindly qualities and helped her in the never-ending task of entertainment. A Legitimist of the straitest sect, Mme. Craven found that the pleasant atmosphere of the Broadlands household made even Persigny, the typical imperialist, both agreeable and amusing ; which was small wonder, since he told her, in his odd fashion of thinking aloud, that all the Empire needed to strengthen it was the support of the Legitimists, and that he had often urged the Emperor to secure in them the most honest people in France. Mme. Craven was too good a Catholic to find pleasure in visiting the great English cathedrals, which, consecrated in earlier days to her own faith, were, in her opinion, desecrated by the Protestant worship within their walls. She was too much of a religious controversialist to enjoy the absolute silence on all religious topics that reigned at Broadlands, and she refers to the energetic Churchmanship of Mr. Gladstone and the excitement of the Tractarian movement on the one hand, while on the other the only sign of interest Lord Palmerston gave was by his successful efforts in behalf of Catholic emancipation. Mme. Craven tells a curious story of Charles Greville, the author of the 'Memoirs' that have had, it may be said, such a *succès de scandale*. In a moment, as she thinks, of religious doubt, he begged her to help him to believe, and urged her to have pity on his want of faith ; but she was shrewd enough to refuse to listen to him, or she might have figured in the long roll of the dupes of his simulated pledges in politics and in the other less noble pursuits of his long life.

The Broadlands of to-day Mme. Craven saw lately under the control of its present owners, the Cowper-Temples, when they assembled, as in a sort of religious retreat, two hundred persons of both sexes and all ranks, for prayer and exhortation, led by Mr. and Mrs. Robert Pearsall Smith, of Philadelphia, who alternated in preaching their peculiar doctrine of personal religion, and were followed by a variety of speakers, lay and clerical. Mme. Craven naturally draws a strong picture of the contrast between her two visits at Broadlands, and of course takes advantage of it to commend to her readers the one true Church. Her sketch of Bridgewater House is full of interest, and she traces the lives of its owners from 1836, when her first visit was made, down to the present day. Then she was introduced by her husband to his countrymen, and especially to the Ellesmeres, whose chief she had already known at St. Petersburg, where her father was ambassador when Lord Francis Leveson-Gower came in the suite of the Duke of Wellington to congratulate the Emperor Nicholas on his accession. She tells a romantic story of an unknown young friend who fell mortally ill at the sight of the handsome Englishman, from his likeness to a lover who had jilted her—an illness from which death only relieved her. Mme. Craven sketches the curious position held by Henry Greville, the brother of Charles, and she borrows several of the capital descriptions given by Mrs. Kemble in her 'Old Woman's Gossip.' These were brothers of the future Lady Ellesmere, from whom they differed in many ways. She had profound religious convictions, was unceasing in her charities, and loved a simple country life, in which she found relief from the cares of a London season. At Bridgewater House, with its famous picture-gallery, and at Worsley, their great Lancashire house, both husband and wife recognized perfectly the duties imposed on them by their wealth and their rank, and that true enjoyment was to be had only in their rural retreat near London, to which they could retire in the midst of a session of Parliament or from the fatigues of Court. Their life was spent in giving pleasure and help to others, and Lord Ellesmere's love of art and of literary pursuits was never allowed to interfere with his public duties. Even in building he chose a site that best enabled him to benefit the tenants of his great estates, and to expend part of the income from his coal and iron mines on the men who worked them to his advantage. Thirty years of happy married life were followed by ten years of a widowhood dignified by gracious kindness and cheerful activity.

The other sketches of this volume are more in the strain of Mme.

* 'Réminiscences, Souvenirs d'Angleterre et d'Italie. Par Mme. Augustus Craven.' 8vo, pp. 419. Paris : Didier ; New York : F. W. Christern. 1879.

Craven's earlier books, characterized by an ultra-Romanism and a desire to bring her readers within the pale of the Church. "Holy Week in Rome," "A Year After," "Livia," "Charity at Naples," and "La Cava" are all full of the propagandist purpose that lies so near the author's heart. The occasional autobiographical memoranda scattered through the book are likely to interest the large circle of her readers, and her clear and simple style lends a charm to incidents of ordinary life and every-day experience. As far back as 1840, Mme. Craven and her sister-in-law became sisters of the order of Pilgrims of the Trinity, and of course she shared in the exaltation incident to the part they took in the great church ceremonies. She inherited from her father, M. de la Ferronays, long in the French diplomatic service, a love of such religious services, and at St. Petersburg and at Rome she saw them in all their splendor. For her the benediction of Pius IX., and the spectacle of St. Peter's under his guardianship, were naturally of unusual solemnity, In 1830 she had seen Pius VIII.; in 1840 she knelt at the feet of Gregory XVI., and in 1850 she first received the benediction of Pius IX., whose personal acquaintance she had during his long pontificate.

Mme. Craven closes her book with extracts from her letters written during a sojourn in the neighborhood of Naples, at La Cava, between the Gulf of Naples and that of Salerno, and she shows great literary skill in reproducing the leading features of the curious life led in the mountains, still unchanged by the modern innovations that have made their way into almost every other quarter of Italy. Her pious faith is rewarded by finding new miracles and fresh legends told of various local saints and their altars. Her own industry in authorship, it seems, dates only from 1865, although she had written a few pages in 1830, and from that period her first work and her last draw their material.

The Philosophy of Music. Being the Substance of a Course of Lectures delivered at the Royal Institution of Great Britain, in February and March, 1877. By William Pole, F.R.S., F.R.S.E., Mus. Doc. Oxon., one of the Examiners in Music to the University of London. (Boston: Houghton, Osgood & Co. 1879. 8vo, pp. xx. 316.)—The appearance of the work of Prof. Helmholtz, 'Die Lehre von den Tonempfindungen' (The Theory of the Sensations of Tone), may almost be said to have made an epoch in the history of both science and art. All the resources of modern science and all the learning of past ages, under the most favorable external circumstances, seemed to have been concentrated in a single individual and brought to bear upon the solution of problems which had long baffled investigation. Musicians and men of science were astonished and, perhaps, a little dazed by the spectacle of a man who seemed equally at home in construing a crabbed sentence in a Greek writer on music, in treating a problem in acoustics with all the apparatus of the differential calculus, in discussing minute points in the anatomy of the human ear, or in criticising a chorus of Handel, a symphony of Beethoven, or a delicate turn in an air of Mozart. The gravest men of science became enthusiastic in their commendations of his patience, his care, his fertility of resource, his marvellous ingenuity, and his many brilliant discoveries. The natural result was that a great number of persons of all degrees of ability and scientific preparation began immediately to repeat his experiments and expound his theories. This was the case especially in England, and among the books the publication of which was due in a greater or less degree to the work of Helmholtz may be mentioned the treatises on sound by Lord Rayleigh, Sedley Taylor, and Prof. Tyndall. The work before us is due to the same cause. Mr. Pole tells us that his principal object has been to render more accessible to the musical world a portion of the work of Helmholtz, which is somewhat difficult to understand, and which, though really the most important, has received less attention than it deserves. The physical and scientific parts of Helmholtz's work have, he thinks, been abundantly illustrated, to the neglect of the æsthetical portion. Further, as the word "theory" is very vague, and as the subjects he intends to treat are essentially philosophical in their nature, he has adopted the title "The Philosophy of Music." He says (p. 15):

"The popular impression probably is that music is altogether an artificial and fanciful thing, having no more fixed principles than the fashion of a lady's bonnet or the pattern of a wall-paper. On the other hand, the notion most generally prevalent among *musicians* is, that the rules of their art are founded in imperative natural laws which will not admit of violation and scarcely of alteration. Musicians are aware that great changes take place from time to time as the art advances, but they account for this by the assumption of a gradual progress in science, every change involving, as they think, either the discovery of some new natural law or the extension of some old one.

"Philosophical investigation will show that the truth lies between these two extremes. It is possible to trace the simpler elements of music back to certain physical and physiological principles; but this connection does not go very far, for when the enquiry reaches the more complicated and elaborate features of musical structure, the physical explanations will be found to fail, and recourse must be had to the influence of æsthetic considerations."

After a careful perusal of the book we are compelled to say that any clear enunciation and exposition of these "æsthetic considerations" is nowhere to be found. Its whole tendency is negative. It asks many questions which the reader would like to see answered, and dismisses them with the declaration, not only that no answer can be given, but with an intimation that the questions are impertinent and no answer is required. As may be inferred from the extract we have given, Mr. Pole seems still to be in the thraldom of a habit of which we had supposed that scientific men of the present day were pretty well cured. When the evidence is too overwhelming to be disputed, he admits that phenomena in art and science are regulated by certain fixed and definite laws. When they become a little too complicated for our present knowledge and means of investigation to unravel, he denies that any law exists. The old philosophical mandate, "Continue to seek," finds little favor in his eyes. In all difficult cases he seems decidedly inclined to take the side of the "lady's bonnet and the wall-paper." That there have been great changes in musical taste, that there have been and still are great differences in the music of different nations, that many things which called forth the enthusiastic admiration of musicians a century or two ago are now obsolete, no one acquainted with history will deny. But where, according to Mr. Pole's statement, most musicians see only progress and development, the supplanting of what was good by what is better, Mr. Pole sees only a capricious change of taste. Most of the rules of musical composition, as laid down in the treatises on that subject, Mr. Pole regards as arbitrary. Perhaps next year the rule will be reversed. In support of his views he relates (p. 299) an anecdote, as he says, of Beethoven:

"Some critic remarked that a passage in one of his later works was 'not allowed.' 'Then,' replied the composer, 'I allow it; let that be its justification.'"

Mr. Wade, in his hand-book for the piano, tells essentially the same story of Mozart. The story will also be found in Holmes's life of Mozart with the passage which gave rise to it. We have not the book at hand, but, if we recollect aright, the passage referred to is from one of Mozart's concertos. However, be its origin what it may, all the story proves is that the composer thought proper in certain circumstances to violate a rule which in most cases he himself followed. Most reasonable persons will readily assent to the assertion of Helmholtz, that nothing is absolutely forbidden in music. But that does not prove that all rules are merely arbitrary.

In its treatment of many points in the history of music, and in the department of acoustics, this is an excellent book. Its chief divisions are: the "Material of Music," that is, musical tones; the "Elementary Arrangements," or musical scales; and the "Structure of Music," as made up of harmony and melody. Although in most respects Mr. Pole closely follows Helmholtz, yet it is with the freedom of a man who thoroughly understands his subject. From the stores of his own knowledge he has contributed much that will not be found in the work of the German philosopher, or at least not in so condensed and convenient a form. No work with which we are acquainted presents in so clear and practical a form the elementary mathematical facts which lie at the basis of the science of acoustics, requiring nothing more than a knowledge of common arithmetic for their complete comprehension. The author's account of the nature of Greek music is a model of simplicity and clearness. Equally good is his sketch of the history of early church music, and his account of the "plagal and authentic modes." The development of the modern system of harmony out of these ancient forms is traced in a manner always interesting and often ingenious, though Mr. Pole's philosophy unfortunately too often leads him to regard it as merely a chapter of happy accidents.

The Life of Charles James Mathews, chiefly autobiographical, with selections from his correspondence and speeches. Edited by Charles Dickens. (London: Macmillan & Co., 2 vols.; New York: Harper & Bros., Franklin Square Library No. 71).—Mr. Dickens's portion of this work—between a third and a half of it—has been written with the aid of abundant letters to and from its subject. Mathews's mother, the second wife of the first Charles Mathews (whose biography she had written in four volumes), died at the age of eighty-seven, in October, 1869. She had carefully preserved every scrap of writing from her son, or to him, or about him; and to this store Mathews himself had added, so that

there was no lack of material ready to the editor's hand. This very plethora of matter, however, has proved unfortunate for Mr. Dickens. The mother's papers, as might have been expected, are ample in detail about Mathews's earlier years; and Mathews himself, in an unfinished autobiography, seems to have supposed the public likely to be most interested in learning about his youth, when he was an architect, a pupil of Pugin's, and about his journeyings with the Blessingtons, when he almost had his duel with Count d'Orsay. Mr. Dickens has fallen in with this manifestly erroneous idea, and recounts the early life of his subject at length, but treats the later and far more important part of his career—after he went upon the stage—with a strange want of proportion. It would take more than twice the barely twenty-five pages (of the American edition), which Mr. Dickens devotes to his dramatic doings, to do justice to Mathews's career on the stage; to his influence as an actor, both in England and America; to his several unfortunate attempts at management, and to his productions as a playwright. As a dramatist Mr. Dickens's notice of him is extremely inadequate; no list is given of his dramatic works, with the times and places of first performance, and no estimate is made of their merit. As a manager and as an actor Matthews is better treated, for we find in the appendix lists of the pieces brought out under his management of Covent Garden and the Lyceum, and a list of the plays in which he had acted—though this last, even, is incomplete and unsatisfactory; it does not give the part he played in each piece, nor the date when he first played it.

Still, in spite of shortcomings like these, the book is to be cordially welcomed. It is full of anecdotes, nearly all of them fresh and well told. Mathews's frequent letters are as light and sprightly as possible, which, by the way, causes one to regret the omission of the familiar epistle to Mr. Charles Reade. His correspondence gives us his views on his trips to this country in 1838 and 1857. Mathews ought to have had the best feeling toward this country, because he owed both of his wives to his visits to us. The second he married here in 1858, and the first he married in 1838 because he was coming here. It is to be remarked that he did not seem to understand the objection shown to Mme. Vestris when she came here with him forty years ago. It was merely to do obeisance to our alleged prudery that they had gone through the form of marriage before they left England; and yet Mathews failed to see that the opposition to Mrs. Mathews came from those who objected to the character of Mme. Vestris. Mathews made two appearances in Paris; it may be remembered that Talma was always anxious to go over to London to play *Hamlet* in English, and that the late J. B. Booth, on one occasion at least, acted *Oreste* in French with a French company in New Orleans; so Mathews went over to Paris in 1863 and acted at the Variétés in "L'Anglais Timide," a French play adapted by himself from the English "Cool as a Cucumber." His success was so great that he returned two years later to play in "L'Homme Blasé," the piece from which the English "Used Up" had been taken by Boucicault and himself, and in which Mathews had made a great hit as *Sir Charles Coldstream* (ludicrously misprinted *Coldcream* on page 63 of the Franklin-Square edition). Mr. Dickens translates M. Sarcey's criticism on the performance. It is highly eulogistic and well worth studying, as it sheds incidentally some light on the reasons why a performance in Paris is generally better than a performance in London or New York. The French act at rehearsal. Mathews did not attempt it, but seemed to be fumbling for the words, to the intense disgust of the author, Duvert (called Duval, p. 64), who was hoping great things from the English actor, as Arnal, the French original of the part, had very highly praised Mathews's performance—praise which the latter justified when he really did act. M. Sarcey preferred the Englishman in the first act and the Frenchman in the second, and all readers of M. Sarcey's criticisms know the very high opinion he always expresses of Arnal. One of the anecdotes told in the earlier part of the book suggests that possibly Mathews may have taken a few hints for his *Sir Charles Coldstream* from Lord Blessington. It may be noted that M. Got, of the Comédie-Française, in his recent letter on the English stage, referred to the acting of Charles Mathews in "The Game of Speculation," Mr. Lewes's adaptation of Balzac's "Mercadet, le Faiseur," as a performance from which he himself had been able to get more than one hint—evidence in Mathews's favor which would have delighted him immensely could he have lived eighteen months longer to hear it, as he had more than once seen his *Affable Hawk* contrasted with M. Got's *Mercadet* greatly to the French actor's advantage.

A Manual of International Law. By Edward M. Gallaudet, Ph.D., LL.D., President and Professor of Moral and Political Science in the College for Deaf Mutes, Washington, D.C. (New York: A. S. Barnes & Co. 1879.)—It appears from Mr. Gallaudet's preface that M. Calvo's well-known treatise on international law has been taken as the basis of his manual; but as the author does not call it an abridgment it is proper to consider it upon its own merits. A very large portion of the volume is taken up with historical accounts of the leading events which have marked great epochs in the development of international law, and with this portion we have no fault to find. This, however, is not the most important part of such a work. The really essential requisite in a treatise on law of any kind, and particularly international law, is a correct statement of the principles which are recognized as governing its development. We do not mean that these are fixed and unchangeable—they have changed enormously within the last three centuries; but without clear views as to the principles, the changes themselves cannot be properly explained. Mr. Gallaudet is a professor of ethics and politics rather than a lawyer, and it is his indifference to legal distinctions which is the cause of the chief faults of his book. To give one or two instances of what we mean—in the introduction occurs a reference to the *jus gentium* of the Romans, and a comparison of what Mr. Gallaudet says on the subject with what Calvo says shows at once that the former does not clearly understand what Calvo says about it. "From all the definitions given of the term *jus gentium* by Roman jurists, it appears clearly that these words do not signify a rule of conduct applicable to international relations, but only the general principle of right grounded in human nature, influential only so far as civilization had at that time permitted it to be established and comprehended." This is Gallaudet's translation of a single sentence from Calvo (vol. i. p. 4). It is, in the first place, incorrectly translated, for Calvo's "principe général de droit" means really a general principle of *law*, not *right*; and, in the second place, it is entirely inadequate, for it leaves out what is a most important part of the history of the term—the fact that it originally meant a particular kind of positive law administered by regular tribunals. A comparison of what Calvo and Savigny have to say on the subject, with the remarks of Austin, would have saved Mr. Gallaudet the error of giving an account of a very intricate and difficult subject in a single misapplied sentence.

Turning to page 50, we find that Mr. Gallaudet defines international law as "the entirety of the mutual obligations of states," or "the duties to each other they are bound to fulfil, and the rights which, one of another, they may properly demand." This definition is imperfect because it contains no adequate explanation of the fundamental difference between the sanction which enforces these rights and duties and that which enforces municipal law. To put the matter to a direct test, Mr. Gallaudet's definition covers the case of treaties between two or more states, which may be quite outside of and even hostile to the general principles of international law. Besides this, international law does not deal with the mutual obligations of states alone. Piracy is an offence against the law of nations—so much so that a pirate is regarded as an enemy of all mankind; but there is not necessarily any state responsibility in the matter. The pirate is dealt with directly, if caught, as a pirate, and no question between states can arise out of his capture or execution—unless, indeed, some state has supported him in his depredations. But Mr. Gallaudet does not seem to think that definitions are of much importance, inasmuch as he alludes (p. 56) to the fact that we speak of "moral laws, physical laws, laws of quantity, etc.," as an argument to show that "international law" is a perfectly proper term for the collection of principles which generally go by this name. It is only fair to say, however, that in this respect Mr. Gallaudet's book does not differ materially from many other works on the law of nations of recognized authority. Accuracy of legal definition is rarely to be met with; and most legal writers are content to take definitions handed down by their predecessors unquestioned. It is high time, however, if international law is to make any progress in the future, that writers who undertake to explain what it is should make accuracy their principal aim.

Illustrated Biographies of the Great Artists: Titian, by Richard Ford Heath, B.A., Hertford College, Oxford; Rembrandt, by John W. Mollett, B.A., Officier de l'Instruction Publique; Raphael, by N. D'Anvers, author of 'The Elementary History of Art'; Tintoretto, by W. Roscoe Osler, of University College School, London; Hans Holbein, from Dr. Woltmann's book, by Joseph Cundall, author of 'The Life and Genius of Rembrandt'; Van Dyck and Franz Hals, by Percy Rendell Head, of Lincoln College, Oxford; Turner, by W. Cosmo Monkhouse, author of 'Studies of Sir E. Landseer.' (New York: Scribner & Welford.)—These

are pleasant books to handle and to hold, medium octavos, rather thin in proportion to their size, having from 100 to 120 pages each except the Turner, which is one-fourth thicker, in flexible blue cloth covers, with a design in black taken from the title-page of a Terence of 1499. The idea of the series is a good one, viz.: that of making up a brief biography of each famous artist, and an account of his important works, from the very latest authorities; and of publishing it in a pleasant and cheap form, for very general reading. At the retail price of $1 25 no one can call these books dear. Few persons have observed how rapidly new books on fine-art subjects succeed one another nowadays, and how commonly they are the result of new investigation and discovery, and therefore real additions to our common stock of knowledge. The press of London, of Paris, and of the important German centres of knowledge is continually at work with these new contributions to a branch of knowledge which had no existence fifty years ago. The circular signed by the London publishers, and bound in with the earlier volumes of those before us, speaks very properly of this matter, and calls attention to the very recent treatises on the times, lives, and labors of Michael Angelo, Raphael, and Correggio, the work of Messrs. Crowe and Cavalcaselle on Titian, and that of Mr. Gilbert on Titian's country, Cadore; of Dr. Thausing on Dürer and Herr Vosmaer on Rembrandt, and names the new edition of Dr. Woltmann's book on Holbein, having been printed too early in the year to allow of mention of the latest and apparently the best book on that artist and his work—the splendid folio of Paul Mantz. That this is so is proved by the Rembrandt biography before us; our readers are aware how great a part of Rembrandt's art-work is contained in his etchings, how unquestioned is his supremacy among artist-engravers, and how wide and general an interest his engraved work has excited. Mr. Haden, the English landscape designer and etcher, has published an admirable monograph upon the etched work of Rembrandt, but so brief, and so purely technical and practical, so confined to the evidence contained in the etchings themselves, and so recently and so privately issued, that it is rather surprising to find it quoted by Mr. Mollett. But this pamphlet, and Dr. Middleton's very lately printed catalogue, have both been freely and properly used.

The 'Rembrandt' is very nearly what it ought to be, simple and workmanlike in arrangement, and a model to be followed in the preparation of other books of the series. The 'Titian' is rather vague and wordy, and is too full of florid writing and exclamations to allow of a pleasant and orderly giving of information. The 'Raphael' is interesting and readable, and would be excellent but for the too monotonous pouring out of praise on all the master's works alike—the good and the not so good. The 'Tintoretto' is confessedly half made up of Mr. Ruskin's opinions and observations; so little has been written about the artist that Mr. Ruskin's constantly reiterated admiration could hardly be ignored, and the author, as it happens, is very ready to endorse it. Still more clearly stated is the derivation of the whole book on Holbein from Dr. Woltmann's 'Holbein und seine Zeit,' an excellent and complete monograph. The essays on Van Dyck and Hals, brief as they are, have more the air of independent biographies, meant for reading as well as reference. And finally, the Turner, the longest, seems to be also the most serious of all, having been composed with evident care, and a desire not to lose hold of reason and sense in homage to splendid genius.

It is matter of regret that the illustrations are very unsatisfactory. With the exception of a map of the Cadore country, in the 'Titian,' a map so badly reproduced that it is almost illegible, and of a copy of part of an ancient view of Leyden in the 'Rembrandt,' Ingres's sketch of Raphael's birthplace, and a few more, the pictures had better have been omitted. It would be worth the expense and trouble to some publisher to have memorandum-sketches made of world-renowned pictures similar to those which illustrate catalogues of many exhibitions nowadays. Such sketches, or the more elaborate engravings given by *Harper's* and *Scribner's Monthly*, when those magazines show us the best they can do, are what this series of biographies should have.

Famous French Authors. Biographical Portraits of Distinguished French Writers. By Théophile Gautier, Eugène de Mirecourt, etc., etc. Illustrated. (New York: R. Worthington. 1879.)—This is, as its title indicates, a collection of pen-portraits which nothing can prevent from being in a measure both entertaining and instructive literary reading. If it were not for this the way in which the book is got up would be fatal to both its value and its interest. There are "portraits" of Gautier, Sainte-Beuve, Madame Swetchine, Madame de Girardin, Arsène Houssaye, George Sand, De Musset, Hugo, Paul de Kock, Lamartine, Gavarni Baudelaire, Balzac, Béranger, Monnier, Dumas, Maurice de Guérin, Diderot, and La Fontaine. They are of all degrees of merit; some of them are by distinguished pens, that of Gautier, for example, being taken from Sainte-Beuve's 'Nouveaux Lundis,' and so excellent; others are compilations by some literary journeyman who has felt it safe to refrain from all criticism, but otherwise has shown no judgment, such as the chapter on Sainte-Beuve himself. That on Madame Swetchine is by M. Pontmartin; that on Madame de Girardin, by Imbert Sainte-Amand; Mirecourt's 'Portraits et Silhouettes' is largely drawn upon—for a most unsympathetic sketch of George Sand among others. Many are printed anonymously, including several of the most important, such as that of Balzac. Even in these there is no sense of proportion or fitness shown; M. Paul de Kock gets more attention than La Fontaine or Béranger. Gautier's name appears on the title-page, but is signed to no chapter, and there is nothing to indicate that any portion of the book is translated from his writings. The translation is not particularly idiomatic, many locutions being literally rendered, and the proof-reading is none too careful. There is no scheme whatever about the book except that all the authors treated are French. There are appalling wood-cuts of Gautier, Lamartine, Béranger, Dumas, and others, but the reader unfamiliar with their features will perhaps fail to identify some of them. Altogether there is a frank air of brigandage and carelessness of concealment about the manner in which the work is constructed that is almost humorous. There could hardly be a more amusing instance of literary barefacedness, for example, than to find, as one does, pp. 272–306, Matthew Arnold's essay on Maurice de Guérin, word for word, in a collection of sketches of 'Famous French Authors,' with no sign whatever to indicate its origin.

Tanagra Figurines. (Boston: Houghton, Osgood & Co. 1879. 8vo, pp. 44; with four heliotype plates.)—In the *Nation* of Jan. 30, 1879, we gave an account of the collection of Tanagra statuettes then on sale by M. Feuardent in this city. This collection was shortly afterwards, as we stated at the time, purchased by Mr. T. G. Appleton, and presented by him to the Boston Museum of Fine Arts. The interest excited by these charming little productions of a branch of Greek sculpture unknown till within a few years has led to the publication of this quaint little volume, which professes to present to its readers what is known and what is conjectured concerning the character, intention, and history of the Tanagra *figurini*. It is obviously the work of a writer possessed of a strong interest in the subject, though somewhat unskilled in literary composition. The historical and archæological learning of the book, however, needs serious revision. Both the historian and the philologist would be startled by many both of the author's statements and speculations. But there are touches of vivacity which make the pages entertaining, and we commend the little volume to those who have not access to the works of foreign scholars upon the subject.

Fern Etchings. By John Williamson, author of 'Ferns of Kentucky.' (Louisville: J. P. Morton & Co. 1879.)—The good reception of the smaller book referred to in the title, and the enjoyment which Mr. Williamson evidently has in his own handiwork, have led him to illustrate in a similar way, but on a somewhat larger scale, all the Ferns of the Northern and Western Atlantic States. The new work is a quarto, made up of fifty-five etched plates and as many leaves of letter-press. The latter gives the botanical and the popular or anglicized name of the Fern, and the technical characters, generally taken from Gray's Manual. A few of the etchings are reproductions or reimpressions of the former plates; generally they are new and better; many are particularly good and characteristic, considering the very reduced size of the larger subjects and the absence of color. For our own part we do not miss the latter when we have good representations of outline and habit.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*	
Bayne (P.), Lessons from My Masters	(Harper & Bros.)	
Bigelow (J.), Life of Benjamin Franklin, written by himself, 3 vols., new ed.	(J. B. Lippincott & Co.)	$4 50
Coates (H. T.), Children's Book of Poetry	(Porter & Coates)	3 00
Dick's Irish Dialect Recitations	(Dick & Fitzgerald)	
Dick's Ethiopian Scenes	" "	
Dick's Original Album Verses	" "	
Gibbs (H. H.), Silver and Gold, swd.	(Effingham Wilson)	
Hillebrand (K.), Geschichte Frankreichs, Part II., swd.	(F. A. Perthes)	
Howgate (Capt. H. W.), Cruise of the *Florence*, swd.	(James J. Chapman)	
Joyce (R. D.), Blanid: a Poem	(Roberts Bros.)	1 50
Kulpe (W.), Lafontaine: seine Fabeln und ihre Gegner, swd.	(Wilhelm Friedrich)	
Littell's Living Age, July-Sept., 1879	(Littell & Co.)	
Mann (H.), Ancient and Mediæval Republics	(A. S. Barnes & Co.)	3 00
May (Sir T. E.), Constitutional History of England, 2 vols.	(A. C. Armstrong & Son)	5 00
Moncel (Count du), The Telephone, Microphone, and Phonograph	(Harper & Bros.)	1 25
Oncken (W.), Allgemeine Geschichte, Parts 7, Peter the Great, 8, Ancient Greece, swd.	(B. Westermann & Co.)	
Rydberg (V.), The Last Athenian: a Tale	(T. B. Peterson & Bros.)	
Scudder (H. E.), The Bodleys Afoot	(Houghton, Osgood & Co.)	1 50

The Nation.

NEW YORK, THURSDAY, OCTOBER 16, 1879.

The Week.

OHIO underwent on Tuesday a political revolution by which not only was the Republican State ticket, with Mr. Foster at its head, elected by more than 25,000 majority, but the Legislature too has possibly been made Republican, from having been Democratic by 42 majority. This result is altogether what it should be; and not only that, it is what all men, of both parties, expected from the moment the issue was made up and the candidates were chosen. Purer demagogy than that which characterized the Democratic canvass, or more deserving of utter defeat, has seldom been seen, and every one should rejoice in the fate that has overtaken Messrs. Ewing and Thurman, after their degrading subserviency to the spirit of Greenbackism. Mr. Thurman, whether or not the Legislature prove able to appoint a Republican to succeed him in the Senate, has lost his chance of the higher prize of the Democratic nomination for President. As for the national bearing of the election otherwise, it undoubtedly will strengthen the Stalwarts and the Machine in the November elections. This may mean an acceleration of the Grant boom, or (seeing that the need of the Strong Man diminishes as the North becomes solider) an abatement of it; and certainly Mr. Sherman must feel that as against Grant or any other rival his "claims" have been vastly strengthened by the vote on Tuesday. We should not omit to notice the great gain in local government which must attend the change of party supremacy in Ohio, the Democratic rule having been low in tone, corrupt of purpose, reckless as to means, and dangerous to the welfare and the liberties of the State.

This has been one of Mr. Sherman's bad weeks. His letter to Silas B. Dutcher granting him leave of absence to stump the State for Cornell at the public expense has been published. He "cordially approves" of his taking part in the campaign, and says he has no "objection to the Government employees making contributions to the fund." Other Custom-house employees, it is announced, are going to leave their posts and travel about the State on the same errand, on the invitation of General Arthur and with the permission of their superiors. Whatever this may be, it is not in the line of "thorough, radical, and complete" reform of the civil service; in fact, it is not civil-service reform at all. We know of nothing that can excuse or palliate it unless it be "State rights." It is, moreover, in contravention of the famous civil-service order, and the terms of Mr. Sherman's letter will help to confirm the opinion on which all civil-service abuse is based—that the employees of the Government are the servants of the party and not of the country at large. All the old hacks are rejoicing over it, as another proof of the "humbug" of the civil-service reform movement. Moreover, things of this sort make it certain that we shall have no legislation in aid of the reform, and that the Democrats will make no pretence of following it out. We cannot expect Congressmen to pass acts in aid of a change which the Administration that recommends it shows it does not itself believe in; nor can we expect the Democrats to lay aside a weapon which the Republicans have freely used against them. The next Democratic President we have will, of course, consider it his duty to dismiss Dutcher and his colleagues and put men in their place who will stump for the Democrats.

It seems, by the bye, very hard, if not impossible, to get into the heads of the opponents of reform the distinction in this matter which exists between Cabinet officers and other officers of the Government. Mr. Sherman and Mr. Schurz, they say, go stumping, and why not Dutcher and Noble? The reason is that the members of the Cabinet necessarily change with the Administration, and distinctly represent the party in its ideas and methods; Custom-house officers do not. The former cannot be permanent; the latter ought to be, or at all events ought not to have their bread dependent on the result of each election.

While the Secretary of the Treasury is bringing civil-service reform into contempt, the "regulations governing appointments and promotions in the customs service and Sub-treasury of the city of New York" approved by the President on March 6, and for which Mr. Sherman has heretofore had the credit, are in quiet and, we are glad to add, successful operation. Last week the third general examination was held at the Custom-house, exhausting the list of applicants; and although the improved condition of the labor market has drawn off the best of the unemployed, the class just passed was of a noticeably good character. Only four months have elapsed since the first appointments under the system were made, and these are probationary for two months longer, but the Examining Board is satisfied that the appointees are superior to those heretofore selected by the private judgment of the heads of offices, or in deference to the representations of personal friends or the dictates of political "influence." The examinations are conducted openly, and it is easy to obtain an invitation to be present; indeed, the Board would be pleased if its efforts to secure the attendance of "prominent citizens" to inspect them and test their thoroughness and impartiality, and "certify the results," were responded to in a way to develop a proper degree of interest in so important an experiment.

Senator Conkling made his first speech of the campaign at the Brooklyn Academy of Music. There was nothing peculiar in the occasion beyond his speech, except the appearance of Mr. Beecher, who also made some remarks, which we have commented on elsewhere. Mr. Conkling made no reference to State politics or State affairs, confining himself pretty closely to the bad conduct of the South for many years past. The principal feature in the speech was a list of bad things chargeable to "State rights." It is useless to enumerate them, but we must mention one as an illustration of the mental condition of the orator. He said "State rights sent the army into Kansas, and by war, murder, and outrage attempted to force slavery upon her and upon other coming States." Now, here is the construction put on this same event by the Republican Convention of 1860, which nominated Abraham Lincoln:

"That the maintenance inviolate of the rights of the States, and especially the right of each State to order and control its own domestic institutions according to its own judgment exclusively, is essential to that balance of powers on which the perfection and endurance of our political fabric depend; and we denounce the lawless invasion by armed force of the soil of any State or Territory, no matter under what pretext, as among the gravest of crimes."

Mr. G. W. Curtis has thought it necessary to resign his position as Chairman of the Richmond County Republican Convention, owing to the "serious dissatisfaction" felt by some of the Republicans of the Convention at his recommending the scratching of the ticket in *Harper's Weekly*. In his letter he reiterates his belief in the right to scratch as the only effective way, "in a Government like ours, to correct and purify the management of parties." The reading of the letter caused a good deal of confusion in the Convention, but the resignation was accepted, Mr. Curtis's successor defending him. It is to be regretted that, if Mr. Curtis thought his course a proper one, he should have resigned without being positively called on to do so, inasmuch as resignation is, in a certain sense, a confession of error. Moreover it is concession to dissatisfaction, which is almost certain to die out after the election, whether Cornell be elected or not. The only thing that is really punished under the rules of party discipline is difference of opinion about party aims rather than about particular means. But Mr. Curtis's opinion would undoubtedly

have had more weight if he had protested in the Convention. We believe he intended to do so, but the expected opportunity did not come. If Cornell is elected, however, the more ardent brethren will be so rejoiced that they will forgive Mr. Curtis readily. If he is not elected they will be sorry they did not heed what he said, and will forgive him for that reason. The state of mind of working politicians for a few weeks before election is always a little peculiar, and it is not always safe to take what they say at that period too seriously to heart.

The party dissatisfaction with Mr. Curtis is, it appears, not confined to Richmond County. The current number of *Harper's Weekly* prints a letter from the publishers in reply to one from a "Southern Republican," complaining of Mr. Curtis's editorials and terming him "a soreheaded, self-conceited disorganizer in the Republican party." Its tone and statements leave no doubt of the substantial accord subsisting between Mr. Curtis and the Messrs. Harper upon the question of individual independence of the party Machine, and as it was written and sent without Mr. Curtis's knowledge it is in the nature of a delicate compliment as well as a frank vindication. The Messrs. Harper say that their *Weekly*, which has always denounced Democratic error, must "with equal force and from weightier motives contend with the evils that arise within the Republican party." If it cannot do so successfully they "would rather discontinue its publication," and they have "the same feeling respecting the party," which, "if its success depends upon the surrender of the personal independence of its best friends, deserves to die." It seems to them more important for it to get rid of "a dictatorial leadership" than to succeed under such leadership. They add that Mr. Curtis made at Saratoga the only protest then possible in voting against making Mr. Cornell's nomination unanimous. The "Southern Republican" had been misled, perhaps, by the Stalwart cartoons of Mr. Curtis's "Wicked Partner," Nast, into supposing disapproval of the second Southern plot for the overthrow of the Government inconsistent with disapproval of Senator Conkling's manner of running his Machine in New York.

The Independent Republican Committee have this week put the Union League Club in a position which we trust will not prove embarrassing, by writing to the Club Committee on Reform a very trenchant letter, which recalls the opinion of Cornell and his ways expressed by the Club in 1876. It also cites Mr. Sherman's opinion of the manner in which Cornell discharged his duties as a Custom-house officer, expressed in his letter to the Senate when he (Cornell) was removed; refers to the light thrown on his capacity as a business man by his testimony touching his own assets and investments when examined on supplemental proceedings as an insolvent debtor in 1876; compares the cost of Custom-house administration under his rule with the cost since his dismissal; mentions the defeats suffered by the party in this State under his management, and reminds the Club of his description of their reform resolutions in 1876 as "impudent declarations." The Committee also make unpleasant reference to the complicity of Soule, the Republican nominee for State Engineer, in the canal frauds, as revealed in the Eleventh Report of the Canal Investigating Commission. The letter is, in fact, very racy, and the point and vigor of its style are something new in political documents of this character.

One passage in the letter is marked by very grim humor, in which the Scratchers, returning from a sail in their "bark" "on the furthest verge of what they think they know," catch sight of the Organ "skirting the shores of what he hopes he has learned," and "go for him." They bump his "bark" unmercifully without regard for his grey hairs, and make it leak all over, and leave him with his aged legs in a foot of water, and with a winter of articular rheumatism in store for him. In plain English, they recall the fact that in 1876 he, too, was shocked with Cornell and the Machine, and indignantly asked "what decent Republicans were going to do about it." "Plain speech," he cried, "is very well; it will continue timely till the convention meets, but will that be all?" We cannot dispose of this strong language by calling it an outburst of youthful impatience, for if the account he now gives of his age and experience be correct he cannot have been a day less than seventy-seven in 1876. His severity with the young men is also evidently intended to be taken as a sign of his own longevity. An unfortunate person, signing himself "A Stanch Republican," wrote to him the other day complaining of the way the nominations were made at Saratoga. He rebuked him sternly for his youth and threatened to publish his age. He evidently wishes no one under fifty to vote the ticket.

The Tammany opposition to Governor Robinson have started what their enemies call a "travelling combination troupe" on a stumping tour throughout the State in behalf of Mr. Kelly's candidacy. Among the members are Mr. Kelly himself, Mr. S. S. Cox, Mr. J. H. Strahan, Mr. O. B. Potter, formerly of the Committee of Safety, Mr. John B. Haskin, and others less eminent, but perhaps not less influential. Mr. Dorsheimer was expected to join the company during its progress, but for some unexplained reason has not hitherto done so; Mr. Strahan has returned to this city; and Mr. Cox, who was naturally depended on to some extent for the gayety of the trip, has become ill and dropped out. The others have stuck to their work nobly, and have held apparently well-attended meetings at Albany, Troy, Utica, and elsewhere. The *World*, however, which is doing excellent service in showing up Tammany "methods," and every week or two reports several defections from the Tammany ranks, due to disgust at the frightful character of these "methods," assures us that these meetings are exclusively composed of Republicans, who constitute Mr. Kelly's sole support in the campaign, and who feign to swell the ranks of the disaffected in order to dishearten honest Democrats. Mr. Kelly's speeches are also reported failures by the same journal, which says that on one occasion he was "obliged to stop until the house had half-emptied itself," and that "when he finished, the house was not more than one-third full"; and that on another, "when he was through, the audience rushed pell-mell from the building." The inference from this is that the Republican audiences not only publicly affronted their "ally," but by their base desertion defeated the object for which they had assembled, and that therefore Mr. Kelly may be set down as not eloquent. He seems, nevertheless, moderately piquant in print. From the reports of his remarks we learn that Mr. Tilden's physical infirmities are in part shared by his lieutenant, Governor Robinson, whom Mr. Kelly believes to have "sore eyes," and to have great difficulty in reading and signing bills intelligently. He adds that he sympathizes with him "as a citizen should"; but the *World*, which again is our authority for distrusting Mr. Kelly's information, denies that the Governor is a "purblind incapable," and maintains that he is in "most excellent health."

On the very day (October 2) that the news of the disaster to Major Thornburgh's command reached Eastern readers, relief unexpectedly came to the besieged survivors in the shape of Captain Dodge's Company D, Ninth Cavalry, forty-five strong, and composed of colored men. This small body had turned aside from Bear River, on learning of the situation at Milk Creek, and, without orders, gallantly fought its way to a junction with Captain Paine, losing every horse but two by the time this was effected. Movement, on account of the wounded, was thus made impossible. Three days later, in the early morning, Colonel Merritt's command, after a remarkable forced march from Rawlins, brought final deliverance. In the afternoon a visit was made to the battle-field, where Major Thornburgh's body was recovered, and where an attack of the Utes was met and repulsed. In a parley they declared their intention of resisting to the death any advance of troops upon the White River Agency. Fighting was immediately renewed. On October 11 the Agency was reached, where a miserable scene pre-

sented itself. Father Meeker's dead and naked body and those of several of the male employees were found lying about, more or less mutilated and burned, in the midst of the buildings, which with one exception had been fired to the ground. The white women had been carried off, and their fate is at this moment in painful uncertainty. It is reported that among the slain on the Indian side in the Thornburgh engagement was discovered an unknown white man dressed in buckskin, killed in the act of aiming from a stone breastwork. Whether the fleeing Utes will be overtaken as a hostile band seems doubtful. Those at Los Pinos are quiet, but apprehensive of being involved in the punishment of their brethren of the north.

On Saturday, at the celebration of the thirteenth anniversary of the Grand Army of the Republic in Philadelphia, Mr. John A. Bentley, Commissioner of Pensions, delivered an address in the nature of an apology for the shortcomings of his office. He denied that the fault lay with the management of the office, or with the failure of Congress to maintain the necessary clerical service, but with the *ex-parte* system of making applications for pensions, the frauds to which it opens the door, and the delays caused by precautions against fraud. We conceive, however, that the management is too lightly acquitted by the Commissioner. More than three months usually elapse after evidence is submitted before it is examined, frequently six months, and sometimes a year. This delay is not seldom increased by some absurd official blunder, such as requiring evidence that a man was loyal, at a time long subsequent to his death. In two precisely similar cases, one will be accepted and the other rejected, and the action of the office is therefore wholly uncertain. Nor are the arrears treated in an orderly manner, late applications being paid before earlier ones. Mr. Bentley's prejudice against lawyers has naturally, considering the ignorance and helplessness of pensioners, worked in favor of the "shysters." The old scale of fees was certainly open to objection, but the reduction to $10 has driven out almost all the respectable lawyers. His proposed substitute for the *ex-parte* system, superior as it may be, will not do away with the necessity of legal assistance nor with the pensioner's right to employ it.

The death of Henry C. Carey, which occurred this week at the age of eighty-five, removes a writer who has probably had more influence on the economical opinions of his own countrymen than all other authors put together. He was a man of considerable acuteness, great industry, and wide reading, and a fanatical apostle of high tariffs, to which he ascribed almost indefinite civilizing and enlightening power. But to carry out his ideas would, in many ways, restore the Middle Ages, and make what science and invention have done to promote the intercourse of nations wear the air of a curse or a superfluity. He made an important correction in Ricardo's theory of rent, and his books, some of which have been translated and are held in high esteem in Germany, where salvation by Government still holds a high place, are full of ingenious suggestions and widely-gathered information on social and economical questions. The fury of his convictions, however, made his argumentation very defective, and he ended by becoming one of the most fervent apostles of the paper-money craze.

Of the foreign gold on the way to New York only $3,440,000 arrived during the week; but this raises the total receipts of foreign specie since the first day of August to $41,538,000, and since the resumption of specie payments to $47,735,000. At the close of the week foreign exchange was "heavy," and further large amounts of gold were ordered from Europe. Gold has become so plentiful, and legal-tender notes so scarce, that the New York banks have been forced to use gold certificates in their settlements at the Clearing-house. As the Treasury no longer issues these, the banks have selected the Bank of America to take charge of gold and issue certificates therefor in sufficient amount to furnish a currency for the settlement of differences at the Clearing-house. This is a return to the custom that prevailed up to 1862; these certificates in no way affect the general volume of the currency, but are used to save the risk and trouble of carrying gold in bags to and from the Clearing-house. The statement of the foreign trade of New York for the month of September is remarkable in that it shows that the specie and bullion imports were within $2,781,000 of the value of all the merchandise imported. The Stock Exchange speculation continues wild, and although there was a "break" on Monday which terrified the vast number of speculative recruits, who appear to have been drawn hither from all parts of the country, the course of prices was upward, and the rise for the week ranged from 1½ to 14½ per cent. All securities are high, and many which are called securities only by courtesy, and which are known to have no present nor any remote value, are selling at ridiculous figures. The price of silver bullion has advanced during the week from 51⅝*d.* to 52⅛*d.* per ounce. The bullion value here of the 412½-grain dollar at the close of the week was $0.8739.

Englishmen seem to have taken up the "personal journalism" of this country, long after it has fallen into discredit here, just as they are taking up the caucus after the best Americans have grown sick of it, and are anxious to find means of escape from it. The two leading ventures in this field have been very successful and have had a good deal of excellent writing, but their main attraction has been the gossip of society and piquant details of the private life of well-known persons. Another leading feature has been savage attacks on the conductors of obnoxious newspapers, in the style of the late James Gordon Bennett. One unhappy man, Buchanan the poet, appeared on the scene some years ago in the character of the Indignant Moralist, and tried to stop their excesses by a series of prosy articles on the "Signs of the Times" in the *Contemporary Review*. He had only issued one when he disappeared under a retort from the *World* which covered him with mud as no man was probably ever covered before. Since then the fun has grown fast and furious, *Truth*, under the editorship of Mr. Labouchere, leading the way into fresh fields every day. Having fallen foul savagely of one Lawson, the proprietor of the *Daily Telegraph*, there followed the old-fashioned American street-fight—Lawson with a cane, Labouchere with an umbrella—in which Labouchere apparently got the worst of it, and is now threatening his opponent's life in default of "satisfaction." He is known to his brother-editors of the same school as "Labby" and "Henry." One of the fraternity, the editor of *Town Talk*, is in Newgate awaiting his trial for a criminal libel in announcing proceedings for divorce by the husband of one of the reigning beauties, Mrs. Langtry. The whole business is a much more disgusting mess than anything of the kind we have had here, owing to the popular eagerness to know what the aristocracy are doing—a passion of which we have here no counterpart.

The Afghans made a feeble defence, as usual, on the heights outside Kabul, and at the last accounts General Roberts was in possession of the city. The inhabitants, as in 1842, have tried to relieve themselves from complicity with the mutineers, and the Indian Government seems to be thoroughly puzzled by Yakub Khan's position. They apparently cannot make up their minds whether he sympathized with the revolt or not. He is so weak in every way that he probably cannot tell himself. Herat is still in the hands of its rebels, and there is talk of a proposal on the part of Russia that she should take that province, and England the rest, but this is hardly likely to be entertained in London. Herat is the most important stronghold in Central Asia. What will be done with Kabul remains to be seen. Sending another envoy there to be guarded by an army would hardly look well at the elections, and it would probably be difficult now to find one who would go without an army. The Ministry is menaced with a new trouble in the shape of a deficit. The quarter's revenue receipts have fallen below the estimates in an alarming manner.

ORGANIZATION *VERSUS* THE MACHINE.

[*Speech of the Rev. H. W. Beecher at the Brooklyn Academy of Music, Oct.* 8, 1879.]

"The third thing I have to say is that there is no such thing as administration of government except by the administration of parties, and they are as much a part of our political machinery as our laws and institutions. They are founded in necessity, and all talk against parties, and machinery, and politicians, and management is the talk of men that do not care what they say in accomplishing a purpose, or of men who do not know what they mean, or of men who do not mean anything because they do not know anything. (Laughter.) You cannot have administration under free institutions without parties; you cannot have parties without organization; you cannot have organization without engineers and managers. It is said, however, that the running of the Machine must be broken up and stopped. Whenever you will run freight trains and passenger trains without engineers successfully, letting the engine take care of itself or letting the passengers do it, then you may run parties so. (Laughter.) It may not be the best thing you can imagine, but it is the best thing in the present state of human nature that you can have; and if you are to run parties as a part of that economy of civil liberty by which we administer free government, and if you must run parties by appropriate organizations and managers, then it is no use for anybody to bolt his party because he doesn't like every single step that has been originated in it. I am amazed at either the profound unwisdom or the altitudinous wisdom of those who think it is too much trouble to take care of primaries or prepare public sentiment, or to arrange conventions—who neglect the work by which the Machine is put upon the track and then vindicate their neglect by bolting, their conclusion being that the convention has gone to those who they think should not have had it. If from indolence, preoccupation, prejudice, or any other reason, they did not care enough about affairs to bring them to pass by the natural way of creating a sentiment in the convention or party, they should at least have modesty enough not to attempt to overrule those who have taken those pains and have done this work. I read with disapprobation of a movement among young Republicans—whom I take to be quite young (laughter)—men of influence and admirable excellence of character, who sometimes, nevertheless, being human, make mistakes—men who have called upon Republicans to scratch the ticket. Any physician will tell you that when there is an efflorescence on the skin scratching is natural but always harmful. (Laughter and applause.) For myself I propose to do no scratching (renewed laughter), but to accept not as the best that possibly might be, but to accept as that which is the best attainable, organization and body and candidates; and in so far as I have influence with the young men in this community who are impressed with the solidity and importance of Republican principles, my word to them is, Stand in the line. (Loud applause.) Assert every good principle by good argument, and set an example of sterling fidelity to that party which you believe carries in its heart and in its hand the welfare of the State and the welfare of the nation. (Loud applause.)"—*Tribune Report.*

[*Speech of Mr. Richard O'Gorman at Tammany Hall, Oct.* 13, 1870.]

"But Gov. Hoffman is 'the slave of the New York Ring.' It is his great fault. He would be honest enough himself, but he is 'the slave of a dishonest Ring.' Now, fellow-citizens, what is the meaning of this word 'Ring'? A Ring I take to be a collection of men united for some common object. If the object be bad, it is a bad Ring—if good, it is a good Ring. Now, I will tell you what I mean by a bad Ring. There is the Whiskey Ring, and the Land-grabbing Ring, and the Gold Ring, and the Bessemer-steel Ring, and all the other Rings in which the Republicans in Congress have been disporting themselves. These are indeed 'bad Rings,' for they are conspiracies to plunder and defraud and dishonor the American people. These are specimens of bad Rings—conspiracies of the few against the many—and these ought to be denounced as political crimes. But if the Ring referred to means a body of men in the city of New York, directing, organizing, guiding, and governing the Democratic party in this city, and governing it so that the effect and history of the party expresses strong success, then I say that 'Ring' is a necessity; it is a good 'Ring,' and I for one am in favor of it. (Enthusiastic applause.) No body or party can exist without a government—call it a 'Ring,' if you like to. It means simply some directing, advisory, governing power. A party to be successful must be organized like an army. All the men in the army cannot be generals. There must be a few leaders; and the rest, if they are wise and mean to make it a success, must obey. And when men tell me that they are Democrats and yet are determined to break up the Tammany Ring, I stop and ask, 'What do they mean?' Don't they mean, if they succeed in breaking up the present Ring, to be themselves its successors, and form a Ring in place of the men they have expelled? That is the meaning of it, my friends of the Young Democracy. I know that many of them have for me the kindest feelings, and I deeply regret to see them taking what I regard as a mischievous course for the party—a fatal course for themselves. But if the question is to be fairly put before the people, if instead of the present Ring, composed, if you will, of Mr. Tweed, Mr. Sweeny, and Mr. Hall—if, instead of that, there is to be a Ring composed of any other men I have ever heard named in what is called the 'Young Democratic Party,' I for one will stand by the old Ring, because I believe it has more sagacity, more power, more intelligence, more political skill, and more promise of success than the other. (Applause.)"—*Times Report.*

WE print the above as an illustration of the pass to which Republican politics have come in this State. The O'Gorman defence of the Tweed Machine is as good as the Beecher defence of the Conkling Machine. It is, of course, fitting that when the Republican Machine is eulogized simply for its power, the work should be done by a minister, and not by a lawyer. The traditionsof the party in a certain sense prescribe this. The party was, in the beginning, the product of moral forces which ministers rightly have a large, perhaps the largest, share in directing, and, greatly to their credit, they have in all the stages of its eventful existence contributed in no inconsiderable degree to its triumphs. In fact, there never was a political party in which clerical influence could so legitimately show itself. But on the other hand there is nothing very extraordinary in the fact that when the party Machine begins to be turned to base uses a minister, and even a conspicuous minister, should be found ready to act as its public apologist, and try to confuse the minds of "the young men" for its benefit. There is nothing more melancholy, not only in the history of the Christian Church but in the history of human nature, than the fact that there never yet was an organization so bad in its aims that it could not find a clergyman to bless it. When, therefore, Messrs. Beecher and Conkling rushed into each other's arms, on the stage at the Academy of Music the other night, ludicrous as the spectacle was in some of its aspects, there was nothing unprecedented or even very strange about it.

The moral of the Beecher-O'Gorman eulogy on the Machine is plain enough. It is true, as they both say, that there is nothing bad about a machine *per se;* that it means organization, and that without organization a party, however devoted and able its members may be, cannot succeed in making its ideas felt in the Government of the country. In the early days of a party, when few or none belong to it with the hope of personal profit, the machinery of organization honestly represents the mass of the party, and is managed in strict accordance with the prevailing party sentiment. Nominating conventions when they meet are in fact, as well as in theory, representative bodies which meet to deliberate. There may be members pledged to vote or determined to vote for particular men, and some one man may be so conspicuously marked out for nomination by party opinion that the decision of the convention may easily be predicted beforehand. But as long as the convention is either fairly chosen by the party or feels itself responsible to the voters at large, and has, as a whole, no ends in view but the satisfaction of party aims or desires in so far as these are ascertainable, there is nothing to be said against it.

The Machine begins to work evil when the management of the party—that is, the selection of delegates to conventions and of the candidates for office—falls, whether through the growth of apathy on the part of the members at large or the increasing assiduity and dexterity of those who make politics a business, into the hands of one man, or of a small knot of men, whose leading motive is their personal advantage, whether in the way of money or office or power. To select delegates, for instance, and make nominations with a view of satisfying the various shades of opinion by which even the most homogeneous party is more or less divided, with a view to giving full expression to its highest and best ideas about public policy, and gratifying its legitimate pride and ambition in the mental and moral quality of its candidates, is organization of the best kind and for the most legitimate ends. A convention made up in this way is sure to be a deliberative body, and even if its decisions do not satisfy the party, they are sure to command its approval and support. When, however, there arises in the party a power which manages it not with the view of making it produce results satisfactory to the party at large, but with the view of producing results satisfactory to one man, or one set of men, of either getting a certain office for a particular man, or of enabling one man, or set of men, to reward their adherents with offices, or of arming one man with influence to be used secretly in his own discretion and for his own benefit, then the organization is bad. There are, for instance, in this city 40,000 Republican voters; there are, however, only 10,000 enrolled Republican members of associations competent to vote at primary meetings. Of the reasons which keep the 30,000 from joining the associations and attending the primary meetings we do not need to speak here. If the 10,000 who do the work of sending up delegates to the nominating conventions have, in doing it, the feelings and opinions of the bulk of the party—of the other 30,000 voters, for example—in their minds, and elect the delegates with a view to the success of party doctrines—the organization is valuable. If, on the other hand, when they get together they have no settled views of their own as to what they will do, but accept from some one man, who in turn receives his instructions from another who is not present, a list of the delegates they are to elect, and elect them, and these delegates are in their turn pledged to nominate certain men, because their nomination is desired, for reasons of his own, by an individual or by a clique, and without regard to the probable views or aspirations of the voters—they are the Machine in the bad sense of the term. They are not in any proper sense of the term a party organization. Their organization is despotism working under the forms of representation, and pure selfishness under the forms of public spirit.

This Machine, moreover, is no new thing. It worked for a good while in Rome after the fall of the Republic. The Senators used

to meet and pass laws and go through all the forms of constitutional government, but the laws they were to pass and the decisions they were to reach were always determined beforehand by one person—the commander of the army. It was in full operation in England in Walpole's and Lord North's day. The House of Commons had all the outward marks and tokens of a deliberative legislative body. It made speeches and listened to speeches; but the votes of the majority were determined beforehand by the minister by means of offices and pensions and other bribes. He had a secret understanding with them that they were not to be influenced by the arguments which might be addressed to them in the House, or by the state of opinion out of doors. To make assurance doubly sure, he saw to it that unpledged persons should not get seats in the House. The government of George II. and George III. was, in short, during the greater part of the time, Machine government. The government of the Second Empire was the same. There were two deliberative bodies in it, the Senate and the Corps Législatif, both of which went through the forms of deliberation—that is, debated and decided after debate; but these forms were shams, because the result was settled beforehand by a knot of men at the Tuileries. In this city in Tweed's day there was no appearance on the surface of the city Government of anything but lawful organization. In fact, there is a strong tendency in all popular government to become Machine government—that is, to transfer the real power of deliberative bodies to a small clique, and to confine them to the task of registering decisions supplied to them by this clique. To prevent this, and to secure the public presentation of the real reasons on which legislation is based, is now the great problem of politics. Government, in short, means organization, and party means organization. Machine means the secret abuse or perversion of government or party for the personal ends of one person, or of a small number of persons acting in concert—the secret withdrawal of men and measures from the jurisdiction of deliberative bodies, while keeping up all the forms of deliberation and honest decision.

The way in which the Machine is defended never varies. Both Mr. Beecher and Mr. O'Gorman repeated an old story: The Machine means organization; without organization the Government or the party cannot succeed. Organization, of course, means skilled leaders who understand the Machine and know how to work it. They may not be all we could wish, but the crisis is too grave for criticism, much more for positive disobedience. Young men may not like their way of working, but this is because of their inexperience. Therefore they must keep silence and reserve the discussion of a change until a more convenient season—which of course never comes. The one sure sign, however, that the time for revolt has arrived is the defence of the Machine—as in the Beecher-O'Gorman case—on the naked ground that it furnishes the best means of succeeding. When this is put forward alone it always indicates that the higher order of expediency can no longer be appealed to; that the inner working of the Machine will not bear examination; that the motives and character of its managers cannot stand criticism, and that all that can be said for it is what the soldier of fortune can say for his battery—that it will smash anybody who comes within its range.

THE ORIGIN OF THE "STRONG MAN CRY."

THE New York *Times* commented the other day in very sensible terms on the "Strong Man cry," as recently raised by ex-Postmaster-General Creswell. "The need of the hour," said he, "is the presence in the White House of a man whose past acts would be a guarantee that fraud and corruption in elections could not exist—a Strong Man in whom every one would have confidence." The reasons for desiring such "a Strong Man" have been recently set forth in a Republican campaign document issued from Washington. They are these or such as these: In 1868 General Grant received 57 electoral votes at the South; in 1872 he received only 55. In 1876 Mr. Hayes received only 19. To the question what became of these majorities the answer is that they were "suppressed in blood and terrorism and fraud," which, as regards South Carolina, Mississippi, and Louisiana, is probably largely true, but the document brings the charges against nearly every cotton State also. The same story is told of the falling off of the Southern Republican representation in Congress. It is due, it is said, to "usurpation through shot-gun outrages, bloody raids, and ballot-stuffing." The *Times* disposes very neatly of the proposition that "a Strong Man" in the White House would remedy all this, by showing that not only did all this occur when there was "*a* Strong Man" in the White House, but the particular "Strong Man" whose presence there is now called for again. He was there in 1872, when his electoral votes fell from 57 to 55; he was there in 1874 when the Democrats captured the House of Representatives; and he was there in 1876 when his successor's electoral votes fell from 55 to 19, so that either the Strong Man failed or refused to bring out the Republican majorities, or they have ceased to exist.

But the assumption on which the "Strong Man cry" is based is that they do exist; therefore, etc. The *Times* accordingly treats the Strong Man party with a certain contempt which, on its own showing of their case, is perhaps justifiable. But its showing is not at all fair. They have a better argument than the one we have cited; that is, they want a Strong Man not only to put a stop to the suppression of majorities, but to meet other dangers to the Government which are still to come; and if it had not been made to appear to the public that other dangers were impending, we do not believe the "Strong Man cry" would be nearly as loud as it is, or in fact loud at all. They have a better case, which is this: They would probably never have thought of calling for a "strong man" or threatening a renewal of civil war under General Grant, like Mr. Bowman in Massachusetts the other day, but for the description of the situation at Washington which was gradually forced upon them by the Republican newspapers. The process by which the "Strong Man cry" has been produced is, in fact, one of the most remarkable episodes in the history of journalism. The mere reappearance of the Southern Democrats in Congress could not, of course, have done the work. These Southern Representatives were a minority, and a cowed and dispirited minority, most of them ruined men, and elected by impoverished communities, and faced in Congress by exultant conquerors. The chances are that they would have been perfectly content for years with a very modest and, indeed, humble rôle in legislation, which was what most befitted them, if they had not suddenly, in 1874, found themselves made members of the majority by the widespread defeat of the Republicans in the Northern States. The Republicans in that year not only lost control of the House of Representatives, but lost enough State legislatures to make the control of the Senate by the Democrats certain before long. They were defeated in Massachusetts, New York, Pennsylvania, Ohio, Illinois, and other States in which they had had large majorities in 1872.

Nor were these defeats due to any lack of "outrages" at the South, or to "waving of the bloody shirt" at the North. There have been since the war no better years for "outrages" than 1872–3–4, and "the bloody shirt" was never more "freely waved," as Mr. William E. Chandler says, than in those years. The result was that Southern representatives found themselves suddenly, as it were, put in power, a result which probably not one of them had looked for as likely to occur in his lifetime. That they bore their elevation badly there is no denying. They were intoxicated by it, and began to give themselves airs which they could not safely or becomingly assume within the present century. Their first attempts at legislation were most foolish attempts to repeal measures which had grown out of the war, and were intended to secure what the North considered the most valuable results of the war. But these attempts, though foolish, were perfectly lawful and constitutional. They were no more than the majority had a right to make, no more than majorities had a hundred times made, down to that most questionable use of power—the refusal of appropriations as a means of coercing the President. No lawyer could open

his mouth against them. There was nothing revolutionary about them; nothing that looked to violence or secession. They were simply, in their worst aspect, inexpedient, mischievous, and exasperating, and were properly punishable, like all other obnoxious legislation—like the Republican "salary grab," for example—at the polls, after a proper appeal to public opinion through discussion in the press and on the platform. They were attended, of course, with much wild talk in debate, which the Republicans were careful to stimulate and draw out, but there was no threat from any influential or authorized quarter of secession or revolution, and no "presentation in Congress of the doctrine on which the theory of secession rested," to use the language of the New York *Times*, and no threat to apply the old nullification theory to the administration of the Government. The controversy between the two parties at this stage was, in fact, a controversy over the construction of the Constitution on a point of administrative practice—the regulation of elections—and had no taint of revolution in it whatever. Such controversies have been raging since the foundation of the Government, and the means of deciding them is provided in the Constitution with the utmost clearness. Some are referable to the voters at the polls and some to the Supreme Court. This particular one was a controversy to be settled at the polls. The Republicans had only to win back, by appeals to Northern public opinion, the seats they had lost in 1874 and 1876, to cause the Southern construction to vanish in thin air, and to relegate "the Brigadiers" once more to the humble rôle of receiving instead of giving the law. There was no more call in the matter for "a Strong Man" than for a steam-engine.

This course was inconvenient to the Republican chiefs, for reasons which we have no space to give in detail. The chief one was, however, that it would have involved explanation and discussion of the causes of the defeats at the North in 1874 which gave the Democrats the majority, and which Republicans were anxious, for obvious reasons, to bury in oblivion. It would have brought up carpet-baggery, whiskey-thievery, moieties, rings, grabs, Crédit Mobilier dividends, and the various other Republican scandals of the period between 1868 and 1874. Nor was it at all certain that the lost ground could be regained by simple debate on the expediency of having the national Government take charge of Federal elections, for this was hardly exciting enough. Outrages, too, at the South had declined so much in number that the canvass now pending came near having to be conducted on the Chisholm tragedy of 1877; there would have been little else of the kind to rely on if the Dixon murder had not taken place, and the Blackville postmaster had not been assailed a month ago.

The bolder course was therefore adopted of alleging that the Southern representatives in Congress had reasserted the old Calhoun doctrine of the right of secession and nullification, on which the rebellion was based. This was sure to rouse the Northern people as nothing else would, and destroy among them the critical spirit from which the party had suffered so much since 1872. It was a daring scheme, because the story had no real foundation. It could hardly have succeeded by the efforts of the party orators alone. The newspapers, however, with their power of daily iteration made it succeed. We have watched it for the last year with increasing surprise, not unmixed with admiration. Its engineers counted, and properly counted, on two things: (1) the spirit of competition among the newspapers, and (2) the indifference of the public to the exactness of any statement which chimes in with their prejudices and prepossessions. The party newspapers, when the denunciation of the Brigadiers began, were soon vieing with each other in expressions of hostility and distrust. Accusing them of a desire to return to the practice of treating every election as a State election, which had prevailed from the foundation of the Government, was soon found to be too tame and commonplace. They were then accused of secretly meditating the revival of the secession theory, then of having openly "presented" it in Congress; and thousands of articles were written on the assumption that this accusation was literally true. The public does not read the *Congressional Record;* does not even follow the brief and imperfect summaries by the party press of Congressional debates with any care or constancy, and was ready to believe anything of the Brigadiers. In a few months the people were so excited and alarmed that they were half prepared for a new rebellion, and naturally looked about for some one to organize the physical force by which it was to be again resisted. For this crisis the managers had the Grant boom all ready, and at once opened it. They produced "the Strong Man." For this state of things, than which nothing can well be more prejudicial to healthy political life and pure administration, the press, as we have said, is mainly responsible—how responsible no one knows who is not compelled, as we are, to watch it working up an incident or a subject for party consumption, and who has not seen papers trying to outrun each other in violence of language and the production of startling effects. The last marked illustration of the play of this half-insane competition was the Johnson impeachment trial, when they were endeavoring to outstrip each other in the description of Johnson's depravity. He was at first "a criminal"; then "a great criminal"; then "the greatest criminal of the age"; and finally the silly old man became "the greatest criminal of this or any other age." At this point the resources of vituperation would have been exhausted if they had not resorted to comparison with various historical monsters like Nero and Caligula.

They are now performing the same process on the Brigadiers, and with far greater success. They have produced the cry for "the Strong Man." They have discredited the cause of peaceful and patient reform; they have weakened the popular reverence for law; they have planted in the American mind the seeds of that fell and foul disease of free governments—the hankering for a chief who will not be over-scrupulous about obeying the Constitution. The New York *Times* has been one of the chief offenders; perhaps, owing to its greater temperance and independence, one of the most efficient. In now denouncing the cry for "a Strong Man," therefore, it is trying vainly to lay a devil which it has helped to raise. We were fortunately able the other day, by pouncing on one of its repetitions of the reckless statement about the production of the theory of secession in Congress, to drag to light the foundation on which all this fabric of wicked misrepresentation has been built—which was nothing more than that Blackburn, of Kentucky, had predicted that the majority in Congress would repeal certain Republican legislation. The remedy for this, the old American remedy, is of course simple enough—an appeal to the people against Blackburn, which will take from him his majority. Those who have persuaded the people that the case calls for a soldier's hand and for departure from the ancient ways of American politics, and that we have in one century reached the stage in which we have to rely on one man to save us from perishing, deserve that future generations should curse their memory.

Correspondence.

JEWISH FARMERS.

To the Editor of The Nation:

Sir: In your issue of the 2d inst. you express doubts if a Jewish farmer can be found in either hemisphere. I know of several in this State, and have heard of others in the Western States. It cannot be expected that their religion be advertised over the main entrance of their farms. Some of these Jewish agriculturists have intermarried with Christians; what particular ostracism the *Germania* will decree upon these we are only left to surmise. In conversation with one of the trustees of the Hebrew Orphan Asylum of Cleveland, Ohio, I was informed that the purchase of a tract of land near the city was contemplated, on which to educate boys and instil in them a love of farming.

As the Jews are by nature a gregarious race, and as in both hemispheres people of all sorts of religious views gravitate towards the large cities, we must not wonder if the former take slowly to agricultural pursuits.—Respectfully yours, H. L. F.

Chicago, October 6, 1879.

SOUTH CAROLINA REDIVIVUS.

To the Editor of The Nation:

Sir: I have just returned from a summer spent in South Carolina, where I had every opportunity to study the political and social condition of things. The gain in material prosperity since the educated classes recovered the control of politics is marked—more so among the negroes even than among the whites.

I can compare the old condition with the new. I spent nine months in South Carolina almost immediately after the war, when carpet-bags were a possibility rather than a fact. The older men of the State were stunned by the complete collapse of the old institutions, and knew not how to adapt themselves to the changed conditions of life. It was the same with the negroes. Up to this point there was no sign of ill-feeling between the white man and his former slave. Indeed, the master was grateful for the kindness and fidelity shown during the war. Why should there be antagonism, the interests of the two races being the same?

What followed, we all know. The most ruinous accomplishment of the set of men who flocked to the State, scenting plunder, was the antagonism they brought between capital and labor; capital, being less robust, suffered more than labor. My next winter was during the triumphant "spoils" period, which has been elaborately enough described. Land was lying uncultivated, the negro was idle and perfectly demoralized. I was shocked to see the drunkenness, to hear of the stealing. There seemed no hope for the future. This fair State was given over to the robber and to the ignorant.

The change in the condition of things during the last eighteen months is positively startling. It is difficult to know where to begin. Every one seems hopeful and, better still, busy. The negroes are working cheerfully. If the wages be low, so is the living; think of good chickens for sale at ten cents apiece! It does not pay to rob a hen-roost. The large estates are being cut up into small farms, owned indiscriminately by black and white. I drove through the country districts, through lands which only a little while ago were covered with oaks and pines. Now I find little homesteads, with gardens and beginnings of orchards; in some cases, pathetic attempts at "decoration." For the first time in my experience fruit, vegetables, and chickens were daily offered at the door by negro men and women. I saw few or no idlers, and heard no expressions of discontent.

The increased earnestness and hopefulness of the young white men is most encouraging. They no longer *direct*, oversee, but literally put their own hands to the plough, with honest pride in their work. They work during the day, in that burning sun, side by side with the negro, in perfect good comradeship. The great want of the State is capital, and that must flow in when the future is assured. Outside interference in politics will be ruinous. It means accentuating the color-line; it means arraying labor against capital, ignorance against education. The misfortune for South Carolina is the coming Presidential election. But for that the names of Republican and Democrat might be erased from the spelling-book. If she were not needed for party purposes, she might be left in peace to bind up her wounds.

Now one last word as to security of life and possessions. The contrast here is in favor of South Carolina as against my own New England. In a Connecticut town, last summer, I kept a pistol as a comfort, if not a protection. In South Carolina, not a tramp all summer, and no beggars! Our household was composed of three women, the servant sleeping in "the yard." Our house is a little isolated. We sat or slept with doors wide open until late into the night, and we never had one moment's uneasiness nor anxiety.

When so much that is false is being said, I hope these few words from a New England Republican may not pass quite unheeded. N. S.

New York, Oct. 7, 1879.

[The writer of the above, a woman, is a well-known teacher in this city.—Ed. Nation.]

NEW YORK REPUBLICAN *vs.* DEMOCRATIC RETRENCHMENT.

To the Editor of The Nation:

Sir: In your issue of Sept. 25 (No. 743), under the head of "The Week," you favorably mentioned Governor Robinson's letter of acceptance, and, in repeating some of his figures, said "they tell a remarkable tale and are not to be questioned." However, they were questioned the same day in an article in the *Evening Post* entitled "Let us have a Judicial Statement." The article assumed that your reputation for impartiality must be maintained by a subsequent presentation of the Republican side of the case, and, in professed aid of such a course, undertook to furnish what it termed "several well-known facts."

You do not appear to have considered the tender favorably, and if the article in the *Post* is in all respects as inaccurate as in the three particulars which, with your permission, I will indicate, your course in failing to accept the proffered assistance is very wise.

First. The article in the *Post* alleges that the constitutional amendment authorizing the change from three Canal Commissioners to a single Superintendent of Public Works was proposed by a Republican Legislature in 1873 and 1874.

This statement is as inaccurate as the consequent claim of the *Post* for exclusive credit to the Republicans for passing the amendment. The true history of the amendment is as follows:

Rejected at the election of 1869, it was again proposed by the Constitutional Commission of 1872, consisting of sixteen Democrats (Governor Robinson being one) and sixteen Republicans.

Approved by the Legislature of 1873 and the Senate of 1874, it was, on February 18, 1874, rejected in the Assembly by a vote of nearly two to one (76 to 42). As the *Post* truly claims, the Republican party had a majority in this Assembly and was responsible for its action. The truth of the claim cannot be questioned merely because the Assembly defeated the amendment instead of adopting it, as the *Post* supposed.

The amendment now seemed to be for ever lost, as would doubtless have been the result except for the election of Governor Tilden in the succeeding fall. Upon the nineteenth day of March, 1875, the Governor's famous canal message reached the Senate. It paralyzed the forces of the Canal Ring and opened the way to vigorous action on the part of the friends of administrative reform. To the public spoilers it was the past which was full of peril, and they were too much absorbed in schemes for escaping conviction to rally to the defeat of legislation concerning only the future. At this opportune juncture (April 14) Senator Madden introduced the amendment. Within five weeks it passed both houses (the Assembly being strongly Democratic) without a single opposing vote.

The only influence to which it is possible to trace this extraordinary change in sentiment of the preceding year is the powerfully constraining force of Governor Tilden's canal message. In the Senate of 1876 the amendment was introduced by Mr. Gerard, and in the house by Mr. Sherman, both being Democrats, and passed with only slight opposition, of which the head was Mr. McCarthy, then, as now, Republican Senator from Syracuse. It was ratified in the fall of 1876 by a popular vote of 533,153 to 81,832.

In view of all these facts, that it was proposed by a commission equally Democratic and Republican; that it was defeated in the Republican Assembly of 1874; that under Governor Tilden's influence it passed the Legislature and the Democratic Assembly of 1875; and that it was introduced by Democrats in both houses in 1876, it seems difficult to accept as the basis for a judicial statement the claim of the *Post*, that the Republicans are entitled to exclusive credit for this amendment.

Second. The history of the States-prisons amendment is almost exactly the same as that already given, with the important qualification that it was not adopted but substantially defeated in the Republican Constitutional Convention of 1867 (see Journal, June 24, 1867; February 25, 1868; Documents Nos. 122 and 123).

Third. The article in the *Post* places at your service the alleged "pertinent fact" that the sinking fund was depleted to the extent of six millions of dollars by the Democratic administration of Governor Hoffman.

The responsibility for this deficiency has been so often and so unjustly charged upon the Democrats alone that it is well to dispose of the question by a citation from the very highest authority—the report of the very able and upright Republican Comptroller, Hopkins, to the Legislature of 1875 (Ass. Doc. No. 3, pp. 24, 25). Comptroller Hopkins charges this deficiency upon the vicious habit of legislatures of making larger appropriations than they dared to provide for by tax. He specifies beyond possibility of question which were the delinquent legislatures. They were:

The legislature of 1869 as to		$1,493,181 28
"	1870 "	2,355,927 40
"	1871 "	2,748,595 56
"	1872 "	1,785,762 97
"	1873 "	254,253 53
making a total excess of		$8,637,720 74
from which being deducted the surplus of Sept. 4, 1868		1,850,000 00
resulted the actual encroachment of		$6,787,720 74

Of these five guilty legislatures three (those of 1869, 1872, and 1873) were Republican in both branches. In the claim that the Democrats alone were responsible the article in the *Post* again seems to lack the quality of judicial fairness.

This same deficiency in the article might be indicated as to several other statements, but I have already occupied too much of your space.

I am, sir, respectfully yours, FRANCIS LYNDE STETSON.

39 EAST EIGHTEENTH STREET, October 13, 1879.

MR. BERGH AS A COMMENTATOR.

TO THE EDITOR OF THE NATION :

SIR : It seems that the discussion in regard to vivisection has once more broken out in the daily papers, with the usual exchanges of denunciation and defence. The present aspect of the controversy is essentially this : Mr. Bergh contends for a legal suppression of the practice ; and, in order to influence the public mind in that direction, he portrays in strenuous language the iniquities of the physiologists, and denounces their results as uncertain and worthless. The doctors, on the other hand, say that his descriptions are exaggerated or untruthful, and his inferences false. It is proper that the unprofessional reader should have some means of judging between these antagonistic parties. If Mr. Bergh's statements are exact, let them have the weight which they deserve ; if they are open to doubt, the public should be warned. An important element in this question would be that of faithfulness in the matter of *quotations*.

One of Mr. Bergh's favorite assertions is that the medical profession is opposed to vivisection ; or, as he expresses it with a pleasing erudition, "From the time of Celsus, the Hippocrates of the Romans, till our own day, when humanity is making itself heard, the best men have raised their voices against it." To establish this point he quotes from many well-known authors, and uses the weight of their names and language to discredit the propriety of experiments on animals. But in looking over these quotations we are struck by one peculiarity—that is, there is nothing to show where they came from. The value of a quotation, apart from the reputation of its author, depends upon its accuracy and the connection in which it is used. In the discussion of controverted topics it is usual to accompany a quotation with exact references, giving the title of the book from which it is drawn, and the page where it is to be found, in order that any one may refer to the original passage and satisfy himself that the citation is genuine. Mr. Bergh habitually omits this useful precaution. Most of his quotations give the name of the author, but no further reference which would enable the reader to verify their correctness.

Besides this, to the medical mind there is something a little odd in seeing such names as Colin, Carpenter, Longet, or Hunter arrayed as witnesses against the value of experimentation on animals. These men have passed their lives and gained their reputation in performing experiments or in collecting their results. That they should, nevertheless, believe and declare them to be worthless, has a puzzling look about it. It would be interesting to refer to the original language of these authors and find out what it means.

But in order to understand the matter fully it is necessary to know, in the first place, from what source Mr. Bergh derives his scientific information.

In 1866 the London Society for the Prevention of Cruelty to Animals published a prize essay on vivisection,* by Mr. G. Fleming, veterinary surgeon to the Third King's Own Hussars—an essay which is spoken of by a reviewer in the London *Athenæum* for September 22, 1866, as "ignorant, fallacious, and altogether unworthy of acceptance." After a perusal of the work we heartily agree with this estimate of its character.

It is from this essay that Mr. Bergh has drawn most of his ideas and much of his language. The similarity of expression, in many instances, is too close to admit of any other conclusion. Let us compare a few passages by way of example :

Mr. Bergh, in the N. Y. Evening Post, September 12, 1874.

"From the time of Celsus, the Hippocrates of the Romans, till our own day, when humanity is making itself heard, the best men have raised their voices against it."

Fleming's Essay, 1866, *page* 25.

"From the time when Celsus, the Hippocrates of the Romans, blamed Herophilus of Chalcedon for having dissected the bodies of living criminals, which had been given over to him by the kings of Egypt, up to the present day, when the voice of humanity is making itself more loudly and forcibly felt on behalf of the lower animals, many and just good men have given their opinion as to its barbarity."

Mr. Bergh in the N. Y. Evening Post, September 12, 1874.

"The director of the imperial school of Alfort, in reviewing a long series of vivisections, felt himself compelled to ask," etc.

Fleming's Essay, 1866, *page* 40.

"The conscientious director of the imperial school at Alfort, in reviewing a long series of vivisections, has felt himself compelled to ask," etc., etc.

Mr. Bergh, in the N. Y. Evening Post, September 12, 1874.

"Is it not time that universal sentiment should put a stop to these horrid operations, which tend to harden the heart, extinguish those instincts which give man confidence in man, and make the physician more dreaded than disease itself ?"

Fleming's Essay, 1866, *page* 67.

"It is time that universal resentment should arise against these horrid operations, which tend to harden the heart, extinguish those sensations which give man confidence in man, and make the physician more dreadful than the gout or stone."

There can be no doubt that Mr. Bergh has attentively read Fleming's essay, and is indebted to it for much of his inspiration.

One of the authors whom we have mentioned above as appearing in an unexpected light is Professor Colin, of the Veterinary School at Alfort, in France, and author of the 'Physiologie Comparée des Animaux Domestiques.' Mr. Bergh arrays this writer as one of his chief witnesses. In the New York *Herald* of February 13, 1867, he says :

"Colin, the author of a treatise on Physiology, wholly condemns vivisection."

In the New York *Tribune* of September 26, 1874, he enumerates Colin, with others, among those who consider experiments of this kind as "worthless," owing to unavoidable errors.

In the New York *Evening Post* of September 12, 1874, he cites the writer in question as follows :

"Monsieur Colin says : 'From the moment that a function is disturbed in its normal condition it changes its character, and all the others experience a like commotion and soon become suspended. The possibility of isolating physical or chemical phenomena is simply hopeless.'"

Now, what is the meaning conveyed by this language ? The reader will of course infer that, in Colin's opinion, no possible result can be obtained from such experiments ; and that, from the nature of the case, it is useless to attempt it. The fact is exactly the contrary.

The quotation is from a passage in Colin's 'Traité de Physiologie Comparée des Animaux Domestiques,' Paris, 1854, tome i. page 32. It occurs in paragraph iv. of the introduction, a paragraph expressly devoted to the subject, and entitled "De l'Expérimentation." The author is treating of experimentation in general, as a means of study in natural science, and the manner in which it should be employed in various cases in order to be useful. He is showing the difference which exists between experiments in chemistry and physics, which may be fully simplified, and those in physiology, which are more complex. As Mr. Bergh gives it, the quotation is incorrect. The genuine passage is as follows :

"Dès l'instant qu'une fonction est mise en dehors de ses conditions normales elle change de caractère, et dès qu'elle cesse de s'exécuter, toutes les autres (si elle est un peu importante) éprouvent des perturbations plus ou moins profondes, et bientôt se suspendent. La possibilité d'isoler les phénomènes physiques et chimiques, et l'impossibilité d'arriver à ce résultat en ce qui concerne ceux de l'ordre physiologique, établissent une différence capitale entre le mode d'expérimentation qui s'applique aux premiers et celui qui convient aux seconds. La différence est si grande que l'on ne voit pas ce qu'il peut y avoir de commun entre les deux modes ; il est superflu pour nous de chercher à imiter des procédés inapplicables aux recherches physiologiques."

Colin, therefore, has not the remotest idea of condemning experimentation on animals in physiology. On the contrary, he is doing his best to show how it is to be made effective and trustworthy.

What excuse has Mr. Bergh to offer for this palpable distortion of his author's meaning ? It is possible that he might refer us to his favorite Fleming's essay, and plead that he took his quotation at second hand, without consulting the original work. Such a defence, in any event, would be a lame one, but in this instance it would make the matter worse, because in Fleming's essay the translation is correctly given. Let us see how the two quotations look side by side.

Mr. Bergh, in the N. Y. Evening Post, September 12, 1874.

"From the moment that a function is disturbed in its normal condition it changes its character, and all the others experience a like commotion, and soon become suspended. The possibility of isolating physical or chemical phenomena is simply hopeless."

Quotation in Fleming's Essay, page 26.

"From the moment that a function is disturbed or removed from its normal conditions it changes its character, and all the others (if it is a function of some importance) experience a commotion more or less profound and soon become suspended. The possibility of isolating physical or chemical phenomena, *and the impossibility of isolating those which belong to the order of physiology, establishes a capital difference between the modes of experimentation as applied to the first and those which belong to the second. The difference is so great that it is impossible to see what there can be in common between the two modes. It is, then, superfluous for us to seek to apply a means of procedure which is inapplicable to physiological researches.*"

Besides the usual resemblance in phraseology between Mr. Bergh and Mr. Fleming, there is also a singular difference between them in the sentence which introduces this quotation from Colin :

* 'Vivisection : is it necessary or justifiable ?' London : Robert Hardwicke, 192 Piccadilly. 1866.

Mr. Bergh, in the N. Y. Evening Post, September 12, 1874.

"I will quote from the work of a French physiologist, in this instance a stanch admirer of those men who have made themselves notorious for their practice of that branch of science. Monsieur Colin says," etc., etc.

From Fleming's Essay, 1866, *page* 26.

"Let me quote from the work of a French physiologist, *who is a great advocate for vivisection*, a stanch admirer of those men who have been notorious for their practice in that particular branch of science, *and who is himself a most enthusiastic experimenter*. M. Colin says," etc., etc.

Mr. Bergh is here endeavoring to prove that Colin is opposed to experiments on animals; and, in extracting his opening sentence from Fleming's essay, he has left out that part of it which shows that Colin in reality approved of them. The disloyal intent is too manifest to require comment. Our eminent philanthropist would have the "doors of the State prison" close upon such persons as do not meet with his approval. But if confinement in State prison were the legal penalty for tampering with an author's opinions and falsifying his language, I am afraid Mr. Bergh would have been there long ago. J. C. D.

New York, Oct. 10, 1879.

A CHOICE BETWEEN MACHINES.

To the Editor of The Nation:

Sir: I have read with the interest of a perplexed and enquiring mind the editorial and other articles in the *Nation* of the 18th and 25th inst. concerning the coming State election and the duty of independent voters in regard to it. I do not find my doubts solved by what has been published, and ask your indulgence to state my difficulty. That difficulty is the impossibility of so voting in the coming contest as to utter a protest against what is known as "Machine politics." To utter such a protest is, of course, the desire of all who favor civil-service reform; and the one course to do it, as indicated in your columns, is to vote against Cornell and for Robinson. But this does not solve the difficulty; it only gives the opportunity of smashing the Republican Machine by maintaining the Democratic Machine. The Convention at Syracuse seems to an unprejudiced mind—at least, to one mind which wishes to hold aloof from prejudice—as much the product of the "Machine idea" as the Convention at Saratoga. Judging from the whole course of the controversy, as gathered from the press, Mr. Robinson is as much the appointee of Mr. Tilden as Mr. Cornell is of Mr. Conkling. The only option left to the independent voter is which Machine he will choose. I cannot doubt, from all that I have read and heard, that Mr. Tilden held the Democratic delegates as firmly in his grasp as Mr. Conkling did the Republican. To vote for the Democratic candidate, therefore, is not to utter a protest against "the Machine." The only choice, therefore, left to the independent voter is a choice of individuals and parties. Each side, as represented in the coming election, is the exponent of the working of the Machine; and, with every desire to destroy that, seeing that neither party gives the opportunity, the independent voter has simply to consider to whose advantage he prefers the prestige of victory should accrue, and which party, as judged by its action in regard to honest finances and just government, he can most implicitly trust. Reformer.

New York, September 26, 1879.

[Then do not vote for the Democratic candidate; but, also, do not vote for the Machine part of the Republican ticket. It may be that Robinson as well as Cornell is the nominee of a Machine, but it is also true that Robinson has for two years been a good Governor, and has filled other State offices with honesty and efficiency. We believe he served one term as Comptroller since the war on the nomination of both parties. Cornell's career, on the other hand, has been simply that of an expert and tricky electioneering agent, whose last public act in office was to bid defiance to his superior officer, and treat with contempt the declarations of the Republican platform. If you vote for Cornell you help to declare to the world, not so much that you believe in the Republican party as that Mr. Conkling controls the party in the State of New York to such a degree that he can give the Governorship to a man who represents nothing, as has been well observed, but a quarrel with the Administration and hostility to civil-service reform. If you help to elect this man you send Mr. Conkling to the Convention next year with the air of having the State which will probably decide the Presidential election in his pocket, and thus enable him to secure the nomination of some one who will either so repel the independent voters as to cause the defeat of the party at the polls, or who will, if elected, restore the régime at Washington which led to the loss of Congress in 1874, and almost the loss of the Presidency in 1876. If you are a good Republican, therefore, you owe it to the party not to degrade and put it in peril in the Presidential contest by supporting Conkling's Machine. You are not responsible for the working of the Machine in the other party; you are responsible for it in your own party. If you could utter your protest against it by voting for some blameless man of splendid talents, or by some good work, such as endowing a school or church, we would advise you to do it. In the present state of the world we know of only one way in which you can utter it, and this we recommend, although, like all human instrumentalities, it has its imperfections and drawbacks.—Ed. Nation.]

Notes.

THE 'Publishers' Trade-List Annual' for 1879 (New York: F. Leypoldt) makes the seventh of the series, and is perfect even beyond its predecessors as an index to current publications. The dealer, or the general reader or student, is provided first with the latest catalogues of the leading houses of the United States; next with the Annual Reference List (July 1, 1878–79), compiled from the *Publishers' Weekly*, arranged alphabetically according to author and subject, and giving a full bibliographical and commercial description of each work; then with a Classified Summary, according to topics—a new and extremely useful survey of Biography, Travels, Poetry, Fine Arts, Political and Social Science, etc.; a special Educational Catalogue, classified and by authors; and an Order List, in which each publisher's books are grouped under his name.——Bigelow's 'Life of Benjamin Franklin,' composed of his autobiography and of personal extracts from his writings, has just been issued in a second edition, revised and somewhat enlarged, but above all brought out at a price quite within the reach of persons of moderate means (Philadelphia: J. B. Lippincott & Co.) This has been effected without sensibly diminishing the typographical beauty of the three volumes, and ought to ensure them a wide sale.——W. J. Widdleton has issued a revised edition of the 'Life and Poems of Edgar Allan Poe,' which comprises a memoir by Eugene L. Didier, an "introductory letter" by Sarah Helen Whitman, the poems, a lecture on "The Poetic Principle," and an essay on "The Philosophy of Composition." It is nowhere indicated wherein the revision consists, even the preface bearing date of 1876.——'The New Plutarch' is the title of a series of biographies of "men and women of action," of which the Messrs. Putnam have begun the publication with a life of Abraham Lincoln by Charles Godfrey Leland. It is a direct and simply-told narrative, but contains nothing very new, except a few misstatements, and does not perhaps evince the firm grasp of all the facts of life which the old Plutarch possessed in such a signal degree.——Capt. H. W. Howgate has edited, under the title of 'The Cruise of the *Florence*,' Capt. Tyson's journal during the preliminary Arctic expedition of 1877–78 (Washington: James J. Chapman). It makes a modest pamphlet of 183 pp. Capt. Howgate states that the report of the naturalist is now in the press, and that the meteorologist's is nearly ready for the printer.——We have received from C. Collins & Co., Part I. of 'The American Continent: a Complete History of North and South America.' That is to say, the earlier periods are provided for by reprinting verbatim the comparatively unprocurable Belknap's 'Biographies of the Early Discoverers,' Grahame's 'History of North America,' Ramsay's 'History of the United States,' and Robertson's 'History of South America'; and the later periods by continuations to the present day. When these additions are reached we shall speak of them critically, as also of the well-imagined "Complete Chronology from 458 to 1880," which will conclude the work. The size is quarto, and the paper and print attractive.——N. Tibbals & Sons will shortly issue Fairbairn's 'Scripture Typology,' in two volumes octavo.——Macmillan & Co. are the publishers of an attractive little series of "Elementary Classics" designed for schools, and also, fragmentary as they are, well fitted to be carried in the pocket by those who wish to revive their classical studies.——Sixty-three of the 136 enrolled students of Johns Hopkins University are graduates of other colleges, including Harvard and Yale, which send four each. Eighty-one are residents of Maryland.——Parts 7 and 8 of Oncken's 'Allgemeine Geschichte,' now rapidly issuing, continue the history of Peter the Great to 1716, and that of Greece to the

Peace of Naupactus (B.C. 217). In the former, several curious portraits, in the latter, copies of busts, gems, vases, etc., enhance the value of the text. Part 8 concludes the first volume of Hertzberg's 'Hellas und Rom.'——Our attention has been called to a slip in our notice of Morley's 'Burke' last week. It was at Dilly's dinner-table, not Cave's, that Johnson's meeting with Wilkes occurred.

—We take from the *Athenæum* the following titles of English books in course of publication: Several series, after the fashion of the day, including 'Philosophical Classics for English Readers,' edited by Prof. Knight, beginning with Berkeley, Butler, Descartes, Hamilton, Hegel, etc.; and 'Early Chroniclers of Europe,' edited for England by James Gairdner, for France by Gustave Masson, etc. To be mentioned with the latter is 'The Boy's Froissart,' being selections from the chronicles of England, France, and Spain, by Sidney Lanier (of which, by the way, Charles Scribner's Sons will be the American publishers), and 'Tales from Ariosto' retold for children by a lady. Mr. Swinburne's 'Study of Shakspere in Three Periods' is nearly ready. Mr. Justin McCarthy's third and fourth volume will complete his 'History of Our Own Times,' and simultaneously will appear the first part of 'A Guide to Modern English History from 1815 to 1830,' by William Cory. 'Germany, Present and Past,' by the Rev. S. Baring-Gould; 'Portugal, Old and New,' by Oswald Crawfurd; and Count von Moltke's 'Notes of Travel in France, Rome, etc.,' may fairly be mentioned together, and after them the first volume (1623–1654) of a 'History of the Administration of John De Witt, Grand Pensionary of Holland,' by James Geddes. 'Matabele Land and the Victoria Falls' will be illustrated from the sketches and specimens collected by a naturalist, the late Mr. Frank Oates, who died of fever soon after reaching the falls. The following works will meet a variety of tastes: Prof. Sayce's 'Introduction to the Science of Language,' in two volumes; 'Old Celtic Romances,' translated from the Gaelic by Dr. Joyce; 'Mind in the Lower Animals in Health and Disease,' by Dr. Lauder Lindsay; 'The Abolition of Zymotic Diseases,' by Sir Thomas Watson; 'The Early Teutonic, Italian, and French Masters,' translated from the 'Dohme Series' by A. H. Keane; 'The National Music of the World,' by the late H. F. Chorley; and 'Songs from the Published Works of Alfred Tennyson,' with musical accompaniments.

—We have received eight parts (pp. 256) of the 'Poetical Works of Henry Wadsworth Longfellow,' illustrated, now being published by subscription by Houghton, Osgood & Co. This edition, it is announced, will consist of about thirty parts, at fifty cents each, and be completed in the autumn of 1880. It is in form a large quarto, the page of almost the same size as our own, and, as the promised number of parts will make up two or three stout volumes, it will be seen that this publication is no trifling matter. What the advertisement on the cover claims for the paper and printing can be granted: the paper is of that heavy, cream-tinted, and glossy kind which appears to be accepted as the thing to please this American public, and is the best of its kind; the letter-press is perfect enough, and the ink black enough, for any one. The long lines of "Evangeline" and "The Children of the Lord's Supper" have the whole width of the page; the shorter lines of "Hiawatha" and the smaller poems, and even the text of "The Spanish Student," are arranged in double columns. Scattered about the large pages are many woodcuts illustrative of scenes in the text, and each division of the poems and each longer poem has a headpiece of some ornamental design. Occasionally a full-page woodcut appears, and a portrait of Mr. Longfellow in line engraving by Mr. Marshall serves as frontispiece. It will be seen that we have here the "Gift Book" in its fullest development. The greater part of the illustrations are not such as call for remark. The regularly-arriving Christmas books of a month or two months hence will contain many woodcuts of the same sort—Mr. Darley's wooden Indians and tame bears, Mr. Frederick's warriors and ladies, Mr. Reinhart's romance, and Mr. Moran's mountains, all passed through the disenchanting medium of the Messrs. Anthony's wood-engraving. There are half-a-dozen little landscapes which are interesting, especially those by Mr. J. A. Brown, and the large print after Mr. Whittredge's landscape drawing has a certain value; there is little else to care for in the pages before us, though some of the original drawings may have had a charm of their own.

—The impatience with popular histories and popular views of history which we noted in Professor Seeley's initial article on "History and Politics" in the August *Macmillan* is distinctly traceable in his second paper, which opens the September number. If it were not so distinctly querulous, one would be justified in calling this an elegy. It laments at the outset the lack of interest displayed by Englishmen in modern Continental history of a really solid sort, such as 'The Life and Times of Stein' perhaps; and though there is, to be sure, as Professor Seeley admits, some interest taken in both French and German modern history, it is only in those portions which are interesting, unfortunately. "I have lately been told by reviewers," he says, "that it is doubtful whether the German War of Liberation is of sufficient interest to deserve careful study." Certain books on the French Revolution and on Frederic the Great have received attention, but that is because "they have been full of everything that is amazing and astonishing." Still, the success of any historical work is assured, he still thinks, "if it is not too long and has but a reasonable seasoning of 'pictorial writing.'" But the upshot of the matter is that "we write no elaborate histories of modern France or Germany or Russia, and we do not think such histories ought to be written." This is one great deficiency, and another is the lack of scientific interest in English history itself. This in schools is "almost as dead as the modern languages," and the proper study of it after one has left school or the university is seriously endangered by party spirit. Every Englishman, being either a Liberal or Conservative, is biassed in his judgment of the history of his country, wherein he sees reflected the party quarrels of his own day. The existing political differences are taken to be "a transient phase of an eternal and necessary conflict between two different classes of men." Hence the parties of the present day are made to answer to the Whigs and Tories of the Revolution, and these to the Cavaliers and Roundheads of the civil War, and these, again, to the parties of Strafford and Eliot; and hence the modern Englishman sympathizes with Laud or Cromwell, as he is a Conservative or Liberal. All this is exasperating in the highest degree to Professor Seeley. "This grand generalization is never established by reasoning," he justly observes; but he adds, "I believe it to be almost entirely baseless," in which opinion it is not necessary to agree with him in order to appreciate the reality of the evil he laments. That there are differences in temperament which have made party distinctions of essentially the same sort ever since the revolt of the Titans it needs no reasoning to prove, and it will probably to the end of time depend in great measure upon the historian's own temperament as to what view he will take of Frederic, say, or Cæsar. There are certainly factors in history which no amount of scientific investigation can determine, and when Professor Seeley sneers at the people who "will probably soon be prepared with a proof that from the essential constitution of the human mind it is not capable of determining who wrote 'Icon Basilike,'" he implies neglect of a very obvious class of phenomena, as he might say. And the way to deal with these impartially is not so much, perhaps, to persuade ourselves that there is really no reason for our having other than a strictly scientific interest in them, and that they have no intimate relations to us and our circumstances, as to endeavor to cultivate an impartial spirit. If we should succeed in that we should be able to view not only history but popular historians without rancor or impatience.

—"Volunteer" writes us from Illinois:

"The correspondent whom you quote on page 226, No. 744, doubtless gives the truth as he saw it, but he is too sweeping in his generalizations. Let it be understood, in the first place, that each company commander has a pecuniary responsibility for all tents, arms, and equipments furnished for the men, and that all clothing is charged to him at a money value till he renders an account of its issue to men, so that he is responsible for accidents and misconduct of ninety-eight men besides himself in a full company, while no enlisted man, orderly sergeants included, is responsible pecuniarily for anything except his own personal action, and it will be seen that even if the orderly does keep all accounts, the case would be no worse than that of the storekeeper who signs the bills and receipts made out by his bookkeeper. Further, Government feeds and clothes the enlisted man, the officer buys his own food and clothing, the Government selling to him at places where he cannot readily get food otherwise. I was in the Army for three years to the end of the war, and I can name officers, both in the volunteer service and in the regular Army, a large part of whose accounts will be found at Washington in their own handwriting. The letters written, and much other writing of the private office, in stores of all grades from the country cross-roads to A. T. Stewart's great New York house, are as little known to the overworked bookkeeper as a great mass of writing by officers of responsibility is to clerks and to orderly sergeants."

—Booth's theatre under the management of Mr. Boucicault promises to be one of the most attractive in the city. During the summer it has been refitted and redecorated in such a manner as to give the interior that gay effect of white and gold and crimson which, meretricious as we might find it anywhere else, in a theatre always seems natural and in good taste. As his opening venture Mr. Boucicault has brought out a play of his own—"Rescued, or a Girl's Romance." It may be generally

described as being in his later manner. It has the inevitable atmosphere of exalted heroism, murderous villany, and vindicated virtue, in which the creatures of Mr. Boucicault's theatrical imagination have lived and moved ever since his dramatic instinct acquainted him with the fact that the theatre-going world were ceasing to care for character on the stage, and were beginning to go to the theatre only to be tickled by exciting incident and situation. We should despair of giving any idea, by a description, of the plot of "Rescued." There is one very effective scene in it, not original with Mr. Boucicault, which displays considerable ingenuity in the important art of avoiding infringement of stage-right. It is well known in "theatrical circles" that the incident of having a person bound to a railroad track, in impending peril from an approaching train of cars and just saved by the unexpected rescuer as the train thunders past the footlights, is protected by the courts. Large sums of money are believed to have been made out of this incident by the owner of the idea. The attempt to infringe was once made by a change in the sex of the person bound, or the rescuer, and a few other minor alterations; but the attempt was frowned upon by an incorruptible judiciary. A playwright was found, however, equal to the task of discovering a way to appropriate the excitement of the situation, without appropriating the central idea itself. To him it occurred that by shifting the moral interest from the peril to the person threatened by the train to a peril to the train itself, all that was valuable in the original idea might be retained without any peril to the dramatist. Accordingly, in "Rescued" we have a railroad track coming from the distance and running across a drawbridge at the front. On the right of the stage is the box in which the signal-man works the draw by means of a huge lever. The draw is open, for the signal-man has just been showing the villain of the play how the machinery works, and has in the very act been chloroformed by the latter. The train is heard coming in the distance. Its lights may be seen winding their way along the foot of the hills which line the shore of the water spanned by the bridge. The chloroformed signal-man lies insensible in his box. Another instant and the train will be plunged into the abyss below. But no—for two friends of the signal-man have arrived upon the scene; for these two it is only the work of a moment to seize the lever, and on dragging it down with all their weight the bridge slowly swings into place and the train whistles and shrieks its unconscious way across. Amid such scenes as this we always feel that it is only out of pure good nature if any acting be thrown in; and yet it must be said that there is a good deal of good acting in "Rescued." Mr. Dominick Murray is very good as the signal-man; Miss Rose Coghlan as *Lady Sybil Ferrers* made at least a *succès d'estime*, while Mr. John Clayton, an actor new to our stage, showed as *John Weatherby* considerable talent of an unusual kind. To represent with any force simple emotions in a simple way is an art possessed by few actors, and Mr. Clayton seems to possess it. It is impossible, without seeing him in some other part, to know how much variety he has, but his *John Weatherby* is a very nice piece of acting.

—At the Union Square Mr. Bartley Campbell has made a hit with his new Californian play called "My Partner." We trust, for the sake of the great future which we still believe lies before the Pacific slope, that there are no such people as *Joe Saunders* and *Mary Brandon* inhabiting it. In *Major Henry Clay Britt*, vulgar and offensive as he is, it is possible to trace some semblance of humanity; we are able, by remembering the lowest politicians in public life, to imagine the sort of man Mr. Campbell may have had in mind; *Josiah Scraggs*, the pitiless villain who hunts his best friend down behind a smiling mask of hypocrisy, we have met with in other plays, if not in real life; *Matthew Brandon* is not out of nature; and *Ned*, during his short life, behaves as we can without difficulty imagine a young man of his education and surroundings behaving. But *Joe* (Mr. Aldrich) and *Mary* (Miss Maud Granger) are characters which it required a powerful imagination or else much reading to invent. Were it not that the suggestion would seem to challenge Mr. Campbell's claim of originality, we should say that *Joe* belonged to a period considerably antedating the present, when it was the delight of novelists and dramatists to clothe virtue in the habiliments of extremely low life, and to attribute to coal-heavers in London or gold-diggers in California a delicacy of sentiment and elevation of spirit which would have done credit to a knight-errant. But *Joe* is all this, and something more. *Mary Brandon* is a part of a kind always unpleasant in any form, but particularly so in that in which Mr. Campbell has chosen to present it. The betrayal of a woman may be made use of in tragedy, because it is a peculiarly tragical thing; but a play turning first on betrayal and utter social ruin, and subsequently on rehabilitation through marriage with a sentimental miner, is neither tragical nor comic. We will not say that such a subject cannot be used in a play successfully, but that Mr. Bartley Campbell has not used it successfully. When we say successfully we refer to success in the eyes of the judicious, for there is no doubt that to the average audience "My Partner" seems just what a play ought to be.

—The leading musical event of last week was the first appearance of a pianoforte player of the very first rank. Mr. Rafael Joseffy introduced himself in Chickering Hall on Monday night with a brilliant performance of an interesting programme, and gained a decided and nstantaneous success. His technique is perfect, absolutely infallible, and there is an air of calm and superior self-consciousness about the young artist when playing the most difficult passages, that inspires his audience with a feeling of entire confidence in his power. His taste is thoroughly artistic, a little inclined towards the sensational, for which his warm Hungarian blood must be held accountable. But his strongest point by far is the poetical beauty of his touch. We have never heard piano and pianissimo passages played with more exquisite grace and finish, with more skill in managing the crescendo and decrescendo produced by the pedals, than in Monday's performance. Along with this, his forte is powerful enough to produce admirably shaded effects. His first number was Chopin's Concerto in E minor. A little cool in the first movement, the artist warmed to his work in the second part, the Romanze, and, encouraged and inspired by the enthusiastic applause of his hearers, played the brilliant finale in truly splendid style. The solo numbers in the second part showed his astonishing technique in the strongest light, particularly in the artist's own Étude on Chopin's Valse in D flat, where the most break-neck runs of octaves, sixths, and thirds were executed in an absolutely bewildering tempo, and yet with perfect correctness and finish. The crowning point was a dashing and poetical performance of an old and dear favorite in our concert-rooms, Liszt's Piano-forte Concerto in E flat. Mr. Joseffy succeeded in holding spell-bound one of the largest audiences that has ever filled Chickering Hall, from the first notes of the Chopin Concerto until the last jubilant chord of his great countryman's composition had died away.

—Mr. Theodore Thomas's second concert, on Tuesday last, was a decided improvement on the first. He had evidently made the best use of the few days that intervened between the two performances, and the work done by the orchestra showed more of the finish and artistic smoothness of style to which Mr. Thomas has accustomed us. The symphony of the evening was Raff's "Lenore," the fifth in number of that most prolific of modern composers' works in that class. The "Lenore" symphony, though not very original in conception and form, and certainly inferior in every respect to the same master's beautiful "Waldsymphonie," never fails to interest. It had not been heard here for some years, and was listened to with evident pleasure by a numerous audience. It would have been even more appreciated by many if the programme had contained a short synopsis of Bürger's famous ballad, which forms the subject of this symphonic poem. Barring a few little *faux pas* in some solo passages, the performance was a very satisfactory one. The remaining orchestral numbers were some ballet music from Cherubini's "Ali Baba," and a very brilliant and spirited Coronation March by Svendsen. The interesting feature of the evening was the début of two young American ladies—one a singer, the other a pianist. Miss Carrington, who has studied in Milan, has a voice of considerable compass, but not of a very sympathetic character. Her training is excellent, and she sang the two ambitious numbers of her programme—the Shadow-song from "Dinorah" and the well-known Bolero from the "Vèpres Siciliennes"—in a very creditable manner. These songs have been heard here from such artists as Patti and Nilsson, and only last year by Mme. Gerster, and comparison in this instance would be odious indeed. Miss Cecilia Gaul is a charming pianist of decided merit. Her touch is warm and sympathetic; her technique, as far as could be judged from her judiciously and modestly selected programme, of a very high order, and her taste throughout is graceful and refined. She did well in not choosing for her début a work of greater difficulty and dimensions than Mendelssohn's Concerto in G minor. She does not yet possess the breadth of comprehension required by any of the Beethoven concertos, nor the strength necessary for a satisfactory rendering of a Liszt or Rubinstein concerto. She played Mendelssohn's charming composition and the three solo pieces in the second part—namely, a Berceuse by Chopin, a Gavotte by Silas, and the Spinning Song by Wagner-Liszt—with perfect grace and artistic polish. Mr. Thomas has engaged this accomplished young lady

as teacher for the Cincinnati College of Music, where, we have no doubt, she will fill a wide sphere of useful activity with credit to herself and advantage to her pupils.

ROOD'S CHROMATICS.*

THE utility and significance of visual perceptions distract attention from the mere sensuous delight of color and light; yet few elementary pleasures are so insatiable. The spectrum, however often it may be seen, never ceases to afford the same sense of joy. The prices paid for luminous and colored stones, though exaggerated by fashion, could only be maintained on the solid foundation of a universal pleasure in color and light, together with a sense of similitude between this feeling and those which the contemplation of beauty, youth, and vigor produces. This pleasure makes one of the fascinations of the scientific study of color. Besides this, the curious three-fold character of color which assimilates it to tri-dimensional space, invites the mathematician to the exercise of his powers. And then there is the psychological phenomenon of a multitude of sensations as unaltered by the operation of the intellect, and as near to the first impression of sense, as any perception which it is in our power to extricate from the complexus of consciousness—these sensations given, too, in endless variety, and yet their whole diversity resulting only from a triple variation of quantity of such a sort that all of them are brought into intelligible relationship with each other, although it is perfectly certain that quantity and relation cannot be objects of sensation, but are conceptions of the understanding. So that the question presses, What is there, then, in color which is not relative, what difference which is indescribable, and in what way does the pure sense-element enter into its composition?

In view of these different kinds of interest which the scientific study of color possesses, it is not surprising that the pursuit is one which has engaged some of the finest minds which modern physics can boast. The science was founded partly by Newton and partly by Young. It has been pursued in our day by Helmholtz and by Maxwell; and now Professor Rood produces a work so laden with untiring and skilful observation, and so clear and easy to read, that it is plainly destined to remain the classical account of the color-sense for many years to come. Chromatics is to be distinguished from several other sciences which touch the same ground. It is not chemistry, nor the art of treating pigments, nor optics (which deals with light as an undulation, or, at least, as an external reality); nor is it a branch of physiology, which might study the various ways of exciting the sensation of color, as by direct sensation, contrast, fatigue, hallucination, etc.; nor is it the account of the development of the color sense. The problems of chromatics are two: First, to define the relations of the appearances of light to one another; and second, to define their relations to the light which produces them. It is, therefore, a classificatory, not a cause-seeking science. The first series of relations according to which it classifies colors are those of the appearances in themselves. Here we have grey ranging in value from the darkest shade to the white of a cloud. The shades may be conceived as arranged along an axis about which we have circles of color—yellow, red, blue, and green, with their infinite intermediate gradations. Each of these varies in value, and also in its color-intensity, from neutrality at the centre to the most glaring hues at the circumference.

The second series of relations which the science of chromatics considers are those which subsist between the appearance of a mixture of lights and the appearances of its constituents. By a mixture of lights is not meant a mixture of pigments, but the effect of projecting two colors—say, for instance, by two magic-lanterns—upon the same spot. It has been found that for this kind of mixture (although not for the mixture of pigments) the appearance of the mixture is completely determined by the appearances of the constituents, whatever may be the physical constitution of the light of the latter. The effect of mixing two lights is, roughly speaking, similar to that of adding together the sensations produced by the two lights separately. Let, for example, two precisely similar lights be projected on the same spot, and the result will be brighter than either, and in hue and color-intensity nearly like them. If white and blue be thrown together, the result will be a brighter and more whitish blue. Red and blue thrown together will give purple, blue and green will give blue-green, yellow and red will give orange, etc. Unfortunately for the perspicuity of the subject, this approximate equivalence between mixing light and adding together sensations is not precise, nor even very close. On the contrary, the mixture is always less bright and nearer to a certain yellow than the sum of the sensations of the constituents. This yellow, the precise color of which is defined, is one in comparison with which the purest yellow that can be isolated appears whitish. It has been called the *color of brightness*. The most striking example of this effect is afforded by a mixture of red and green, which gives a strong yellow effect, although the sum of the two sensations is nearly white.

The study of mixtures has thus given rise to a system of classifying colors which coincides just nearly enough with that derived from the appearances themselves to be generally confused with it, while it differs from it enough to make such a confusion utterly destructive of clear conceptions of the relationships of color. One of the highest merits of the work of Professor Rood is the avoidance of this confusion; and if, for instance, no distinction is made between complementary colors in the sense of those which, when mixed, give white, and in the sense of those whose sensations sum up to white, it is doubtless because here, as elsewhere in the book, logic and scientific precision have more or less suffered from a determination not to repel indolent minds.

As to the question whether scientific investigation is an aid to artistic production or to artistic judgment, the author seems to assume that it may be. In the preface it is asserted that while knowledge of the laws of color "will not enable people to become artists" it may yet help in artistic work, and still more in the appreciation and criticism of artistic work. Now, whether this is so or not there is no chance to discuss in these columns, but a chapter of Professor Rood's book might well have been devoted to the examination of that question, and we regret to find instead of such examination the whole argument of the last two or three chapters resting upon the assumption of what, we think, ought to have been proved. Should the decorative artist regard or disregard Chevreul's 'Laws of Contrast,' Hay's 'Laws of Harmonious Coloring,' and other such tables and treatises? Our author, we think, would say aye to that question, but nearly all artists who are concerned with color would say no; and the more they know of these theories the less, we think, do designers in color respect them. "Red lead with blue-green gives a strong but disagreeable combination; . . . vermilion with blue gives an excellent combination; . . . vermilion with green gives an inferior combination; . . . sea-green with blue gives bad combinations." There are four pages of such statements, arranged in a tabular form and credited to Chevreul (in whose book there are a plenty more) and to Brücke, and tending to no result, for the qualifying terms "good, . . . bad, . . . strong, . . . excellent, . . . weak" at once overset any claim to scientific accuracy, and no color-designer would try more than once to make practical use of such statements. Our author seems, indeed, to be aware that it is not a scientific method he is following here, for he avows his disagreement with one statement of M. Chevreul, both statement and contradiction being given as mere matters of opinion.

The last chapter is devoted to the use of color in painting and decoration; and in this the evident knowledge and right feeling of the author are made useless by the false system adopted—the system of arguing from assumed principles to results, instead of comparing results together with the view of establishing principles. Many of the assertions as to the difference between "painting," as in pictures representing nature, and decoration; as to the difference between transparent color, as in stained glass, and opaque color seen by reflected light; as to the proper aim and limits of decoration; and as to the proper order of artistic study, will wholly fail to command the adhesion or even the respectful consideration of students of art. And this seems to result wholly from the unfortunate assumption spoken of above—the assumption that the scientific method can be carried beyond the discovery of fact to the laying down of positive laws for practice. "The aims of painting and [of] decorative art are quite divergent" (p. 306). No, but convergent; for, starting from different points, as our author truly says, they reach one and the same result. The objects of the painter of pictures and that of the decorative painter are different; but with different aims they reach the same result, and in all the best work there is in the world there is no saying whether the "painter" or the decorator has been at work.

* 'Modern Chromatics, with Applications to Art and Industry. By Ogden N. Rood, Professor of Physics in Columbia College.' With 130 original illustrations. New York: D. Appleton & Co. 1879.

BUCK'S HYGIENE AND PUBLIC HEALTH.*

THE volume on Public Health in Ziemssen's series treated the subject almost entirely from a German standpoint, and it was, therefore, decided to substitute for it a larger work more adapted to the condition

* 'A Treatise on Hygiene and Public Health. Edited by Albert H. Buck, M.D., American editor of Ziemssen's 'Cyclopædia of the Practice of Medicine,' etc.' 2 vols. 8vo, pp. 792, 657. New York: William Wood & Co. 1879.

of things in this country. If it be true, as stated in the Introduction, that "in the United States probably 150,000 persons are constantly sick from causes which we have good reason to think preventable, that the total loss of life from preventable causes is over 100,000 a year, and that the country suffers an annual loss, from non-production caused by avoidable illness, of $100,000,000," surely we must welcome every publication which tends to increase and diffuse sanitary information.

Not only in its size but in its method the present book forms a new departure in hygienic book-making. The encyclopædic principle (if it may be so called) has been applied to it. A series of twenty-three articles has been prepared by twenty-two different authors, most of whom are already known for practical work or for research upon the matters entrusted to them. These articles have all been written for the present publication, and cover a very wide field. In fact, a wider range has been given than has been thought necessary by any other author or editor. This circumstance will undoubtedly aid in giving the book a place before the general reading public whose tastes and needs have—perhaps unconsciously—been consulted by most of the writers, though without materially detracting from the scientific value of the articles. The style is usually clear and free of unnecessarily technical terms, but we fear some country reader may be led to wonder whether his cow yields "amphoteric milk," and wish to know whether its doing so would be an "epiphenomenon." Several of the articles are thoroughly readable. Dr. Billings holds that "there are some cities which it would be cheaper to abandon or burn down and commence afresh than to put them in good hygienic condition, retaining their present levels, streets, sewers, etc." Dr. Tracy says "Healthy people are the happiest, whether poor or rich," and "Cultivated and in other respects intelligent people are even now not ashamed to carry horse-chestnuts in their pockets to keep away rheumatism." Dr. Tracy also is to be credited with the construction of a brief title for the animating spirit of the A. S. P. C. A.—namely, the "philozoic energy of Mr. Henry Bergh." Dr. Lincoln, too, has expressed a great truth in compact language when he says: "The longing for change is so far from being inconsistent with steady habits that it constitutes one of the chief elements in the value of the Sabbath, considered physiologically." The Hygiene of Coal Mines reads like a romance, and Inland Quarantine derives zest from both the recent pestilence and the controversial tone which—perhaps fortunately, on the whole—is absent from most of the articles. Among the remaining contributions those on Infant Hygiene and School Hygiene may fairly be noted, not merely for their position as the first and the last of the series, but for the exceeding importance of the topics and the ability and impressiveness of their treatment. But are we to infer that the writer of the latter has never heard of the "Ruttan system of heating and ventilating," so extensively used at the West for school-houses and other public buildings, as well as for private dwellings; and is it possible that a Clinical Professor of Diseases of Children is unacquainted with Dr. Cummings's little 'Food for Babes,' to which many infants owe the prolongation of their lives?

Passing from the separate papers to the work as a whole, we find that the writers have been chosen not only with judgment, but with commendable impartiality from a geographical point of view. The city of the editing and publication of the work furnishes ten articles, covering 414 pages; Boston has seven with 435 pages, and Philadelphia three with 320 pages. Of the remainder, three articles are contributed by officers of the United States Army and Navy, and the other two come from Pottsville, Pa., and New Orleans. Of the twenty-two contributors all but five are physicians, and all of them are men. Considering how recent is the emancipation of sanitary science from "what may be called the medical priesthood" (vol. ii. p. 593), the proportion of laymen is notably large; but at least one of the topics might have been naturally assigned to a woman, and we are inclined to think that one or two others, here ignored or only incidentally mentioned, might have found fuller if not fairer treatment at the hands of the sex most directly concerned. The Hygiene of Syphilis covers five pages, and the writer half apologizes for saying anything upon a matter which—including other sexual irregularities—is thought by some to be the cause of more bodily and mental misery than all other forms of error combined. On the other hand, certain allusions in other parts of the work are wholly uncalled for in any other than a systematic treatise upon the general subject. Surely, too, the Alcohol Question is a vital one for the public and the profession alike, yet it occupies only a few pages of one of the least satisfactory articles, and is only here and there alluded to elsewhere.

For these deficiencies the Editor is presumably responsible; but while the brevity of his Note—it is only a dozen lines—attests his modesty, it would be more satisfactory to know the limits of his authority, and the degree in which he is to be praised or blamed for the various features of the work. For instance, ought not the editor to have insisted upon a full bibliography for each article, instead of permitting fourteen of them to appear without it? Could not some satisfactory system of references have been adopted, such as numbering the works on the list, and referring to them in the text by naming the author, the number on the list, and the page? Why should not all the articles close with the Summary without which a scientific paper of any length is considered hardly deserving of publication? Would not this work have furnished a good opportunity for aiding the popularization of the Metric System, which, though taught in our schools, and cheaply made known by the American Metric Bureau, is consistently employed in only three articles? Finally, should not the Index be much more complete, and bear evidence either that the whole was prepared by an expert in sanitary matters, or that each article had been indexed by its author? It is certainly not fair to the unlearned reader to allow him to suppose that carbon dioxide is something different from carbonic acid, and that carbon bisulphide and disulphide are as unlike as their names. The editor, too, could alone prevent the occasional repetitions which are especially undesirable in a work necessarily large, and he might have insisted on the more practical treatment of a few points; for instance, a page and an elaborate wood-cut are devoted to a Venetian device of little or no value to us, while the simple and useful arrangement for excluding from cisterns the first washings from the roof is passed over with a vague allusion.

Notwithstanding these defects, most of which might easily be repaired in future editions, we are sure that to public-spirited individuals, members of village-improvement societies or local boards of health, large manufacturers, commanders of ships or troops, architects, and many others in situations involving the health of large numbers of persons, these pages will be welcome and useful. It is doubtful, at least as respects the American public, whether their place could be as well filled by any other extant work. A very liberal use has been made of illustrations. The mechanical execution is most excellent, and the typographical errors are very few indeed.

The Irish Bar. Comprising Anecdotes, Bon-mots, and Biographical Sketches of the Bench and Bar of Ireland. By J. Roderick O'Flanagan. (New York: Harper & Brothers. Franklin Square Library.)—This is a bad specimen of book-making of a kind very common. It is chiefly made up of what are supposed to be the more readable parts of books within easy reach, rearranged and selected with a slight show of editorial discrimination. The history of the Irish bar does contain a great many amusing stories, which might make an entertaining book; but Mr. O'Flanagan is evidently not the person to write it. He apparently has no idea of the difference between a hackneyed and a fresh story, and consequently produces such old acquaintances as Lundy Foot's, or rather Curran's, *Quid rides*, and the most familiar of Sir Boyle Roche's bulls, as if they had not been anybody's stories for fifty years. Here and there, however, we meet some less well-known anecdotes, several of them possessing some historical value. An entertaining account is given of Grady, a native of Limerick, who, after being elected a member of the Irish House of Commons, became a stanch supporter of the Government. When remonstrated with on going against the wishes of his constituents, who opposed the Union, he intimated that the Government had made it worth his while to give them his vote on that question. On this the person who was sounding him cried out indignantly, "What! do you mean to sell your country?" "Thank God," replied Grady, "that I have a country to sell." He seems to have been as unscrupulous in law as in politics and at the bar; was not only a great bully but complete master of the art of influencing the jury by indirect means. Appearing in court one morning in rather depressed spirits, he explained his depression by saying that his "jury eye" was out of order. Of Lysacht, who was called to both English and Irish bars in 1798, and who in literature is known to the curious as the author of "Kate of Garnevilla" and other minor poems, one or two Sheridanesque anecdotes are given. Lysacht, like Sheridan, was generally embarrassed for money, and, also like Sheridan, had a wonderful knack in getting his friends to make loans to him. On one occasion a friend, who was "doing" a little paper for him, said, "Now, Lysacht, I hope I may depend upon your meeting this bill." "Indeed you may," said Lysacht cheerfully, "and the protest along with it." As an illustration of manners in Ireland in the early part of the century, the explanation of the waiter who bursts into the room in which the Bar Mess were sitting at Tralee, amid a din of crashing glass and breaking furni-

ture, and loud-resounding cries, in the room below, that it was the Kerry grand jury "having a fight afther dinner," is worth preserving. So also is the story of the man who cheated O'Connell of a fee, but who, unfortunately, in his escape left his wig in O'Connell's hands. The book contains a good many anecdotes of duelling and fighting; among others that of Thomas O'Meara's reply to a parsimonious client for whom he was conducting a contested election. This gentleman was denounced as "a renegade in religion, a dishonest politician, and disloyal to his country as to his creed," but O'Meara declined to take any notice of the language on the ground that his fee was not "a fighting fee." Among purely professional jokes is that of Chief-Justice Bushe's description of the vacation ramble in Germany of Judge Crampton (a total abstainer) as a *traverse absque hock.*

Ritual of the Altar. The Order of the Holy Communion according to the use of the Church of England. Edited by Rev. Orby Shipley, M.A. Second edition, revised and enlarged. (New York: J. W. Bouton. 1879.)—This volume will be of interest to clergymen chiefly perhaps, and again to clergymen about to begin the practice of ritualism. It is a thick quarto, elegantly printed, and full of curious information and food for reflection for even the evangelical layman. Any one unfamiliar with the liturgy of advanced ritualism in this country, and especially in England, will be able to get from it a more vivid notion of the "practices" which have raised so much dust of late years within the pale of the Church of England than can be obtained from any newspaper or other reports. The Low-church Episcopalian, or even what is known as a "Connecticut churchman," may possibly be surprised and perplexed at the elaborate chancel-directions, so to speak, which are deemed necessary by Mr. Orby Shipley for the celebration of the Communion. They may be as reluctant to have that service termed "the Mass," as it is here termed, as to have it regarded, in Protestant fashion, as a mere commemorative ceremony; and they may infer from Mr. Orby Shipley's manual that the Abbé Martin is nearer right than Dr. Littledale or Mr. Gladstone about the Romish tendencies of English Ritualists. But though this is vehemently denied by the latter, it is a pretty widely-prevalent notion that, in the words of an eminent Episcopal priest of this city, "the present ritual practice of the Anglican Church is uncatholic though her theory be catholic," and we see everywhere evidence of increasing effort to repair this discrepancy. The need of the Protestant Episcopal or Anglican Church for a more catholic ritual is not perhaps universally felt, but it is felt very deeply, as every one will have noticed, in parishes in whose natural conditions there is scarcely anything to foster ritual reform—small Eastern towns and Western frontier settlements, where, at first thought, missionary work seems to demand the most instant attention of the rector. As every one will have noticed, too, the rector's efforts at ritual reform often result unhappily; sometimes his parishioners are so far from sympathizing with them that they openly deride them as mere affectations; sometimes, even when the church is united in sentiment, from a certain awkwardness resulting from unfamiliarity everything goes amiss. With Mr. Orby Shipley's book before him it will be the rector's own fault if his ceremonial is not at once a success. It is provided with introits, collects, epistles, graduals, gospels, offertories, secrets, communions, and post-communions, together with rubrical directions, secret prayers, ritual music, diagrams showing the proper postures and altar arrangements, and, in fine, everything needed by the most fastidious zealot. Withal, the directions are so clear that it would be impossible to mistake them, and they only need to be supplemented, we should say, by constant practice. This is perhaps as far as a lay notice may go in eulogy of the book, though it should be added that Mr. Orby Shipley himself has his doubts as to whether it is not "in some cases absolutely necessary to liturgical completeness, if not essential to sacramental validity."

Scientific Lectures. By Sir John Lubbock, Bart., M.P., D.C.L., LL.D., etc. (London and New York: Macmillan & Co. 1879.)—A handsome book of 187 octavo pages, 54 woodcuts, and a colored plate—a collection of popular lectures and addresses, "which do not profess to contain anything absolutely new," yet are full of matter which will be both novel and highly interesting to the general readers for whom the volume is prepared. The first lecture, on Flowers and Insects, is an epitome of the author's book on British flowers in this relation, which was largely an epitome of Darwin's and H. Müller's popular volumes on the subject. The second is on Plants and Insects in special relation to Kerner's ingenious illustrations of the arrangements in plants by which vagrant and unwelcome visitors to flowers are kept aloof, and to the various kinds of insect mimicry, etc. The third and fourth lectures, on the Habits of Ants, a full presentation of Lubbock's own well-known observations, with an abstract of those of other naturalists, make up a large portion of the volume, and the most widely interesting. At the close we are told that there are three principal types of ants, in their modes of life offering a curious analogy to the three great phases—the hunting, the pastoral, and the agricultural stages—in the history of human development. So this leads naturally to the fifth lecture, an Introduction to the Study of Prehistoric Archæology, and to the concluding Address to the Wiltshire Archæological and Natural History Society, in which Stonehenge is the prominent feature.

À Tire-d'Aile. Poésies. Par Jacques Normand. 1878. 2d ed. (Paris: Lévy.)—*Théodore de Banville. Poésies complètes.* Édition définitive. (Paris: Charpentier.)—*Villanelles.* Par Joseph Boulmier. (Paris: Liseux; New York: F. W. Christern.)—M. Jacques Normand is a young French poet who as a writer of *vers de société* is a worthy compeer of Praed and Prior, of Mr. Austin Dobson, of Mr. Locker, and of Dr. Holmes. His verse at times suggests each of these, while it always has an individual quality. The three elements of excellence in the writing of *vers de société* have been declared to be brevity, brilliance, and buoyancy, and M. Normand's have all these. His verse has almost the polish of Théophile Gautier's, and it has a lyric fervor which at times lifts it above the level of most of its kind, however good; and this fervor, while often amatory and sometimes passionate, is never gross. Indeed, many of the poems are as distinctly moral as Longfellow's, and in much the same way.

The real merit of M. de Banville is that he has enriched French poetry by the revival of the old French metrical forms—the *rondel, rondeau, ballade, villanelle,* and *chant-royal*—a "cluster of forms," he says, which is "one of our most precious treasures, for each of them forms a rhythmic whole, complete and perfect, while at the same time they all possess the fresh and unconscious grace which marks the productions of primitive times." M. de Banville has brought these forms into use again, and his influence has caused their general adoption by many later French poets. Mr. Austin Dobson borrowed them from him, to be followed by Mr. Swinburne, Miss Robinson, Mr. Gosse, and Mr. Andrew Lang. The *ballade* is certainly the best of these forms; the sonnet cannot contain a high thought, or the *rondeau* reflect the changes of a pleasant fancy, better than the *ballade* can give voice with extraordinary flexibility to sarcasm, satire, or righteous indignation. But M. de Banville never equals the *ballade* of Villon or Charles of Orleans, and he has been surpassed by some of his English followers. Certain of the other forms M. de Banville brought into notice are of slight value: the *triolet* is invaluable for epigram, but the *pantoum, chant-royal, rondel,* and *villanelle* are either trifles or *tours de force,* tiresome when not used with extreme moderation.

M. Joseph Boulmier's volume contains forty poems in the *villanelle* form, prefaced by a prose history of the *villanelle.* It is a beautifully printed little book, in which red and black tastefully relieve each other. The poems are pretty, both the *villanelles* themselves and the verses written in early French, with which the volume ends. They are light and graceful, and, it may be as well to add, perfectly pure.

Children's Books.—Mr. John D. Champlin, jr.'s 'Young Folks' Cyclopædia of Common Things' (New York: Henry Holt & Co.) is a plump octavo of nearly 700 pages, clearly printed and freely illustrated with woodcuts. The world of Nature, Science, and the Arts, only, is here drawn upon, and the definitions and descriptions are carefully accommodated, both as regards length and clearness, to the childish mind. The compiler sometimes assumes the first person, as witness his "I have said" (p. 233), or his "I shall tell how" (p. 441); sometimes points a moral, as (p. 280) "That certainly was not a silly goose"; and more or less consciously plays the part of a wise parent who is not restrained from enlivening his instruction with poetry (as in the case of Tennyson and the dragon-fly) and with familiar anecdotes, of which the index contains an imposing alphabetic grouping. On the whole, Mr. Champlin's point of view and execution are deserving of praise. There can be no doubt that the ordinary cyclopædia repels the child by its fulness and technical obscurity; and such an abstract as this ought, as the compiler anticipates, to cultivate the habit of reference, besides saving parents the mortification of having questions put to them which they are unable to answer.

A few criticisms may not be unprofitable. If cross-references in a

dictionary have any value, it must increase in proportion to the intellectual deficiency of those who consult it. For children, therefore, there could hardly be too many. Mr. Champlin by no means neglects them, but he might have been more liberal; *e.g.*, we miss Rubber and Caoutchouc referred to India-Rubber, and Wood-Engraving or Woodcut referred to Engraving. Occasionally his statements are too positive. Thus, in pursuance of his plan of appending to every title its etymology, he attributes the name of the horse-chestnut to the fruit's being fed to horses. This is probably the soundest as it is the simplest view, but it is not beyond dispute. So Coster's claims are balanced against Gutenberg's as of equal weight, with no mention of the fact that the former have been called in question as mythical, if not for ever disposed of, and that by a Dutch critic. In the article on Printing, by the way, when Mr. Champlin, describing how type is set in the composing-stick, says, "beginning at the right, and going towards the left," he completely confuses the young reader, who for the moment stands in the compositor's place, with the stick properly held in the left hand. In the account, under Horse, of the bolas, the three-balled bolas are ignored. We remark that Cricket treats of the insect and not of the game so called, only to add that all games are excluded; Marbles are admitted merely as manufactured articles. Mines and Mining might have been allowed a place, one would think. The most serious general defect of the plan is a want of regular mention of the age of those inventions and discoveries which have done so much to make "life worth living," and of the persons to whom the world is indebted for such benefactions. Under Match we get a date, under India-Rubber a name and a date; but the child is not told when the daguerreotype was invented, or when or by whom lithography, or the electric telegraph; nor when coal was first used, or gas employed for the lighting of cities; and these examples might be multiplied. If the omission resulted from the compiler's systematic exclusion of persons and places from the scope of his Cyclopædia, we should still think it strained; but as it is, it makes still more obvious what room there is, not to say need, for a supplementary volume or volumes of history, biography, and geography.

Another work of a cyclopædic character is the 'Children's Book of Poetry' (Philadelphia: Porter & Coates). In it Mr. Henry T. Coates has gathered together nearly six hundred pieces of verse. Naturally, therefore, he has secured all the variety open to him to secure, since the number of tolerable English poems about children or likely to interest children as such does not, it is probable, greatly exceed six hundred. It has no discoverable unity of thought or purpose. Comprehensiveness seems to have been Mr. Coates's chief aim, and the absence of much of the pure jingle that composes in great part the contents of most collections of this sort is due to his scrupulousness in browsing within the familiar fields of literature only. Any nice sense of juvenile wants and needs, and of what, in literature, is likely to satisfy these, we fail to discover in the collection. Whenever a poem mentions children with any deliberateness, or can be supposed within the grasp of childish comprehension, Mr. Coates seems to have used it, and it is quite impossible to infer the exercise of any selection, judicious or otherwise, except the simplest and baldest, on his part. Its arrangement, too, into departments of "Baby-Days," "Play-Days," "Lessons of Life," "Animals and Birds," "Religion," etc., is at once perfunctory and arbitrary; the last subdivision, "Famous Poems for Older Children," in particular, displays the absence of any consistent scheme on the part of the editor, although it is perhaps true that all the poems may be called famous, and that none are too youthful for advanced adolescence. There are two hundred odd woodcuts, in one or two instances after pictures by eminent artists, but usually of the cheapest order of both design and execution. Children are not, indeed, art critics, but it is the reverse of missionary work to familiarize them from infancy with bad art of this kind. We could wish, also, that Mr. Coates's text were less voluminous, though its curtailment would, we admit, demand some system of exclusion, some standard of admission. It ought to be remembered, however, that his task is a particularly difficult one. Mr. Palgrave's non-success with his 'Children's Treasury' should illustrate that.

Mr. Darwin's narrative powers have been so much eclipsed in reputation by his powers of observation and of insight that the contents of 'What Mr. Darwin Saw' (New York: Harper & Bros.) will be a revelation to a great many people who know nothing of the naturalist of the *Beagle*, or of the author of the 'Journal of a Voyage.' A second surprise will be that a book for children could be compiled by literal extracts (with a few verbal simplifications and piecings) from a work in which lurk the germs of the development theory. It follows, of course, that, being thus made, the book is as readable and instructive for adults as for youth—another singularity in juvenile literature. A certain progression has been observed in the arrangement. In the first section, "Animals," the lizards, turtles, and birds of the Galapagos Islands naturally hold the first place in interest; in the second, "Man," the Fuegian has the post of honor, but older readers will perhaps prize most the passages relating to the Negro, as evidence of Mr. Darwin's fine humanity; in the third, "Geography," the Pampas, the plains of Patagonia, and the beech-covered heights of Tierra del Fuego are about equally attractive; in the fourth and last, "Nature," earthquakes will chiefly arrest attention. The book is beautifully printed and bound, and almost superabundantly illustrated, and is provided with an apparatus of charts, prefaces, and indexes not common to the class.

'The Bodleys Afoot' (Boston: Houghton, Osgood & Co.) is the fourth of a series in which the defunct *Riverside Magazine* renews its youth like the eagle. As the bowl is strong, so will the tale be long, apparently. In the present volume a convenient sailor furnishes with his yarns an excuse for introducing a large part of the illustrations, and a supposed pedestrian excursion from Boston to Hartford furnishes all the rest. We fear that the clever author has not done much tramping himself; but the youngsters will not detect him in that, any more (and this is a graver matter) than they will discriminate between Whittier's "Abraham Davenport," as poetry, and much of the versification which a too indulgent taste permits the Bodley family to commit to memory and repeat on the smallest provocation.

READY ON SATURDAY NEXT.

Hector Berlioz:

Selections from his Letters and Æsthetic, Humorous, and Satirical Writings. Translated by William F. Apthorp. 12mo (Amateur Series), $2.

"Of the great musicians who have recorded their thoughts in words as well as in tones it may be asserted that . . . Berlioz is the most brilliant and interesting. . . . If his musical compositions are remarkable for their brilliant and original instrumentation or sensuous coloring, no less is this true of his writings, which, in imagination, wit, sarcasm, and champagne-like sparkle, remind one of Heine and the best French writers."—*Nation.*

The Magic of the Middle Ages.

By Viktor Rydberg. Translated by A. H. Edgren. 12mo, $1 75.

PRIMITIVE MANNERS and CUSTOMS. By J. A. Farrer. 12mo, $1 75.

THE YOUNG FOLKS' CYCLOPÆDIA of Common Things. Large 12mo, illustrated, $3.

HENRY HOLT & CO., NEW YORK.

BINDER for the Nation, *convenient for receiving* the current numbers, also for permanent binder. Holds one volume. Price, in cloth, 50 cents; half-cloth, 25 cents (stamps). If sent by mail, 15 cents additional. Address THE NATION, Box 25, New York.

J. B. LIPPINCOTT & CO.

Have Just Issued:

A NEW AND CHEAPER EDITION OF

Bigelow's Life of Benjamin Franklin.

The Life of Franklin. Written by Himself. Embracing a brief account of his Ancestors, and an Autobiography of the first fifty years of his life, with a continuous story of his later years and the events of his times. From his original manuscripts, printed correspondence, and other writings. Edited by the Hon. John Bigelow. 3 vols. 12mo, with portrait from steel. New and revised edition. Per volume, extra cloth, $1 50.

"Here is a work that well deserves to be read and studied, to be diligently perused and thought over by the men, and especially by the young men, of America; for it is full of the most various instruction set forth in the most exquisite order."—*Boston Traveller.*

Compendium of Swedenborg's Works.

A Compendium of the Theological Writings of Emanuel Swedenborg. By Samuel M. Warren. Second and revised edition. With a Biographical Introduction by Hon. John Bigelow. With fine portrait from steel. 8vo, extra cloth, $3.

"The numerous quoted passages have been translated anew from the original Latin, and the book will be found sufficient, in its copious extracts, to show the belief, present the doctrines, and exhibit the exemplary character of the sage and saint."—*Philadelphia Press.*

Words for the New Church.

A Serial controlled by the Academy of the New Church. Vol. I. 8vo, extra cloth, $3 50.

"Those interested in the views held by Emanuel Swedenborg and his disciples will find this periodical one of great value."—*Louisville Courier-Journal.*

Ticknor's Poems.

The Poems of Frank O. Ticknor, M.D. Edited by K. M. R. With an Introductory Notice of the Author by Paul H. Hayne. 12mo, extra cloth, $1 50.

Viva:

A Novel. By Mrs. Forrester, author of 'Rhona,' 'Diana Carew,' 'Mignon,' 'Dolores,' etc. Cheap edition. 16mo, paper cover, 50 cents.

"'Viva' is a lively, fascinating love-story, full of exciting incidents, but written in a most pleasing and at the same time a chaste style."—*Commercial Bulletin, Boston.*

The Nation.

NEW YORK, THURSDAY, OCTOBER 23, 1879.

The Week.

WE like fun as much as anybody, but we do not like cruelty, and it seems to us the Scratchers in this State are laying themselves open to the charge of cruelty in their way of treating the Organ. They are still hanging round his "bark" and tormenting him in the most shameful manner, by poking him in the ribs with his own articles about Conkling, Cornell, and the Machine in 1876. They have even gone so far in their brutal sport as to make up a campaign document, composed of extracts from the articles, in which he roars against these persons most lustily, accuses them of treating the voters as "cattle," declares that "the political managers have trespassed too long on the forbearance and good-nature of the people"; abuses Conkling for having "approved of every one of General Grant's most flagrant blunders"; and says he "would be a worthy successor to a President whose policy had corrupted the entire Government and disgraced the country in the eyes of the world."

"Mr. Conkling," he said, "has been President Grant's principal flunky. In obsequious complaisance to the will of the President this Senator has surpassed all others. In every controversy in the party his aid has been consistently given to the least decent and worthy element. If there was rottenness to be covered up, the Senator has always been ready. If the Administration had disgraced itself, his hymns of praise sounded louder than ever. If investigation was proposed, he was quick to asperse the motives of those who urged it, and to throw contempt upon the enquiry itself."

He also warned the people "that the hands of the Machine politicians were still on the Machine." He demanded savagely what the people were going to do about it, and—being fond of imagery—whether, after having thrown grass so long, they would now "try stones."

But in nothing have the Scratchers shown so much want of good breeding as in the reproduction of this passage, which we think one of the greatest efforts of the Old Man's life (March 25):

"There are thousands and tens of thousands of voters who have pretty well determined 'to occupy an independent position—cutting loose from party affiliations, and exerting whatever influence they may possess in securing the success of the purest and best elements in political matters'—and who think that the safety of our institutions is imperilled by a too blind adherence to party. They are weary of allegiance to committees, they are tired of being annually disposed of by conventions, and they are trying to understand how infinitesimal is their share in the selection of candidates for whom they are expected to shout and vote in spite of all doubts and maugre all qualities of conscience. Howls of honor and incredulity—accusations of treason—insinuation of idiocy—will not shake the voter in his solid mind. He cares nothing for names. His allegiance is for the candidate who is worthy of it. No caucus owns him. While in time the broad liberality of his principles will compel the caucuses to consider them and to be chary of experiments upon party fealty and upon popular credulity.'

Now, we would ask these young men whether this is the kind of amusement their teachers and pastors taught them to seek, and whether making game of the aged and infirm is a creditable occupation for persons setting up to be reformers, and proposing to give lessons in government to a Christian community?

If the Scratchers show no reverence for the venerable Organ, it would be idle to expect them to regard Mr. Evarts as sacred. In fact, they handed him a letter on Tuesday actually prescribing the course of his remarks at the "grand Republican rally" at Cooper Union in the evening. As they said they should "regard the support of Mr. Cornell by the chief of the Cabinet as a blow at the permanent interests of the party," they asked him to be good enough "either to preserve a significant silence as regards Mr. Cornell and Mr. Soule," or to explain on what grounds he recommended them, in view of the former's peculiar relations to the Administration and the latter's connection with canal jobbery. Mr. Evarts so far heeded this youthful advice as to say nothing about Soule, but he directly and unequivocally and without the smallest reserve endorsed Mr. Cornell, ridiculed scratching as "voting in the air," and raised again "the Strong Man cry." Mr. Sherman is to follow him next week in a similar vein. We do not think we can add anything to what a correspondent writes on another page as to the indecency of these appearances.

Is the *Evening Post* still satisfied that the account it gave on the 25th of September of the history of Canal and State Prison reform in this State—*i.e.*, that it originated with the Republicans, and was carried by them in spite of Democratic opposition—is correct? Does it still hold to the story which it told of the $6,000,000 having been taken from the Sinking Fund by the Democrats *exclusively*, thus forcing the Republicans to increase the taxes to replenish the fund? If its failure to allude to these matters again is due to unwillingness to have a change of opinion made public, of course we have nothing to say, or we will carry our delicacy and consideration so far as to wait for an answer until after election.

Later news from the Ohio election than we were able to give last week reduces Mr. Foster's majority considerably, but more than correspondingly increases the Republican majority in the Legislature. Foster's plurality is now placed at about twenty thousand, and the Republican majority in the Legislature on joint ballot at thirty-one. For important revision of these figures the official account will be needed. The Democrats, however, are apparently so discouraged that they are not even trying to make the best of a bad bargain. "It is hardly necessary to say," the Cincinnati *Enquirer* telegraphed to a Washington paper, "that the Ohio Democrats will henceforth look to S. Jones Tilden"; and there could hardly be a more complete admission of the present inefficiency of the "Ohio idea." Whether or no "S. Jones Tilden" is materially benefited by the result is nevertheless an open question. On the contrary, there seems to have been a mild Bayard "boom" started in certain Democratic quarters on the strength of the news, and arrangements have been made, we believe, for a "demonstration" upon the Senator's return from Europe. One of the most indisputable effects of the election, and one of the least to be regretted, is the political death of Senator Thurman, whose friends were angrily accused of selling out Ewing in his behalf, and who now seems to have none poor enough to do him reverence. The result in Iowa was, of course, a foregone conclusion. The Republican majority securing the re-election of Governor Gear, hitherto a "minority governor," was something like 25,000, there being four tickets in the field.

The Butler canvass in Massachusetts is being carried on with extraordinary rancor, owing to the fact that he and his principal opponents were not long ago friends and fellow-workers. His hits at them are, therefore, unusually sharp and telling, but for that reason none the less exasperating. He meets their attacks on his character by the retort that he is no worse man now than he was between 1868 and 1875, when they loaded him with honors and rewards and frowned down any criticism of him. Can it be, he asks with much force and humor, that they thanked, eulogized, entertained me, and sent me to Congress by overwhelming majorities, because I was "a bad man"? It is impossible even for his worst enemy not to enjoy this stroke, in which he touches up the true in-

wardness of Stalwartism (which he knows as well as any man living): "When we ask to have these things [State abuses] corrected, they say, 'How terribly those fellows are behaving down South!' If we insist upon having them remedied, they say, 'Have you heard how they're shooting niggers down South?'" Of course such sallies as these are greeted with "applause and laughter." Taken in connection with this the natural man cannot help enjoying his expressions of contempt for Senator Dawes, who stumped Butler's district for him in 1876 on "the bloody-shirt" issue, and showed the terrible consequences to the State and nation of not sending him back to Congress. Mr. Dawes is now stumping vigorously against him, also on the "bloody-shirt" issue, and Butler visits him with scorn.

The most comic episode in the struggle is the fight between the ex-Collector Simmons and the present Collector Mr. Beard. Simmons called Beard "a bankrupt tailor," to which Beard replied that Simmons, when at the head of the Custom-house, filled it with his relations and his wife's relations, who, as he had two wives, were numerous, and employed his aunt (his mother's sister) to scrub the floors and clean the spittoons. Among the other amenities of the struggle is Butler's refusing to be criticised by the editor of the Springfield *Republican*, on the ground that he (the editor) "never wore a uniform except when he was in the House of Correction." In fact, there is something very droll in the contrast between the accounts the speakers give of the exalted character of the Massachusetts voters and the stuff by which they seek to influence their decision. Butler's chances are not by the best judges supposed to be improving, but they are probably not declining, and he is conceded from 80,000 to 90,000 votes, which would be a considerable falling off from last year. It has to be remembered, however, that last year his forces had no idea of their own strength. The regular Democrats have been undoubtedly strengthened by Mr. John Quincy Adams's nomination.

General Merritt's advance to the White River Agency resulted in the complete disappearance of the hostile Utes in the direction of the Uncompahgre Park, and that officer had begun to march after them when he was recalled by an order from Gen. Sherman, the transmission of which was very reluctantly executed by Gen. Sheridan. Before the Agency had been reached, Secretary Schurz had despatched a special agent of his department, Gen. Charles Adams, to visit the Los Pinos Agency and strengthen the chief Ouray, whose good-will had been greater than his influence in opposing the revolt of the northern tribe; to reconcile him to the advance of the troops to White River and allay his fears; and at least to separate the peaceful from the hostile Indians, if he could not effect the surrender of the latter. The news of Merritt's success caused further instructions to be sent Gen. Adams, viz., to endeavor to bring about the surrender, and to communicate his knowledge of the whereabouts of the hostiles and his views of the situation to Gen. Merritt. Gen. Sheridan, hastily associating this mission with Gen. Merritt's recall, telegraphed in his blunt way to Gen. Sherman that "it looks as though we had been pretty badly sold out in this business," meaning evidently from the context that he thought that the Indian Bureau had first got the troops into a scrape, and then tied their hands when just about to follow up their advantage. But Gen. Sherman quickly let him know that purely military considerations had led *him* to propose the withdrawal to Secretary Schurz, who had assented, and that Gen. Adams's mission was not to make but preserve peace, and not to hinder but further the military operations if anything was to be gained by them. It will be a long time, we suppose, before Mr. Schurz's personal or official title to respect will be acknowledged by Gen. Sheridan, and the public should be prepared for yet other occasions on which the soldier's haste and prejudices will contrast unfavorably with the Secretary's forbearance and sacrifice of personal feeling.

The opinions of the Judges of the Supreme Court with regard to the constitutionality of the Pacific Railroad Sinking Fund Act of May 7, 1878, show a wide divergence of judicial sentiment. The Act, it will be remembered, affected both the Union and the Central Pacific roads. Under the acts of 1862 and 1864, passed in aid of their construction, the Government advanced to the companies enormous sums of money, no adequate provision being made for repayment. According to the statement of the majority of the Court, "in less than twenty years from the present time there will become due from the Union Pacific Company about $80,000,000 secured by first and subsidy mortgages, besides the capital stock, representing $36,000,000 more." With the exception of the land-grant and the earnings (paid out from time to time as interest and dividends) there was before the passage of the Act of May 7, 1878, little or no property which could be depended upon to meet these liabilities. The Act provides substantially for the accumulation of a sinking fund for the liquidation of the debt by annual payments into the Treasury. The statute was passed under the reserved authority to alter or amend the original charter. The view taken by the majority of the Court is that it was a perfectly legitimate exercise of this authority, and involved merely a provision for the due performance of contracts already entered into. From this Judges Strong, Bradley, and Field dissent, chiefly on the ground that the Act substitutes a new contract for the old one, sequesters property of the debtor for the benefit of the creditor, and violates the constitutional provision that no person shall be deprived of property without due process of law. There can, however, be no doubt that the companies, taking into account the peculiar manner in which their concessions from the Government were originally obtained, are, in the forum of morals, not in a position to complain of the Thurman act. It is a pity that they could not have been compelled to take steps towards liquidating their debts without the passage of a statute which this conflict of opinion in the Supreme Court shows to be calculated to create a feeling of insecurity as to corporate property.

Mr. Edward Atkinson has lately been drawing attention in the *Herald* to the enormous size of this year's cotton crop—5,074,000 bales—and also to the immense gain in production of the last ten years of free labor over any preceding ten years. He seems to be greatly pleased with it, but we may fairly ask him whether he is not mistaken about the size of the crop? We allege with confidence that if the account his friend, Mr. "Zach" Chandler, gives of the condition of the negro laborers at the South and of Southern society be true, no such crop has been raised. No such result can be, or ever has been, achieved in a community such as Chandler describes. There must be some mistake in the figures. Laborers who are being constantly and on a great scale whipped and murdered, and have to hide a great deal of the time in "the swamps" (*vide* Mr. Sherman), and are frequently burnt out of their houses at night, are not and cannot be in the condition of mind and body to give so delicate a shrub as the cotton-plant the care which its successful culture requires. To avoid the painful conclusion, therefore, that a large number of eminent Republicans are constantly making untruthful statements on the stump we prefer to believe that the last cotton report is a gigantic rebel lie.

The importations of foreign specie continue, and the total which has arrived in this country since the resumption of specie payments is now something over $51,000,000, of which more than $45,000,000 have arrived since the beginning of August. Foreign exchange still rules at figures which warrant imports. The London money market, however, has become firmer, and the actual discount rate has advanced from ¼ of 1 per cent. to 1⅛ per cent. per annum. It is not unlikely that the rate will advance to 3 per cent. before the close of the year; but even such an advance would not check the flow of gold to the United States. At this centre money has been in active demand during the week at 6 to 7 per cent., and borrow-

ers who had "cats and dogs," or securities and shares of questionable value, have had to pay more. The general activity in trade has started a movement among the banks to take out new circulation, and U. S. bonds have accordingly been in demand for hypothecation at Washington to secure circulating notes. To this is due the fact that on a 7 per cent. money market 4 per cent. bonds have advanced ¼ to ⅜. At the Stock Exchange, speculation was comparatively quiet early in the week, but towards the close again became wild and rampant, and all manner of rubbish was included in the rise. Observers who remember the speculative times of 1863 to 1865 say that the present eclipses them in the extent of transactions, in the number of persons—men, women, and minors all over the country—who are now speculating, and in the fury with which prices are knocked about. The spirit of speculation also shows itself in the merchandise markets. Cotton and grain are gambled in on "margins," very much as gold was during the war. Iron, iron products, wool, hops, and in fact nearly every article in the commercial list "from ashes to zinc," are now bought as if there were not enough to "go around," and as if there would never be any more. There has even been a rise in silver bullion to 52⅛*d.* to 52⅜*d.* per oz.; but this, of course, is a foreign matter and not the result of speculation here. The bullion value of the "dollar of the fathers" has advanced to $0.8817.

The Afghan problem does not seem to have come any nearer to a solution for the British Ministry. General Roberts is in Kabul, and has established a military governor of the city and of the district ten miles around, but he appears to hold simply the ground he camps on. The tribes still make attacks on small parties, and, though invariably repulsed, their operations are very wearing for the troops, who are kept constantly on the alert. The telegraph wires, too, are frequently cut and communication destroyed for some days. There seems to be no possibility even of buying the good offices of the Khybar tribes, who still attack the convoys, and yet this Khybar route will soon furnish General Roberts's only line of communication with India, the other routes being impassable in winter. To crown all, Yakub Khan has abdicated in spite of all remonstrance, being apparently as sick of the whole business and just as powerless as old Shah Soojah was in the winter of 1841–2. There seems nothing now for it but to occupy and administer the whole country, and to take and hold Herat, an appalling task in the present condition of Indian and British finances, but one which Lord Lawrence, Sir Richard Temple, and a score of other experienced Indian officials warned the Ministry would be the certain consequence of meddling in Afghanistan at all. It is now proposed to set up Yakub's son, aged five, as his successor.

Of course, the Opposition are making good use of the opportunity all this gives them. Sir William Harcourt and Mr. Grant Duff have been shaking the old prophecies of the Ministers before their eyes with almost cruel persistence and *éclat.* The latter has gone over Lord Salisbury's opinions on the leading events of foreign politics during the last twenty years, and shown that he was almost invariably put in the wrong by events, which makes his direction of the foreign policy of the Empire at such a crisis something fantastic as well as deplorable. The Marquis has, however, replied to his enemies in a speech in Manchester, which was doubtless carefully prepared. The force of it, as far as one can judge from the telegraphic summary, lay in the point that if the Liberals got into power they would not only modify but reverse the policy of the Government abroad, for which even the bulk of the Liberal voters are not prepared, and he is able to educe more or less support for this theory from recent Liberal criticisms. The silence of Lord Beaconsfield about foreign topics at the Aylesbury dinner is said to have been concerted in order to leave the field to Lord Salisbury. His exposition of his great economical discovery of the necessary "three profits" in agriculture continues to excite the merriment of his enemies. He also declared lately that farm-laborers in Canada got from four to four dollars and a half a day; but this being commented on as amazing, he has announced that he meant to say four dollars a week, which is almost equally incorrect. He ought to have followed the example of the witness who swore the horse was fifteen feet high, and "stuck to it."

The result of the visit of the German Chancellor to Vienna is the establishment of a close alliance with Austria, not, however, based on a treaty but on understanding, and this, though England has apparently had nothing to do with it, is a fortunate event for the Ministry, and enabled Lord Salisbury at the Manchester dinner to resume the lofty and defiant tone towards Russia which he displayed in his famous Circular at the close of the Turkish war, but had to lay aside in a pitiful manner when his secret "Memorandum" with Count Shuvaloff came to light. The alliance is to be followed, it is said, by a revision of the tariff of the two Empires, so as to bring them into closer commercial relations. The scheme is likely to be attended with great difficulty, as the Protectionists are much stronger in Austria than in Germany and have more political weight, owing to the fact that the Chambers of Commerce, which are mostly protectionist, form of themselves parliamentary constituencies, and are represented in the Reichsrath. They have recently held a convention at Prague, in which they resolved that they were opposed to a commercial treaty with Germany, unless Austria could obtain a modification of the German tariff favorable to "her commercial, industrial, and agricultural interests." Another difficulty lies in the fact that both England and France, whose rivalry Germany has just been legislating against, would share the benefit of any new arrangement with Austria, under the most-favored-nation clause. But the German Chancellor will probably find a way to carry out his designs.

The war between the Universal Israelite Alliance and the Rumanian Government about the status of the Rumanian Jews continues with great heat. M. Crémieux, the well-known French advocate, now in his eightieth year, is devoting himself vigorously, as President of the Alliance, to the defence of the claims of his brother Israelites under the Treaty of Berlin. In a letter to the Paris papers he ridicules the plan of naturalization by "categories" proposed by the Rumanian Ministry, which he says would only confer citizenship on 1,014 Jews, leaving the lot of the remaining 260,000 without amelioration. He alleges that the Rumanian Jews cannot have a permanent domicile in the country districts; cannot own houses, lands, or vineyards; cannot rent farms; cannot farm the octroi duties; cannot keep hotels or taverns, or sell tobacco, or own real estate in cities; cannot be professors, or lawyers, or druggists, or state doctors, or railroad employees, or reach a higher grade than sub-lieutenant in the army. To all this the Rumanian Minister in Paris, M. Callimaki Catargi, replies that not one of M. Crémieux's charges is true except that Jews cannot own real estate in the country and cannot vote, and he asks, with a certain sophistical force, how is it if they are so much oppressed in Rumania they flock thither, and stay there in great numbers? We presume the truth is that the Jews have all the legal rights that M. Catargi alleges, but are prevented by popular feeling from exercising them, and that they flock to Rumania chiefly from Russia, where their position is worse, and because in Rumania the indifference or incapacity of the Christians for trade and finance has given them the chance of making a great deal of money.

President Grévy and his Cabinet show no disposition to yield submissively to encroachments upon their dignity. A striking proof of this is the trial and conviction of M. Humbert, the returned Communist and Member-elect of the Paris municipality, for insulting the magistracy and defending occurrences which the law regards as crimes. He has been sentenced to six months' imprisonment, and to pay a fine of five thousand francs. A like punishment befell the editor of the *Marseillaise* newspaper on a similar charge, and the paper was suspended for a fortnight.

THE THEORY OF THE GREATEST TROUBLE.

THERE was, in Mr. Beecher's defence of the Machine the other day, a fallacy which, according to the point of view, may be regarded either as very impudent or very amusing. It occurred in the rebuke which he administered to the dissatisfied Republicans for their "indolence" and "preoccupation" in not taking care of primaries and conventions, and for their immodesty in attempting to "overrule those who have taken those pains and have done this work." That is to say, since Mr. Beecher avowed his intention to support Cornell, he presented the labors of the Machine and those of men like Mr. Curtis as precisely the same in kind. He appeared shocked that Conkling's henchmen should have had all the trouble of "fixing things," only to be told that they were not to reap the rewards of their superior industry. Political energy is accordingly divisible not into good and bad, but into greater and less, or into successful and non-successful; and political duty is summed up in Mr. Beecher's exhortation to "accept the best attainable organization," or the rule of the smartest.

This fallacy is by no means original with Mr. Beecher, though the immorality of it is a little more apparent when he fathers it than when it is put forth by the ordinary politician. It constantly vitiates the advice of newspapers whose sincerity need not be questioned, but which assert that the remedy for the Machine lies in attending the primaries, while insisting that if the game goes against the reformer there he is bound to endure the consequences till another time. It is hardly necessary to point out that this is the doctrine of the Machine itself, as it is of all gamblers who play with loaded dice; and its horror on seeing the Scratcher take out his pencil at the polls is precisely that of the gambler whose victim suddenly lays a revolver on the table and calls for a restitution of what has been foully won. When the Independent Republicans complain that they have tried attending primaries, and that it does no good, they are told by the very tricksters whose cunning has defeated them to try again: they were quite right in endeavoring to have their way, and should not be discouraged by temporary failure. Then the Machine's chaplain pats the good little boys on the head, says they will learn the game by-and-bye if they will only stand by the rules; that in politics the great thing is to be a worker; that *labor omnia vincit*, etc.

During the week another party moralist has appeared on the scene with counsel for the Scratchers. Mr. George Bliss, in a very ingenuous letter to the *Times*, accepts Mr. Cornell as sure to make a good Governor, but explains that he opposed his nomination on the ground that a stronger man could be furnished by the Republicans. Now, if the Scratchers had only seconded Mr. Bliss "at the proper time and in the proper place," the nomination would have been prevented and harmony have prevailed. But if political activity is in itself so admirable a thing, it seems strange that it should cease before the opportunity for it has passed. Except the length of the ticket there is no limit to the amount of work which a lively Scratcher can do at the polls, and it is not clear why "indolence" or "preoccupation" should excuse a man from this sort of exercise any more than from attending his primary. The trouble involved in scratching only makes it the more meritorious; for political desert, as Mr. Beecher has argued, is in direct proportion to the pains you take to make your convictions prevail. To vote the ticket prepared for you by the convention prepared by the prepared primary, is worthy of the Castle of Indolence, and no man not hopelessly given over to sedentary habits should submit to it.

We may as well concede that scratching is generally resorted to as a short cut, and is, instead of an added labor, the substitution of a small trouble for a greater. It is a kind of shirking which is particularly distasteful to the Machine and its apologists, whose rôle is to magnify the demands on the voter's time and patience in the discharge of his political duties. They appeal to a well-known weakness of human nature when they dwell on the necessity of organization and the unremitting attention which it imposes, and declare solemnly that men should drop their business and leave their firesides to take part in it, and refer feelingly to the good old times when the town-meeting was the type of universal political interest. They know that nothing is better calculated to disgust the common voter with the whole business, especially if he makes a simple-minded effort to leave no part of his duty neglected. They are perfectly serene in their expectation that he will conclude that politics is a science not to be learned in a day, and organization the proper work of a few, and that if he casts his ballot on election day it is as much as can be required of him. In the end they are sure of his gratitude for saving them from bother, and of his admiration for such unselfish assumption of the burden of carrying on the government. Or if by a miracle he is undeceived, and his manhood revolts at the dictation of the party managers, they depend for their security against a reform movement first on the love of ease which kept him or drew him out of "practical politics," and then on the enormous difficulties of getting control of long-established machinery. They even mock him by pretending that reform within the party is so easy that it should be attempted in no other way.

One of the last lessons in popular self-government is that politics is no exception to the rule that, with the growth of society in numbers and civilization, comes a deepening aversion to those cares which divert a man's mind from the pursuit of happiness. The same instinct which makes him satisfied to call in a policeman to expel an intruder from his house, instead of turning him out by main strength, or to shift on the Fire Department the responsibility of protecting his house against being burnt up, and which makes him welcome every fresh domestic "convenience," drives him irresistibly towards the greatest possible simplification of his share in the political organism. He feels that government is not one of the ends of life, and that, whatever his obligations to it may be, they are inferior and not supreme, and ought to exact of him the least amount of thought and personal discomfort compatible with their fulfilment. He will avoid them as far and as often as he can, and he will not take two steps for them where he can take one. For this reason the working party organization is always greatly outnumbered by the voters on whom it depends, and the full voting strength of any considerable political district is never seen at the polls. The discrepancy cannot be removed by addressing the sense of duty. The remedy lies in diminishing the number of elections and the causes of vacancies in office, and in reducing the whole system of government, as nearly as may be, to the pattern of a private business establishment.

The result of this would be to invest with greater dignity every political act, and to allow deliberation where now there is no chance for it whatever. All the apparatus which leads up from ward meetings to the Saratoga or Cincinnati convention has for its object the suppression of individual judgment, and it is literally true that the polls are the only point in the series at which there is any play for private choice. But then, of course, it is almost always under the disadvantage of having no power beyond a veto, with the risk of seeming to let in a greater evil than the one sought to be condemned. Hence the long impunity of the Machine, and the slow growth of the independence which is at last beginning to perceive that the best way of attending a corrupt primary is by scratching. Men may very well say, and they are saying in greater numbers every day: We will no longer be the dupes of those who tell us that organization is the life of party, and then control the organization beyond our utmost endeavors to employ it in behalf of the principles on which the party professedly rests; who taunt us, while holding up the ticket which we have had no hand in framing, with having neglected our duties at the primaries; who glorify their own artifices at the expense of our "indolence" and "preoccupation." They offer us as the price of reform the theory of the greatest trouble; we offer them in return the theory of the least. They may intrigue, and dicker, and "fix," and nominate by acclamation; we will erase from the ballot what they have concocted at the convention. We will enable an honest voter, without becoming the sport of primaries, to interpose a negative when their work is all done. Robbed of our right to weigh and discuss and choose elsewhere, at

the polls at least we will discriminate. If we have not assisted in "putting the Machine on the track," we shall do our best with the least exertion to throw it into the ditch.

THE GERMAN-AUSTRIAN ALLIANCE.

THE visit of Prince Bismarck to Vienna has excited the greatest interest throughout Europe, and is clearly a political event of the first importance. It is impossible not to look at it at first from what may be called the dramatic point of view. Can anything show better the changing nature of man than the reception given in Vienna to the stern diplomat who, after Sadowa, signed the preliminaries of Nikolsburg and turned the Austrian Empire out of the Bund of German Princes? It is quite true that even at Nikolsburg Bismarck was careful not to inflict on Austria wounds that cannot well be cured; he offended the pride of the Emperor more than the interests of the people. The Prussian military party was very anxious to keep the battle-fields of Bohemia, and to annex this province to Prussia, as the great Frederic had once annexed Silesia. Bismarck, who was not then as powerful as he is now with his sovereign, had the greatest difficulty in imposing moderation on the leaders of the conquering army. His secretary tells us, in those curious memoirs where the true Bismarck is found, that his *patron*, as he always calls him, left the room where Moltke and the others were, retired to an adjoining room, and had become so nervous with his discussion that he began to sob; the generals heard him, and renounced an annexation which would have been a perpetual obstacle to a reconciliation with Austria. Bismarck's object was to give to his own sovereign the undoubted leadership of the German race; meanwhile he considered, as Metternich and Gentz and all the German political philosophers have done, that Austria had a special mission in the East. She was to represent German civilization and culture in the valley of the Danube, in the peninsula of the Balkans, and to stand as a living obstacle to the growing influence of Panslavism, a force which is yet hardly defined in its character and ambitions, but which has always inspired the German mind with a profound and mysterious awe.

The occasion has come for Prince Bismarck to give effect to the German theories about Austria. By the Treaty of Berlin, Austria was allowed to occupy Bosnia, Herzegovina, and the outlying district of Novi-Bazar. This occupation has met with no serious opposition, while it has given great satisfaction to the military party in Austria. The extension of Austria-Hungary towards the East has begun. It is obvious that the occupation of Bosnia and Herzegovina will be indefinitely prolonged. This district is placed between Montenegro on one side and Servia on the other, and these two countries will fall by necessity under the influence of the Austrians. There will be, in consequence, in the peninsula of the Balkans, in the direction of Salonica, a group of states placed under the direct or indirect administration of Austria. Prince Bismarck has in this way given a mission to Austria-Hungary; it will be a long time before all these provinces are well intersected with railroads, and before the effects of the government of the Turks are effaced. Austria has always shown much capacity for governing half-civilized countries; she will accomplish much for the Oriental races, and confer on them benefits which will prove the most effectual barrier against Panslavism. Has Russia the right to complain of these changes? It would seem so, according to the Russian papers, the tone of which has lately become excessively hostile to Germany. It would seem from them as if Russia had been betrayed and deprived of all the results of her victories, and had been a mere cat's-paw for Austria. But these attacks are without sufficient justification. First of all, it is quite evident that, had it not been for Prince Bismarck, Russia could not have entered on the war with Turkey. At the Conference of Constantinople peace seemed at one time almost certain. The representatives of Europe had united upon a certain *minimum* of reforms which were to be imposed upon the Porte; Lord Salisbury assented, as did the French plenipotentiaries and General Ignatieff himself. At that juncture Bismarck sent a telegram to Count Münster telling him that it was a disgrace for Europe to give way before Turkey; that if the others were satisfied with the *minimum* of reforms, he was not. The surprise of Count Münster amounted almost to consternation. The Conference was broken up without having been able to come to an agreement on the Turkish question.

Prince Bismarck not only allowed Russia to enter upon the Eastern war, but he protected her against all the other Powers while the war was going on. There were hours of trial for Russia. Her armies were not well organized, the transports were slow, the army of Osman Pasha was inflicting enormous losses on the army commanded by the Czar in person. Who can tell what thoughts came across the minds of Austrian statesmen during that period? During the siege of Plevna one single Austrian *corps d'armée* entering Turkey would have turned the Russian campaign into a disaster. But Count Andrássy was ruling the policy of Austria, and there was already at that time a thorough understanding between the German and the Austrian chancellors. Russia was, in fact, protected against Austria during the war, and the neutrality of Europe allowed the Russian armies to arrive before Constantinople. Why they did not enter Stamboul, why they did not use the force of accomplished facts and strike one of those blows which seem the blows of destiny and which seldom meet with any resistance, is a mystery which has hitherto not been solved. It seemed almost incredible that Russia should not give her people and the Christian world of the East the pride of occupying Constantinople. When the Congress of Berlin was opened it was clear that Prince Bismarck had repaid, and had repaid generously, the debt of gratitude which Germany owed to Russia. Prince Gortchakoff may now be speaking with bitterness of the ingratitude of Germany; he may regret that he allowed France to be too much humbled and weakened in 1870. He bids her "faites-vous forts"; she can return him the compliment, but it is more difficult for her to make herself strong, as he desires, than it was for him to use his victories and to make them bear the best fruit. The Russians entered into the war with the greatest audacity, not to say imprudence, and when everything had become easy they became timid. They allowed the Powers which had not made the war to draw more prizes than Russia herself. She is left with slices of Armenia and Bessarabia, while England has taken Cyprus, and Austria is now quietly taking possession of Bosnia, of Herzegovina, and of the district of Novi-Bazar. The understanding between Count Andrássy and Prince Bismarck is of long standing. Bismarck has often said that Andrássy was necessary, not only to Austria, but to Europe; but since the visit to Vienna this understanding has become more apparent, and it may have taken the form of some practical arrangements, not to say treaties. These arrangements principally concern France, Italy, and Russia.

As for France, there is little to say. There was a deep-seated irony in the declaration which Prince Bismarck made to M. Teisserenc de Bort, the French Ambassador to Vienna, when he paid him his visit. He said that France had nothing to fear; that Germany was satisfied, quite satisfied. Perhaps this was a distant allusion to a famous saying of Napoleon III. in his days of glory: "Quand la France est satisfaite, l'Europe est tranquille."

As for Italy, she cannot see with much satisfaction the alliance of Austria with the strongest power in Europe. In his recent sensational pamphlet, called 'Res Italicæ,' Colonel Haymerle speaks with great sympathy of the Italian army and of the Italian people; but he warns them against the designs of the party called "l'Italia irredenta," the party of action, which is keeping up an agitation for the annexation of Trieste and of the Trentino. Would it not be much better for Italy, he asks, now that she has completed her unity, to become a friend of Austria? It is quite clear that Austria, backed by Prince Bismarck, will only look with contempt on the "Italia irredenta" party. Italy can get nothing out of the present situation; she was used to obtaining a province after each European war, whether she had herself been beaten or victorious on the battle-field; but this time, as a diplomat wittily remarked, she can get nothing "parcequ'elle n'a pas même été battue." The establish-

ment of the Austrian rule all along the opposite coast of the Adriatic is not pleasant to the Italians; but they must submit to the inevitable.

Russia looks, of course, with much concern on the alliance which has been made at Vienna, and in which she is more interested than any other power. She feels now more isolated from Europe; she found it difficult to carry on a war against the Turks, how could she carry on a war against Germany and Austria-Hungary? In case Russia should begin, a few years hence, a war against Turkey, it would be easy for the Austrians, starting from Novi-Bazar, to reach Constantinople before the Russian armies had crossed the Danube and arrived before the Balkans. Austria has now a flank position which allows her to go straight to Constantinople without encountering great difficulties. Russia is not and cannot be well pleased with such a state of things; she comes out of the war tired, discontented, disappointed; there are in the empire many germs of discontent. Russia must do again what she did after the Crimean war—reconstitute her army, build up railways, civilize her people, develop her immense natural resources. She has a vast future before her; but she needs financiers, engineers, economists, professors more than diplomats. Prince Gortchakoff has done as well as he could; he is a true Russian patriot; but he must have found that there is still too great a distance between the dreams of Russia and the stern reality—between the cup and the lip.

LAND AND LAND REFORMS IN ENGLAND.

London, October 5, 1879.

WE seem to be about to enter, after a short interval, upon a new period of economic legislation. The great commercial reforms which were timidly commenced by Huskisson half a century ago, which were conclusively settled in their principle by Sir Robert Peel, and which Mr. Gladstone developed in detail during his long term of office as Chancellor of the Exchequer in the successive administrations of Lord Aberdeen, Lord Palmerston, and Lord Russell, are about to receive a further application. The time to which Mr. Cobden looked forward, when the doctrine of free-trade, acknowledged with respect to the products of the soil, should be applied to the soil itself, is evidently coming. Lord Hartington's speech on Mr. Chaplin's motion for a Royal Commission of Enquiry into Agricultural Distress marked the conversion of the Whig aristocracy on this point. It is as notable in its way as the Edinburgh letter in which Lord John Russell gave the signal for the repeal of the Corn Laws. The conversion has not been effected by argument, though irrefragable arguments can and will be used in defence of it. The potato disease and the Irish famine repealed the Corn Laws. The beggary of the farmers, the falling rents, and the untenanted acres of landlords will precede the substitution of commercial for feudal principles in the ownership and tenure of the soil. The first effect of the distress is, of course, to provoke an outcry for protection. Familiar quackery occurs more readily to the mind of the farmer class than does unfamiliar political economy. But dear and scanty bread and meat cannot be forced upon a nation which knows what it is to have them cheap and abundant. The demand for protection, or for reciprocity, is simply a signal of distress, a cry of pain, and as such only does it deserve attention. The speeches of Lord Beaconsfield in the House of Lords and at Aylesbury are as good indications of the future as can be desired. He does not understand economic questions, though he is very fond of talking about them; but he clearly sees what are going to be the questions of the future.

Of course, Lord Beaconsfield begins by misrepresenting—or perhaps it would be fairer to put the initial step in the process a stage further back, and to say he begins by misunderstanding—the position of his adversary. He charges Lord Hartington with advocating the artificial creation of peasant proprietorships and the compulsory division of the soil. The same accusations were thrown a generation ago at the heads of Mr. Cobden and Mr. Bright, and provoked a furious encounter between them and the *Times* newspaper. What Lord Hartington asks now is that legislation intended to promote the accumulation and retention of land in a few hands shall be abolished, that settlements shall be restricted to lives actually in existence, and that the law of entail and the custom of primogeniture shall cease. Scope will thus be allowed for the free action of the natural forces of accumulation and distribution, and even for the liberty of personal caprice in the distribution of property. Greater variety would thus be introduced into the rural life of England. Instead of the iron-bound system which now prevails, in which the soil is owned by great landlords, farmed by capitalist tenants, and cultivated by landless laborers, this arrangement, while possibly for a long time predominant, would be gradually and increasingly tempered by an infusion of the old yeoman class and by that of peasant proprietors. The embarrassed landowner, instead of mortgaging the whole of his land for the payment of younger sons' portions or dowries, would clear it of these incumbrances by selling a part, if there were no entail or settlements tying his hands. It is often denied that any such consequences as these would follow. Land, it is said, is a bad commercial investment, and few persons will put their capital into it merely for the sake of the return it brings. The land of England is under-rented. The great landlord, whose income is counted by thousands and tens of thousands a year, compounds for diminished rent by the social ascendency and political authority which make his tenants his electioneering retainers, and enable him to control the representation of counties, and to earn a peerage, if he be a commoner, a step in the peerage if he be a peer already, a seat in the cabinet or a Garter. Smaller men are obliged to follow this ruling example. The sentiment of independence is so little developed in the farming class that they are willing to do personal and political homage for the sake of diminished rent. They like, too, to feel that, in case of a bad year or succession of years, they have a good landlord behind them. They speculate on the return of ten or fifteen or twenty per cent. in hard times. In Ireland this fact accounts for the strange phenomenon that tenants have been found to refuse the fee-simple of their farms, and to pay its full value for the mere tenant-right. They are not so foolish as they seem. They pay for the protection and assistance in emergency of the landlord. They invest in his kindness and good-nature. Of course on such a system as this a healthy self-reliance is impossible. In any other business such a principle would be seen to be absurd. The social evils which spring from it are even more serious than its economic disadvantages. Arrogance and ostentation on the one side, and an unmanly dependence and servility on the other, are its results. These disagreeable moral features are, perhaps, more conspicuous in England than elsewhere, and they painfully mar the finer elements in the national character.

Of course, long-established habits might for a considerable time interfere with the use, by landlord or tenant, of the freedom which the proposed legislation would give them. Landlords might for some time, under the influence of perverted class-feeling, continue to prefer a large and embarrassed to a smaller and free estate. Their greatness in the county would be estimated by the number of acres nominally theirs. The farmer, too, might shrink from severing himself from a landlord to whom he looks up as a patron and an insurance office. But here and there, and one by one, bolder spirits would break through the old routine, and their example would be followed. This is not merely theory, though even if it were, it is so obvious a corollary from human nature that it might be taken for granted. It has, however, even under present conditions, already received ample verification in one of the most important agricultural districts of England. In South Lincolnshire there are no great landlords; the land is mostly held in properties varying from a thousand to fifty or thirty acres, and the properties of fifty or thirty acres are fragments of once larger properties. Whenever a considerable farm is to be sold, it is found most profitable to split it up into small lots—two hundred acres, a hundred and fifty, fifty, thirty, twenty—and these are bought by men who intend to live on and cultivate them. The laborer who has saved a little money, who keeps the village public-house, or whose wife keeps the village shop, borrows a little more and buys a farm of twenty or thirty acres, which he cultivates with his own hands and those of his sons, with occasional hired and neighborly aid. The interest of the debt is paid, and gradually and ultimately the principal. It is noteworthy that the portion of Lincolnshire in which this system prevails suffers less from the general agricultural distress than any other.

It would be erroneous to say that an alteration of the existing laws would make this practice the rule. It exists in the part of Lincolnshire to which we refer because there are no large-acred squires and nobles anxious to monopolize a whole county, and driving the competition of yeoman and peasant out of the field. But it would become the rule in some parts of the country and the healthy exception in others. Probably for many generations England will be mainly owned by great landlords, and cultivated by tenant-farmers through the instrumentality of hired laborers, but it will be raised and tempered by an infusion of yeomen and peasant proprietors. The scientific methods appropriate to large farming, and the energy due to the sense of ownership, thus brought each

into the view of the other, would elevate the standard of agricultural skill and industry. The total productiveness of the country would in all probability be greatly increased.

We are far enough, however, from this result at present. Lord Hartington's speech, justifiable on social and economic grounds, had, of course, its party motive. It is connected with the effort now being very systematically made to win back the counties to the Liberal side. They were its strength before the Reform Bill of 1832, which, by the Chandos clause, handed them over to the Tories. For a long time the farmers will remain the political retainers of their landlords, believing in their patronage and not believing in the protection of the ballot. A more serious hindrance to the reform of the land-system will be the opposition of the great family solicitors, who hold the title-deeds of country gentlemen and are their confidential advisers and social confessors, and whose business would be cut down to nothing if the sale of land was made easy and simple negotiation gave a title. But though these things will delay the reform, it will ultimately be achieved in spite of them. †††

Correspondence.

THE HONEST MONEY LEAGUE.

To the Editor of The Nation:

Sir: I object to the suggestion of your Cincinnati correspondent "S. R. R.," that "under the depraving influence of the legal-tender notes" I have in some way been instrumental in making the term "honest money" appear as "a dissolving view." I do not quite understand how this wonderful stereoptical feat is supposed to have been accomplished, but I feel that the suggestion is not complimentary, and I object to it.

If "S. R. R." wishes to criticise an association formed for the purpose of convincing the people of the folly of irredeemable paper money, for assuming the name of the Honest Money League, he has found fair game, vulnerable to his most carelessly aimed arrows. The name was recognized when it was adopted as open to many objections. It is not precise; it may be also pharisaical. It was simply the least objectionable which could be devised at the time when the League was organized. The name, however, was not allowed to cloud the object which the League had in view—the consummation of resumption at the time fixed by law and the prevention of the many schemes for the issue of "fiat" money. This was its main if not its sole end, and to this it directed all its efforts. The only exception to this course was its publication of Mr. McCulloch's lecture on Bimetallism. When, therefore, the Greenback-inflation party becomes disintegrated and disappears, and Democratic and Republican platforms vie with each other in extolling coin and paper convertible into coin at the will of the holder as the only legitimate currency, its work is accomplished.

It cannot be denied that there is much in the present condition of our national finances, and in the laws which regulate them, to cause grave apprehensions in the minds of thoughtful men. But if one looks back to our situation a year ago, and compares it with our condition to-day, he must be a chronic grumbler of the most dismal type if he does not find ample cause for congratulating himself and his countrymen. Indeed, one need not be naturally very sanguine to see the happy change which has taken place—a fair road opened to the measures which are necessary to put our monetary affairs in the most satisfactory condition. There should not now be any great difficulty, if the work were systematically undertaken, in creating a popular sentiment in favor of retiring and destroying the three hundred and forty-six millions of outstanding legal-tender notes. If the same number of men as originally met to form the Honest Money League, equally in earnest, will organize an association for this purpose, and will give their thoughts and time to the work, it can be accomplished. Here is a fair field for "S. R. R.," and, if he accepts the challenge, it is to be hoped that he will invent some more definite and fortunate name for his association than that of the Honest Money League.

I can speak for a considerable number of those who have sustained the Honest Money League in saying that we consider it the imperative duty of the Government to redeem and cancel the legal-tender notes as fast as they are presented for payment, and that we are in favor of repealing the law of 1878 by which the Secretary of the Treasury is ordered to keep them in circulation, as soon as possible. We also hope that the decision of the Chittenden case by the Supreme Court will show that the greenbacks have already lost their legal-tender character, and that they are now no more than simple demand-notes, kept at par by redemption on presentation.

Lest I should seem to be avoiding the point concerning the silver coinage made by "S. R. R.," I will say that that danger seems to be very greatly lessened by the present temper of the people. The coinage of two millions of silver dollars per month may go on for a year or two yet without damage to our standard of price. These dollars will take the place of the one and two-dollar bills of the national banks, the issue of which is now forbidden by law, and we shall still maintain our gold standard.

In conclusion, let me say that my former letter was not intended to lay "the unction of the aged Simeon" anywhere, but simply to show from the experience of the Honest Money League that popular opinion can be successfully influenced by furnishing correct information in a cheap form on any economic question of present political interest, and to express the hope that a permanent society might be organized for this purpose.

M. L. Scudder, Jr.

Chicago, Oct. 13, 1879.

THE ADMINISTRATION AND THE NEW YORK ELECTION.

To the Editor of The Nation:

Sir: Republicans who have sincerely supported the Administration in its efforts at reforming the civil service are surprised and indignant at the support apparently given by it to the Cornell ticket. If Messrs. Evarts and Sherman, in giving countenance to the supporters of Cornell, were merely overlooking and pardoning personal insults, we could commend their unselfish patriotism. But when they condone opposition to principles which they have taught us to consider vital to the welfare of the nation, we cannot forgive them so easily. President Hayes in his letter of acceptance gave more prominence to civil-service reform than to any other portion of the Republican platform. That admirable letter, so clearly stating and enforcing the need of reform in this respect, won more votes for Mr. Hayes from independent citizens than anything else. These principles were reiterated in the President's inaugural address. It will be remembered that disaffection among Machine politicians was manifested very soon after the inauguration, and the Senate exhibited unusual hesitation and delay in confirming Mr. Hayes's Cabinet appointments. This called forth strong expressions in favor of the President among the people. But the bitterest and most decided opposition to any attempt at improving the public service appeared in the Rochester Convention of 1877, at which Senator Conkling denounced in the most vituperative terms members of the Administration, and all who favored any reform in the civil service. He brought Dr. Johnson into requisition—language of his own failing in bitterness—and said that "reform," instead of "patriotism," was the "last refuge of a scoundrel." Before long a practical test occurred. An order, designed to promote civil-service reform, was issued, which Mr. A. B. Cornell, holding a federal office, disregarded and openly defied. He was therefore removed by the President. When the question of concurrence in his removal came before the Senate Mr. Conkling opposed the Administration, and made one of the numerous "greatest efforts of his life" in striving for his retention in office. Mr. Sherman, in communications to the Senate, showed not only that Mr. Cornell had been contumacious and disobedient, but that he had neglected the duties of his office and ought not to be retained. And now that Mr. Cornell, by Mr. Conkling's personal dictation, has been nominated for Governor of New York, we are told that Mr. John Sherman is coming to our State to advise his friends and supporters to forget the past and vote for Cornell! And we are also informed that Mr. Evarts is to make a speech in favor of the Saratoga ticket, and that this ticket is also approved by President Hayes!

There is something almost ludicrous in the last newspaper reports about Mr. Evarts. They say that he has returned to Washington satisfied, after an interview with Mr. Cornell and Gen. Arthur, that there is no alliance between the Cornell Republicans and Tammany Hall! Credulous Mr. Evarts! Does he forget that when John F. Smyth was in danger of removal for his violations of law, and his extortions from insurance companies, the Tammany Senators came to his rescue and saved him? Does he know that John Kelly avowed that the object of his running was not to be elected himself, but to defeat Robinson—in other words, to elect Cornell? Has he noticed the efforts of Police Commissioners French and Wheeler as champions of Tammany Hall? Has he observed the fulsome praises of Kelly and his chief supporters which appear daily in

the Albany *Evening Journal* and other leading partisan Republican newspapers? Does he suppose that "alliances" of this kind are in writing, under seal, and capable of proof, except as they are proved by the acts of the parties?

Secretaries Evarts and Sherman may choose to abandon the principles which they have seemed to espouse, but I trust they will not be able to carry with them those who have sincerely adopted these same principles, not because members of the Cabinet have advocated them, but because they believe them right. "T. W.," who was opposed to Cornell's nomination on other grounds, advises Republicans now to support him, mainly because Cornell *was* opposed to the Administration in this civil-service business. This is very well for "T. W." and any others who agree with him in opposing civil-service reform; but it is a powerful and controlling reason to those who do approve of the *expressed* policy of the Administration for *opposing* Mr. Cornell as the champion of the Machine doctrines that "to the victors belong the spoils," and that our present civil service is "the best in the world." If the Administration is not willing to stand by its doctrines, *some* of its supporters are.

It is said we must elect Cornell and all his colleagues on the ticket, or the Democrats will win in 1880, and all that was won in the war will be lost. Senator Conkling and Rev. Henry Ward Beecher both seem to be of this opinion. Their speeches in Brooklyn, however, fail to tell us why this is so. Must the Insurance and the Tammany and Canal rings control in New York in order to prevent the "solid South" from coming into power in the nation? Does the "life of the nation" depend on the election as Governor of New York of a man whom a Republican Administration found unfit to be Surveyor of the Port? or as State Engineer of a man who was convicted by a Republican committee—of which Assistant-Secretary Seward was one—of the grossest incompetence and rascality? or on putting into the office of State Treasurer an intriguing Machine politician now before the Supreme Court as defendant in an action brought by some of the most prominent tax-payers of this city, in which he is charged with attempting—by fraudulent collusion with Democratic politicians—to collect a fraudulent claim from the treasury of the city of Albany?

I have no sympathy with the Democratic party; I desire to defeat its attempt to get possession of the Government in 1880, but *non tali auxilio*. The Republican party will be all the stronger next year by such a lesson in favor of the nomination of the best men of the party as will be taught to those who run the Machine by the defeat of Cornell, Wendell, and Soule.

INDEPENDENT REPUBLICAN.

ALBANY, Oct. 13, 1879.

AN OPEN QUESTION.

TO THE EDITOR OF THE NATION:

SIR: The last Legislature of Massachusetts bestowed upon the women of this State the legal right to vote, under the same conditions as men, for members of the public school committees. The law was passed after much hard work on the part of the Woman's Suffrage party. This party regarded the new law as the opening wedge which would eventually clear the way for woman's suffrage in the full meaning of the expression. But a great disappointment has befallen the friends of woman's suffrage in this State. Having overcome the so-esteemed brutal force of a Massachusetts Legislature, they are met by a new difficulty—the, to them, childish indifference of the women themselves. After the most careful instructions touching the manner of registration—which instructions were published in the newspapers of the Commonwealth—there seems to be no general movement on the part of the women of our State to prepare for the new duties awaiting them. The right to vote for school committee, instead of proving a wedge in the hands of the advocates of woman's suffrage, is now being used as a weapon by their opponents, who declare the present indifference of women to be proof positive that the woman's suffrage movement will fail. This, of course, the Woman's Suffrage party indignantly deny, while they contend that, woman's right to vote being indisputable, the suffrage should be conferred on women though but a handful of women desire it.

That the apathy of the women of this State concerning their newly-acquired privilege does not in itself show that woman's suffrage must prove a failure, I admit. That the apathy in question may indicate a very important—indeed, all-important—reason why woman's suffrage will never be a success, I think is unquestionable. So far as this apathy means only an inexperience of new duties and an unwillingness to undertake them, it counts for nothing; or rather it counts for only this, that, from the position taken by the Woman's Suffrage party—the position that women are kept from the enjoyment of certain natural rights by the tyranny of men—the women of Massachusetts show a disgraceful lack of character concerning their rights, which no theory of man's tyranny will satisfactorily explain away. But if, instead of meaning an inexperience of new duties, this apathy referred to points to a permanent natural disqualification in women generally for that amount of public life which voting implies, then the great mass of women will never want to vote, and the woman's suffrage agitation will come to naught. The real question, the vital question still open is this: Are women by nature disqualified for voting? The question, Have women the right to vote? is absurd and not worth considering. Of course women have the right to vote if they wish to vote. No conceivable argument can deprive them of this right. I have that confidence in Nature, however, which leads me to believe that the wishes of the great mass of women will be an absolutely safe guide in settling this matter of woman's suffrage.

In questioning woman's natural qualification for the suffrage, no question is intended to be raised touching woman's mental ability if she choose to divert her mind, in a measure, from its usual channels in the direction of politics. What I do mean to question is, Whether woman's natural duties can be as well performed if she add political duties to them? If they cannot, Nature has disqualified women for the exercise of political duties. Now, the dividing line between the duties—or occupations—of men and women respectively is by no means fixed, and is perhaps less fixed to-day than ever before. This line, however, can never be obliterated. Women can never become soldiers, or sailors, or police, or—to my thinking—State officers. On the other hand, women always must—and their nature will make them always ready to—fulfil the duty of bearing and raising children for the race. This is the special, the all-important function of women, and there is no danger that anything will permanently interfere with it. If woman's suffrage be found to interfere with it, woman's suffrage will be impossible.

I said above that women should vote if they so desired. But by women I do not mean one woman in five hundred. The exceptional woman with a taste for politics argues but little for woman's suffrage in view of the real question to be decided. For it is nonsense to suppose that men and women are so different in nature that special training cannot greatly modify this difference. Indeed, special training has so modified or changed the natures of some women as to make distasteful to them the performance of those duties which I have indicated as the most natural and the most important belonging to women. We have no reason to doubt, then, that the necessity or the desire on their part could make it possible for women to perform many duties belonging to men; but the question is not, What are women capable of doing? the question is, What are women capable of doing consistently with the complete performance of their special duties?

The proposition laid down by woman's suffrage advocates, that any woman wishing to vote should be allowed to do so, does not seem to me defensible. It is perfectly defensible, however, to hold that if any woman chooses to modify or change her nature, or take upon herself duties generally performed by men, she should have perfect freedom to do so; always provided her doing so does not work injustice to her fellow-citizens. For example: Would a woman become a merchant? The door is open to her and should be kept open, and this, too, though there is little doubt that a general following of mercantile pursuits on the part of women would interfere with the due fulfilment of their special function. For the state to prohibit women from mercantile pursuits, however, would be as absurd as for the state to compel women to marry. Why, then, should not those women vote who wish to, however small their number? Because such a course would be unjust to the great mass of women. The right to vote carries with it the duty to vote, and the state has no right to impose upon women in general—as granting the privilege of voting to a few women who wish it would practically do—a duty which nature may have incapacitated them from fulfilling. The Woman's Suffrage party would, of course, deny such incapacity, which would be to deny the existence of the whole question at issue. The question exists, however, and there are more who answer it against woman's capacity for the vote than who answer it the other way; and this is true among women themselves. The only position for the state in the matter is not to answer the question at all, but leave the answering of it to women as a sex. When women with some unanimity demand the suffrage, the state should bestow it. Whether we think so or not, this is practically the position the state takes to-day. Let women as a sex demand the suffrage, and the opposition to their demand would count for little. But besides the injustice to woman of forcing the suffrage upon her, the state owes it to itself not to

grant the suffrage to women until there is good reason to believe they will generally use it. If a large majority of the better classes of women neglect the suffrage when granted, the state opens the gates to all the evils lately pointed out by Mr. Parkman in his recent *North American Review* article. If it be asserted, on the other hand, that the better women will perform their political duties as a matter of conscience, should the suffrage be given, though not demanded by them, then, in view of the open question above-indicated, the state, by forcing women to perform political duties, may be forcing them to do so at the expense of the welfare of the race. However we look at the matter, the only rational course for the state is to withhold the suffrage from women until there is a real and general demand for it.

This conclusion has been reached without meeting the argument, so often brought, that it is unjust that women should have no voice in the election of that body which takes their money from them in taxes, and makes laws for them to obey. In reply to this, it may be said that the great mass of women who feel this no injustice, and who are willing to trust to man to see to it that they are fairly dealt with by the law, can hardly be said to be treated with real injustice. An injustice that is unperceivable to intelligent women generally either can be no injustice to them or else they are hardly fitted, at least as yet, to get rid of this injustice by taking upon themselves political duties. Perhaps they feel that though unrepresented in the deliberations of legislative bodies, as far as votes make representation possible, they are practically represented by a more potent unseen influence over men than their votes would give them. Those women, however, who really feel the injustice referred to deserve our commiseration. This I say with all seriousness. They are in an unfortunate position, whichever way the question of woman's qualification for the vote be decided; for either they are unfortunate in belonging to a sex disgracefully blind to its own rights, or else they are unfortunate in possessing natures out of harmony with what Nature intended woman's nature to be. Their unhappy position, however, can hardly affect the conclusion reached concerning the state's proper position toward woman's suffrage.

If the foregoing be the true philosophy of the woman's suffrage question, would it not be in the interest of woman's suffrage for its advocates to waste less time over the question of woman's right to vote, and concentrate all their strength on the real enemy to their cause—the women themselves? If they fail to convince them, they must accept defeat as Nature's negative answer to the question, Are women naturally qualified to vote? B.

Boston, October 16, 1879.

DEPARTMENT ATTORNEYS.

To the Editor of The Nation:

Sir: In connection with your remarks in your last issue on the speech of Mr. John A. Bentley, Commissioner of Pensions, at the anniversary of the Grand Army of the Republic, I would call attention to the fact, but little known, that under the present laws practically any person, without regard to character, intelligence, or profession, may appear as attorney before the Pension Office or any of the executive departments. This may account in some measure for "Mr. Bentley's prejudice against lawyers," but, as you well point out, he has done much towards magnifying this evil. Nor is an upright attorney protected, for if in any way he infringes the severely technical rules of the Pension Office he is at the mercy of the Commissioner, and may be suspended or debarred from practice at his pleasure.

Bills have been introduced in both Houses of Congress to form a regular departmental bar, under such regulations in regard to admission and exclusion as govern the bar of every court; but, so far, each measure of relief of this sort has failed of passage.—Yours, respectfully,

William B. King.

No. 908 M Street, Washington, D. C., Oct. 18, 1879.

Notes.

THE September-October number of the *Library Journal* recommends itself to all parents and instructors of youth, for it contains a full report of the papers and remarks at the late Boston Conference on fiction and the reading of school children.——We have received the current circular of the Chautauqua Literary and Scientific Circle—an organization for promoting home study with a view to securing "the college student's general outlook upon the world and life." Full information concerning it may be had on application to the President, Mr. J. H. Vincent, Plainfield, N. J. The studies for the present year include Merivale's 'General History of Rome,' Eugene Lawrence's 'Primer of Latin Literature,' 'Philosophy of the Plan of Salvation,' by J. B. Walker, D.D., Blaikie's 'How to Get Strong,' and numerous other text-books which we cannot specify here.——M. Feuardent has disposed of four Tanagra figurines to Mr. Fairman Rogers, of Philadelphia, who has, after Mr. Appleton's example in Boston, presented them to the Academy of Fine Arts in his city. They are all female figures. One has the pointed hat characteristic of these statuettes, two have fans, and the third perhaps had one. For gracefulness of lines the smallest is easily to be preferred. On account of the excessive duties imposed upon antiquities at this port, these four figures are delivered from Canada—a fresh argument against annexation. ——Prof. Charles Eliot Norton has placed on exhibition at 127 Tremont Street, Boston, a collection of drawings by Mr. Ruskin which are partly the exhibitor's own, and partly contributed expressly by Mr. Ruskin. They considerably outnumber the drawings which were shown last year in London in connection with Turner's. The catalogue, like the exhibition itself, is arranged chronologically, and the notes and memoranda appended from Mr. Ruskin's own hand are, if we may use a Teutonic compound, autobiographical-critical.——We have received from G. A. M. Liljencrantz, C.E., Chicago, two charts published by him representing in zigzags the series of thermal maxima and minima daily for one year at four cities in this country. The value of these diagrams will not equal the pains required to prepare them. The description is obscure in saying that "the full lines represent the series of the maximum . . . daily *variations*," forgetting that this last term is commonly employed to denote the *range* within a single period, and not the difference between adjoining periods.——John Wiley & Sons have issued the completed 'Treatise on the Differential Calculus' by Profs. Rice and Johnson, an excellent work. Its philosophy of the calculus is essentially the same as that of the German work of Prof. Karl Snell, of the University of Jena (published in 1846). ——With Part VIII. begins the second volume of Dr. Grove's 'Dictionary of Music and Musicians' (Macmillan & Co.) It opens in the midst of Libretto and closes in the midst of Mendelssohn. Some of the prominent names included are Jenny Lind, Mme. Lucca, Malibran, Liszt, Lulli, Martin Luther, Lowell Mason, and Méhul, and Colonel Mapleson is not omitted. Famous songs like "Lilliburlero," "Lochaber no More," "Malbrook," and the "Marseillaise" have here the words, history, and music given. Lute, Lyre, and Mandolin are the chief musical instruments treated, and under the last is given an inedited sonatina of Beethoven's, composed for the mandolin. Macbeth Music, Magyar Music, Madrigal, and Mass are among the more important general articles. There is a noticeable increase in portrait illustrations, Liszt, Lulli, Malibran, and Méhul being thus commemorated.——Mr. F. W. Foster is contributing to successive numbers of *Notes and Queries* a "Title List of Catalogues of English Plays," including, besides professed dramatic bibliographies like the 'Biographia Dramatica,' all the important sale-catalogues of theatrical libraries.——Mr. Austin Dobson is preparing for the series of "Illustrated Biographies of the Great Artists," issued in this country by the Scribners, a life of Hogarth. A selection of Mr. Dobson's poems is to be published in New York this winter. His Theocritan *villanelle* in the November *Scribner's* was written as an introduction to a forthcoming translation of Theocritus, Moschus, and Bion by Mr. Andrew Lang, whose prose translation of the 'Odyssey' we reviewed not long ago.——We are indebted to Sr. Don Alfredo Chavero, President of the Congress of the Mexican Republic and, besides his prominent legal and political standing, a genuine enthusiast in the antiquities of his country, for the 'Anales del Museo Nacional de México.' It can safely be said that nothing has ever been published on Mexican aboriginal history (excepting, perhaps, the Collections of Documents of Sr. Icazbalceta) exceeding in interest and importance these luxuriously equipped brochures, which contain fac-similes of paintings and scrupulously exact reproductions of monuments, not to speak of the texts, which appear under such signatures as Orozco y Berra, Chavero, and Sanchez. The publication reflects the greatest credit upon our sister Republic, and promises to be of lasting value for science.——In our recent review of 'Fern Etchings' we understated the number of etched plates, which are sixty-five in all. As three of these are double, they represent sixty-eight species.——The Independent Republican Committee, whose headquarters are at 8 Union Square, have issued a timely pamphlet capable of being divided at once into tracts, and well adapted to convince candid voters of the reasonableness of the aims of the movement headed by the Committee.

—More English announcements are: 'The Russians at Home and the Russians Abroad,' by Mr. Sutherland Edwards; 'Russia before and after the War,' by the author of 'Society in St. Petersburg'; 'Cyprus as I saw It in 1879,' by Sir Samuel Baker; 'Travels in Asiatic Turkey,' by Commander Cameron; 'Sunshine and Storm in the East; or, Cruises to Constantinople and Cyprus, 1874–78,' by Mrs. Brassey. Several important works are to be completed—Mr. J. R. Green's 'History of the English People,' with a fourth volume; Prof. Masson's 'Life of Milton,' with a sixth; Lanfrey's 'History of Napoleon I.,' with a fourth; also, Walpole's 'History of England from 1815' will be continued in a third volume from 1832 to 1841; the fourth and fifth volumes of Ihne's 'History of Rome' will appear this season; and Mr. E. A. Freeman will bring out a third series of 'Historical Essays.' In the same branch of literature we must mention a 'History of the Huguenots of the Dispersion,' by Reginald Lane Poole; the 'Correspondence of Gilbert Elliot, First Earl of Minto, while Governor-General of India, 1807–14'; a 'Life of Cobden,' in two volumes, by John Morley; the 'Letters of Charles Dickens,' edited by Miss Dickens and Miss Hogarth; and 'Fifty Years of the British Constitution, from 1830 to 1880,' by Prof. Sheldon Amos. Translations into prose of Dante's 'Purgatorio,' by A. J. Butler, of 'Select Letters of Cicero,' by the Rev. G. E. Jeans; 'Selections from Addison,' edited for the Golden Treasury Series by J. R. Green, and from Shelley, by the Rev. Stopford Brooke; 'Essays on Art and Archæology,' by C. T. Newton; 'Lectures on German Thought,' by Karl Hillebrand; and the 'Folk-Lore of Old Japan: a Budget of Notes about Nypon,' by C. Pfoundes, conclude our summary for the present.

—*Harper's Monthly* for November has the popular character which one expects in this magazine. The opening paper, by W. H. Rideing, treats of the national pike between Cumberland and Wheeling, and is worth reading if only for the glimpse it gives of one of the most beautiful regions in the United States. The writer's imagination is not equal to that of Mr. Howard Pyle, who furnishes several charming illustrations to the article. Mr. S. G. W. Benjamin has a chapter on "Early American Art," of which sundry interesting examples are given in the accompanying engravings. Mr. Benjamin's critical capacity is freshly revealed in sentences like these: "Sully had great refinement of feeling; this is shown in a certain favorite ideal head of a maiden which he reproduced in various compositions. One often recognizes it in his works." In what he has to say of Copley some of his dates would be changed by reference to the latest life of that artist, whose portrait-painting began at fifteen. The warfare against the English sparrow, with which Dr. Coues's name is so prominently connected, is discussed and partly deprecated by one of his associates in the Smithsonian Institution, Prof. H. W. Elliott. This well-known writer relates the history of the introduction of the sparrow into the United States, and sums up the pros and cons of his case by acquitting him as a city bird, and sentencing him to judicious suppression as a country bird. In regard to the moot question whether the sparrow feeds on insects, he suggests rather than makes the point that the young, of which there are three or four broods every year, are fed wholly on insects or their larvæ. Mr. A. A. Hayes, jr., describes what he saw among the cattle ranches of Colorado, and enters into an elaborate estimate of the profits of a business whose magnitude, actual and future, has not yet dawned upon the Eastern public. In his Easy Chair, Mr. Curtis tells a flattering tale of the pecuniary success of the late Summer School of Philosophy at Concord, and finds Sir George Campbell's observations in America highly creditable to his temper and his intelligence.

—There is little in the November *Lippincott* to call for special remark. The second paper of "Rambles of Three" is not more successfully humorous than its predecessor, although we are shown a gentleman in the attitude of the Venus de Médicis, and a lady posing as the Fighting Gladiator, and although the text is fully as amusing as the illustrations. Mr. Oswald continues his Central American sketches acceptably. The first part of a story called "Aimée," by G. H. Peirce, promises well; Mr. J. Brander Matthews writes circumstantially about Sheridan's "Critic," without attempting criticism of course; "Goethe's Mother," by Alfred S. Gibbs, consists principally of letters to and from the "Frau Rath," and is accompanied by an outline portrait of her; "Leadville" is an illustrated and substantially complete account, by I. Bonner, of the new mining city; there are also articles about the raising and exportation of beef in the West, and about the bicycle and how to use it, and poems by Miss Lazarus and Miss Charlotte F. Bates which are not particularly striking. The cream of the number, perhaps, is "Sir Charles Godfrey, Baronet," a short story by Philip Bourke Marston; it has a very delicate flavor, and is in the main so cleverly handled that the reader will regret the cheapening of the tragic element due to a slip or an oversight, very likely, and remediable by the cancelling of a single sentence. In "Our Monthly Gossip" there is a translation from Zola, in which he is at his best and uses his realism to heighten the poetical effect of his picture.

—Mr. Goldwin Smith speculates in the November *Atlantic* as to "The Prospect of a Moral Interregnum," which, since "the realities of faith" seem to him inextricably bound up with "current definitions" (to borrow a phrase from a transcendental writer who holds the contrary opinion), he thinks is good. The replacement of the current theology by Evolution and Agnosticism points to it very clearly, he believes. "Nothing, we must recollect, can in any but a figurative sense be henceforth *sacred*"; "In the struggle for existence he (Napoleon) survived the Duc d'Enghien"; "he (Napoleon) was an Agnostic, thoroughbred; all the more evidently so because he coolly restored religion for the purposes of his policy"; "If Jonathan Edwards found the truth it is very remarkable, since he never sought it for a moment"—there are a number of neat, not to say telling, phrases indeed, which make the paper entertaining reading aside from its value. As to its value opinions will undoubtedly differ. "In the next generation Evolutionists and the belief in the struggle for existence will be clear of the penumbra of Gospel morality, and the world will then have their Sermon on the Mount," is an assertion which must seem to many people less and less likely to prove true, since, measured by the test of experience even, the aforesaid penumbra appears to many as real and valid as any induction can, and to be no whit impaired by the attacks on the theology with which it has hitherto been bound up. It will not, however, be denied that Mr. Goldwin Smith makes out a good case, and that his essay is both serious and stimulating. The same can hardly be said of any other paper in the number. "Our Military Past and Future," which is this month the "sensational leader," views with alarm the condition of American militia, proposes to substitute for it "a force of national volunteers organized by the War Department and commanded by the President," and wants military science added to the studies of the public schools. The article, which is anonymous, addresses its suggestions "not only to the national authorities but also to the American people," but we fear thorough consideration of them will be postponed in both quarters, at least until after the Presidential election of next year. As a pure matter of taste it would, perhaps, have been more satisfactory if a critic of the military capacity and personal bravery of eminent generals in the late civil war had signed his paper. "Irene the Missionary" is finished; "The Waldenses of To-day," a short paper by George E. Waring, jr., is worth reading; "Englishwomen in Recent Literature," which, for some undiscoverable reason, associates Lady Anne Blunt, Mrs. Mark Pattison, and George Eliot, is distinctly the reverse; the reviews are numerous, and, for the most part, well done.

—A correspondent, writing from the University of California, for whose communication in full we are unable to make room, calls attention to the graduates of our so-called Agricultural Colleges as fit subjects for adoption into the army as second lieutenants. Their advantage over other civilians is, first, the general scientific and classical education which they have received—in some cases comparable to that obtainable at West Point—and, secondly, their instruction in military tactics, as required by the law which endowed those colleges, for the express reason that "there might be a large number of educated men, having a considerable knowledge of military affairs, who would be of service to the Government in case of emergency." The last class graduating from the University of California—47 picked men out of the 142 who entered—had been "made familiar with the manual of arms, and the manœuvres of company and battalion drill, target practice, and the use of a battery of field guns," besides having listened to "frequent lectures by a regular army officer on the organization and supply of armies, grand tactics, and the conduct of campaigns." Such men, our correspondent thinks, should by law have precedence of all other civilians in the appointment of second lieutenants.

—We have been favored with an abstract of the civil-service examinations in the New York Custom-house from April 3 to June 3, 1879—for admission only, and not for promotions. Applicants are divided into two grades, (A) if the annual salary is $1,200 or more, (B) if the salary is less than $1,200. For the former there were 266 applicants, for the latter 51. The following statistics concerning them are not without interest. Age: A, ranging from 20 to 72 years (average 42 years, 6 months); B, from 19 to 62 (average 40 years, 9 months). Nationality: native, A, 228, B, 29; born in New York State, A, 140, B, 22. Education: common-school only, A, 56½ per cent., B, 92; academic, A, 33½ per cent., B, 8; collegiate,

A, 10 per cent., B, 0. Previous occupation : in United States civil service, A, 33⅓ per cent., B, 20 ; military, A, 20½ per cent., B, 25½ ; naval, A, 3½ per cent., B, 4. Vocations : these range from a railroad president to a stoker, and are summarized as follows : clerks, A, 38¼ per cent., B, 23⅓ ; mercantile, A, 17, B, 17¾ ; professional, A, 14½, B, 2 ; brokers and agents, A, 13¼, B, 5¾ ; mechanics, A, 10, B, 39½ ; farmers, A, 3½, B, 5¾ ; seamen, A, 3½, B, 5¾. The appointments to vacancies in Grade A were, in the Collector's Office, 9, in the Naval, 4. Their ages ranged from 26 to 54, with an average of 37 years. Ten of the thirteen were born in New York ; six had been in the civil, and two in the military service of the United States ; six had received a common-school education only, six an academic, and one a collegiate ; seven had been clerks, three merchants, one a manufacturer, one a broker, and one an expressman. Their examination standings upon a scale of 100 varied from 96.56 to 91.03, with an average of 93.49. Six appointments to vacancies in the Collector's Office were made from Grade B. Their ages ranged from 30 to 43, with an average of 38 years. One-half were born in New York ; all had been in the United States civil or military service; only one had received an academic education. Four had been clerks, one a policeman, and one a mechanic. Their examination standings varied from 95.6 to 88.75, with an average of 92.16.

—In the October *Nineteenth Century* Mr. Karl Hillebrand begins a series of "Familiar Letters on Modern England," which by and by, probably, we shall see collected, but which, to judge by the opening paper, will also be worth noticing as they appear. A great many things relating to English life Mr. Hillebrand is not going to write about—politics, for instance ; and why so large a portion of the female part of the community "prefer being treated by their male fellow-creatures as sexless comrades, to receiving those homages, rather understood than outspoken, and more of general attitude than of direct courtship, which make the charm of French society." It will be seen from this phraseology that if Mr. Hillebrand abstains from discussing this subject, it is not because he has no opinion upon it ; indeed, our author everywhere in this essay expresses his views with a bluntness and decision which remind one less of a literary critic than of a professor talking *ex cathedrâ*. What strikes him first in modern England is the respect paid to the ways and works of foreigners, a tendency not bad in itself, but bad here because founded not on reason and knowledge but upon whim and fashion. "When I live among the English," says Mr. Hillebrand, "I always feel as if I were aboard ship, and every now and then all the passengers at once rushed to starboard when their attention was called to something on that side, and again to larboard, with the same awkward impetus, as soon as some authoritative voice pointed out something there. . . From a British Thucydides Macaulay has become a species of British Capefigue, and the awkward scholar of Jena and Heidelberg, who did not understand himself, a poetical dreamer, full of hidden treasures of thought ; the flippant and frivolous Parisian wit, half malicious monkey, half good-natured child, the model of all radical and democratic virtues." The cause of the extravagance, if not of the changeableness of British opinion, proceeds, according to Mr. Hillebrand, from British indisposition, or incapacity, to look below the surface. "An English liar, or hypocrite, or humbug is the character easiest to be looked through; partly because the inflexible Englishman wants the suppleness necessary to assume half-true appearances ; partly because such half-true appearances are not admitted by the moral code of English society. . . . Now, a little exaggeration in kindness of manner, in statement, in dignity of behavior, in assertion of principles, is a thing which nobody finds fault with in the Continental nations of old civilization, and which everybody there takes *cum grano salis*. Now, it is this *fable convenue* of political, religious, literary, and social life in France which the English are very apt to take for genuine, when it is not meant at all to be taken thus by those who use it." All this is noticeable, not only in political judgments and in conversation, but also with regard to literature and art, and in the writings of persons who pretend to wide and thorough scholarship. "You hear people speak quietly of Mlle. Sarah Bernhardt and Rachel, of Gambetta and M. Dufaure, of G. Planche and Sainte-Beuve, of O. Feuillet and Mérimée, without the slightest perception of the distance between such names, and the very relative consideration their bearers enjoy in their own country"; and further proofs of the same tendency are given in the shape of quotations from reviews and popular authors like Mr. Lecky. Perhaps the class most hardly hit is that which finds such delight in the use of foreign catchwords :

"To take up only one of those instances of want of *nuance* resulting from a misunderstanding of foreign words and ideas, the word *philistine* is a new expression taken from the German ; and if an Englishman uses it he is bound to use it in the German sense, or to declare he gives it another sense. . . . This word, indeed, has always kept in the German mind something of its origin—the opposition to the liberty and Bohemian life of the student. What constitutes *philistinism* is pedantic regularity of habits, both in life and thought, prosiness, want of enthusiasm, narrowness of social and intellectual horizon, a certain mild conventionalism, and timid shrinking from paradox, noise, and fantasy. Never was there any man less *philistine* than the dashing, bustling, passionate Whig [Macaulay], whose ponderous rhetoric charmed the youth of our generation throughout the civilized world."

—The French opera season has thus far proved very successful. The operas which have been given, "La Fille de Madame Angot," "La Périchole," "Giroflé-Girofla," and "Barbe-Bleue," have all been well given, and have each run for a considerable number of nights. All the parts have been well taken, even the subordinate ones (as, for instance, the *Trois Cousines* in the "Périchole"), and there has been nothing to complain of in the chorus or the orchestra. Of course interest has centred in Capoul, who had never been heard here in opéra bouffe, in Mlle. Paola-Marié, the sister of Irma (through whom the part of *Périchole* first became familiar to New York theatre-goers), and Mlle. Angèle, about whom nothing was known here at all. As to the last, we can only say that if her musical taste and skill were equal to her beauty she would make the most dangerously-fascinating *Lange* on any stage. But she has as a singer very serious faults. She does well enough in energetic passages, but where delicacy and shading are required she breaks down, and, what is worse, frequently sings false. But her appearance is so fine that the blemishes in her singing are not treated critically. With Paola-Mari the case is very different. She is decidedly attractive in appearance and sings almost perfectly in both serious and bouffe methods. She has a refined and pleasing manner of acting, though to our recollection she is inferior to Irma in the "Périchole." She is not such a poetical gipsy and vagabond ; there is a little too much air of business about her Bohemianism, and this does not belong to the part. In other words, she is inferior as an actress to her sister, as she is also to Aimée, whom she surpasses, however, considerably in refinement. Capoul has made in opéra bouffe a success only equalled by that he made some years ago in Italian opera ; and the success in the present case is much the more legitimate of the two. He never had a sufficiently powerful voice for Italian opera, but for the light music of Offenbach and Lecocq a powerful voice is not needed, What is needed is, above all, refinement and delicacy and expression. All these Capoul has to an extraordinary degree, besides that admirable faculty of making love well which counts for so much in any kind of opera. His manner is not at all bouffe, indeed we doubt if he has a conception of what bouffe acting is. He generally acts and sings his parts as if they were serious or genteelly comic, and the result has been a complete triumph. Capoul's method of singing is perfect, and the management of his voice so good that its weakness seldom makes itself felt.

—Besides these stars Mr. Grau's company comprises Mlle. Beaudet, who made her first appearance here in "Le Petit Duc," and has developed a good deal of musical and dramatic talent. She makes a very pretty and pleasing *Paquita* in "Giroflé-Girofla." Of Mézières, Duplan, and Jouard (whose acting of *Pomponnet* in "Madame Angot" struck us as better than ever), it is hardly necessary to say anything. On the whole, the company has proved much stronger than Aimée's, though we do not think it has an actress as good as Aimée. It has produced, however, in every way more respectable performances than Aimée is in the habit of giving ; indeed, the manager has endeavored to restrain the license peculiar to this sort of entertainment by giving the less objectionable operas, and making them as decorous as possible. This sort of reform cannot be carried very far, for expurgated opéra bouffe would be nothing at all. But Mr. Grau has persuaded people that he has been giving a series of operas which are free from reproach. The Muse of bouffe may fairly, now and then, pay to morality the tribute of a little hypocrisy, and this is what the Muse, as managed by Mr. Grau, is made to do. Nevertheless, we must say that the hypocrisy is apparent. Nothing will ever make opéra bouffe an improving or harmless form of entertainment ; and the rapid progress it has made of late years in New York towards a socially respectable status may well fill the moralist with apprehension. Unmarried women do not as yet go to see "Madame Angot" or "Giroflé-Girofla." But will they not in a few years ; and if they do, will it not be even more difficult than it is now to prove to the biassed foreigner that our country is the home of purity and innocence ?

—Colonel Mapleson opened on Monday night the season of Italian opera with a performance of Verdi's "Traviata." Two artists unknown to the New York stage made their début in the two principal parts. Mme. Ambre, who appeared as *Violetta*, has a voice of uneven character and strength. Her middle and higher notes are full and sympathetic, her lower notes weak and wanting in artistic finish. Her interpretation of the leading rôle was not altogether satisfactory. Whilst she possesses much of the graceful ease which is the stamp of French artists, she is unfitted to represent the morbid passions attributed to this most pitiful of stage heroines. The very incapacity, however, may enable Mme. Ambre to appear to greater advantage in other parts. Of the new tenor, Signor Runcio, it suffices to say that he has a pleasant little voice, which, however, is neither strong enough nor sufficiently cultivated to entitle him to take a leading part in Italian opera. Signor Galassi was the same delightful, highly-finished artist that we knew last season. The orchestra, under Signor Arditi, was very strong and effective. As a whole, however, the opening evening was very far from being a success. The audience remained cold and indifferent, and Colonel Mapleson must bring out stronger forces than last night either to ensure an artistic success or, what is of greater importance to himself, to make this year's enterprise a profitable financial investment.

—The first number of a weekly newspaper devoted entirely to music appeared on Thursday last. We welcome in the *Musical Review* a journal which in its line is certainly much superior to any paper of the same class published in this city. The editor states in a short address to his readers that having no connection whatever with any firm engaged in what may be called the musical trade—musical-instrument makers, music publishers, etc.—the purpose of the paper is to represent and view music as an art, not as a profession or calling. The first number, besides very excellent critical remarks on the musical events of the week, contains original articles, general notes on kindred topics, some highly interesting extracts from German musical papers (among which we would call attention to a spirited defence of Schumann's genius, written with all his dignity of style by that veteran critic, Dr. Hanslick, in reply to a very violent attack on the great composer published in Wagner's organ, the *Bayreuther Blätter*), and finally a long and interesting letter from a correspondent in Paris.

—It is often said that the bibliomaniac and the pinakomaniac are not extravagant, but are making a good investment with a certainty of a rise in price; which would be true if there were no such thing as a change of fashion. But many an edition of a Greek or Latin classic that was fought for at the auctions of the last century and brought tens or hundreds of pounds, is now lumber on the booksellers' shelves and would not bring as many shillings. It will be interesting to see if there will be any diminution or reversal in our day of the Molière mania that now possesses France. It seems to be at its height; but no one can tell how far an extravagance of this sort may go. The 1666 edition of the 'Œuvres' (Paris, G. Quinet) sold in 1876 for 5,700 francs, and has since been priced at 7,000 francs ($1,400). Single plays sell at auction for over 1,000 francs, and Morgan & Fatout ask in their last catalogue 2,200 francs for the "Femmes Savantes" of 1673, and 2,500 francs for the "Sicilien" of 1667!

ARNOLD'S MIXED ESSAYS.*

UNDER this title Mr. Arnold has collected nine essays; one, that on "Democracy," published nearly twenty years ago, but the others so recently that they must be familiar to readers of the prominent English reviews. They are as follows: "Equality," "Irish Catholicism and British Liberalism," "'Porro Unum est Necessarium,'" "A Guide to English Literature," "Falkland," "A French Critic on Milton," "A French Critic on Goethe," and "George Sand." Collection of them in one volume has been esteemed a mere piece of book-making by some of the large class of critics permanently hostile to Mr. Arnold, we believe, but what he says in his preface, that they have "a unity of tendency," is true, though, since we gain a preface thereby, we are none the less obliged to him for pointing it out. Literature, he says, is a great force of civilization, but it cannot do everything to secure it, and is indeed only a part of it. Civilization is really the humanization of man in society. This is in great measure the goal of man's endeavor, and the means of attaining it are various. "First and foremost of the necessary means toward man's civilization we must name *expansion*," says Mr. Arnold. The need for expansion is as genuine an instinct as the need for right conduct. Railroads and the telegraph, and "all the conveniences of life by which man has enlarged and secured his existence," are manifestations of this instinct; but that which "we English know best and prize most" is the love of liberty. "The love of liberty is simply the instinct in man for expansion," and the fatal objection to Prince Bismarck's ideal of a benevolent despotism, for example, is that it is "against nature." Besides liberty the love of equality is a manifestation of the instinct of expansion; of this, however, "we English" have little, but it is just as real a tendency as the other, and "inequality, like absolutism, thwarts a vital instinct." The instinct of expansion, in short, manifested by the love of liberty and of equality, is "the basis which man's whole effort to civilize himself presupposes." The basis given, Mr. Arnold sums up the powers which contribute to build up civilization as "the power of conduct, the power of intellect and knowledge, the power of beauty, the power of social life and manners." And he goes on: "That the aim for all of us is to make civilization pervasive and general; that the requisites for civilization are substantially what have been here enumerated; that they all of them hang together, that they must all have their development, that the development of one does not compensate for the failure of others; that one nation suffers by failing in this requisite, and another by failing in that—such is the line of thought which the essays in the present volume follow and represent. They represent it in their variety of subject, their so frequent insistence on defects in the present actual life of our nation, their unity of final aim."

This is excellent constructive criticism of his volume. But it is also a substantially accurate statement of "the unity of final aim" of all of Mr. Arnold's writings, and there is perhaps nothing in this last volume to indicate a revision in any important respect of one's former notion of its author, of his sentiments, and of the value of them. Another way of putting this is to say that Mr. Arnold is still harping on the same string, and there is nothing new to report of him. And doubtless there are many persons of distinguished culture who think of Thackeray's wish that Carlyle would "hang up his damned old fiddle" when they read another essay insisting in the same way and in almost the same phraseology upon the "sweet reasonableness" of another than "the Puritan ideal," and upon "our old remedy, culture," for the cure of all present ills. Nevertheless, several of these essays have an air of practicality that is perhaps a little more distinct and emphatic than heretofore it has been—a definiteness and particularity of statement which many persons may hitherto have missed in Mr. Arnold. The charge of vagueness has been one of the principal charges against the "religion of culture," as it is derisively termed, and of which its promulgator wrote some eight or ten years ago: "It is said to be a religion proposing parmaceti, or some scented salve or other, as a cure for human miseries; a religion breathing a spirit of cultivated inaction, making its believer refuse to lend a hand at uprooting the definite evils on all sides of us, and filling him with antipathy against the reforms and reformers which try to extirpate them. In general, it is summed up as being not practical, or—as some critics familiarly put it—all moonshine." We should say that the criticism which this so happily and vivaciously epitomizes had been gradually decreasing in volume and intensity since 'Culture and Anarchy' was printed, and that it had been to some extent replaced by a recognition on the part of "my countrymen" that "our urgent want now is, not to act at any price, but rather to lay in a stock of light for our difficulties"; or, at least, that such a position was a tenable one.

To several of these essays, at all events, it would not be necessary to apply it. They are none of them, to be sure, essays in practical politics, but they certainly are, as Mr. Arnold says in that on "Equality," "for the thoughts of those who think." The first is a plea for regarding state-action as something which may be right or wrong as circumstances indicate, but which in itself contains no fundamental error or tyranny. "If I were a Frenchmen I should never be weary of admiring the independent, individual, local habits of action in England, of directing attention to the evils occasioned in France by the excessive action of the state. Being an Englishman, I see nothing but good in freely recognizing the coherence, rationality, and effectiveness which characterize the strong state-action of France." The second is a plea for "Equality," by which is meant social equality, and is perhaps the most elaborate and the most substantial in the volume. "Equality before the law," says Mr. Arnold, "we all take as a matter of course; that is not the equality which we mean when we talk of equality. When we talk of equality we understand social equality; and for equality in this Frenchified sense of the term almost everybody in England has a hard word"—Lord Beaconsfield, Sir Erskine May in his 'History of

* 'Mixed Essays. By Matthew Arnold.' London and New York: Macmillan & Co. 1879.

Democracy,' Mr. Froude, Mr. Lowe, and Mr. Gladstone had lately been stigmatizing it each in his own way. Mr. Arnold makes an examination of contemporary national opinion upon the subject, and regards freedom of bequest as a bulwark of inequality, since the constitution of property with which the feudal Middle Age left the societies of Europe was full of inequality and tends thus to preserve itself. And after showing his country to be in a minority of one in the matter, he accuses her social inequality of "materializing our upper class, vulgarizing our middle class, and brutalizing our lower class. And this is to fail in civilization," he dryly adds, proceeding to support his accusation in his familiar manner. "Irish Catholicism and British Liberalism" is a plea for an Irish Catholic university, for recognizing that hostility to Catholicism as such tends to increase its dogmatism and its Ultramontanism, which are its worst side and are already conspicuous in Irish Catholicism, and for transforming the English middle class, if Ireland is still to be governed in deference to its prejudices. The next essay is in behalf of better secondary schools in England, and the next a suggestive review of Mr. Stopford Brooke's 'Primer of English Literature.' That on Falkland—"our martyr of sweetness and light, of lucidity of mind and largeness of temper"—is too familiar to need further mention, and the remaining three contain much delicate and just literary criticism, besides representing the tendency which gives them a place in this volume.

This is not vague or impractical. It is, on the contrary, all very simple and plain. It is, most of it, directed to Mr. Arnold's own countrymen, to one class of them, to one fault of that class: it is, all of it, English, local and personal. This, indeed, we take to be the essential mistake of Mr. Arnold's later writings—their distinctly practical tendency, namely; whether or no they be considered to have any really practical value, is another matter. A writer may merely be "holding out his pouncet-box in the midst of the general tribulation," as Mr. Arnold says he is accused of doing, or he may indicate with precision and power one great source of the evils in question, and advocate with luminous persuasiveness one plain but very widely neglected remedy for them, and yet it may be that his true function is not to be continually concerned with the general tribulation at all. Few Anglo-Saxons probably sympathize with the regret of M. Taine that in Thackeray the gain of morals was the loss of art. But few of Mr. Arnold's sincerest admirers, we imagine, are reconciled to the exclusiveness with which of late years he has devoted himself to his missionary work. It is possible to go along with him completely and still regret this. One may be fully convinced of the provinciality and faith in machinery of "our English race," of the worth of ideas and of knowing the best that has been thought and said in the world, of the nobility of sweetness and the necessity of light, of the just demands of intellect as well as the claims of morals, may even accept the theology and theory of 'Literature and Dogma,' and still regret that pure literature does not more completely absorb his attention. To feel this one need be neither ungrateful for nor tired of Mr. Arnold's advocacy of culture. It is so good a thing that it cannot be too much insisted upon, and few people, we imagine, easily tire of witnessing the way in which he exhibits the inadequacy of Puritan and "progressive" ideals. There is always an intimate pleasure to be obtained by the disinterested observer when the process of flaying somebody is going on, and no one has reached the perfection in this art which belongs to Mr. Arnold. The spectator need fear no remorse accompanying his enjoyment, since it generally happens that the victim is both as unconscious as is consistent with squirming, and guilty as well. And if Mr. Arnold's power and dignity were less than they are it would be possible to go over the list of those whom he has delicately castigated, from Bishop Colenso to that school "whose mission is to bring into order and system that body of truth with which the earlier Liberals merely fumbled," with positive satisfaction. But controversy cannot be said to lose all its evil by losing all its grossness; no one has shown its weakness, and the contrasted strength of statement not deliberately persuasive, better than Mr. Arnold; and, however delightful and instructive it may be, it has at least one serious defect—it takes the place of something else, something, upon the whole, better. "The general public carries away little from discussions of this kind," said Mr. Arnold long ago, "except some vague notion that one advocates English hexameters, or that one has attacked Mr. Newman. On the mind of an adversary one never makes the faintest impression." And later: "Only think of all the nonsense which you now hold quite firmly, which you would never have held if you had not been contradicting your adversary in it all these years." And evangelization necessitates controversy. It is true that writing about literature and contending for nothing, for no principle underlying literary phenomena, so to speak, is only dilettanteism, but there is a level which Mr. Arnold sometimes reaches, upon which he writes in such wise as to show that he is perfectly at home there, upon which we always find him when he gives us joy instead of pleasure, as he says of Joubert, and upon which he seems to evince almost no concern for the transformation of the British Puritan. At such times he brings to literature—to the "criticism of life"—a union of intelligence, culture, divination, and seriousness of thought which many who admire the vivacity that his tact brings to the conduct of controversy never suspect in him. At such times few other writers so well satisfy one's reason, who so effectively stir one's susceptibility. "Freedom of speech may be necessary for the society of the future, but the young lions of the *Daily Telegraph* in the meanwhile are sacrificed," said Mr. Arnold once, and we may say in the same way that the British Puritan certainly needs transformation, but that in the meanwhile Mr. Arnold sacrifices himself. In the meanwhile he is in a measure lost to letters.

RECENT NOVELS.*

THE Southern mind is a very curious subject of study. We hear a good deal of the Southern heart when it is to be fired, and of Southern susceptibilities when they are to be spared, but back of these emotional regions must exist a mental framework of what stand for ideas, which, as giving final direction, must be worthy of investigation. 'The Earl of Mayfield' contains four hundred and twenty-eight pages, and two hundred and twenty of them may be read as any other sane book may be, with more or less satisfaction in the cleverness and variety of the story, although we confess to gloomy forebodings when the hero, Mr. Carew, soothes the pangs of personal bereavement by getting up on his plantation an imitation of the ancient Saturnalia; but on the two hundred and twenty-first page begins, and fills the rest of the book, the purest melodrama. The author apparently considers this the fitting complement to the rest of the story, and the reader rubs his eyes, turns the pages backward and forward, and finally betakes himself to the study of the Southern mind wherein coherence and incoherence stand on precisely the same level.

Thomas Carew, a Southerner with Northern convictions, finds himself in Corinth, in 1862, just after the battle of Shiloh. Having been goaded into the army, and being convinced that the struggle is hopeless for the South, he contrives to get his discharge and makes his way to Memphis, whence, with one companion and a colored boatman, he floats down the Mississippi to his own sugar plantation, a few miles above New Orleans. This voyage, with its tribulations and final success, is very well described, and in quick succession follow his relations with General Butler, commanding in New Orleans, the freeing of his own slaves by Carew, and his departure for New York, having largely increased his fortune by sales of sugar and cotton, and leaving his colored brothers working the plantation better than ever before. In New York he finds himself in the midst of the draft riots, and is joined by a long-tongued and noisy compatriot, who induces him to set off for Washington, with a view of enlightening President Lincoln on Louisiana affairs. This compatriot, De Lancey, is drawn with considerable humor, and all the hurried march of events is represented with simplicity and an occasional vivid touch which makes one feel that the writer knows whereof he affirms.

The war is over, and Mr. Carew is living on his plantation, when he sees an English advertisement for "next of kin." By examining family papers he is convinced that the advertisement relates to himself, and he sets off immediately for England to claim the title and estates of the Earl of Mayfield, explaining to his friends that he is not proud, but he much prefers to be an English peer. In England all doors open before him, his attorney "simply lays the papers before my friend, the Home Secretary"; the Attorney-General is of opinion that "the petitioner has shown sufficient evidence of his right to the dignities of Earl of Mayfield, Baron Carew of Gracedieu, and a Baronet of Great Britain." Carew orders the immediate purchase and restoration of the "Palace of Mayfield," and goes home to receive a call from the Duke of Norfolk, who salutes him as "Cousin Carew," and invites him to take his seat in the House of Lords whenever he likes. The Lord Chancellor sends for him in a day or two, and, after some bowing to the right and left, "the duke gently led the new peer to a bench covered with crimson-velvet, on which he now took his seat as 'Earl of Mayfield.'"

The Earl issues orders for the restoration of park and barbacan, for the emblazoning "of his arms on sundry stone towers, and, adopting the

* 'The Earl of Mayfield: A Novel.' Philadelphia: T. B. Peterson & Brothers.

style of the 'gentlemanly clerk,' for the preparation of a suite of elegant sleeping apartments," and then promptly recrosses the Atlantic, orders all his property in Louisiana sold, and returns to find the palace "like a fairy vision, surmounted from its highest tower with the broad ensign of England"—so that no doubt he had been made Lord-Lieutenant in his absence. Entrance reveals a bewildering mixture of crimson-and-gold lackeys, pointed stone arches, Axminster carpets, and painted glass windows "replete" with ancestors. Then comes a hasty trip to Rome ; Mr. Carew, having got his house ready, looks up and finds a long-lost love, marries her with the jovial assistance of Lord Augustus Loftus, and takes her to England without informing her of his new rank. They reach the "palace of Mayfield" with some confusion of mind on the bride's part, but before she can get her bonnet off, the irrepressible Duke of Norfolk trots in with his wife ! The Duchess addresses the bride as Countess of Mayfield, whereupon she faints, and no lady who respected herself could do less. She recovers, finds that the Duke and Duchess have just dropped in to stay a day or two, without invitation ; there is a vista of a week at Arundel, and the happy couple are seen last in a blaze of glory. The book is a very curious one—there are gleams of humor in the first part ; over the second part no human being can keep his sobriety—chiefly on account of the infantile attitude of mind at the shows of this world. In the first part the writer deals with actual events which have stirred the hearts of his readers ; in the second he wanders into a fool's paradise, where his ignorance and his fantastic standards are equally manifest. His notion of the process by which a claim to a peerage is established is worthy of Victor Hugo. The book is painful but interesting reading as an indication of the specialties of the Southern mind.

A new edition of 'Toinette,' by Albion W. Tourgee, gives an opportunity to call attention to a distinctively American novel of more than the usual merit of its kind. The subject is a difficult one to handle, as it involves in one of its phases the race-prejudice of the North, and in another the caste-prejudice of the South. But, however difficult the problem, it is clearly stated and carried out to its legitimate tragic end with much subtle persuasiveness and candor. Here, however, the author's heart fails him, and after the real close of the story, at Toinette's flight, he adds the perfunctory termination of a happy marriage. This is to be regretted not only because the literary unity of the book is impaired, but because an excellent picture of the present relations the races in the South bear to each other is obscured. The interest in novels of the 'Uncle Tom's Cabin' order is now become historic or wholly intrinsic; but 'Toinette' deals with what are called "living issues," and deals with them well enough to make one desire even better success. 'Figs and Thistles,' by the same author, is marred by occasional whimsicality of a purely American and conscious type, as in the prologue, and now and then by un-English phrases so foreign to the general style of the book as to suggest that the author might have easily avoided them if he had considered such matters important. Indeed, these blemishes change Mr. Tourgee's audience from the lovers of literature to the bright boys and girls who are devourers of stories. The story is of the temptation of a conscientious hero, who from obscure beginnings has pushed himself through college, into business success, and into Congress ; this is made particularly trying, but his wife, who does excellent duty as a *dea ex machinâ*, steps in and rescues her husband in a melodramatic scene. The details are unimportant, and the actual historical properties are used exclusively as properties and have no political interest. The merit of the book consists in its showing of the conjunction of self-reliance and humorous tolerance in American character, the origin and peculiarities of which form the puzzle that so many foreign travellers set themselves to solve.

Miss Bates's novel does not, as part of the title might suggest, deal with the question of claims against insolvent states based on overdue negotiable securities. Her story turns upon the familiar but interesting passion of love, and the bonds she has in mind are those which mysteriously linked the fates of three persons whose fortunes the story pursues, Miss Rachel Poynter, Mr. Oscar O'Grady, and Mr. Frederick Bathurst. Of these three the last-named is a young man of excellent character, but of somewhat *borné* intellect and sympathies, proud, reserved, and of an argumentative turn, who is engaged to Miss Poynter ; the next is a young man of taste, fancy, courage, susceptibility, everything but depth of character; abominably selfish, and quite fitted by nature to charm the heart of woman and make her miserable for life. Miss Poynter is a lovely young woman, full of character, sensibility, and feminine capacity for self devotion. Her heart is torn by the conflicting emotions produced by a growing interest in O'Grady and her sense of duty to her affianced lover, who, it should be said, is very fond of her. The scene is laid on the Nile, the party of which these three are the principal actors making the usual winter journey in the usual Nile boat. The Nile novel is rapidly becoming a branch of literature by itself, and Miss Bates follows all the rules which experience has shown to be proper for its production. Some conflict of feeling in the heroine between two lovers is as much a part of the necessary "business" as the descriptions of the scenery, the natives, and the dahabeah. Miss Bates is somewhat original in her plot. She first breaks the engagement with Bathurst, and substitutes one with O'Grady, though the experienced novel-reader can see with half an eye at the same time that the second engagement will come to nothing. The death of her father, who does not appear to have had much confidence in O'Grady, leaves Rachel in a position in which she has an independence, but not enough to enable two to live upon it luxuriously. O'Grady, who has, beneath his devotion to art and whatever is beautiful and harmonious, a good deal of practical sense as to the relation between income and expenditure, suddenly finds that he is confronted by the staggering thought that if he wishes to marry Rachel he must work for a livelihood. Accustomed as he is to an easy life, and finding it difficult to reconcile himself to the idea of coming down from dry champagne to claret for dinner, he does not long hide his embarrassment from his *fiancée*, who, not ceasing to love him, insists on releasing him from his engagement—a release against which he, however, like an honorable man, loudly protests. This leaves the heroine in rather a melancholy situation, and Miss Bates is clearly of opinion that she never will marry at all. The tale is distinctly a woman's novel, and will not be likely to interest masculine readers very much. It may safely be put into the hands of young girls about to go up the Nile as a sort of sentimental *vade mecum* of that fascinating but dangerous region.

'The Old French Château' is a nice, lively, bugaboo story, apparently of modern times ; a suitable mixture of haunted castles, gipsies, grated vaults, smugglers, battles in the dark, and the inevitable English peer travelling with his family. Things seem a little "mixed" at the end; but this is natural, and in the course of the story there are various points from which the reader does not see his way out at all, which we take to be the object of a mysterious plot.

We wonder if the Mme. Charles Reybaud whose name is on the title-page of 'Uncle César' is the author of 'Le Cadet de Colobrières' and other pretty stories which we remember of old, or whether this writer succeeds to her name as she does to some of her literary gifts. The story is somewhat painful, but there is good character-drawing, and a certain persistent fidelity in treating of the slow, disintegrating processes that affect human character and action, which is anything but commonplace. The buoyant and successful selfishness which at first makes M. Fauberton the delight of his fellow-townsmen is the same sentiment which shapes his subsequent cruel life, and the prudence which seems altogether admirable in Camille's youth slowly dries up the sources of feelings which seemed sincere and might have been controlling. The Messrs. Appleton are fortunate in their translator, whose work is very well done.

We believe it is the Duchess in 'Alice in Wonderland' who constantly remarks : "And the moral of *that* is . . ." Following her example, we should say that the moral of 'Sarah de Berenger' is: "Behold, we suffer fools gladly." A greater fool than Miss de Berenger it would be difficult to find, and she controls the fate of most of the characters. Another woman, whose folly is so steeped in disinterested humility and self-abasement that one hardly likes to call it by its right name, is the other controlling influence in the story, and between the two they make a singular world. The best part of the book is the description of Uzziah Dill, the convict, cobbler, temperance lecturer; the story of his sins, weaknesses, and gifts, his downfall and despair, with the slender thread of rectitude and affection running through his wretched life, make the most original and truest thing in the volume. Of course a book by Miss Ingelow is refined and readable, of course there are pretty scenes in it, but she easily gets off her own ground, and does not get back with that alacrity which would indicate that she knew it.

'Haworth's' does not amount to much. There is an inventor with

'Toinette : a Tale of the South. By Albion W. Tourgee.' New York : Fords, Howard & Hurlbert. 1879.

'Haworth's. By Frances Hodgson Burnett, author of 'That Lass o' Lowrie's.' New York : Charles Scribner's Sons. 1879.

his model; an impossible Miss Ffrench; her very silly father; Haworth, who is essentially the navvy raised to his highest power; with his impossible mother; a few gusts concerning labor and capital. But the tools seem quite unmanageable by the hand that holds them, and after having called up spirits, Mrs. Burnett is forced to let them go without making them speak.

'Madelon Lemoine' will do no harm to anybody. It is not really tedious, though it is long, and the want of truth to human nature in the more ambitious parts is balanced by some good descriptions and the better drawing of some of the minor characters. Mr. Unwin, the clergyman, and his wife are life-like, and their daughter Mary is charming. There must be a considerable class of people in England and America who consider marriage with a peer (present or prospective) the legitimate and natural result of a life of humble duty, and it is to this class that 'Madelon Lemoine' especially addresses itself.

'The Marable Family' describes the very complicated doings of a highly principled and gorgeous family living in Georgia before and during the War of Secession. We have failed to master the plot, which is complicated by theft and adoption of children, but there are a great many of the finest sentiments in the book.

'The Distracted Young Preacher' is a lively little smuggling story.

THE TELEPHONE AND ITS INVENTOR.*

THE Count du Moncel has for a generation been a prolific and popular historian of electrical novelties. Without being especially distinguished for original research, he has the art of arranging heterogeneous materials cohesively, and presenting them in entertaining, readable shape. He is a little inclined to exalt the claims of the scientists and inventors of France, but is reasonably impartial in distributing praise among the scientists and inventors of other countries. He is occasionally superficial, and sometimes falls into serious errors, which are probably necessary consequences of the haste imposed upon him by an apparent attempt to keep up in his reports with the rapid progress of invention and discovery. In the work under consideration he treats of the telephone, microphone, and phonograph as cognate subjects, and has collected a large mass of curious information with reference to them.

The second French edition of this work, published in 1878, contains in its introductory chapter a tolerably correct account of the origin of the invention for transmitting speech telegraphically, which is now distinctively called the telephone, and for which the world is indebted to Alexander Graham Bell, of Boston. The corresponding account in the introductory chapter of the American edition is calculated to convey a grossly erroneous impression of the facts. The two accounts are subjoined, the wider column indicating those portions which are alike, and the points of departure being indicated by two narrow columns. The left-hand column gives the correct translation of the second French edition, and the right-hand column gives the version published by Messrs. Harper & Bros.:

"As early as 1874 Mr. Elisha Gray was occupied with a system of musical telephone, which he wished to apply to manifold telegraphic transmissions, and

[Second French edition.]	[American edition.]
"if it is to be believed, the researches which he had to undertake"	"the investigations which he made in order"

"to establish this system under the best possible conditions, gave him a glimpse of the possibility of transmitting articulate words by electricity. While carrying on his experiments on the telegraphic system, he arranged, in fact, about the 15th of January, 1876, a system of *speaking telephone*, and he deposited the specification and drawings in the American Patent Office, in the form of a *caveat*, or provisional specification. The deposit was made on the 14th February, 1876; on the very same day Mr. Graham Bell also deposited in the American Patent Office a request for a patent in which"

[Second French edition.]	[American edition.]
"in addition to a system of simultaneous electrical transmissions by means of a telephonic apparatus, were mentioned not only a telephonic speaking apparatus based on the employment of *undulatory* electric currents, but also the means which may be employed to obtain *these undulatory currents themselves*, whether by induction or by variations in the resistance of the circuit. The telephonic apparatus which was represented in this *request for a patent* had not, it is true, furnished at first satisfactory results, as Mr. Bell himself admits, but operated under the best conditions it has been able to reproduce speech very well, and it may be considered as the point of departure of the magneto-electric telephones which have furnished the interesting results which are known to us. In the *caveat* of Mr. Gray, it is true, it is only a question of the speaking telephone, and the drawings which are given of it are so exact that an apparatus made according to them would work perfectly, but the principle of this telephone was clearly indicated in the patent of Mr Bell, and under the conditions in which it was placed it was hardly susceptible of application; this was, indeed, a telephone which puts under contribution a pile and a liquid conductor, and the best proof of its small practical importance is that Mr. Gray himself, in the last improvements which he has made in this kind of instruments, has only improved the Bell telephone. Nevertheless, we should consider it as the point of departure of battery telephones, which, improved by Mr. Edison, were to furnish the best results on long telegraphic lines, and which, later, were to give birth to the microphone. "It is known that Mr. Bell was put in possession of the American patent, but this decision has lately been attacked by Mr. Gray before the Supreme Court of the American Patent Office. The sequel will tell on which side was the right."	"he spoke of an instrument of the same kind, but with special application to simultaneous telegraphic transmissions by means of a telephonic apparatus; and the few words which could, in this specification, refer to a telephone with articulate sounds, applied to an instrument which, by Mr. Bell's own admission, had not produced any satisfactory results." "In Mr. Gray's *caveat*, on the contrary, the application of the instrument to the electric transmission of speech alone is indicated, the description of the system is complete, and the drawings which accompany it are so exact that a telephone made from them would work perfectly; this was proved by Mr. Gray himself, when, some time afterward, he finished his instruments, which differed in no respect from the one described in Mr. Bell's statement as worked by a battery. On these grounds Mr. Elisha Gray would certainly have obtained the patent, if the expiration of his *caveat* had not been the result of an omission of form in the Patent Office, which, as we know, decides the priority of inventions in America. An action on the ground of this omission has lately been brought against Mr. Bell, in the Supreme Court of the American Patent Office, to set aside the patent granted to him. If Mr. Gray did not appeal before, it was because he was then wholly occupied with experiments on the system of harmonic telephone, applied to telegraphic communication, and he had no time to attend to the matter."

Judged by the foregoing, the American edition does not contain the corrections and additions made by the author and appearing in his second French edition. The subject is of general interest, and there are some other additions and corrections which may well be made in any future edition. Thus, Mr. Gray executed his caveat on the day on which it was filed—February 14, 1876—while the application of Mr. Bell bears upon its face the evidence that it was executed upon the 20th day of January preceding. Figure 20, on page 57 of both the American and the second French edition, is not, as is asserted, a copy of the drawings accompanying Mr. Gray's caveat, but is a copy of the drawings contained in his application for a patent, made nearly two years afterward, and differs materially from the caveat drawing.

The New York *Tribune* of April 3, 1877, contained a report of some remarks of Mr. Elisha Gray's at a public exhibition on the preceding evening, in which he gave the credit of the invention of the speaking telephone to Mr. Bell, who was, as Mr. Gray said, present at the time in the audience. In a lecture delivered by Mr. Gray in McCormick Hall, on February 27, 1877, he also gave Mr. Bell "full credit for the talking feature of the telephone," as may be seen on reference to the Associated Press reports of that lecture at the time. Mr. Gray was a truthful witness. The real history of the speaking telephone is that Alexander Graham Bell, of Boston, was the first to invent a method of, and apparatus for, transmitting speech telegraphically, by causing electrical undulations similar in form to the form of the vibrations of the air accompanying speech, and that all the so-called telephones which preceded Bell's worked by interruptions of the electrical current, and not only were not intended to transmit speech telegraphically, but could not possibly transmit it; one very good reason for which is that interrupted or discontinuous electrical currents cannot copy the forms of the vibrations of the air accompanying speech, because such vibrations are continuous. All telephones previous to Bell's were intended for signalling by the Morse system, and operated by causing a receiving instrument to give out a musical tone of definite pitch—a long tone, or a long interval between two tones, and a short tone, or a short interval between two tones, corresponding respectively to the dash and dot of the Morse alphabet; the pitch of the tone given out by the receiver being that due to its rate of vibration, which corresponded with the rate or periodicity of the interruptions in the current. In Mr. Bell's invention the sound which is made or uttered at the transmitting station, and which is the prime mover or prime controller of the apparatus, is faithfully reproduced by the receiving instrument. That is to say, the vibrations of the air accompanying the sound made or uttered at the transmitting station cause the transmitting membrane or disc to set up corresponding forms of vibrations, which so vary the strength of the electrical current in the circuit that the membrane or disc at the receiving station, in obedience to the varying attraction of its electro-magnet, is also made to set up the same forms of vibrations, and hence to communicate them to the air and excite in the listener's ear the sensation of sounds like those made or uttered at the transmitting station.

The value of the American publication is, of course, greatly impaired by the presence in it of so misleading an account of the origin of the tele-

'Madelon Lemoine: A Novel. By Mrs. Leith Adams, author of 'Winstone,' 'My Land of Beulah,' etc.' Philadelphia: J. B. Lippincott & Co. 1879.

* 'The Telephone, the Microphone, and the Phonograph. By Count du Moncel.' Authorized translation, with additions and corrections by the author. New York: Harper & Bros. 1879.

phone. It is noteworthy that there seems to have been on some one's part a lack of either patience or ingenuity enough to make the work consistent with itself throughout, as will be seen from the subjoined quotations: Thus, on page 33: "Up to the time of Mr. Bell's invention the transmission of speech could only take place by means of acoustic tubes, or of the string telephones of which we have spoken." Again, page 36, referring to Bell's telephone shown at the Philadelphia Exhibition of 1876: "This telephone, in fact, reproduced articulate words, a result which surpassed all the conceptions of physicists." On page 56, referring to Gray's caveat, it is stated in substance that it contained so precise a description that an instrument made from Mr. Gray's design "would have acted perfectly. This was, in fact, afterward proved by him." Page 72: "The Edison telephone, like Mr. Gray's, which we have already had occasion to mention, is based upon the action of undulatory currents, determined by the variations in the resistance of a conductor of moderate conducting power, which is inserted in the circuit, and the vibrations of a diaphragm before which the speaker stands react upon it. Only, instead of employing a liquid conductor, *which is practically useless*, Mr. Edison has attempted to use semi-conducting solid bodies."

The publishers will doubtless perceive the propriety of revising their translation in another edition, and it seems hardly worth while at present to spend further time in calling attention to the jumble of inconsistencies which the present translation contains. As the commercial interests of the owners of the Bell and Gray patents have now been happily settled, by a compromise which is understood to be satisfactory to all parties, it may naturally be expected that the future English literature of the telephone will not be stained by further attempts to obscure the subject unfairly in the interests of owners of conflicting patents.

A Defence of Philosophic Doubt; being an Essay on the Foundations of Belief. By Arthur James Balfour, M.A., M.P. (London and New York: Macmillan & Co. 1879.)—Mr. Balfour begins his preface by describing his book as "a piece of destructive criticism, formed by a series of arguments of a highly abstract character." He seems to think this statement sufficient to deter the general reader from his pages. It would surely be more than sufficient to deter him from the present notice, were we to attempt in it any analytic report at second hand of the particular highly abstract and concisely-stated arguments which Mr. Balfour uses for his purpose. But as we pen this sad concession there comes over us a compassionate sense of what an exquisite kind of æsthetic enjoyment the general reader is deprived of by his invincible repugnance to the divine exercise of reasoning, for reasoning's own pure sake, about the first foundations of belief. Mr. Balfour's book betrays an analytic power, a neat compression of statement, an ability to see familiar things as if they were strange things, and a dry and ironical humor, which mark his accession to the band of English-writing philosophers as an event of which it may be difficult to measure in advance the importance.

Briefly then, without reference to specific arguments, the purpose of the work is to show that the ordinary scientific conceptions of the world as matter in motion, which existed as such before consciousness supervened, of the uniformity of nature and the law of universal causation, are beliefs wholly without *rational* warrant; that the arguments of the neo-Hegelians in England to establish the absolute certainty of their own principles are nugatory; that all the popular tests of a belief's being certain are worthless; that Spencer's proof of an external world is ridiculous; that the ordinary psychologic idealism, of which Professor Huxley is perhaps the best mouthpiece, is contradictory; that the proof of a belief, and its disproof alike, by an appeal to the necessities by which it was evolved, are irrelevant; and that, finally, science, so far as it pretends to use particular perceptions as premises, reaches conclusions which are suicidal, by showing that no particular perception has any worth. In some admirably-written pages which introduce the book the special province of "philosophy" is defined by Mr. Balfour as the systematic account of the *grounds* of our beliefs and disbeliefs. The grounds or *claims* on belief of all our commonly-accepted creeds, so far at least as they are scientific, do not then consist "in *reasons*. Whatever they may be they are not rational grounds of conviction, raised by their very nature above the reach of criticism. It would be more proper to describe them as a kind of inward inclination or impulse, falling far short of—I should perhaps rather say, altogether differing in kind from—philosophic certitude, leaving the reason therefore unsatisfied, but amounting, nevertheless, to a practical cause of belief, from the effects of which we do not even desire to be released."

But the grounds for any religious belief can be described in quite as dignified a set of terms as this. It is quite true that philosophic men of science are prompt to admit that all science is but an hypothesis, and at most a probable one. But the trouble is that the anti-religious popular scientific professors always speak of religion as if science had made it far more than improbable—namely, impossible. The defence of religious faith against such illogical death-sentences is the positive interest which has animated Mr. Balfour throughout all his pages of destruction. But on this positive part of his task he hardly expatiates at all, and his book will speak as little to the ears of popular theologians as to those of popular scientists. To genuine students of philosophy, who really care for consistent thinking wherever it may lead, we recommend it as one of the most original and refreshing productions of recent years.

The Law of Domicil as a Branch of the Law of England, stated in the form of rules. By A. V. Dicey, B.C.L. (London: Stevens & Sons. 1879.)—A treatise on domicil such as Mr. Dicey's is an important addition to the literature of the law. Considering how much has been written about it by very able men and its great practical importance, it is not a little remarkable that the subject of domicil in many of its parts should be still involved in obscurity and doubt. To those who are familiar with Mr. Dicey's method of discussing legal topics it is unnecessary to say that his examination of it has every merit which can be given by a clear style, and the happy union of a keen power of discrimination with a strong faculty for perceiving and stating general principles. Mr. Dicey is the author of a valuable work on Parties, and was, unless we are much mistaken, the originator of that method of writing law-books (made so familiar, both in England and on this side of the water, by Sir James Stephen's digest of the Law of Evidence) which consists of stating principles of law in the form of rules. As contributions to a possible future code of English law Mr. Dicey's and Sir James Stephen's books are of great interest; but, apart from all questions of codification, they have an immediate practical value as law-books. The new method has many great advantages over the old, of which the chief, perhaps, is that it conduces to great clearness and precision of statement. Though these are in law-books the primary requirements, they are yet conspicuous by their absence from far too large a proportion of current treatises. As between the books of Mr. Dicey and Sir James Stephen, it is hard to say which are best written. Sir James Stephen has been fortunate in taking branches of jurisprudence for his province in which the novelty and success of his treatment compelled immediate attention. Mr. Dicey's have attracted less general attention only because they relate to special and technical branches of the law. Mr. Dicey's present treatise relates, it will be seen, solely to the law of domicil as administered by English courts. "No attempt is made to determine whether the rules which made up the law of domicil, as administered by English courts, are or are not the same as the rules administered by foreign tribunals, and forming, therefore, part of various foreign legal systems." The advantages which this method has in the eyes of a follower of Austin are very obvious to the professional eye. For the English lawyer the rules of law prevailing in foreign countries are not, properly speaking, law at all, since they do not rest upon the only sovereign authority which, for him, has the power of imposing or enforcing sanctions, and a law without a sanction is a contradiction in terms. It avoids, too, the errors "which have arisen from confusing the rules of so-called private international law, which are in strictness 'laws,' but are not 'international,' with the principles of international law properly so called, which are 'international,' since they regulate the conduct of nations toward each other, but are not in the strict sense of the term laws." It should be observed, however, that most of the principles of the law of domicil are the same in all civilized countries, and consequently the greater part of Mr. Dicey's rules state the law of the United States on the subject in stating that of England. The treatise embraces the following topics: the nature of domicil, the ascertainment of domicil, and the legal effects of domicil. It covers the greater part of the subjects included in Story's 'Conflict of Laws.' As an illustration of the ease with which the great bulk of English law may be condensed and digested we may mention that Mr. Dicey brings the entire body of the law on this involved and difficult subject into seventy-three rules, covering twenty-eight pages. The remainder of the book is taken up chiefly with an exposition of the rules, based, of course, in great measure upon an examination of decided cases. We have no space to criticise the work in detail. There are here and there rules, for instance, in the part devoted to the ascertainment of domicil which, we think, might be modified as to form, though not in substance. There appears to be here a slight tendency to lay down, as principles peculiar to the law of domicil, rules which are merely branches of

the general law of evidence. But this is perhaps rather a criticism of the courts than of Mr. Dicey. Altogether we must cordially commend the book to lawyers as a treatise on a branch of English and American law which will be found alike of much practical value in professional practice and of great philosophical interest to the student of jurisprudence.

Lancashire Memories. By Louise Potter. (London and New York: Macmillan & Co. 1879.)—This is a book of unpretentious essays on English country life, written from the personal experience of a cultivated lady. They are pleasant reading for their air of gentle breeding, but principally, perhaps, for the inherent interest of the subject. English rural scenes will probably always continue to have a unique charm for people given over to literature for its own sake. There are character-sketches here where the past and passing generations, with their personal prejudices and idiosyncrasies, are shown in the midst of a forgotten fashion of surroundings; country scenes, with anecdotes of sharp-witted rustics pitted against condescending city-bred curates, the honors of victory resting with the former, to their own satisfaction at least, and forming premises for most unreasonable conclusions; reminiscences of girlish boarding-school life, in which the awkwardness of the English school-girl, which was the despair of the French dancing-master, is naïvely accepted as praiseworthy, and proof of qualities in which the French girl, by reason of her grace, perhaps, is lamentably lacking. The reader will readily recognize the order to which the book belongs, and, we trust, with respect, although doubtless with tempered enthusiasm.

Hector Berlioz:

Selections from his Letters and Æsthetic, Humorous, and Satirical Writings. Translated by William F. Apthorp. 12mo (Amateur Series), $2.

"Of the great musicians who have recorded their thoughts in words as well as in tones it may be asserted that . . . Berlioz is the most brilliant and interesting. . . . If his musical compositions are remarkable for their brilliant and original instrumentation or sensuous coloring, no less is this true of his writings, which, in imagination, wit, sarcasm, and champagne-like sparkle, remind one of Heine and the best French writers."—*Nation.*

The Magic of the Middle Ages.

By Viktor Rydberg. Translated by A. H. Edgren. 12mo, $1 75.

PRIMITIVE MANNERS and CUSTOMS. By J. A. Farrer. 12mo, $1 75.

THE YOUNG FOLKS' CYCLOPÆDIA of Common Things. Large 12mo, illustrated, $3.

HENRY HOLT & CO., NEW YORK.

HARVARD UNIVERSITY.

Instruction in Chinese.

Instruction in the Chinese (Mandarin) language will be given daily in term-time, beginning October 22.

The tuition-fee will be $150 for the academic year, payable by thirds in advance. No fee less than $50 will be received; but the tuition-fee may be remitted to promising students who are unable to pay it. Two hours a day of work with the instructor, and from two to three hours a day apart from the instructor, will be required in order to make satisfactory progress.

The instruction is open upon the above-mentioned terms to any competent person who has a serious purpose of acquiring the language. Students will be received at any time during the year, but may best begin at the opening of the course.

For further information address AMORY T. GIBBS, Secretary.

October 13, 1879.

DAVID G. FRANCIS, 17 Astor Place, New York, Dealer in Valuable Second-hand Books, has always on Sale 25,000 volumes or more of Ancient and Modern Books in various departments of Literature, for Public and Private Libraries. PRICED and DESCRIPTIVE CATALOGUES of portions of the Stock are issued from time to time, and will be forwarded to book-buyers *free of postage.* Orders for any obtainable books, American or foreign, promptly filled at the lowest prices.

IN any family, whether large or small, but especially where the number of children is large, a record of the constitutional peculiarities of each one, and the whole course of its physical development in sickness and in health, is certain to be instructive and may prove invaluable. Such a record is Professor J. B. Fonssagrives's 'Mother's Register,' consisting of a series of tables scientifically arranged for brief and convenient entries. A separate volume for boys and for girls. Price, post-paid, 75 cents per volume, or $1 25 for two volumes. Address PUBLISHER OF THE NATION.

D. APPLETON & CO.

Have just Published:

I.

A Gentle Belle.

A Novel. By CHRISTIAN REID, author of 'Morton House,' 'Valerie Aylmer,' etc. 8vo, paper, price 50 cents.

II.

Christie Johnstone.

By CHARLES READE. Forming No. 43 of Appletons' "New Handy-Volume Series." Paper, price 30 cents.

'Peg Woffington,' by Charles Reade, commonly considered a companion volume to 'Christie Johnstone,' is published as No. 38 of the "Handy-Volume Series." Paper, 30 cents. The two volumes in cloth, uniform, price 60 cents each.

III.

THE

Skin and its Troubles.

Forming the sixth volume of the new "HEALTH PRIMERS." Previously published: 'HEALTH AND EXERCISE'; 'ALCOHOL AND ITS USE'; 'PREMATURE DEATH: ITS PROMOTION OR PREVENTION'; 'THE HOUSE AND ITS SURROUNDINGS'; 'PERSONAL APPEARANCE IN HEALTH AND DISEASE.' In cloth, 16mo, price 40 cents each.

☞ For sale by all booksellers. Any volume mailed, post-paid, to any address in the United States, on receipt of price.

D. APPLETON & CO., PUBLISHERS,

549 and 551 Broadway, New York.

CHINA PAINTERS

May do their own "firing" (of small articles) in a common kitchen stove by use of the

AMATEUR'S MINIATURE KILN.

Price $3 and upwards, according to size. Send stamp for descriptive circular.

N. M. FORD, Port Richmond, N. Y.

For sale also by Society of Decorative Art, 34 East Nineteenth Street, New York City.

BINDER for the Nation, *convenient for receiving* the current numbers, also for permanent binder. Holds one volume. Price, in cloth, 50 cents; half-cloth, 25 cents (stamps). If sent by mail, 15 cents additional. Address THE NATION, Box 25, New York.

SECOND EDITION NOW READY OF

The Life and Work of St. Paul.

By the Rev. F. W. FARRAR, D.D., F.R.S., author of 'The Life of Christ,' etc.

Two vols. 8vo, 1,380 pages, with 4 Maps. Cloth.....$6 00
" " " " Half-calf..... 12 00

"What Dr. Farrar accomplished with such signal acceptance and success in preparing a Life of Christ he has undertaken with similar results in these volumes on the Life of Paul. They form a biographical commentary on the Acts of the Apostles and the Epistles of St. Paul, as the former work was a similar commentary on the Gospels. Notwithstanding the number and variety of treatises on the Life of Christ, Dr. Farrar's work was received with all the interest of an entirely novel effort. For similar reasons this Life of Paul will be read with just as much avidity as if Messrs. Conybeare and Howson, and many others, had not given us admirable helps in following the footsteps of the great Apostle of the Gentiles. . . . In giving the results of diligent research, with great charms of style and pictorial power, Dr. Farrar is a master. He writes the life of one whose history and writings have been the subject of innumerable discourses, commentaries, treatises, critical and imaginative, and yet this biography seems no less fresh and interesting for all that has preceded. Such a result reveals not only the remarkable gifts of the author, but the marvellous character of the subject which he treats."—*New York Observer.*

MODERN CHROMATICS,

WITH APPLICATIONS TO ART AND INDUSTRY.

By OGDEN N. ROOD, Professor of Physics in Columbia College.

Forming No. 26 of "The International Scientific Series." With one hundred and thirty Illustrations. One volume 12mo, cloth, price $2.

From the Saturday Review, London, Aug. 23, 1879.

Chevreul announced the existence of the law of simultaneous contrast, and there can be no doubt that his work has been of considerable use to all since engaged in textile and decorative art. But many of his conclusions have been modified or altered by the observations of subsequent writers.

Professor Rood has now done good service both to science and to art by publishing his present work on color, in which he collects the remarks of the most recent observations by others, and adds to them some valuable contributions of his own.

The subject of contrast, simultaneous or successive, is well illustrated and worked out; and here, as might have been expected, the book will be found of the utmost use to the artist. To him, and to the architect and decorator, and to their employers the chapters on the combination of colors and their practical applications are more especially addressed, and by them may be studied to the greatest advantage.

From the Athenæum, London, Sept. 27, 1879.

The author's chief claim to originality is in the department of practical application of physical laws to artistic generalizations. Being himself an amateur painter, he has studied the question of color both from its scientific and its æsthetic side; and his remarks upon the latter aspect of his subject are singularly free from the affectation and haziness so common amongst artists. At the same time his evident good taste and familiar acquaintance with the best works inspire a certain amount of confidence, which we cannot always feel in the *rationale* of æsthetic preferences given by the mere physicist.

From the Examiner, London, Sept. 13, 1879.

We learn from the preface of this volume ('Modern Chromatics') that the object of the author has been to present in a clear, logical, and attractive form the fundamental facts connected with our perceptions of color, so far as they are at present known or concern the general or artistic reader, and we believe that he has succeeded most admirably in his undertaking. In a book treating scientifically of so subtle a perception as that of the varying tints and hues of Nature, and of the methods by which such perceptions may be artificially aroused, much technical and difficult ground must necessarily be traversed; but Professor Rood has evidently been a conscientious worker himself, and knows the obstacles to be surmounted, and how to remove them from the path of the investigator. The consequence is that he has produced a work which can be read with profit and pleasure by the artist as well as by the man of science, while even those who are quite ignorant of the study of chromatics may learn much from its pages.

The remaining and comparatively larger portion of the work is devoted to the investigation of color in its various artistic and practical developments. The mixture of colors both in the case of colored lights and of pigments is fully dealt with, showing that while the first case is essentially a mere addition of one color to another, a mixture of pigments is complicated by two or more acts of absorption. Of more practical importance to the artist is the question of complementary colors and of contrast of colors, which receive a complete solution in Young's theory, while many of the experiments recorded in the chapters dealing with them afford excellent suggestions for pleasing combinations of tints, which in turn excite and give repose to the nerve-fibres, as is the case in the harmonious gradations of the hues of natural scenery. In fact, the present work, dealing almost entirely with clearly ascertained facts, and having a practical tendency, will form an excellent companion in the artist's studio to the suggestive and speculative work of Mr. Grant Allen on the Color Sense.

From the Scotsman, Edinburgh, Sept. 12, 1879.

Good popular works on chromatics are rare, probably owing to the fact that the subject has an artistic as well as a scientific side, and few authors are equally competent to deal with both. Mr. Rood, Professor of Physics in Columbia College, is one of the few, and his work, which forms the latest volume of the International Scientific Series, bears ample testimony to the fact. In dealing with the subject of color in painting and decoration, he points out an important distinction which, in decoration at least, is apt to be forgotten. "The object of painting," he says, "is the production, by the use of color, of more or less perfect representations of natural objects." The artist is thus to a considerable extent restricted in the choice of his tints. "In decorative art, on the other hand, the main object is to beautify a surface by the use of color rather than to give a representation of the facts of nature. . . . Accurate representations of natural objects are avoided; conventional substitutes are used; they serve to give variety, and furnish an excuse for the introduction of color which should be beautiful in itself, apart from any reference to the object represented. Accurate, realistic representations of natural objects mark the decline and decay of decorative art. A painting is a representation of something which is not present; an ornamental surface is essentially not a representation of a beautiful absent object, but is the beautiful object itself; and we dislike to see it forsaking its childlike independence, and attempting at the same time both to be and to represent something beautiful." To those who wish to know not only the facts but also the method by which they have been reached, no better guide than Professor Rood's work need be desired.

*** *Sent, post-paid, to any address in the United States on receipt of price.*

The Nation.

NEW YORK, THURSDAY, OCTOBER 30, 1879.

The Week.

BEFORE our next issue the elections will be over, leaving many interesting conclusions to be drawn, upon which it would be idle now to speculate. The *Times* has been summing up the canvass in this State in letters from an intelligent staff correspondent, who concludes that Cornell's election is assured. Nevertheless, he asserts that the most noticeable feature of the campaign is "the indifference and apathy which the masses of both parties display regarding its progress and result." There has been no lack of endeavor to rouse popular enthusiasm, he says; indeed, the two parties have exerted themselves much more than has been customary of recent years. Meetings are incessant, the people flock and listen, and even applaud, but still are not "roused." Outside of the meetings there is very little talk of politics; "the observing traveller," who would like to have it, does not overhear it and cannot readily get it. "There is hardly a Democrat in the State who is not quite willing to admit that against Mr. Cornell's character as a private citizen or a public man not one word can with truth be said; and it is difficult to find a sensible or intelligent Republican who denies that Lucius Robinson has been a very good governor, and that the interests of the State might, without danger, be again given into his hands." This, if true, is remarkable enough; but the correspondent adds: "Under such circumstances, as may readily be imagined, there is but little opportunity for discussion." He forgets, however, that if we are to believe the Republican stump-speakers, from Mr. Evarts down, the issue is not at all whether Mr. Cornell is an honest and capable person, or whether Mr. Robinson has been a faithful governor; nor is it in the smallest degree local, but wholly national. Hence the Administration excitement on the platform; and if there is any good reason for this, why should the audience grow cold as soon as it leaves the hall, and be silent on the railroads and in the hotels, and find "but little opportunity for discussion"?

Mr. Sherman's speech at the Cooper Union on Monday evening was more discreditable than Mr. Evarts's, by as much as the Secretary of the Treasury was more immediately concerned in the dismissal of Cornell. In other respects they differed but little. Both declared Mr. Conkling's puppet a mere name in the present canvass: "it is the cause, not the man," as Mr. Sherman expressed it. Both made the Southern question the staple of their exhortations, and drew the same false moral from the Chisholm and Dixon murders; though here, it is only fair to Mr. Evarts to say that he was easily surpassed by his colleague in drawing a misleading picture of the actual condition of the South. Both, finally, ignored civil-service reform, Mr. Sherman rather ostentatiously; for he opened his speech with a careful statement of the present Republican platform, from which the most important plank in the Cincinnati platform of 1876 had completely disappeared. He concluded his speech by saying that he knew of nothing that would disqualify Mr. Cornell for the office to which "he was nominated by a Republican convention fairly and openly"; that the President "has openly expressed his desire for the success of the entire Republican ticket"; and that as for himself, regarding the election of Mr. Cornell "as of the highest national importance," if he had "a thousand votes and a thousand voices they would all be for him." This is the very bouffe of politics.

Mr. Sherman's account of the actual condition of the South is so extraordinary in a public officer, part of the Federal Administration, and bound by his very position to know the essential untruthfulness of his representations, that it calls for the severest censure. At a time when the crop which is peculiarly associated with negro labor is annually on the increase beyond the production of the palmiest days of slavery, the Secretary of the Treasury dares to say that "whole communities" at the South "are slowly decaying in all the elements which would tend to make them prosperous and happy." Mr. Boutwell himself, looking out of his car-window, would hardly have returned from the South with such a report as that. Mr. Sherman has not lately been South, except into Kentucky, where he was very careful the other day not to indulge in talk like this, or to allege that "a controlling minority in some of the Southern States . . . has reduced the body of the negroes at the South to a condition but little better than that of slavery." This language might have passed in the days when outrages were manufactured for political purposes, but it is ridiculous now. Mr. Sherman asserts that "no Republican speech, pointing out the errors and wrongs of the laws devised by the ruling class, could be made in these Southern States without danger of life or liberty." This is not true, but if it were, we should like to ask him whether freedom of speech is likely to be promoted south of Mason and Dixon's line by reckless and extravagant declamation north of it concerning Southern society. What sort of a preparation is it for Mr. Sherman's joining in his own canvass in that section if he secures the Republican nomination next year? or what for the humbler stump-orator honestly seeking to recommend his party to a suspicious and hot-blooded population?

Two days before, in a speech at Paterson, New Jersey, Mr. Sherman considerably modified the Stalwart position. In the beginning, Stalwartism made *all* voting at the South, and, in fact, the preservation of the peace at the South, matter of Federal concern, and all Southern crimes and outrages, such as the Chisholm murder, affairs on which elections all over the country, and especially Federal elections, ought properly to turn. At this very moment Republicans in New York are asked to vote for Cornell for the State Governorship because of the Chisholm and Dixon murders in Mississippi. Secretary Sherman has now, however, considerably reduced the sphere of Stalwart responsibility by declaring that what the Republican party demands is the right to protect voters at Federal elections, while in local elections the State voters "may cheat each other as they please." This will be cold comfort for the negro voters at the South, who have been taught to look for Federal protection under all circumstances, because it is in State elections they are most interested, and it is as State voters that they are most exposed to violence and intimidation.

But it would probably be difficult to get any Stalwart to define his exact position with regard to Federal power at the South, although he is quite clear about its limits at the North. Indeed, there is a wide discrepancy between the accounts given by Stalwarts of their grounds of complaint. Mr. Sherman says now he will be satisfied if Federal voters are protected; but others complain of the appearance in Congress of "Confederate Brigadiers," while Mr. Foster, the Governor elect of Ohio, said in his late speech here that he did not mind the presence of these Brigadiers in Congress; what he finds fault with is that these gentlemen "come to Congress unrepentant," and "declare that they never will make any apologies for what they have done." So that it would appear that we at the North are to lay aside all serious business of government, and devote ourselves to abusing the South, until its representatives, after a bloody civil war of four years' duration, come forward and humiliate themselves and discredit the memory of their 200,000 dead by a public confession of guilt and shame. To talk of this seriously as the politics of grown men is very difficult, and yet the Stalwart leaders are mostly middle-aged and gray-haired, and the Organ makes much boast of their "age and experience." Age

and experience seem, however, to do about as much for them as they did for old George III. Some of them ought to be keeping a nice little Kindergarten, where the naughty boys come up and say they are sorry and will never do it again.

"Ben" Hill has played into their hands lately with curious indiscretion by writing a long letter in reply to one from Mr. S. B. Chittenden upbraiding the South with its crimes and shortcomings. There was nothing in Mr. Chittenden's letter which has not appeared in a thousand newspaper articles. The reason for writing it is by no means apparent; but whether well-founded or not, its assertions and charges called for no answer. But the Southern political usage requires every public man to defend his State or "his people," and so Mr. Hill composed a long epistle showing that the present troubles were all the fault of the North, and every Stalwart paper reproduced it as a capital campaign document, because it shows that the writer is "unrepentant." "Stirring up Ben Hill" has long been a favorite Stalwart pastime, and we suppose it will continue as long as he remains as simple-minded as he appears to be now. Mr. Blaine began the Stalwart movement by "drawing" him in 1874, and Butler was re-elected in the following year "to take care of him."

Mr. John Jay has written a letter to the Republican State Committee, provoked by the announcement that he had served in the capacity of Vice-President at the recent Republican mass-meeting, from which it seems clear that he is not yet prepared to support the Republican candidates. Mr. Jay would be glad to know—and he is sanguine enough to think "thousands of Republicans would welcome the assurance"—that Mr. Cornell is an ardent and unselfish civil-service reformer, and to receive some unmistakable declaration from him that he "has taken his stand upon the national platform adopted at Cincinnati." At present Mr. Jay is left in a good deal of doubt, not to say distrust, concerning this, and he submits his right to have his doubts cleared up before recognizing the importance of Mr. Cornell's election in a national sense. He inclines, however, to the belief that Mr. Cornell is not an advocate of civil-service reform, and mentions as evidence which has weight with him the pointed declarations of President Hayes in his message to Congress, January 31 last, which pronounced Mr. Cornell's removal from the Custom-house necessary in order that "the office may be honestly and efficiently administered." He also recalls the fact that Mr. Cornell's nomination was greeted "as the triumph of a splendid audacity, the knell of reform, and the boom of a coming flood of corruption." Still, to dispel "these doubts and dangers which seem to gather about us" very little is needed, in Mr. Jay's estimation. "A simple declaration from Mr. Cornell and his associates" that they stand on the Cincinnati platform would be almost sufficient to clear the air completely. His letter is written "with all respect and frankness," he says, and though impulsive young Scratchers may think the tone of it characterized by a temperance that amounts to timidity, it is quite possible that what appears like caution is in reality to be ascribed to a subtle and insidious courtesy calculated to do Mr. Cornell as little good as outspoken denunciation.

The Scratchers have had one curious experience. They have found it impossible to get six or seven of the leading Republican papers of the State, such as the Buffalo *Commercial* and the Rochester *Democrat*, to publish their addresses, even as advertisements. This illustrates well both the fidelity of country papers to the party, and the doubts which they all feel, in spite of their expressions of confidence, as to the effect of "Independent" views on the voters. It sheds some instructive light, too, on the kind of education on current political topics which the voter gets from a party paper. It was probably to the expectation that these would permit dissenters to use their columns, if not for love for money, that the Organ referred when he warned the "large-eyed boys" against "the mirage." The eyes of "the boys" certainly grow larger the longer they watch the performances of himself and his colaborers during a political canvass.

Ostensibly, at least, there is to be no "fusion" between the Republicans and Anti-Tammany Democrats upon county nominations this year, although there will probably be the usual "trading." Indeed, the three county tickets in the field are unusually weak, or, at all events, not composed of the names which have been accustomed to fire the heart of the naturalized voter every fall, and it is suggested that the candidates have been put up merely to be knocked down. But this is not important, if true, as the same game has been played apparently by all parties, and if the Republicans are disposed to sacrifice their local ticket in the interests of Cornell, they will probably find the Robinson men quite as ready to do likewise. The tickets are such, however, that the independent voter will not find it difficult to make a fair selection, though he will hardly need to resort to the Tammany list, which, with the exception of one or two names, is the most impudent offered by Tammany to the voters of the city since 1871; and we say this without reference to the fact of the foreign birth or parentage of every one of the candidates. The *Times*, we observe, is doing excellent work in assisting its readers to vote judiciously, and points out the propriety of scratching certain "regular" nominees, with a zest due, perhaps, to the comfort it takes in feeling that, if bad State officers are necessary to the salvation of the country, bad local officers are not.

The approaching election in Louisiana is really "of national importance," since the new Constitution provides that the legislature to be then chosen may appoint Presidential electors for 1880, and no one doubts that it will. Both parties have made their nominations, Mr. Wiltz being the Democratic candidate for governor, and Mr. Taylor Beattie at the head of the Republican ticket. The Republican Convention met last week, and besides nominating, so far as appears, irreproachable candidates, adopted a platform in curious contrast both to previous Southern Republican platforms and to this year's assortment of Northern ones. It expressed gratitude to Mr. Sherman for bringing about the present national prosperity, praised President Hayes "for his acts and fidelity to the party," protested against the ousting of Kellogg from the Senate, and declared General Grant its unalterable choice for President in 1880. But with this everything that can be suspected of Stalwartness ended. No reference was made to the fact that the South is solid for fraud, violence, and murder, and the Democratic attempt to repair in Congress the result of the war is not mentioned. As the *Times* remarks, "these exciting themes are reserved for Northern platforms." Indeed, there seems to be nothing in the resolutions, so far as politics are concerned, that can repel any sensible and sincere voter, but, on the contrary, much to compel respect and attract support. A Republican victory in Louisiana under these circumstances is something to be desired. It would mean that constitutional government is respected in at least one State of the South, on the one hand, and on the other that to this end the overthrow of carpet-baggery was necessary.

The appearance of another Independent candidate in Yazoo County is a good sign. Mr. R. G. Hudson has offered himself as a candidate for the State legislature, and solicits colored votes while desiring and expecting white ones, in the proportion, he says, of at least one-half. He deprecates the race issue, and declares he would leave the Independent ranks if the movement led to that. He is opposed to extremists whose triumph would confirm the North in being "solid," and would stimulate instead of allaying emigration of negro laborers. Emigration he regards as a calamity, especially for all who, like himself, own large tracts of land—Mr. Hudson has 1,500 acres—which they want cultivated, and depend upon for their solvency, and who are supply-merchants into the bargain.

The letter has a tone of sincerity, and does not invite the wrath of the Barksdales or Dixons.

The Boston *Journal*, by way of showing that the Republicans did not tolerate Butler's badness between 1868 and 1875, prints an indictment of him drawn up by his constituents in the Middlesex District in the fall of 1878, after he "had sought the nomination of the Democratic party for Governor," and committed other party offences; that is, they put up with him beautifully, bad as he was, as long as he was "faithful." The exposure of the moral obtuseness of his former associates, in which Butler is now engaged, is the best work—in fact, in our opinion, the only good work—he has ever done, and we have watched his career as closely as most people.

The mission of General Adams to the hostile Utes has had the gratifying result of securing the immediate release of the women and children who were carried off from the White River Agency. They appear to have owed their lives to the wife of Chief Johnson as much as to any one, she being the sister of the friendly Chief Ouray. This chief's orders to cease fighting were, it is alleged, heeded in time to save Merritt's command from utter destruction, as the hostile band had been greatly strengthened by accessions from neighboring tribes. The latest statement of the causes of the outbreak enumerates the repeated lessening of the amount of rations, the want of any head chief at the Agency, an interpreter unfriendly to Mr. Meeker, and bad whiskey furnished by the ranchmen. The instigation of renegade whites should, according to the revelation of the battle-field, also be reckoned. The trouble is not yet over, but General Adams is evidently well fitted for the delicate task of effecting the object of further military operations without actually resorting to them. While his success in rescuing the innocent captives was still problematical, Governor Pitkin, of Colorado, addressed Secretary Schurz by telegraph in very heated terms, complaining that the Government was doing nothing to protect the frontier, accusing Ouray's tribe of being as much implicated in the hostilities as the Utes of the north, and intimating that if the troops were to be withdrawn he ought to have authority to carry on "the most vigorous and uninterrupted warfare" by means of volunteers. Mr. Schurz replied that the Government was acting, through Commissioner Adams, in a way calculated first to save the women and children, and then to satisfy the ends of justice without renewing hostilities; and this he thought much the best way of protecting the frontier. His information from the Commissioner was directly opposed to the Governor's assertion that Ouray's tribe had had any part in the rising; nor were the White River Indians all engaged in it.

The acquittal, after a long and careful trial, of Blair, who killed his coachman in New Jersey last summer, calls for some explanation from the Brooklyn *Eagle*. That paper tried and condemned him to be hanged within twenty-four hours after the killing, without having heard the culprit or examined witnesses, although it makes great fun of the Stalwarts who pronounce people guilty of murder in the South under similar circumstances. Now, what we should like to know is, whether the *Eagle's* trial of Blair was, in its own opinion, sufficient; whether it thinks he ought properly to have been executed on its verdict, and whether the subsequent proceedings before the Jersey courts were superfluous? If these proceedings were not superfluous, and the legal trial was a proper trial, and the finding of the jury worthy of respect, we should like to know what we are to think of its furious attack on the prisoner in advance of the trial, and before his jury had been impanelled. If trial by jury is the right of everybody accused of crime, what are we to call the conduct of an excited editor who calls for his execution as soon as he hears by telegraph of the crime?

The specie imports during the week were again large, and the total amount of foreign specie received here since the resumption of specie payments is now a little over $56 000 000; of this total about $50,000,000 have been received since the first day of August. Foreign exchange is still favorable for gold imports, and between $7,000,000 and $8,000,000 is said to be afloat bound for New York. It will cause no surprise if the net specie imports for the first year of specie payments amount to $75,000,000. This amount, together with what is mined and coined, will represent the expansion of the currency, since by existing laws all the paper legal-tender that was outstanding at the beginning of specie payments must still remain in existence. In these pregnant facts are to be found some of the most important reasons for the wild speculation that is now raging at the Stock, the Produce, the Cotton, and minor trade Exchanges. At the Stock Exchange, where railway securities and shares form the bulk of what is speculated in, there is the additional reason that while the tonnage of the railroads is largely increased, the rates for transportation are very much higher. At the Produce Exchange the full harvests in this country and the short crops in Europe afford another reason. The increased consumption of goods and general merchandise supplements the general favorable currency condition for advancing the prices in the other markets. But after all the good reasons are fully taken into account, the fact remains that speculation is overdone in every department and that the times are becoming wild. The volume of business at the Stock Exchange has reached such a magnitude that the New York banks have had the subject of check certification under consideration, and have appointed a committee to confer with the Stock Exchange on the advisability of establishing a clearing-house for Stock Exchange transactions, so that only the resulting differences on stock transactions rather than the whole volume of these transactions may require bank facilities. If such a clearing-house could be established it would make safer the business of such banks as mainly have brokers for their customers, but it would also tend to increase the volume of speculation by making the conditions under which it is done easier. Silver bullion advanced in London to 53¼*d.* per ounce; and the bullion value here of the 412½-grain silver dollar advanced to 89⅝ cents ($0.8933).

The foreign news of the week is without interest. The British seem to be settling down at Kabul, and have begun by hanging five persons guilty of complicity in the murder of the embassy; but no policy for the future has yet been announced, and it seems to be doubtful whether an occupation of the whole country or of only the provinces adjoining British territory will be attempted. Both parties in England are preparing vigorously for the elections by imposing "demonstrations," in which their weightiest orators thunder forth criticism and denunciation; but the Liberals are already hedging a little in their foreign policy, by giving out that they would not be by any means as peaceable and industrious as the Tories try to persuade people. In France and Germany there seems to be for the moment complete quiet.

Colonel Haymerle's article on the "Italia irredenta" folly has probably not forced any public man of weight in the Peninsula into sympathy with the movement, but the respectable and thinking classes have been doubly shocked by having the whole nation implicated in the plans of a small and only noisy faction, and by the sudden springing of a German-Austrian alliance which leaves Italy completely isolated. That her statesmen should, as is reported, be talking freely of a counter Latin-Slav alliance, is credible enough; and perhaps France and Italy would be thought, as hostile neighbors of the new allies, a more than sufficient offset to the Chinese menace to Russia on which some military critics in Germany rely in case of need. It must be apparent, too, that if Russia is in danger from having so large a territory adjacent to China, on the other hand she is in the best possible position for making and keeping friends with her. The British Government is already said to have despatched a reinforcement to its fleet in Eastern waters, in view of a possible war between China and Japan, and of the alleged concert by which, in consideration of a part of Kuldja, Russia agrees to support the Chinese fleet against the Japanese.

MR. EVARTS'S SPEECH.

IT was a new surprise when the Secretary of State of the United States made, last week, an ordinary campaign speech to promote the election as Governor of the State of New York of a man whom the President of the United States, according to his own official declaration, dismissed from the position of Naval Officer of the Port of New York because that dismissal was necessary "in order that this important office may be honestly and efficiently administered." The general purpose of having Mr. Evarts appear as the advocate of the election of Mr. Cornell is not hard to divine. The present President of the United States, as Mr. Evarts said in a speech at the Cooper Union on November 1, 1876, is a man "nominated because he was in favor of civil-service reform, accepting the nomination as given to him because he was in favor of civil-service reform," and, Mr. Evarts might have added, elected "because he was in favor of civil-service reform"—or because he said that he was. The one thing that has made Mr. Cornell a prominent man—in fact, the main thing that has given him his nomination—is that he has done all he could to kill civil-service reform. When, then, we see the Secretary of State make one of his most humorous and sonorous speeches in favor of Mr. Cornell's election, the meaning of this unusual performance is that it is an attempt to have the champion of civil-service reform do the work of its most bitter enemy, and to bring out the respectability of the Republican party in support of its refuse; and it is an attempt which has succeeded.

That was the general purpose of Mr. Evarts's appearance. The especial manner of his service in the ranks of Mr. Cornell's retainers was this: He was not to bring forward arguments in favor of any supposed policy of the Republican party, or to give testimony as to the good character of its candidates, and thereby to bring new recruits to the party from without; but his work was to stop the defections within the ranks of the party itself. He was to put an end, as far as might be, to the pernicious practices of "bolting" and "scratching." With all deference to Mr. Evarts, the practice of "bolting" and "scratching" is a wise one. If a man has a right to vote at all, he has the right to vote according to his own conscience; and if he has a duty to vote at all, it is his duty to vote according to his own conscience; and if the voter thinks that the public interests call upon him to vote against any one man or set of men, we all agree that he is bound so to vote, whether that man or set of men be nominated by the one party or the other. "Bolting" is simply voting against the whole of a party ticket, and "scratching" is voting against part of it; and if a man is bound at any time to vote according to his conscience, he is bound at all times to "bolt" and "scratch" whenever his conscience tells him he will so best serve the public interests. Not only, too, is it a duty to "bolt" and "scratch," but this same bolting and scratching is a very simple way, and the only way, of keeping bad men out of our public offices. Every man who strikes the name of Mr. Cornell from the Republican ticket, whether he votes for any other candidate or not, takes a very effectual method of keeping him a private citizen and out of the governorship; and to accomplish that would be a very solid, substantial result, though it is what Mr. Evarts calls "voting in the air."

Three years ago Mr. Evarts professed to believe that the matter of most vital importance to the people of the United States was to destroy the power of men precisely like Mr. Cornell. In his New York speech of 1876 he said: "The future question of this country is precisely that—how we are to curb the power of the immense range of office-holders over the politics of the country; they are killing all the statesmen; they are belittling all the issues; they are degrading all politics." And he added: "The Republican party has a right to demand of Governor Hayes, if he is elected, . . . that he carry out the work of weeding out the incompetent and unworthy Republicans and filling their places with honest and worthy Republicans; and if there are not enough Republicans, filling them with *honest and worthy Democrats*." The work of "weeding out" began, under Mr. Evarts's own advice, with the removal of Mr. Cornell.

Mr. Evarts, too, has professed to be himself a believer in civil-service reform. Civil-service reform, as he well knows, means only one thing—the putting men in our public offices, and keeping them there, because they are honest and capable public servants, whether they belong to the one party or the other. Now, we all know, as does Mr. Evarts, that, practically, the only opposition that civil-service reform now meets, or has ever met, in this country comes from party men like Mr. Cornell, who use the public offices to pay for work done in their own service. Mr. Evarts said of civil-service reform, "That is the war we are in for," and he has told us how he proposed to carry on that war. At the mass-meeting held on the 11th of January, 1875, in New York City to protest against illegal interference in the affairs of Louisiana, we had a speech from Mr. Evarts. The acts he complained of were acts of a Republican President and a Republican Cabinet, and he then said to his hearers: "You, therefore, are assembled here as citizens of the United States to teach every political party that there are limits to their competition and their antagonism which *no political party shall safely pass*." He meant, though he did not say it in so many words, that political parties were to be taught that lesson by "bolting." There was no other way. He had no other in his mind. And when Mr. Evarts, for the purpose of serving Mr. Cornell and Mr. Conkling, speaks of "voting in the air" he is throwing aside the best words and acts of his life.

Civil-service reform has not fared well at the hands of some of its professed friends. The President, who was elected "because he was in favor of civil-service reform," carried out his promises to the people by giving public offices to one man who had written a cheap campaign life of himself, and to other men who counted the votes that elected him. The men to whom he gave offices were notoriously neither honest men nor fit for any public service. The Secretary of State of that same President gives his voice and the weight of his official position to secure the election to a high office of a man who, as he well knows, represents all that is bad in American politics. Mr. Evarts has done himself no honor. Mr. Cornell and Mr. Conkling have made such use of him as they wished; they will throw him aside whenever it suits their purposes. He does not trust them, nor do they trust him. He does not respect them, nor they him. If Mr. Evarts had spoken on this occasion as we had a right to expect from his past utterances, he might have done a great service to the American people and to himself. He has benefited neither.

THE LAST REPORT OF THE WOMAN SUFFRAGISTS.

THE revival of the Woman's Suffrage controversy in the *North American Review* by Mr. Parkman's article, and the replies to it of five of the leading friends of the movement, have attracted attention mainly because of Mr. Parkman's appearance in the field. The debate has slumbered so long, and the world has so long been familiar with what Messrs. Phillips and Higginson, and Mesdames Howe, Stone, and Cady Stanton have to say on the subject, that probably no fresh utterances on their side would have caught the general ear. Mr. Parkman has won distinction in a field far removed from politics, and in so far as he has touched on contemporary politics at all, has touched on it in the character of a calm if not very hopeful observer. His views on the woman's suffrage agitation were, therefore, to all intents and purposes those of a new-comer, and his presentation of the case against it, though made up in the main of old arguments, had much of the charm of novelty. These arguments were very skilfully arranged, too, and he was unusually successful in his attempt to produce those which are in this matter the least presentable, though the most important. If the Suffragists could have put forward a recent convert in reply to him, somebody of mark, for instance, in any field of activity who had during the last fifteen years been won over by their labors, it would have given vastly more weight to their answer, and this may be said with-

out any disparagement of the answer itself as made. As it is, the renewal of the discussion cannot be thought to have much if any political importance, and we fear most of those who have read it have done so through a somewhat languid curiosity simply.

What the world wants to hear now from the Suffragists is, as a correspondent suggested in our last issue, some account of the progress they have made in converting men and women to their views, and of this they give us nothing. This is the more important because there is a widespread, and we believe well-founded, impression that their cause has lost ground with the general public within the last ten years, both in this country and in England; or, in other words, in the only two countries in which it ever obtained any foothold whatever. Some persons of note in England who ten years ago openly advocated it have publicly withdrawn their support, and a still larger number, both here and there, who once were active in promoting it have ceased to appear as its champions, though they may not have abandoned it as a theory. The popular interest in it, if we may judge from the newspapers and from private conversation, has all but died out. In saying all this, however, we have men in our mind, and the Suffragists could well afford to admit its truth, if they could show that they had been successful in spreading their own ardor to a considerable degree, or, indeed, to any degree, among women themselves. We looked, therefore, with some interest into their essays in the *North American Review* for evidence of the progress of the movement in this direction. On this point the friends of the higher education of women, and of the admission of women to wider and more varied fields of labor, are very strong. Their articles bristle with facts as to the number of schools and colleges which have been opened to women, and as to the success of women in new fields of industry. The Suffragists produce none of this kind of testimony. Their practical success is limited still to Wyoming, which is too new and gelatinous a community for its experiments to make much impression on those who are laboring with the problems created by dense population and deeply-rooted habits and traditions. In other words, they are still, by way of convincing us that female suffrage would work well in practice, forced to rely mainly on their own prophecies, which are not received as yet with the respect and confidence to which they may hereafter prove to be entitled. After they have shown that women are entitled to the suffrage *à priori* as a natural right, and that the world, as now governed by men, is governed badly, there remains a huge gap in the argument which can only be filled by prediction, and it is, of course, of the utmost importance that the prophets should not only be numerous, but should come from outside the very small number of persons who have made female suffrage a hobby, and have staked their reputation on its success.

What is of more importance than all is, that they should show that they have made some progress in enlisting the support of women themselves; but on this point they are silent. They argue that women have the right to vote, are morally and mentally competent to vote, and that the community would be the better of their voting; but they do not say that the women wish to vote. They must admit that this makes their agitation very peculiar. In all other movements for the extension of the suffrage—except, perhaps, that by which it was conferred on the negroes at the South—the desire of the class on which it was proposed to confer it to possess and use it has been unmistakably manifested. There never has been any doubt of its existence. Thus far the Woman's Suffragists have been unable to produce any proof that their clients approved of their advocacy, and they do not produce it now any more than fifteen years ago. As well as we can make out, there are in the neighborhood of Boston a few hundred women who would vote if they could, and who believe they ought to vote. There may be more, and they may have numerous sympathizers in other parts of the country, but these give no sign of their existence. If they desire a share in the Government through the ballot-box they keep it secret. This is not true of the desire to multiply and diversify women's occupations and the means of earning their bread, and to provide them with better means of education. On these matters there is no lack of expressions of feeling and opinion; but as yet there is no evidence that any considerable or increasing number of women would like to take part in elections.

Nor are they showing an increasing desire to participate in current political discussion, either through the press or platform, although to enable them to do this no legislation is necessary. We venture to say that within fifteen years not one woman has been added to the list of those who make themselves heard in public on questions of general politics, nor have the women who fifteen years ago were engaged in agitation added a single subject to the list of their topics. They were then engaged in denouncing intemperance and unchastity and the subjection of women, and they are engaged in doing the same thing still—nothing more; and yet within that period by how many questions of surpassing interest besides these has the world been shaken? If, therefore, the Female Suffragists cannot show that their cause has made any progress among women themselves, or that the attraction of political discussion has not increased among women, it is easily seen that they appeal to the public once more under serious disadvantages, because it is on these points the public expects them to have something new to say.

They labor under one other disadvantage, which is also serious. Usually, agitators laboring for an important legislative change for the benefit of a particular class have special and peculiar knowledge of the class, and are in a certain sense its recognized representatives, and maintain its rights against those who do not belong to it and have but slight if any acquaintance with it. In the case of the Female Suffrage agitation, however, there is no outward sign that the agitators speak for the class for which they claim emancipation. They have received no marks of adhesion from the great body of women. They can show no credentials of any kind beyond their own ardent interest in the subject, and they have, it would appear, made little or no progress in procuring them. But this is not all. In demanding from men the concession of the vote to women they are addressing a body who know fully as much about women's wishes and feelings as they do. Almost every man is in some sort of relation with a woman for whose opinion on the question of woman's rights and possibilities he has more respect than he has for Mrs. Howe's or Mrs. Stone's or Mrs. Cady Stanton's, and whose opportunities for enlightening him are far greater than those of these ladies, or of any orators, can possibly be. This influence, which is none the less powerful for being unseen, would seem to be at present exerted against the Suffragists. There can, in fact, be little question that it is to this that the smallness of the impression the agitation has as yet made on men is due. We venture to say that ninety-nine men out of every hundred find that the women for whose judgment and character they have most respect are either indifferent to the suffrage—that is, believe it would burden them with a new duty without adding to their happiness or usefulness—or else believe that it would be a positive injury to women and introduce into the world a fresh obstacle to what they consider right living.

This may be a regrettable state of things, but it is a state of things with which the friends of the suffrage must deal promptly, if their discussions are to lose the air of barrenness which now unquestionably hangs around them. Dr. Johnson's saying—quoted by Colonel Higginson—that "Manners make the laws," bears strongly on this point. Women cannot be got to call for the suffrage, either by Mr. George Hoar's proposition that "the fundamental principles of republican government" require them to take it, or by Dr. Franklin's dictum, that those who "have no vote" are "absolutely enslaved to those who have votes." All the logic in the world will not make either man or woman clamor for liberty who does not feel himself or herself a slave, and it never has done so. As a matter of fact, in all republics men agree to be governed by persons against whom their votes were cast, or whose principles they detest. Half the people of the United States are living in this very condition at this moment, and the reason they do so is that it is under this arrangement they find themselves most comfortable and their chief aims in life most easily attained, and they pay

little heed to what orators say about the logical absurdity of it. No government could be carried on, and no government ever was carried on, by literal acceptance of the loose generalizations of political philosophers, even when they are as practical as Dr. Franklin, and the women in this matter are as shrewd as their fathers and brothers.

A POMERANIAN WATERING-PLACE.

AHLBECK, Sept. 2, 1879.

THIS little Pomeranian settlement near the great harbor of Swinemünde has now become, with the adjoining Herringsdorf, the fashionable sea-side resort for well-to-do Berliners. During a visit of nearly a month we have heard scarcely a word of English, or seen an English or American name in the hotel-register or in the published visitors' list. There are crowds of rest and pleasure seekers, but no games, no races, no rowing, and almost no society in the sense of American watering-places. The summer and early fall are divided into four "seasons" of from three to six weeks each, and the houses—mostly owned by a few large stock companies—are rented in flats or suites already furnished, even to kitchen utensils, to families, or more commonly *parties* of families, who take them invariably by the season, make few acquaintances outside their own party, and live immensely at their ease. There are big out-of-door beer-gardens, and concerts or theatrical performances in the large hotels daily; bathing, mainly by children and invalids; meals five times a day, commonly in large, open porches built for the purpose, where many a *Geheimrath*, member of the Reichstag, or general may be seen from the promenades with his family and friends.

These things, however, interest the stranger far less than the scenery and native inhabitants and institutions of the place. Beech and oak-covered hills, reminding one of a New England village, heavy pine forests, and a wonderful sandy beach give a strange variety. Half a mile back of the hilly ridge which skirts the sea lie immense fertile meadows of ten thousand acres, from which the sea was pumped in thirty months, twelve years ago, by wind and steam power, and the moisture of which is now controlled by a simple system of self-regulating canals and windmills. Around it to the north and east are the Pomeranian forests, in which deer, wild boars, and occasionally moose are hunted. The forester has an acre cleared and replanted every year, and the wood sold at auction to the fishermen at a very low price. In spite of his precaution, however, trees are silently sawed down and stolen nearly every night in winter by those too poor to buy, and his too strict predecessor was lately murdered by a trespassing party which he discovered, while a strand officer who attempted to enforce the laws against *hauen* for eels—a method by which all fish within reach of the too-fatal instrument are destroyed without being secured—was taken from his house by masked men and drowned with an anchor about his neck. Every storm from the north or east throws the now very common amber upon the strand, and the fishermen occasionally bring it up in their nets. It is farmed out by the Government to a Jewish company, to whom all that is found must be sold at a fixed price, unless the finder makes oath that he intends to keep it himself. The fishermen insist that it is not the resin but the decayed and petrified wood of antediluvian trees of extinct species.

This is, moreover, the *locus* of several interesting myths which German poetry and romance have made famous. A mile out at sea stood the once famous city of pirates and freebooters, Vineta, wealthy and magnificent beyond imagination, submerged by the gods for its pride, and now occasionally seen in calm weather by fated souls, who are sure to be drawn by the charm of the vision beneath the waves. Near my window, in a deep ravine, was the home and treasure-house of the pirate chief of the Vitalians, Störtebeck, who in the rôle of the awful black man is still the terror of the German nursery. "The friend of God and the foe of all men," he preyed long and successfully upon the commerce of the Hanseatic League, till he was at last captured, early in the fifteenth century. After his head was struck off he rose and ran past fourteen of his condemned followers before he fell, thus saving their lives, according to the sworn promise of his judges. A bowlder on the strand confines the Amber Maiden in her subterranean chamber of the dwarfs, whence she briefly reappears every hundred years, and where she still awaits her deliverer.

There are no tides in the Baltic, but a brisk wind changes the sea-level several feet, and a great storm like that of 1872 more than twenty-five feet. It is relatively very shallow; its surface is somewhat higher than that of the North Sea; and its waters, fed by more than two hundred and fifty streams, are warmer, and consequently less salt, than those of the North Sea. All its harbors are artificial, and located at river-mouths. Its level is gradually rising in the north and sinking in the south from geological causes, and zoölogists enumerate here about one hundred species of fish, more than a dozen of which are well known in the market. During four or five of the coldest months the East Sea is ice-bound, and sometimes frozen over for miles from the mainland. Every storm changes the bottom, and wrecks are very frequent. During the last twenty-five years nearly a quarter of the fishing population of this place has been drowned.

We began our study of the inhabitants by a visit to the village school, where the shady side of the German school-system may be seen. There is but one teacher, who has been at his post forty-eight years, and has now two hundred and thirty children under his care. He lives in the reed-thatched school-house, and until recently was obliged to eke out a living for his family by working in the harvest-field. He is a pietist, and teaches his pupils to sing Sankey's melodies while he plays a two-stringed violin. The children have few, often no school-books, and the instruction is almost purely oral. They are trained in the three Rs, learn a little geography, and are taught to revere God and the Kaiser. At fourteen the boys go into the boats and the girls learn to dress fish, gather faggots, harvest, cook, weave nets, etc. There is a town library of forty volumes, although many inhabitants scarcely see a book after leaving school. We listened the other day to an animated discussion by a dozen fishermen whether the world went round the sun or vice versa—a question on which opinion was about equally divided. The people are remarkably sober, industrious, honest, moral, and contented, and without exception Protestants. With a population of nearly one thousand souls there is no church, and the burial service is conducted by the schoolmaster. Many of the more prosperous have built neat cottages, which are rented to summer visitors. Their owners are sometimes thrifty enough not merely to remember in the bills of their guests the ordinary extra items for boots, candles, *Trinkgeld*, mustard, beer that was never drunk, etc.; but soap and feather beds, every bath taken in the sea, notification at the police-office, all contribute their mite to charges which, after all, are astonishingly small. The fisher himself lives in a substantial house built on the sand of drift-wood and brick, covered with mortar and thatch-roofed; sleeps on a mattress of sea-grass, under a bed of the feathers of wild ducks caught in fish-nets often fifty feet under water. His diet is of fish and pork fattened on fish, of potatoes grown in sand fertilized by fish-guano that he has made himself and with sea-tang; and in winter he must often borrow money at usurious rates from the well-to-do owners of the smoke-houses, who get the lion's share of the profits of his business.

The sea has a rationalizing influence, and the fisherman is far less superstitious than the *Bauer*, or peasant. He is brought into closer contact with a greater variety of natural phenomena and more disciplined in reasoning from cause to effect. We have heard the inhabitants here discuss, with a degree of intelligence for which it is difficult to account, not only such questions as why fish are more palatable if smoked with oak than with other species of wood, the merits of different sorts of nets and of different methods of drying, weaving, and preserving them, the marvellous properties of dolphin oil, etc., but why the sea draws showers over to itself from the land; why lightning prefers to strike in the sea-water rather than in the sand; the cause of water-spouts and whirlwinds so often occurring hereabouts; the right of the Government to levy a tax on the sea-fisheries; the partitioning off of the Baltic between the various nationalities which now have equal rights on all its water; the evils of the new suffrage law, under which every apprentice and employee, without being bribed, must vote the ticket his superior puts into his hand; the propriety of paying the count, who owns all the land save a few small building-lots he has lately consented to sell, for masts, drying-poles, and faggots in days' work, as at present, rather than in money, as proposed. The three years of military service and the campaigns in which they have served supply the place of an university education to men of this class. It is a part of their patriotism to bring out their best beer and charge their smallest price for their own townsmen or countrymen, and they are fond of boasting how poorly they have served and how much they have overcharged strangers, and especially foreigners. Fishermen here regard peasants with ineffable contempt, as stupid and fit only for woman's work, such as harvesting, digging potatoes on their knees, carrying and cutting wood, etc. Finally, they are not without a saving touch of rough humor. A drunken fisher, nicknamed *Bleistift* from his lead-tipped wooden leg, had quarrelled with his brother, who steered to the shore and left him to push off in the boat alone, a few days ago. In a sudden flaw the boat was upset, and, heavily ballasted as it was with stones, it sunk at once, and *Bleistift* was drowned on the fishing

ground. The next night, as a group of fishermen were drinking beer and eating fresh flounders at the village inn, one pushed back his plate and said solemnly to the dead man's partner: "This flounder tastes of Heyne's schnapps; your brother sends you greeting."

Such a people make the best subjects for a government like that of Germany that we have ever seen, or, in fact, that we can conceive of. They are not educated above their station, have no consuming ambitions and no subversive ideals, are reverential almost to an inconvenient degree to visitors, officers, etc., and are, in repeated instances, stupidly duped by Government subalterns, who are left both to interpret and administer the laws, which only they have read, to the advantage of their own pockets. Refuge from a year of jaded city life among such a people, in a cleanly and simple fisher-cot as is here the custom, is so refreshing to body and soul that one is sure to ask himself if, after all, absolutism, and even obscurantism, may not be here the most sane and moral of administrative policies.

Correspondence.

THE *EVENING POST* ONCE MORE.

To the Editor of The Nation:

Sir: Referring to the letter entitled "New York Republican *vs.* Democratic Retrenchment" in the *Nation* for October 16, the *Evening Post* of the same day published a short paragraph which may be worthy of attention. If so, you may or may not use the following statements (the italics being always my own).

1. The *Post* did not (as indeed it could not) question the truth of any of the statements of political history in your correspondent's article, and complained principally that no attention had been paid to its own subsequent correction of one of the gross errors in its article of September 25. This correction your correspondent never saw, but it could not excuse such flagrant inaccuracy as was exhibited in the criticised editorial article of the *Post*, written expressly that you might accept it as a basis of judicial statement.

2. The *Post* says that your correspondent made a "conspicuously inexact" assertion—namely: "that the *Post* gave all the credit *of the improved management* [of the canals and prisons] to the Republicans." Your correspondent made no such assertion, but said that the *Post* claimed exclusive credit for the Republicans for *passing the constitutional amendments*. Whether or not this assertion was inexact may be determined by a consideration of the following extract from the *Post* for September 25:

"It is only fair to give the Republican Legislature the credit of furnishing the means by which this saving [in canals] was effected, and without which it could not have been effected—*that is, the constitutional amendment*," and again, referring to the States-prisons savings, it said: "The Democratic administration . . . would not have been able . . . to have effected a savings in expenses if the *Republican Legislature had not prepared the way with the constitutional amendment.*"

It did not seem "inexact" to your correspondent to say that in these lines the *Post* claimed exclusive credit for the Republicans (not for improved management, for all concede that to be Democratic) but for passing the constitutional amendments. Neither did it seem unfair to prove that the Republicans were not alone entitled to the credit for these amendments.

3. The *Post* distinctly declared it to be a *pertinent fact* that the Democratic administration of Governor Hoffman depleted the Sinking Fund to the extent of six millions of dollars. Your correspondent showed that this was not a fact at all, but that three Republican and two Democratic legislatures had caused the depletion. Notwithstanding its faulty reply, your correspondent is still unable to believe that the first erroneous article of the *Post* was sufficient basis for "a judicial statement." F. L. S.

[You have been very lenient with him on the whole. Since you wrote the above letter, by way of correcting his own story about "the depletion of the treasury to the extent of $6,000,000 by the Democratic administration of Governor Hoffman," he says with perfect calm:

"As to the depletion of the Sinking Fund we have not the exact figures and dates at hand, but the letter of the *Nation's* correspondent to which we have referred seems to claim that only $5,104,522 96 were misdirected by Democratic legislatures. Whatever the amount may be, it remains true that the sum was restored by the Republican administration of General Dix."

From this you will see that you will do well to keep your eye on him. The "depletion by the Democratic administration of Governor Hoffman" has become a "misdirection by Democratic legislatures." Perfect candor would have required him to confess that $8,637,720 74 was taken out of the Sinking Fund, $5,104,522 96 by the Democrats, and $3,533,197 78 by the Republicans, but the total "depletion" was reduced by a surplus of $1,850,000 from 1868. The two parties were, in fact, to blame in the proportion of about 7 to 10, and the wicked Legislature of Governor Hoffman's first year was Republican.—Ed. Nation.]

END OF THE ADMINISTRATION PARTY.

To the Editor of The Nation:

Sir: Your Albany correspondent, signing himself "Independent Republican," gives true expression to the feelings of a large class of voters in this section, and probably throughout the State. In the struggle of the Administration at Washington with the Conkling-Arthur-Cornell Machine there was a strong feeling of sympathy with, and a desire to support, the former, coupled with an equally strong feeling of indignation for the latter; but save as this feeling found utterance in the fearless and able articles of the *Nation*, and other anti-Machine papers, it could not, of course, make itself heard or felt. But when the contest was brought so to speak, right to our own doors, by thrusting, through the agency of a packed convention, the most obnoxious of the Machine leaders upon the ticket as a candidate for the highest office in the State, then the "Administration Republicans" said: "We will now show President Hayes and Mr. Evarts that they have 'troops of friends,' and loyal ones, in the old Empire State."

Of course the cry of "Tilden" and a "Solid South," and a coming Presidential election, rendered the work of defeating the Machine peculiarly difficult; but many honest men, both "young" and old, set themselves in a quiet yet earnest way to work, and were succeeding beyond their most sanguine expectations, when, lo! we find that there is no "Administration party" to support. Mr. Evarts, Mr. Sherman, and (if reports are true) Mr. Hayes are vying with Mr. Conkling in urging the election of Mr. Cornell. I submit that this is not only discouraging but positively humiliating. In the caucus phraseology, do we not seem to have been "sold out"? Of course we do not "despair of the Republic," nor do we expect that by the election of any of the three candidates for governor "constitutional liberty would be at an end"; but, in view of all the circumstances, we may be pardoned for saying, "Nusquam tuta fides."

A Would-be Independent Republican.

Albany, N. Y., Oct. 25, 1879.

THE PACIFIC RAILROADS AND THE GOVERNMENT.

To the Editor of The Nation:

Sir: In your comment upon the recently-delivered majority and minority opinions of the judges of the Supreme Court of the United States touching the validity of the act of Congress popularly known as the "Thurman Act," which deals with the indebtedness of the Pacific Railroad Companies to the United States, growing out of an advance of subsidy bonds, you evince rather more discernment than most newspaper writers on that subject.

I do not propose to enter into a discussion of the merits of the Court's decision, but merely to notice the implication in your concluding expression. You say:

"There can, however, be no doubt that the companies, taking into account the peculiar manner in which their concessions from the Government were originally obtained, are, in the forum of morals, not in a position to complain of the Thurman Act. It is a pity that they could not have been compelled to take steps toward liquidating their debts without the passage of a statute which this conflict of opinion in the Supreme Court shows to be calculated to create a feeling of insecurity as to corporate property."

To one not familiar with the history of this controversy between the Pacific Railroad Companies and the Government agents this passage might convey the idea that the companies either denied the obligation to pay or were seeking to evade payment of this debt, and that some such compulsory process was urgently needed to make them provide for it in advance of maturity; and that the effect of this Act and the decision on it is to save to the public Treasury a vast amount of money which would

otherwise have been lost. Such an impression has been industriously circulated by the promoters of this policy of coercion, but it is not warranted by the facts.

The Act has not even the poor excuse for existence you suggest of being required to secure the debt. The direct contrary would be nearer the truth. The Central Pacific Railroad Company does complain, both in the forum of morals and in that of public policy, as well as in the courts of law, that this act is unprovoked, impolitic, and unjust in principle.

Finding that the volume of Government transportation was diminishing year by year far beyond all expectation, and that the compensation was also shrinking (greatly to the benefit of the Treasury, though not directly credited as against these subsidy bonds) and might continue to do so unless, by the outbreak of a great war or another inflation of the currency, the traffic and the remuneration should be carried up again, the companies themselves, realizing that a considerable balance must accumulate at the close of the thirty years' term which it might be difficult or impossible for them to meet, called the attention of the officers of the Government to the fact, and to the propriety of some modification of the contract by mutual agreement which would meet this debt, and at the same time do away with the litigation of which the acts as they stood were so prolific. As long ago as February, 1875, they proposed to start a sinking-fund in the U. S. Treasury, with fixed semi-annual payments sufficient to cancel the entire debt, principal and interest, within a few years after its maturity—these sums to be paid whether the roads earned them or not. For this indulgence of a few years' extension in time there were good public reasons and equitable claims entitled to consideration in any readjustment of the burden beyond that of guaranteeing a debt otherwise perhaps uncollectible in money.

There are other ways of providing for a debt not due for many years, known to business men, besides a sinking-fund, and one of them is to enlarge and improve the property itself by the construction of feeders and branch lines, so as to create a productive basis of credit sufficient to meet all the obligations as they matured ; and this policy the companies have been censured, by unthinking persons, for having pursued to the apparent neglect of a less productive sinking-fund. Time may demonstrate the wisdom of that, and the folly of this plan of exacting from these roads, and of course from the people who use them, the extinction of this subsidy debt at so rapid a rate, regardless of the efforts of rival routes, or of the well-being of the property lien itself.

These offers were made in good faith and in a conciliatory spirit by the companies, and were received by the executive branch in the same friendly manner, as became the representatives of parties anxious to put an end to a vexatious contention by which neither side profited. No sooner was the matter referred to Congress than certain demagogues (whom I must suppose either egregiously misunderstood the subject before them, or else had their own ambition more at heart than the good of the country) fancied they saw an opportunity to gain personal advantage by setting aside these amicable negotiations and insisting upon a resort to new, doubtful, and mischievous usurpations of power by the legislative branch, in order to carry out a theory of compulsion there was no occasion for. The Supreme Court, apparently sharing the delusion that it was helping to save to the country a large sum which would otherwise be lost, has been constrained to lend its sanction to this extreme measure.

Had there been a real danger that these subsidy bonds would never be repaid except in the way of transportation of mails, troops, munitions, etc., perpetually, it would hardly have justified such undignified trifling with the public faith ; for at the inception of this great enterprise it was the general expectation that double the amount of aid would be required to carry it through, and predictions were common that if it could be built, even at that outlay, it would still be the best investment of the public credit ever made, though no other return should be made to the Treasury than that of saving in time, services, and a multiplied efficiency and safety in internal development, commerce, and national power and prestige.

To the mind of a statesman it would make no difference if the debtor were derelict or reluctant, so long as he was standing strictly on his rights under the law and the contract ; but in this matter there was no wrong, no neglect, no provocation for strained or punitory legislation. The railroad companies were, I repeat, no way in default : and made known their intention and desire to comply with their agreement as made, unless a satisfactory alteration could be reached. They were entitled to respectful, considerate treatment ; they had performed their very important, arduous, and hazardous service in completing these roads as stipulated, and many years sooner than required by the law to do, at great additional cost to themselves and with corresponding profit to the country. The Government, as well as the public, was reaping all, and more than all, the benefits anticipated, and the subsidy bonds were being slowly repaid, with an offer to accelerate the payment, notwithstanding they were popularly, and with some reason, regarded in the light of donations. The real question involved was a simple matter of business policy, viz., how and on what terms shall the ultimate payment of the debt in money be put beyond all contingency, and what rate of extinction will best accommodate the usefulness of the roads without over-taxing the traffic upon which they depend, and which depends upon them ? This was a case requiring the practical wisdom and experience with affairs of magnitude of business men, able to grasp the future needs of the far West, rather than the vanity of self-seeking aspirants for political honors who seized upon it for personal ends. Just how much it will cost both sides to undo the wrong wrought by this mistaken policy remains to be seen.

Meanwhile this Act and the decision on it, which unsettle so much, settle little or nothing to the point in hand. Congress has made its law to meet a fancied case, and the Government has gained the case so made up. The Thurman Act left all the bones of contention of the original acts and added new ones besides. The real difficulties are still to be met, and, notwithstanding this decision of the court, the best thing Congress can now do on behalf of the Government it in part represents is to repeal this strife-breeding legislation, drop the attitude of menace, and treat these companies as their other creditors do, abide by the agreement and the contract morally interpreted, or reopen the negotiations on the business basis in which the obligations and rights of both parties and the equities in the case can be duly weighed and respected.

It is a matter of small moment whether the United States Government gets this subsidy repaid a few years sooner or later; but the question whether this nation can afford to swerve from, vary, or repudiate its solemn covenants, without the consent of the parties thereto, or whether it shall assume to act as judge in its own cause, and thereby procure the labor and skill of its own citizens upon false pretences, is one which touches every person. These companies can better afford to be wrongfully deprived of their property without just compensation than the country can afford to be put into such an attitude of questionable faith.

It is for the Supreme Court to declare the law ; others as well as the judges may trace the consequences of their decisions upon the course of Government and society. This particular judgment and the reasons for it are but another of a series of steps recently taken calculated to fill the country with alarm. The difference in principle betrayed by the majority and minority opinions, which you deplore, is far-reaching and all-pervading ; and grave enough to cause all well-wishers of the country to join with you in regrets at its appearance, but for other reasons. "It is," in truth, "a pity that these companies could not have been" *allowed* to settle "their debts by the passage of an act" which would have called out no such unhappy difference, and not at all "calculated to create a feeling of insecurity as to corporate property."

If it is to become a guiding principle of jurisprudence among us that neither corporation nor person can acquire any right of ownership or enjoyment in property which the majority of the legislative power cannot at its discretion abridge, annul, or take away under the pretence of giving it to the public, then the ordinary incentives to enterprise and industry, the impulses toward associated effort and internal improvements are destroyed ; the element of honest thrift, which characterizes the difference between nations as it does between men, is blighted, and one of the strongest bonds of the perpetuity of society is endangered.

Very respectfully yours,

C. P. Huntington,
Vice-President C. P. R. R. Co.

[We print the above at some inconvenience this week, and must defer our comments for want of space.—Ed. Nation.]

A SUGGESTION FOR OUR CITY COLLEGES.

To the Editor of The Nation :

Sir : The success of the Humboldt Academy at Berlin, which affords young merchants, officials, and university graduates an opportunity of becoming acquainted with the ripest culture of the day, through the medium of scholarly lectures, not "popular" dilutions, held weekly during the winter semester (October-April), suggests the thought, Could not our city colleges imitate the plan so auspiciously begun abroad ? At Berlin the most eminent professors are engaged to lecture, and a small

fee is charged for the course, which was attended in 1877–78 by eight hundred "hearers."

Assuredly in our city an effort should be made by our alumni associations to extend to the constantly-increasing class of young clerks, merchants, and university graduates an opportunity to become acquainted with the best thought of our time, the ripest conclusions of science and philosophy, history, literature, and ethics in their broadest scope and influence. I understand that Columbia several years ago appointed a committee to raise a fund to establish a post-graduate course. The New York University did start such a course about a decade ago, but it was discontinued after one season. By united effort, however, carefully avoiding all preferences save the good to be achieved, it is possible to attain success, especially now when financial prospects are brightening.

It is the duty of our colleges to impress themselves more strongly on the thought of our country. At a time when the public conscience is almost debauched, and a disorderly foreign element threatens to overwhelm American society and politics—I refer to the wild theories of the labor party, etc.—it behooves our colleges to do their share towards creating an enthusiasm for learning and an appreciation for culture among as large a number as possible, and develop American thought, so that it shall be broad, generous, and reverent. Our colleges must ultimately achieve for America what her universities have accomplished for Germany. There it is the student who controls the national life; here it is, unfortunately, the carpet-bagger and the pot-house politician.

Details of the plan I leave to more prominent correspondents of the *Nation*, satisfied for the present in having called attention to what is imperatively demanded (and will be heartily welcomed) by a large number of alumni. A. S. I.

New York, Oct. 20, 1879.

Notes.

GINN & HEATH, Boston, have in press a new edition of Hudson's Shakspere's Complete Works. They have lately issued several of the plays in handy separate volumes, with new notes by the same author. They will publish this week 'Remnants of Early Latin, Chiefly Inscriptions,' by Prof. Frederic D. Allen, of Yale College.——'The Art of Cookery,' by Matilda Lees Dods, is announced by G. P. Putnam's Sons; also, 'The Essentials of Anatomy,' by Profs. Wm. Darling and A. L. Ranney. ——A. C. Armstrong & Son have issued at a low price their octavo reprint, uniform with Hallam, of Sir Thomas Erskine May's 'Constitutional History of England,' in two volumes. This edition follows the third English in including a supplementary chapter, which brings the history down to 1871.——The first number of the second volume of Mrs. Lamb's 'History of New York' will be ready for subscribers about Nov. 1. The last volume ended with the year 1774. A. S. Barnes & Co. are the publishers.——J. B. Lippincott & Co. will publish 'American College Fraternities,' by William Raimond Baird.——Mr. Samuel H. Scudder writes from the Library of Harvard University to *Nature* that the Smithsonian Institution will publish at an early day an index, in one alphabet, to all genera hitherto proposed in zoölogy, whether for recent or fossil animals.——The Historical Society of Rockland County, N. Y., has entrusted to the skilful hand of Mr. H. P. Johnston the compilation of what will be the fullest and most accurate account of the storming of Stony Point. The work will be published by subscription.——We regret to learn, from the October number of the *Bulletin* of the Nuttall Ornithological Club, of the death of Miss Genevieve E. Jones, of Circleville, Ohio, one of the artist-authors of the singularly meritorious work on the nests and eggs of the birds of Ohio now publishing in parts.——In the November *Naturalist* Mr. B. B. Redding has a particularly interesting paper entitled "How our Ancestors of the Stone Age Made their Implements." More exactly he tells how obsidian arrowheads were made before his eyes by a septuagenarian of the Wintoon tribe (Cloud River Indians), who up to the time of the Modoc war had been without fire-arms. The chipping was done with a deer's horn.——All health boards may be advised to take notice of the enquiry into the cause of the foul water universally complained of in the Red River region of Minnesota, as well as further south and west, as set forth in the seventh annual report of the State Geologist (Minneapolis). Alkaline waters and pine well-curbing are the two factors which have produced an endless amount of typhoid fever.——'Contributions to the Natural History of Arctic America' is the title of the report of the naturalist of the Howgate Polar Expedition, Ludwig Kumlien. The chapter on Ethnology is extremely curious.——A valuable Index to the thirteen volumes of the first series of the *American Law Review* (1866–1879) has just been published by Little, Brown & Co. A new series will be begun in January, and the *Review* will thereafter appear monthly.——The second number of the *Musical Review* shows a firmer grasp on the part of its conductors, and is both varied and lively. In a summary notice of Karstner's 'Voix de Paris' it reproduces the author's musical notations for certain exclamations and emotional or physical manifestations, even to the whooping-cough and the hip, hip, hurrah of the English.——Professor Daniel Sanders's 'Wörterbuch der Hauptschwierigkeiten der deutschen Sprache' (Dictionary of the Principal [Grammatical] Difficulties of the German Language), favorably noticed in the *Nation* five or six years ago, has reached an eleventh edition in its old shape, and now appears with twice as many pages in a "large edition" (Berlin: G. Langenscheidt). It is indispensable to any one occupying himself especially with the modern languages.——An interesting portion of the negro population of Africa, if not the highest type of all the *Nigritier*, is the subject of a recent French work, 'Les peuplades de la Sénégambie,' by M. Bérenger-Féraud (Paris: Leroux).——A little pamphlet called 'Quelques Réflexions sur l'Art de Bien Dire' has just been put forth by M. H. Dupont-Vernon, of the Comédie-Française (Paris: Ollendorf). Besides filling a minor but important position in the Théâtre-Français, M. Dupont-Vernon (who is a *licencié en droit*) is a professor at the College Stanislas, at the École Albert-le-Grand, and at the Conservatory. What he offers is a report of a speech on *diction* ("delivery," as we may English it) made to a students' club in the Latin Quarter. It is slighter than M. Legouvé's book on the 'Art of Reading,' but its aim is identical, and it reinforces the argument of the author of 'Adrienne Lecouvreur' with fresh illustrations.

—We have received several communications for which we cannot make room this week; among others, one from Mr. John A. Bentley, Commissioner of Pensions, in reply to our strictures a fortnight ago.

—Mr. E. C. Stedman contributes to the November *Scribner's* the first of two critical papers on his friend Bayard Taylor, and the magazine further celebrates the latter poet in two portraits, one excellent—a woodcut after Gutekunst's photograph; the other, from a replica of the original bronze Cornell Memorial, indifferent. Five years ago, we imagine, Mr. Clarence Cook would have preferred to say of Mr. Morris Moore's "Apollo and Marsyas" that it might be a Raphael, and was at all events a fine picture. Now he has no hesitation in ascribing it to that master, and none in admitting a "Virgin of the Lectern," of which Mr. Moore is also the owner, to be the work of Michelangelo. The engravings of the Apollo and of the drawing for the same subject (an acknowledged Raphael) in the collection of the Academy of Fine Arts at Venice, here set side by side, make the former ascription at least very plausible. Intrinsically, we should say no one except Mr. Moore ought to care greatly if the "Virgin of the Lectern" were prevented from being sold to this country. There is an interesting illustrated article on the Mississippi jetties, by the resident engineer. Most of all we have enjoyed the first instalment of extracts from the journal of Henry J. Raymond, by his son—not the *Times* newspaper of course, but some irregular jottings in an old index-rerum begun three years before the newspaper was established. Mr. Raymond was then connected with the New York *Courier and Enquirer*, and the first entry, in January, 1848, relates to an interview with Webster at Washington, in consequence of Mr. Raymond's having reported his argument before the Supreme Court in a case involving the merits of the Dorr rebellion. Webster, indeed, is the chief figure in these extracts, and capital anecdotes are told about him, as well as conversations reported which, since Mr. Raymond's accomplished hand makes the summary, can be trusted as our common interviewer's cannot. Webster's greatness in familiar contact seemed to his admirer "quite as impressive to his valet as to one who sees the subject of it only on holiday occasions"; and one day when Mrs. Webster remarked, "You needn't give yourself any trouble, Daniel, about your speeches as long as Mr. Raymond reports them," "the effect of hearing her call him *Daniel* was curious." Mr. Webster was at this time no friend of Mr. Clay, concerning whom he quoted J. Q. Adams's saying that "Mr. Clay would be a candidate [for President] so long as he should receive a nomination from a majority of the people in the town of Lexington." The very next month Mr. Raymond saw a letter of Webster's, marked "private and confidential," in which the writer complained of not having been consulted in regard to a proposed Taylor meeting in New York, and intimated that a way should be left open for the nomination of some *other* Whig candidate besides Taylor, from whom

"hundreds of thousands of religious and sober-minded men . . . would be driven to Clay." "Mr. Blatchford said Mr. Webster believed he could be elected President, and none of his friends dared undeceive him." The following judgment is worth quoting :

"After all, said he, what will Mr. Clay leave for future ages ? His speeches contain nothing of permanent value—all relating to temporary topics, and never discussing fundamental principles. He is not an instructed statesman—he knows nothing of the matters we have talked about ; and for what, said he, will he be remembered ?—For his brilliant, effective, popular eloquence, I suggested. Yes, said he, but how much has that availed Patrick Henry ? It is ephemeral, traditional, of little value to any one."

—It requires a steady head to read comprehendingly the first and fourth chapters of "The Grandissimes" in the current number of *Scribner's*. Genealogical details which take us back to La Salle's visit to the Natchez and subsequent excursions of Iberville's men, are, when mixed with the intrigues of a *bal masqué*, slightly bewildering. Mr. Cable is, however, no common novelist, and works a virgin field, so far as he himself has not been the *défricheur* of it ; and already his "story of Creole life" has charms which ensure him eager readers. The date is 1803. There is, to be somewhat nice in our criticism, a certain laxity in the matter of Mr. Cable's French perhaps not altogether Creole. "Theatre St. Philippe," "Nouvelle Orleans," and "chêrie, chêrie" would be thought printers' carelessness ; "Cannes Brulée" seems to plead for a final *s;* and is it quite accurate to call the expression "Comment to ye, Citoyen Agricola !" a specimen of "*tutoiement*" ? In the seventh chapter of his "Confidence" Mr. Henry James, jr., gets down to business, to use a vulgar phrase, and brings the true lover and responsive maid together. But first he sends *him* half across the globe again, and effects a surprising union between two characters not heretofore supposed to touch at any point. "He's so intensely kind," says Gordon Wright's chatterbox wife, "its quite pathetic. One would think he had done me an injury in marrying me, and that he wanted to make up for it." Trouble is evidently in store for this ill-mated couple, for an old suitor has appeared on the scene.

—In an article on "The Use and Abuse of the Pardoning Power" in the November *International Review* Mr. Russell Gray, of Boston, collects various significant statistics. There is, it seems, no record published or kept accessible to the public of pardons granted by the President, and though in some of the States information is to be obtained from printed returns made to the legislatures, these are very defective. Mr. Gray has, however, examined the records of Illinois, New York, and Massachusetts, with, as he says, "rather extraordinary results." In Illinois, during the twenty-one years ending in 1876, there were ninety-two convicts committed to the State Penitentiary for life. During this period ten died, thirty-six were pardoned, and only one of the remainder had been in prison more than ten years. In this State the reasons for pardon are given, and Mr. Gray selects a number of particularly weak ones, among which good behavior in prison, where ill behavior has few attractions, seems the weakest. In Massachusetts a similar return is made to the legislature, and Mr. Gray's examples show that "a prisoner ought, in the opinion of the governor and council, to be pardoned (1) because the testimony on which he was convicted was unreliable ; (2) because the complainant had a bad reputation ; (3) because an accomplice had been pardoned ; (4) because the prisoner was more unfortunate than criminal, by reason of his taste for liquor ; (5) because he is thoroughly reformed (a very favorite reason); (6) because the principal in the crime has escaped punishment." Instances like these, Mr. Gray says, might be multiplied indefinitely from the official returns. The force of them is not impaired by the irritation which the irony of Mr. Gray's paper betrays, or by the inconclusiveness of some of his reasoning from very much such assumptions as those he criticises in pardoning governors and councils. The main evil they suggest is the total lack of system or standard, either fixed by law or enforced by public opinion, in the matter. Mr. Gray suggests several remedies, or rather checks, among which we imagine publicity is considerably the best.

—A swindle of singular audacity is now being extensively perpetrated through the Western and Southern States which our scientific men ought to be more active in exposing. It is a "Chambers's Patent Lightning-Rod," the peculiar feature of which is that it has no connection with the ground, but is supported horizontally on insulators extending over the top of the building. That a device calculated only to invite a stroke of lightning could be publicly announced and sold is not very creditable to the intelligence of our people; but as we learn from reliable sources that it is actually being adopted, our readers may be amused by some account of the descriptive pamphlet circulated by the inventor, a copy of which has reached us. It opens with a statement of the "laws that govern electric action," to which the technical terms lend a very scientific tone, and which, to the poor farmers who are expected to use the invention, will sound all the more scientific in consequence of the obscurity arising from a disregard of English grammar. The following two "laws" will serve as specimens :

"First. There are two great opposite or opposing forces in Nature, such as Life and Death, Day and Night, Summer and Winter, Love and Hatred, Joy and Sorrow, Pain and Pleasure, Male and Female, Positive and Negative."

"Fifteenth. When two objects, holding the opposite kind of Electricity and having their potentials equal or nearly so, as compared with the distance between said objects, there will be no disputive discharge between them."

Further on are pretended quotations from Professor J. Clerk Maxwell, garbled to a degree to amount almost to forgery. A paper of "Professor Caladon," purporting to have been read before the Smithsonian Institution in 1877, is alluded to; but, in fact, no papers are read before the Institution except official ones, and we can find no trace of the name Caladon either in the publications of the Institution or anywhere else. There are a number of illustrations, one evidently designed for the farmers, being printed in two places to be sure of their attention. It represents a Chambers rod stretched over the top of a house and bent up at each end, like a serpent with head and tail erect, engaged in mortal combat with a black thunder-cloud just above it, into which it is belching forth a stream of electricity from each end.

—Of course, also, there is a profusion of testimonials, illustrating the extreme readiness of respectable men to lend their names to projects of which they know nothing. One "Prof." John H. Tice writes a whole pamphlet in favor of the system, but it is not stated what he is professor of. H. B. Lee, Secretary of the Georgia Academy of Science, is entirely convinced of the truth of the theory, and so apparently is W. H. Eckert, Manager A. & P. Telegraph Company, as well as a number of other electricians. W. H. Martin, Actuary Ætna Ins. Co., claims for it a superiority over all other rods. John W. Hartwell, Peter A. White, John P. Whiteman, and other presidents of prominent insurance companies, have witnessed practical tests and experiments "showing conclusively that a ground connection is not necessary for the protection of buildings against lightning." It would be very interesting if these gentlemen would describe the "practical tests and experiments" which they witnessed, and explain the reasoning by which they were convinced. Five ladies of Jacksonville, Fla., certify that they saw a brush of fire nearly two feet in length on each end of a rod in their neighborhood during a recent thunderstorm. We are accustomed to seeing the names of such persons signed to certificates of cures by quack doctors, but not to such a glaring imposition as this. It is perhaps a little creditable to our institutions of learning that the list does not contain the name of any scientific professor, or of any one who could be expected to know anything about the matter. In the latter designation we shall include or omit the telegraph employees who give certificates, as they may consider most to their credit. It may be worth while for the stockholders of the insurance companies whose presidents signed the above paper, to enquire whether they insure against lightning.

—The following extract from a private letter well expresses the state of mind of thoughtful and patriotic men like the writer :

"As one of the 'Independents' of 1876 who, after long hesitation, voted for Tilden, I will say that I cannot even guess with which party I shall vote in 1880. If Mr. Hayes were to be a candidate I should probably vote for *him*—not for his party ; for Grant, I cannot conceive of any circumstances which would lead me to vote. If it came to a choice between him and Tilden, I suppose I should vote again for Tilden. Of all conceivable candidates I should vote first for Charles Francis Adams, and next for Bayard; after these — !"

—We are very sorry to have again to call attention to gross acts of "journalism" on the part of the *Evening Post*. We said in our issue of September 25, commenting on Governor Robinson's letter of acceptance, that, as to "what had been done for retrenchment and reform in the State government during his three years' administration, *he claimed no credit in connection with it for himself and other officers but that of faithful obedience to the constitution and the laws*," and we then gave the figures. The *Evening Post* replied to this by alleging that the means of doing all this had been furnished by constitutional amendments passed by the Republicans, a point on which we had predicated nothing whatever. A correspondent then showed in our columns that it had blundered with

regard to the authorship of the amendments, and had also blundered with regard to the history of the abstractions made from the Sinking Fund. Instead of acknowledging this in its issue of the 24th inst., it has committed more "journalism," by converting the observation of the *Nation* in the paragraph referred to, that "Governor Robinson's letter had all the ring of the old Silas Wright Democracy," into the assertion that "the *Nation* had pleasantly likened the State Democrats to the old Silas Wright Democracy." There ought to be some punishment for offences of this kind, but it would of course be difficult, if not impossible, to devise one. We have several times convicted the *Post* of them, and tried to make clear to it the wrong and shame of them, but apparently without effect. They probably result in part from the too common vice of reading loosely or carelessly, and then lazily omitting to refer again to the subject of your comments when sitting down to write. There is a large number of persons, editors as well as others, who read something and do not like it, because, though not objectionable on its face, it seems to them likely to be injurious to something they value. After it has rattled round in their heads for a week or two the exact language used escapes them, and it sticks in their memory as a direct assertion of the other thing to which it appeared to point at the outset. The editor of the *Post* probably retained no impression of our original paragraph except that it seemed calculated to help the Democrats in the State election. In a week it had become in his brain a claim that the Democrats were like the Democrats of Silas Wright's day, and had passed the constitutional amendments, and that they had selected Governor Robinson to execute them, and that he had done so perfectly. In this state of muddle the editor sat down and began writing on the subject. Being afterwards irritated by our correspondent's exposure of his mistakes he became reckless as well as muddled, and continued to write without consulting either his own files or ours. It is all sad as well as bad.

—The high opinion we had formed of Mr. Joseffy's eminent qualities after his first concert has not only been fully sustained by his subsequent performances, but has been considerably enhanced. Critics and musicians, both professional and amateur, were eager to hear the young artist who had produced such a profound impression in his first concert with works of the modern school—the concertos of Liszt and Chopin—in a composition which to this day is considered to be the highest criterion of the technical and intellectual qualities of a pianoforte-player—namely, Beethoven's immortal concerto in E flat. Mr. Joseffy fully justified the most sanguine anticipations. He rendered this composition in a manner worthy of the master who wrote it—with serene dignity, with brilliant and surprising force, with graceful and poetic finish. There was not a single attempt at sensational effects, nor any evidence of a desire to display his wonderful technique at the expense of the classical beauty of the work before him. It would be impossible to select two compositions of a more decidedly different character and better fitted to prove the versatility of his genius than those chosen by Mr. Joseffy for his second concert—namely, the Beethoven Concerto, of which we have just spoken, and Liszt's Fantasia on Hungarian airs. While the former occupies the first place among the piano-forte compositions of the best period of the classical school, the latter, though it shows perhaps a rather one-sided and local character, may be counted as one of the best and most interesting specimens of the most advanced modern or romantic school. Mr. Joseffy's performance of his countryman's fantasia was given with a fire and passion, yet with a faultless execution and artistic finish, that fairly carried away his audience. Never has an artist in New York been rewarded with more enthusiastic applause, with more demonstrative evidence of genuine appreciation, than were offered to this young stranger, whose name but two weeks before was hardly known in this city, outside of a small circle of professional musicians. In a series of four recitals, without the assistance of Dr. Damrosch's orchestra, Mr. Joseffy performed programmes of a most varied and interesting character, extending over the whole field of pianoforte literature, from Bach to Tausig and Liszt. It is to be regretted that among more than thirty pieces for piano solo he only played one of Beethoven's sonatas, the great "Waldstein," Op. 53, in C major. We can see no reason for this omission, for he showed in the most satisfactory manner by his rendering of this solitary gem how admirably he is qualified to interpret the rest. It would be a treat to hear him play some of the great sonatas belonging to the last period of the master's life, the mere technical difficulties of which are so overwhelming that they are only attempted by artists of the highest rank. Perhaps on his return to New York Mr. Joseffy will gratify us with such a performance, as unusual as it is difficult.

—The first week of Italian opera has not been a success. We noticed in our last number the shortcomings of the first evening's performance, and whilst the second representation—Gounod's "Faust"—was a decided improvement in every way on Verdi's "Traviata," it still fell short in many respects of the standard implied in the high-sounding title of "Her Majesty's Italian Opera Company." The performance of "Faust" was the occasion of introducing two more artists unknown to the New York stage, Mlle. Valeria and M. David. Mlle. Valeria is not a great singer; her voice is neither sufficiently strong nor of sufficient compass to entitle her to this rank; but it is very sweet and sympathetic, the middle notes being of a particularly beautiful quality. She has, moreover, the attractions of youth, of a very prepossessing presence, and of perfectly free and graceful stage manners. We can sincerely congratulate Col. Mapleson upon this acquisition to his company. M. David, who is a Frenchman, sang *Mephistopheles*. He has some very fine notes of the genuine basso timbre, but he sang so abominably out of tune, and used, or rather abused, in so exaggerated and unartistic a manner the *vibrato*, that it was at times positively painful to listen to him. Signor Campanini was received with storms of applause, and gave an admirable interpretation of *Faust*. We have seldom heard his voice to greater advantage than in the "Salve dimora," which, in response to the enthusiastic demands of his audience, he had to sing twice. Signor del Puente was an excellent *Valentine*, and Mme. Lablache a very satisfactory *Siebel*. The performance of "Rigoletto," which took place on Friday, and introduced Sig. Aramburo, a Spanish artist, and Mme. Adini, a lady of American origin, would have been a complete failure but for Signor Galassi's excellent singing and acting. Saturday's matinée gave a repetition of "Traviata," with Campanini in the leading tenor part, which was a great improvement on Signor Runcio's unsatisfactory attempts at the first representation of that opera. Everybody seemed to be conscious of this circumstance, particularly Mlle. Ambre, who appeared in every respect to much greater advantage than on the opening night. In fact, Col. Mapleson's success thus far, what little there has been, has been almost entirely due to his artists of last season, to Messrs. Campanini, Galassi, and Del Puente, and to the excellent orchestra, composed of the best musicians New York can furnish, and led by so experienced a director as Signor Arditi. The chorus, particularly the male part, is vastly better than last year; the *mise en scène*, appointments, etc., very good. But these things are not sufficient. Where is the prima donna? Can the rumor which has lately found its way into musical and dramatic circles, that Mme. Gerster is not coming to New York this season, be true?

—In *Die Gegenwart* for September 20 a Mr. Otto Gross begins a series of articles on "Amerikanisches Universitätsleben," which, to judge by the present paper, will not greatly increase the knowledge of foreigners on this subject. It opens with a picture of the Yard at Cambridge during the admission examination (which Mr. Gross places in the middle of August), in which the local color is spread very thick indeed, but hardly in such a way as would make a possible German student feel at home among the buildings, names, and customs described. Some of the latter have long ceased to exist, and one is tempted to suppose that the writer has got his knowledge of them from such veracious chronicles as 'Hammersmith' and 'Fair Harvard.' An idea of the vividness of his style may be obtained from the following dialogue. The italicized words are in English in the text: "What is a proctor," asks the youth. "*A proctor? Why?* Proctor is a kind of human creature that lives between *Freshmen* and *Sophomore*, and hinders the latter from completely destroying the former. *Proctor's Freshman* has his room directly underneath the Proctor's, and is under his special protection. On this account he often gets off with a less amount of hazing. And then you are certain of Holworth." "What is Holworth?" "Oh! Holworth is the Senior's Heaven; there dwell only Seniors," etc. But the latter part of the article is heavier than this light and graceful beginning. Harvard and Yale are compared, President Porter and a German author, Gerhard Rohlfs, being largely quoted. "Cambridge," says the last-named writer, "is known far and wide, not only as the seat of Harvard College, but also as centre of all that is best in American literature. New Haven cannot claim such a distinction. At Yale a certain earnestness has ever been observed. It perhaps was not the intention, but it certainly has been the result, that its system of instruction has encouraged discipline rather than culture, strength rather than grace, knowledge rather than ornament." "The difference between the two," wisely adds Mr. Gross, "shows itself in the fact that Longfellow is the treasure of Harvard, the geologist Dana that of Yale."

—At the end of a report presented last June to the French Senate on the colportage laws, and recommending changes which would almost amount to their abolition, we find a curious list of books authorized and of books forbidden under the old system. The object of the list was to throw discredit on the laws, and the worst cases no doubt were presented; but even with that allowance they are sufficient. Among the forbidden books are the Bible, Montaigne, Montesquieu, Fénelon's 'Pensées,' Mrs. Gaskell's 'Mary Barton,' Cardinal Pacca's 'Pie VII.,' the 'Mémoires' of Saint-Simon, D'Argenson, Bachaumont, Ségur, the Prince de Ligne, Agénor de Gasparin's 'École du doute' and 'École de la foi,' Quinet's 'République,' the reprint of the *Moniteur*, and actually the future President Grévy's 'Gouvernement nécessaire,' Cousin's 'Fragments de philosophie,' all Victor Hugo's dramas except 'Hernani,' Sir W. Scott's 'Lettres sur les Sorciers,' Fenimore Cooper's 'Camp des Paysans.' But the people whose morals or faith were endangered by such works as these (the list contains ten times as many as we have given) were to be allowed to buy without hindrance 'Les Brigands des Pyrénées,' 'Le petit Sorcier, recueil de prestiges,' 'Le Grand Art de tirer les Cartes,' 'Les Mystères des Harems,' 'Les Grisettes et les Nouveaux Bosquets d'Amour,' 'La Prostitution à Alger.' What will become of the French people if instead of these improving works a flood of Bibles and French classics and works by Coquerel and other Protestants are allowed to be carried around to their doors?

WALPOLE'S HISTORY OF ENGLAND FROM 1815.*

QUANTULÂ sapientiâ mundus regitur! This dictum, if freely rendered "What a small amount of common sense is enough to govern the world," is the true motto for Mr. Walpole's book; for his pages record the immense political results flowing from the prevalence throughout a whole nation of very ordinary good sense. Observers living between 1815 and 1830 might well think, and did in fact think, that England was on the brink of ruin. In 1828 so calm a statesman as Stein wrote as follows:

"The state of England seems to me very serious: a Church, the Anglican, confronting stiffly and oppressively the Nonconformist half of the people; its clergy for the most part non-resident—that is, distant from the scene of their vocation, and not troubling themselves about it; a noblesse that has almost monopolized landed property, and by its Corn Laws drives bread to a price almost twice as high as with us; a population half of which is crowded into the towns, and so becomes dependent on all the accidents of trade and commerce, and is exposed to the most crushing want; a steady persistency in injustice towards six million Irish Catholics, whose treatment exhibits scenes of murder, persecution, spoliation unparalleled in the sixteenth and seventeenth centuries—all caused by legislation, which ought to protect life and property; an enormous national debt; and at the top of the Government a King dropsical and exhausted by sensuality, a successor in bad health, and after his near decease a child, a minority."

This picture was no doubt, even at the time, one-sided. The brighter aspects of English society are left out of view; but every statement of Stein's is true, and Mr. Walpole's pages afford a long list of social and political evils which might easily lend additional darkness to the sketch drawn by the German statesman. What is noteworthy is that England, so far from falling to ruin, passed through a pacific revolution which issued in more than thirty years of unbounded prosperity. No reformer aroused the people to new life. No heaven-born statesman inaugurated a new era. Not one man of heroic mould arose to save a tottering state. A body of able, but for the most part rather dull, ministers, such as were Lord Russell, Lord Althorpe, Lord Grey, Sir Robert Peel, Sir James Graham, and a score more of men (of whom the greatest was a great administrator, whose keen insight into the needs of the moment was not more marked than his want of foresight as to the needs of the future), led a sensible, steady, unimaginative, and rather commonplace generation from the brink of a revolutionary abyss into the quiet but prosperous paths of conservative reform. No one can wonder that an historian such as Mr. Walpole, well crammed with facts and truisms, and happily reproducing the good sense and, one might perhaps add, the dulness of the generation whose annals he digests, should point with heavy satisfaction to the undoubted triumphs of what may be termed the policy of common sense.

No writer in the *Nation* will be inclined to underrate the substantial merits of the English Whigs, or the soundness of the policy which they and the best of their Conservative opponents combined in carrying out. But the merits of sense, a spirit of compromise, of political judgment, and the like, will never want eulogists in any Anglo-Saxon community, and there is some interest in turning from Mr. Walpole's complacent platitudes about the progress of England to the consideration, not of the triumphs but of the shortcomings of the hand-to-mouth policy which certainly achieved in England a success that is not always granted to the efforts of so-called high statesmanship.

The first and the inherent defect of what may be called the statesmanship of common sense is the tendency to defer dealing with any political problem which does not call pressingly for immediate solution. Writers like Mr. Walpole dwell with natural satisfaction on the fact that conservative reform has removed slowly and one by one all the evils which oppressed the British people at the end of the great war. What such writers do not notice is the price at which the policy of bit-by-bit reform is carried out. Catholic emancipation is the typical example of the virtues and defects of English statesmanship. In any other country than England the agitations of 1828 would have ended in violent revolution or in civil war. The spirit of compromise, the habit of looking facts in the face, the tacit but general understanding that come what would a political difficulty must be terminated by legal means, saved the country from ruin. But when this has been admitted, there is scarcely a word more that can be urged in favor of the manner in which Catholic emancipation was carried. If the measure had in 1800 been associated with the Act of Union, it might have made the Irish Catholics ardent opponents of Repeal. Had emancipation been granted in 1820, neither England nor Ireland would have learned the dangerous lesson that the only way to extort justice was to threaten revolution. Exactly the same moral may be drawn from the movement for Parliamentary reform. An experience of nearly half a century now convinces the most timid Conservatives that the Whigs were nothing like revolutionists, and that a reform even more extensive than the measure of 1832 would not have menaced the monarchy or have revolutionized society. It is further clear that changes far short of those embodied in the Reform Bill would, if carried in time, have satisfied what was, after all, the very conservative feeling of the country. But it is, on the other hand, abundantly clear that the delay in carrying any reform whatever very nearly plunged the country into a revolution. The storm has died utterly away. Its very echoes have ceased to be audible to the present generation. A Conservative Ministry may probably, within the next ten years, establish household suffrage throughout the country, and if any future Lord Beaconsfield should discover that universal suffrage is the best basis on which to ground a Conservative party, he may extend the franchise to every man throughout the United Kingdom with far less difficulty than met Lord Grey when he made the ten-pound householders the controlling power in the state. But though circumstances have so changed that modern Englishmen find a difficulty in understanding either the enthusiasm or the dread excited by Parliamentary reform, intelligent students easily perceive that the pacific movement of 1832 only just escaped from turning into a violent revolution, and that the peril of the time arose in reality from the habit, common to English statesmen of all parties, of leaving evils uncorrected till they became so intolerable that they could not be left untouched without peril to the very life of the state.

The second fault of common-sense statesmanship is the preference which it constantly gives to obvious rather than to thorough-going measures. Here again Catholic emancipation affords a fertile theme for reflection. It may possibly be found that in the long run England has gained from the fact that the politicians of 1829 did not carry out what they themselves deemed on the whole the best remedy for Catholic discontent. But statesmen who live from hand to mouth cannot claim credit for benefits accidentally arising from their failure to carry out their own ideas, and one can scarcely doubt that the men who were really in favor of Catholic emancipation wished for the most part to couple it with endowment of the Catholic priesthood. They failed to give effect to their own policy because simple emancipation was the easiest measure to carry which could conceivably meet the necessity of the case. Here, further, we have the bad side of the English spirit of compromise. A great measure based on Liberal ideas is so carried out as to give the least possible offence to Conservative opponents. A scheme of reform is, in other words, made palatable to those who are opposed to its fundamental principles by being applied so as to lose half the advantages which it ought to ensure. Much the same thing may be said in a less degree of the Reform Bill. To abolish rotten boroughs was an obvious necessity. To admit large towns to a share in Parliamentary representation was also unavoidable. Hence rotten boroughs were abolished, and the large towns received representatives. It was, however, believed, whether

*'A History of England from the Conclusion of the Great War in 1815. By Spencer Walpole.' In two vols. London: Longmans, Green & Co.

truly or not, that some indirect benefits arose from the existence of rotten boroughs. Neither Conservatives nor Liberals made the least effort to preserve the alleged advantages of the old system in combination with the changes necessitated by any reform of Parliament. Add to this that it is by no means clear whether, even from a Conservative point of view, it might not have been better to have admitted in 1832 the claim of all householders, at any rate in towns, to share in the franchise. The first requisite of a measure of parliamentary reform was that it should be for a considerable time final, and Lord John Russell showed both firmness and statesmanship when he stood up for the "finality" of the Reform Bill. But a ten-pound suffrage, whatever its practical merits, had that want of theoretical finality which was certain to ensure the rapid growth of a movement for further reform. The terrors of the Chartist agitation are now nearly forgotten; but Chartism was at one time a real peril to the country, and it is difficult to doubt that the introduction of household suffrage in 1832 might have spared England the agitation for further reform which alarmed even calm politicians up to 1848, and embarrassed English politics up to 1868. To have looked forward to the wants or perils of the future would, in 1832, as at almost every other date, have been utterly foreign to English statesmanship of whatever school. Whigs and Tories alike agreed at bottom in carrying or accepting a measure which met the patent wants of the time. Logical completeness, theoretical consistency, or large schemes of policy had as little charm for Liberals as for Conservatives. One and all, they agreed in accepting a practicable scheme, and acquiesced in the policy of common sense. Students or theorists who look at the immense apparent success achieved by such acquiescence find it difficult to decide whether to admire or to condemn a kind of statesmanship which leaves a host of fundamental problems untouched, in the perhaps sound belief that it is best to let things arrange themselves, and that the last word of political experience is "Quantulâ sapientiâ mundus regitur."

DOWSON'S GUIDE TO HINDU MYTHOLOGY.*

TWO or three generations hence the amount of Sanskrit literature accessible through the medium of reproductions in English, German, and French will, no doubt, be inconsiderable proportionally to what there will then be to exhibit. Still, estimated irrespectively of such a comparison, this amount is far from being scanty. Moreover, the time has arrived when popular interest in the ancient creations of the Indian mind, and the materials available in the various languages of Europe for something like an intelligent appreciation of them, amply justify a compilation of the general type of that which has been essayed by Mr. Dowson.

Of attempts hitherto to supply this want for limited departments and provinces the most deserving is the work in two volumes of Sir Henry M. Elliot, entitled 'The Races of the Northwestern Provinces of India.' Under the four heads, Castes; Customs, Rites, and Superstitions; Revenue and Official Terms; and Rural Life, is a rich store of information conveniently arranged for reference. An edition, revised and enlarged by John Beames, was published by Trübner in 1869. The first serious attempt to cover the whole field was made by Mr. John Garrett, Director of Public Instruction in Mysore. In 1871 he published in Madras a stout octavo volume of 793 pages, including an appendix, bearing the title, 'A Classical Dictionary of India, illustrative of the Mythology, Philosophy, Literature, Antiquities, Arts, Manners, Customs, etc., of the Hindus.' To this was added, in 1873, a supplement of 160 pages. The chief defect of this book is its incompleteness, which is not surprising considering that one man has attempted what a score of specialists could hardly have done satisfactorily. There is also an unpleasant look of the scissors about it, too many of the articles being excerpted bodily from the writings of a few prominent Sanskrit scholars. Manifestly the true plan for the compiler of such a work to follow is to collect from every source all accessible information on a given topic, and, having abridged and arranged it, to give his readers the concentrated essence of it. But in spite of these shortcomings, which were hardly avoidable under the circumstances, Mr. Garrett deserves the gratitude of scholars for so much as he has done. The mass of generally trustworthy information which the book contains will be a valuable nucleus for a better-organized and more complete undertaking in the future. It is not strictly a "classical" dictionary, as it includes much that is modern. It has not reached a large circulation in Europe, and is hardly known in this country.

The volume before us, one of Trübner's "Oriental Series," is true to its title, and rigorously excludes all names which do not belong to the ancient times of India. This restriction of the field allows a fuller treatment of subjects, though it is in general brief, in order to bring the book within a moderate compass. The longest article, that on the Vedas, is about eight pages. The leading topic of the book is mythology, which developed to enormous proportions in India, and may be aptly compared to one of its own jungles, which harbors in its tangled depths every monstrous and uncouth shape. Found in its germ in the Vedas, growing under the hand of the exegetes of the Brâhmanas, it came into full bloom in the tasteless and conflicting tales of the Purânas, the latest of the older literature. The honor of bringing order out of this confusion, of detecting the fine thread of sense which runs through all this nonsense, if, indeed, any such connection exists, awaits some future scholar. Much dreary work, plodding through an infinity of speculations and silly legends, remains to be done before a philosophy of the subject will be possible. Naturally, in Mr. Dowson's book we find only a condensed account of the attributes and dignity of each divinity, and the vicissitudes which he suffered in successive phases of religious development. Inseparable from the poetic creations of mythology is religion. Here we miss all but the briefest allusion to Gotama Buddha. Such an inadequate treatment of the author of the great religious revolt, the Protestant Reformation of India, is a serious defect. The accounts of the ancient geography and literature will be found full enough for ordinary purposes. Frequent references to special works where topics are discussed more at length add much to the value of the book.

The author has gathered his materials, as he informs us, exclusively from European writers on India. "I have not resorted to original Sanskrit authorities," he says in his preface; and he adds: "My remaining span of life would at the best be quite insufficient for an investigation of their manifold and lengthy volumes." Why, instead of this somewhat equivocal circumlocution, he should not have frankly avowed himself to be no Sanskritist is not easy of conjecture; the rather, as the fact must be at once patent to any expert, if only from his "Chandîpât," "Chhando," "Gaura," "Havishmata," "Kâvya-darsa," "Târakâ-maya," "Râja," etc., etc. His ventures at criticism apart, his shortcomings are mostly of the kind that might be expected on the part of a person laboring in a field of research for the cultivation of which he has not duly qualified himself. As to editions and translations of Sanskrit works, he has no excuse, however, for not having presented more complete and circumstantial information regarding them. Nor can we commend his habit of sinking mention of his authority for a statement, where such authority is not identified with a name to which he chooses to attribute weight of scholarship. With respect to a statement considered by him to be of this description, it would surely have been better if he had withheld it altogether. And another peculiarity which he more or less obtrudes is that of qualifying a work by an epithet emphatically laudatory, or else of that baldness of characterization which is much more injuriously suggestive than outspoken depreciation. Besides, it is hardly becoming in him to adjudicate on the merits of writers in a sphere where he is a mere amateur.

By way of testing Mr. Dawson's accuracy and ordinary manner of procedure, we take, almost at random, his list of the Pauravas, which occupies a part of pp. 69 and 70. This list is, professedly, that "given in the Vishnu purâna, but the authorities vary"; a remark which we do not understand. By the "Vishnu purâna" is meant Professor H. H. Wilson's English version of it, the revised edition of which the compiler seems to notify that he has followed, in preference to the first edition. In the list in question, Professor Wilson has Prâchînwat, Bhayada, Parîkshit, Asîmakrishna, Nichakra, Sukhîbala, and Vrihatkshatra; Professor Wilson's reviser, Prachinwat, Abhayada, Parikshit, Adhisîmakrishna, Nichakru, Sukhâbala, and Brihatkshatra; and all these corrections Mr. Dowson adopts. On the other hand, he elects, as against the reviser's Pûru, Professor Wilson's Puru, for which there is no authority in the original. Further, Professor Wilson has Nrichakshu; his reviser, Nrichakshus; Mr. Dowson, the unscientific form Nrichakshush. Once more, Professor Wilson, mistaking the sense of the perfectly plain Sanskrit that lay before him, to say nothing of his carelessness, makes Akrodhana father of Devâtithi and Riksha, and Riksha father of Dilîpa; in lieu of which, as his reviser points out, Akrodhana is father of Devâtithi, Devâtithi is father of Riksha, Riksha is father of Bhîmasena, and Bhîmasena is father of Dilîpa. These amended particulars are accepted by Mr. Dowson, with the exception of Bhîmasena, whom he omits; here arbitrarily preferring to repeat a mistake obviously engendered by sheer negligence, if not by what was as bad, the deference of Professor Wilson

* 'A Classical Dictionary of Hindu Mythology and Religion, Geography, History, and Literature. By John Dowson, M.R.A.S., late Professor of Hindustani, Staff College.' London: Trübner & Co., Ludgate Hill. 1879.

to so late and so untrustworthy a guide as the Bhâgavata-purâna, to the effect of inducing him to misrepresent the Vishnu-purâna without acknowledgment. In his "Asîmakrishna," mentioned above, Professor Wilson likewise silently sophisticates his original by the aid of the Bhâgavata-purâna; and there Mr. Dowson declines to follow him. Finally, the names Tansu and Sushena, for Tansu and Sushena, are wholly wrong, and the compiler's own property. We here have abundant evidence of free exercise of caprice, in the absence of capacity of scholarly judgment.

Even a most cursory inspection reveals to us that Mr. Dowson has few pages which are quite free from errors of commission or of omission. He wrongly attributes to the celebrated Colebrooke an edition of the 'Abhidhâna-chintâmani.' Ahichhatra and Ahikshetra are set down as names of a certain city. The words should have feminine terminations, and otherwise are erroneously expressed; for we are to read, in their stead, Ahichchhatrâ and Ahikshatrâ. Both Angirasas and Angirases are given, though only the latter is possible. The "Ânanda-chandra," a drama, is unrecorded, as are twenty-two other compositions of the same class, all which were catalogued together in an English publication in 1865. It is by no means true, as is implied at p. 45, that Burnouf translated the whole of the Bhâgavata-purâna. Bharata is not named by the compiler as author of the Nâtya-sâstra, notwithstanding that the work—which, further, is not registered—has come down to us in its presumed entirety, and that part of it is in print. Under Bhattâchârya we are referred to Kumârila, who did not bear that title, but the title of Bhatta, Bhattâchârya designating none but Pandits of Eastern India, which was not Kumârila's home. And so Tarkâlankâra, not Tarkapanchânana, is given as the title of Jagannâtha, the author of the law-digest translated by Colebrooke. Champamâlinî is no name of a place: the capital called Mâlinî was subsequently called Champâ. Chedi is defined as "the modern Chandail and Boglekhand"; a borrowed conjecture totally unsupported by any good foundation. And here is an article, on the analogy of which Sanskrit epithets without limit would require insertion: "Chirajîvin, 'Long-lived.' Gods or deified mortals, who live for long periods."

But the task would be unbearably tedious if we went through the book as we have begun. So we confine ourselves, in what follows, to one in say twenty of the remaining defects in it which have struck our eye. Seeing how little we possess of sober Hindu history, the Harsha-charita, whose details are so curiously confirmed by the Chinese pilgrim, Hiouenthsang, should by no means have been passed over as if it did not exist. Did the compiler, indeed, ever hear of it? The Kathâmrita-nidhi, also, lacks the niche which should have been assigned to it. Kubjâ (p. 166) is no proper name; just as, further on, Syâla is none, where it is heedlessly assumed to be such. It is not entirely a "fanciful title" that we have in Lîlâvatî, the name of Bhâskara's treatise on algebra, if, as tradition asserts, the mathematician called it after his daughter. That "there appears to have been a city Mekalâ" is an opinion which it would be difficult to substantiate. Manu, as the name of the author of the 'Laws of Manu,' has, it seems unawares to the compiler, been questioned, with much probability, as fabulous. Pushkara is no "tank," but a noble lake, if our own eyes have not deceived us. Sthânwîswara, now popularly known as Thanesur, should not have been ignored, as it is. In Sunahsephas we see one of the many samples of the compiler's ill-advised dependence on so frail a stay as Professor H. H. Wilson. Its final *s* is to be struck off; nor is that all, as the classical form of the name is Sunahsepa. "Manu" does not, as is asserted, speak of Sûrasena as the "capital" of the Sûrasenas. The Vîra-mitrodaya is not "in the form of a commentary on the Mitâksharâ."

But we must have done with these minutiæ. Whatever may be the forte of the compiler, it does not consist in accuracy, the want of which we trace in him everywhere. Professor Böhtlingk he metamorphoses into "Böhthlingk"; and the accomplished principal of the Benares College will hardly be gratified at finding himself figuring as "Griffiths," instead of Griffith. As for the rest, the typographical oversights in the book under notice are anything but few; and yet there is no table of errata.

What, then, are we to say to Mr. Dowson's volume, taken as a whole? In spite of its teeming with faults, it may be recommended as very helpful for purposes of superficial reference. However, if its author, should he think of a second edition, were to go over his sources of information with more care, and were to call to his aid some competent Sanskrit scholar, leaving to him all matters but those of collecting materials from English books, and, especially, entrusting to him all attempts at critical discrimination, the result would, undoubtedly, secure itself against the grave animadversions to which he has too confidently laid himself open by his unassisted efforts.

RECENT ARCTIC LITERATURE.*

'NORTHWARD HO!' is a work of the kind which the specialist reads on the strength of the author's reputation, and, after entering its title in the bibliography of his subject, permanently consigns to an upper shelf. Other readers will find here some of those tales of heroic endeavor which always stir the blood, associated with illusive woodcuts, both tales and cuts being familiar to those interested in the general subject. The new matter consists of the author's preface and a number of chapters of text devoted to the journal of a midshipman on the *Racehorse*, one of Phipps's vessels during the rather uneventful voyage of that navigator to the Spitzbergen seas. This journal, after having remained in manuscript for more than a century, is at length printed, and forms the twig around which the rest of the book has crystallized. It is much more interesting as an autobiographical sketch of a young British naval officer of those days than for any contribution to Arctic literature contained in it, and the errors and exaggerations, which even the editor is obliged to notice, forbid its being considered as authority in any matters of detail. The author, Thomas Floyd, died on board the *Conqueror*, of Howe and Byron's squadron, while stationed off Sandy Hook in October, 1778.

In the preface the author makes the misleading statement that the book is intended "simply as a monograph of *Polar* voyages," or those directed towards "the discovery of the North Pole," as distinguished from those seeking a Northwest or Northeast passage. As a matter of fact only *English* voyages are treated of, and the account is not strictly confined to Polar voyages. In discussing future exploration of the Arctic region he rules out the Smith Sound route as hopeless, and in justification of this decision paints in lively colors the dangers of a passage over or through the so-called "Paleocrystic Sea," which he further extends over almost the whole Polar region. In consideration of reports brought back by the Dutch expedition of last summer, he admits the existence near Franz Josef Land of "two descriptions of ice," one of a "paleocrystic nature" while "the other is the ordinary floe-ice," which are separated by "a distinct line of demarcation extending in a *north and south direction*" (!). The italics are ours. The inventors of this new and awe-inspiring term for the "old pack" of Arctic navigators of the last two centuries have, in truth, a good deal to answer for. We may take it as settled that no English Privy Council would advise her Majesty to spend public moneys in attempts to pierce the paleocrystic ice, now, as we have seen, spread over the whole Polar basin, even if penetrated by bands of "ordinary floe-ice" "in a north and south direction." In addition to the official paralysis thus induced, the labor of reconciling the facts of constant change in the character and condition of the ice, as reported by every Arctic navigator in any part of the Polar region yet explored, with the hypothetical character assigned to paleocrystic ice by its inventors, is too heavy a load even for the gallant author of this well-printed little volume.

Among the Polar expeditions of which no account is to be found in 'Northward Ho!' not the least interesting is that of Captain Hall in the *Polaris*. The sad fate of the leader, the vicissitudes through which the members of the party passed, and the unexpected northward progress achieved, all combine to make the story of the voyage one of the most noteworthy in the whole Arctic record. Hitherto, with the exception of the accounts which have appeared in the daily press, no complete report of this expedition from a person qualified by experience in Arctic matters has appeared. This deficiency is now supplied, at least for those familiar with the German language, by the hand of Dr. E. Bessels, surgeon and naturalist to the expedition. The outlines of the *Polaris* voyage and its results were made familiar to the American public by the newspapers, and it is impracticable within the limits of an ordinary review to summarize adequately a book of nearly seven hundred pages. Yet it will be sufficient for most purposes to call attention to some of its more notable features.

The author details in the preface (p. viii.) the reasons why the work did not appear earlier, though the text was nearly completed in 1874, and why he considered the ground not fully covered by the official 'Nar-

* 'Northward Ho! By Capt. A. H. Markham, R.N.' Small 8vo, 347 pp., 18 cuts. London and New York: Macmillan & Co. 1879.
'Die Amerikanische Nordpol-expedition. Von Emil Bessels.' 8vo, xx. 648 pp., woodcuts, plates, and map. Leipzig: Englemann; New York: B. Westermann & Co. 1879.

rative' issued by the Navy Department. He also gives what will seem to American readers conclusive reasons for not adopting the name of "Paleocrystic Sea" for the waters northeast from Robeson Channel. These are, chiefly, that it was first named by the American discoverers "Lincoln Sea," and that it is due to their right of prior discovery and to the flag under which the explorations were made that the first-given name should be retained. Moreover, while we may well believe that at the time and under the circumstances Captain Markham and his brave comrades did all that man could do, without success, we are not therefore justified in asserting that those circumstances are of such indefinite duration as the name "paleocrystic" would imply. It may be added to this, that abundant reasons are to be found in the very records of the Nares expedition for doubting the permanence of the ice-conditions there described.

In the first four chapters we are informed of the circumstances under which the expedition was organized, and of its departure from the United States, touching at various ports until the most northerly settlement in Greenland was reached. The story is enriched with notes on a variety of cognate subjects, including the Newfoundland seal-fishery and the celebrated masses of so-called "meteoric" iron which have been found in Greenland. The fifth chapter is devoted to a review of the work of Bylot and Baffin, Ross, Inglefield, Kane, and Hayes; in a foot-note (p. 101) some explanation is attempted of the discrepancies between the positions given by Baffin and those due to more modern research. Later (pp. 188–195), the sledge journey performed by Hayes in 1861 is referred to, an analysis of the observations indicating that Hayes was in error in his estimation of the latitude reached by him on that journey. The sixth chapter takes the *Polaris* to her first winter quarters, the author being of the opinion that an even higher latitude might have been reached than the northernmost which was actually attained. Besides the usual account of the arrangements for observations of a scientific character, sledge-journeys, musk-ox hunting, the few items which redeem such an Arctic winter from absolute social stagnation, the melancholy death of the leader, and the subsequent progress of the expedition in general, an easily comprehensible account of the results of the scientific observations is given (pp. 203–7, 224–32) for the general reader. There is also a biography of the Eskimo dog and of the musk-ox, with many details obtained from "Eskimo Joe"; a résumé of the animal and vegetable life (pp. 301–314); geological particulars, including reasons why the author believes that Greenland was connected with the American continent at the north after it had become completely separated at its southern extremity; data as to changes of coast-level; descriptions of Eskimo remains and of their migrations; scientific observations kept during the second winter; an ethnographic sketch (pp. 350–373) of hyperborean people in general; notes on the rate of motion of the inland ice of Greenland; and many more matters of interest for which the reader must be referred to the book itself. The latter portion of the volume is devoted to an account of the experiences of the two parties after their separation and the loss of the *Polaris*, and their final return, without loss of life, to the United States.

Enough has been said to suggest the richness of the volume in details of everything relating to these regions as well as its completeness as a narrative. It is written in a lively and agreeable style, and in general appearance and mechanical detail is superior to most books which issue from a German press. Good paper, clear Roman type, and a profusion of illustrations (of which certain spirited little tail-pieces are not the least noteworthy) form a worthy setting for the record of this remarkable voyage. It is to be hoped that it may be made available for English readers by a suitable translation.

We may remark, in conclusion, that one of the most important scientific results of the expedition, namely, the demonstration of the insularity of Greenland by homologizing the tides of Polaris Bay with those of the northern Atlantic, published by Bessels in February, 1876 (with a map of co-tidal lines), has recently been claimed for the English expedition under Nares; though an inspection of Nares's report will show that the tidal wave of the northern part of Robeson Channel was taken by his party to be derived from the Pacific, and it is only of late that the English investigators have returned to the original view of Bessels, whose promulgation of it they appear to have wholly ignored.

Campaigns of the War of 1812–15 *against Great Britain*, Sketched and Criticised. With Brief Biographies of the American Engineers. By Brevet Major-General Geo. W. Cullum, Colonel Corps of Engineers, U. S. Army, retired. (New York: James Miller. 1879.)—Americans who have reached middle age have frequent occasion to remark the ignorance of the rising generation of the events of the great war of secession. Familiarity with this phenomenon prepares us to observe without surprise the fact that hardly any one knows anything about the War of 1812, so far as it was waged on land. The number of those now alive who had reached manhood when that war was finished is extremely limited, and of those who came after them very few have cared, or now care, to study its history. Therefore, it would seem that the book before us would attract but few readers, and there is little in the manner in which its author has done his work to allure the seeker for amusement. General Cullum is a most respectable and industrious man, but he is not an imaginative person nor an accomplished writer. The student of American history may well consult this volume and he will read some chapters with positive pleasure, but upon the whole it is rather hard reading. The land-battles of the War of 1812 were not generally of a character to make an account of them very gratifying to the powerful Americans of to-day, and so far as the book is a biography it is less entertaining than it is as a history. Rather dry details of the lives of useful but not very prominent or interesting persons are not enticing, but at the same time it is true that to collect and publish these details does credit to the collector's loyalty to his corps. While those who complain that the North American Republic is ungrateful to its defenders may here find abundant proof that the disposition to be so is not a plant of recent growth, they will also perceive in the very fact that this volume has been prepared evidence that the spirit of cordial recognition of duty well done is not altogether wanting.

One finds occasionally in a printed book such flowers of rhetoric that the temptation to gather them into a bouquet is almost irresistible. General Williams is spoken of on an early page as "to the Military Academy an Alma Pater," and the delightful anticipation excited by this utterance is not disappointed. General Cullum, however, is so worthy a man that the critic should deal gently with his work. Moreover, it is the business of West Point to prepare men for the *fortiter in re*, and it has acquitted itself of this duty in a way to command admiration and gratitude. So we limit ourselves to a few strictures, beginning with the expression of a doubt whether it be not too bold a figure which the author uses when he declares that "the British trident was trailed in the mire" by Admiral Cockburn in the Chesapeake. It is undoubtedly true, as the writer says, in describing the battle of New Orleans, that "a column of Spartans could not withstand that American rolling fire of musketry and artillery pouring forth its messengers of death," but the form of expression, and the assertion that Colonel Miller, when ordered to carry a British battery near Niagara Falls, "led forward his three hundred Spartans to achieve a new Thermopylæ," may seem to some persons an infelicitous use of classical knowledge. Nor can we commend to the imitation of such American officers as may hereafter write of battles such sentences as this: "For some time the British officers stimulated the courage of their troops to move obliquely on battery seven, opening wide gaps through the column, which were instantly filled with fresh troops to share in turn a like fate." It may be true that "Tecumseh was a potentate uniting the prowess of Achilles and the authority of Agamemnon," but it will require a new Homer and a (shall we say ?) Tecumsiad to cause the dictum to be generally accepted; and it is a shock to our received opinions to be told that "the surrender of Michigan and an army at Detroit was unparalleled by the capitulation of Ulm or Baylen." When we find that Colonel McKee was the Mentor of the Council and the Palinurus of the battle-field, it sets us wondering what were the scenes of carnage in which the pilot won his fame. The phrase, "a Providential miracle," reminds us of that saint or bishop mentioned by Gibbon who mistook a funeral procession for a pagan ceremony, and "imprudently committed a miracle." We will close our citations with one fine burst about Jackson: "In a few hours he vanquished a powerful foe on the field of Chalmette, washed by the mighty Mississippi, Monarch of Waters, and bordered by morasses where, in wild luxuriance, grew the laurel of the victor and the cypress of the vanquished."

But all this is only the pastime of the reviewer, who is much refreshed when a serious book proves to be amusing. Form and style are not everything, but they are something; and when the proof-reader has failed to correct the errors or subdue the fine writing of the author, the critic feels that he has some work to do, and it is well that he should do it with a smile and not with a sneer. The experience of the last thirty years does not seem to indicate that there is a growing disposition to beat swords into plough-shares. It needs much reading to acquire even a superficial acquaintance with the history of the wars which have been

waged since the middle of our century; but we live in an age of collecting, and no collector of military books should fail to procure a copy of this work of General Cullum's. It is not every collector of books who is a *heluo librorum*, but whoever is, and whoever is a student of American history, whether profound or superficial, may, as was intimated earlier, read this book with much profit and some pleasure. To such readers as like a finger-post we will say that the chapters on the siege and defence of Fort Erie, on the Chesapeake campaign of 1813–14, and on the Louisiana campaign of 1814–15, including the battle of New Orleans, are especially to be recommended. We believe them to contain much valuable matter which is not easily to be found elsewhere. The volume ends with a reprint of Colonel Wood's 'Journal of the Northwestern Campaign of 1812–13,' under General Harrison, which is brisk and delightful reading.

Lafontaine, seine Fabeln und ihre Gegner [Lafontaine, his Fables and their Critics]. By Wilhelm Kulpe. (Leipzig: Wilhelm Friedrich. 1879.)—This book is linked dulness long drawn out; one of the most amazing monuments of dogged industry, misdirected to the concoction and subsequent dilution of insipid commonplaces, which ever found a publisher.

"[In the fable of 'The Wolf and the Mastiff'] Lafontaine means to inculcate this truth: Liberty is the highest good. This idea is one of the most suggestive and delightful ones which can task a poet's pen. Liberty once lost, nothing can take its place—no, not even the sweetest joys of life. Birds have been known to dash their brains out against the wires of their cages; others have died of hunger and left untouched the daintiest tid-bits. There is a proverb which says: It is better to starve in liberty than grow fat in slavery."

Of course a book on Lafontaine must contain a chapter apiece on Lafontaine as Man, as Writer of Fables, as Moralist, and as Philosopher. Philosophizing, however, is our author's forte. Some of his discoveries will be strange to our readers. The descendants of the ancient Gauls, of whom Lafontaine was one, can, even to this day, be distinguished from those of the Franks. Fables certainly rank higher than mythology, one reason being that fables have morals and mythology has not. The bee cannot do otherwise than build its cell with six sides, "its organs, among which the eye, with its hexagonal facets, plays an important part, are incapable of generating other shapes"; and the beaver cannot help building dams, "for that is what his organs are made for." Finally, the author maintains, with great positiveness and an air of honest conviction, that the wolves in Poland never did—King Sobieski to the contrary notwithstanding—make use in war of picket-lines, reserves, and guerilla-corps. This story, he says, is only one more instance of our universal tendency to anthropomorphize brute beasts.

The Rosicrucians: Their Rites and Mysteries. By Hargrave Jennings. (New York: J. W. Bouton. 1879.)—*Ancient Pagan and Modern Christian Symbolism.* By Thomas Inman, M.D. With an essay on Baal Worship, on the Assyrian Sacred Grove, and other Allied Symbols. By John Newton, M.R.C.S.E. (New York: J. W. Bouton. 1880.)—These are revised and enlarged editions of two noteworthy English books, which will be useful to persons interested in the study of symbolism and comparative religion, to numismatists, and, in a less degree, to students of ancient architecture. Mr. Jennings has devoted twenty-eight years to study of the Rosicrucians, and in deprecating acceptance of the ordinary published accounts of the fraternity, either in English or foreign languages, which he has found to be ignorant and prejudiced, and generally drawn from a single source, he has the authority doubtless of an expert. His own work is chiefly a history of the alchemists, with a sympathetic and enthusiastic exposition of the Latin writings of the great English Rosicrucian, Robert Flood, who died in 1637, and is incidentally explanatory of pagan and Christian symbols. The chapters on fire and serpent worship are admirable and elevated, and the defence of the Rosicrucian assumption of power to produce gold and prolong life is curiously ingenious in its air of strictly scientific reasoning. The criticism of Hume seems fully as weak as it need have been, and one feels that Mr. Jennings has become uncritically enamored of his subject when he claims cabalistic expertness for Shakspere, and assumes Pope's "Rape of the Lock" to have been founded upon fanciful hermetic ideas—forgetting that the magic was an afterthought. The style of the book is labored and involved, and the inexperienced reader may find it, consequently, somewhat difficult of comprehension at times.

Dr. Inman's volume is condensed from his larger work, 'Ancient Faiths Embodied in Ancient Names,' and contains mainly explanations of ancient symbols, the great number of which and the limits he has imposed upon himself render the account of each necessarily brief. The book is intended principally as an introduction to the general subject treated; and the opening essay by the author, in which he says, by the way, that this knowledge has been long possessed by all but English scholars, is sufficient for an intelligent appreciation of the numerous plates and their explanations which follow. The closing essay by Mr. Newton is an excellent addition, and imparts to the whole the spiritual flavor which in such a work is so valuable, and which would otherwise have been lacking here. The two books, taken together, disclose the meaning of the numerous symbols with whose exoteric meaning we are so familiar that we do not so much as think of a possible esoteric significance, and the mystic, sacred, occult, or cabalistic doctrines of which these symbols have been the type. The reflective will also find them fruitful of suggestions and inferences concerning subjects whose importance by no means decreases as it comes to be seen that the ordinary view of them is superficial and perfunctory.

Random Shots. By Max Adeler. With many Illustrations, by Arthur B. Frost. (Philadelphia: J. M. Stoddart & Co. 1879.)—Max Adeler is a humorist whose previous books have, we believe, met with a good deal of success. 'Random Shots,' however, seems unlikely to find much popular favor, even with the "lovers of honest fun," to whom the author devotes it in his preface. Though humor never dies, and is always reappearing in some new form and unexpected place, we doubt very much whether that school of humor which Artemas Ward founded, and but for the existence of which Max Adeler would probably never have been heard of (though it must not be supposed from this that the connection between the two is at all close), has not exhausted itself. The work is still handed down from the "funny man" of one newspaper to the "funny man" of another, but it burns dimly, and at times threatens to go out altogether. They are a curious group of jesters altogether, the "funny men" of the United States of the last twenty-five years: A. Ward, Mark Twain, Josh Billings, the *Danbury News* Man, and their fellows. With the exception of the fact that they write instead of talking, and dispose of their stock in trade to the best commercial advantage like other producers, they resemble not a little the professional "fools" of the Middle Ages. Their fooling is done for the benefit of the public instead of an individual, but they answer about the same purpose in the comedy of life that the "funny men" who wore motley did in more primitive times. Sometimes, in those earlier times, they became too serious for their employers' taste, and in that case were often visited with summary chastisement. The only person who can, in the interest of the employing public, castigate the modern "funny man" when he ceases to be amusing, is the critic; and we must accordingly remind the author of 'Random Shots' that the public is a fickle master, and that he must be funny or seek some other employment.

Placita Anglo-Normannica. Law Cases from William I. to Richard I., preserved in historical records. By Melville Madison Bigelow, author of 'A Treatise on the Law of Estoppel,' 'Leading Cases on Torts, with Historical Notes,' etc. (Boston: Little, Brown & Co. 1879. 8vo, pp. 328.)—The historical study of law, which has received so strong an impetus of late, in this country no less than in England, has borne worthy fruit, as well as provided itself with a store of valuable material, in Mr. Bigelow's collection of law cases of the Anglo-Norman period. The collection is practically complete for temporal cases, containing also a few ecclesiastical ones; only some spurious or imperfect cases have been omitted, and the collection has been brought down through the first half of Richard's reign, "so as to make connection with the Rotuli Curiæ Regis." There is an Introduction of 37 pages, an Appendix of 34 pages, a Glossary, an Index, and an Index of Cases. The object of the collection is legal rather than historical, or rather, it is designed to assist in the study of the history of law rather than general history. How valuable it must be for its main object it is easy to see. The introduction sums up briefly its principal results, and the author hopes to publish within a year a history of the Anglo-Norman procedure, for which the present work is in the main a preparation. The points specially treated in the Introduction are, first, the relation of Anglo-Norman procedure to the primitive German law, and, in especial, the continuance, in this period, of the four "forms of proof in use among the Anglo-Saxons—by ordeal, oath, witnesses, and charters"; then the discussion of the

peculiarly Norman type of evidence, the *inquisition* and *recognition*, with which is joined a sketch of the history of writs at this period.

It will be seen that, although the interest of the book is principally legal, it has at the same time great value for the student of constitutional and general history. This is especially the case at the close of the Introduction, where the author takes up the subject of the various royal courts and their relation to one another, passing over, however, the *popular* courts of the county, hundred, etc., without discussion. It is to be hoped that the anticipated volume will help us to an understanding of the relation of the two sets of courts—the instrumentality and method by which the entire legal procedure of the country was woven into one harmonious system; a feature in which, as much as in any, we find English institutions of the middle ages contrasted with those of France. We also have incidentally (p. xli.) a highly important paragraph upon the existence of military tenures in the reign of the Conqueror. It will be remembered that Mr. Freeman, relying upon Domesday Book, denies that there is any clear evidence of these tenures at this period. Mr. Bigelow, however, proves their existence completely by citing several cases in which Domesday speaks of land as simply "held" by such a one, while the Abingdon Chronicle speaks of the very same estate as being held by knight's tenure. This volume forms, in one sense, a continuation to Mr. Adams's Essay on Anglo-Saxon Law; for the appendix of that volume contains a complete collection of Anglo-Saxon cases.

THE FIRST NUMBER OF THE

American Science Series:

Astronomy.

FOR HIGH SCHOOLS AND COLLEGES.

By Simon Newcomb, LL.D., Supt. American Ephemeris and Nautical Almanac, and Edward S. Holden, M.A., Professor in the U. S. Naval Observatory. Large 12mo, $2 50.

Specimen copies for examination with a view to introduction sent post-paid to teachers on receipt of $1 50.

Hector Berlioz:

Selections from his Letters and Æsthetic, Humorous, and Satirical Writings. Translated by William F. Apthorp. 12mo (Amateur Series), $2.

The Magic of the Middle Ages.

By Viktor Rydberg. Translated by A. H. Edgren. 12mo, $1 75.

PRIMITIVE MANNERS and CUSTOMS. By J. A. Farrer. 12mo, $1 75.

THE YOUNG FOLKS' CYCLOPÆDIA of Common Things. Large 12mo, illustrated, $3.

THE ONLY WEEKLY JOURNAL OF ITS CLASS PUBLISHED IN THIS COUNTRY IS

The American Architect and Building News.

It discusses topics of general as well as of professional interest in architecture and related arts, while the four full-page illustrations and the illustrative cuts of each number are valuable to all intelligent persons no less than to architects.

"This excellent periodical leaves nothing to be desired on the part of its conductors."—*The Nation.*

TERMS: Per year, $7 50, or, if paid in advance, $6; for six months, $3 50. Single copies, 15 cents each.

HOUGHTON, OSGOOD & CO.,

Winthrop Square, Boston.

SULLIVAN BROS. & LIBBIE,

Auctioneers, No. 2 Beacon Street, Boston, will sell on

Tuesday, Wednesday, and Thursday,

Nov. 11, 12, and 13, each day at 10 o'clock,

THE VALUABLE COLLECTION OF

Autograph Letters & Manuscripts

Of the late Col. BRANTZ MAYER, of Baltimore, Md.,

Comprising many of the most eminent names in the Colonial and Revolutionary Periods of American history, especially Signers of the Declaration, Generals, Governors, etc., and in Foreign and American Literature, Art, and the Drama, etc.

Catalogues now ready.

The Kissena Nurseries.

In response to enquiries, we would inform purchasers that we are *not* selling out. The mistake has arisen from the selling out of another firm. Our plans are laid for a long future in the sale of TREES and SHRUBS of the best quality, at the lowest prices.

Price-list *free.* Descriptive Catalogue, at 10 cents, includes NEW and RARE PLANTS.

PARSONS & SONS CO. (Limited).

OUR CATALOGUE is now ready and will be sent on request. It contains 168 pages and 375 engravings of suits, cloaks, fur-garments, millinery, underwear, infants' clothing, laces, embroideries, etc., and is designed to convey information in regard to our entire stock. With its aid a lady can order samples of such goods as she may want, and from these samples with prices affixed she can select goods understandingly and with as much confidence as if she were present in the store—perhaps with even greater success, for therein all the various kinds are put before her in an orderly arrangement favorable to comparison and choice.

"In addition to these facilities now so fully afforded for the first time—or rather in consequence of these facilities—we venture to guarantee the full satisfaction of the buyer without stint or reserve."—*Extract from the Preface.*

Our stocks are fuller and perhaps richer than ever before; and on account of the lateness of seasonable weather many articles are marked down to extraordinary prices. In marked-down goods also absent buyers have the same advantage as those present exactly.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 6, 1879.

The Week.

THE Republicans have achieved triumphs of considerable importance in seven out of the eleven States in which elections took place yesterday. We except New York, which to all intents and purposes has gone Democratic. There is at this writing great difference of opinion among all the counters of the daily papers as to the exact figures of the majorities, but there is no reason to doubt that the Democrats have carried their whole State ticket except Governor Robinson, which means that if they had put some one else—Mr. Clarkson Potter, for instance—in the first place, he would have been elected. Robinson has been defeated by the Kelly bolt, which produced an unexpectedly large vote in this city, but the precise amount of which it is impossible to learn before going to press. The defeat of Robinson substantially puts Tilden out of the Presidential field, which for reasons we have given elsewhere is not a piece of good fortune for the Republican Stalwarts. On the other hand, it is a triumph for nobody (besides Kelly) except Senator Conkling, who may well feel gratified by it. Of course he could not have achieved it without the aid of the Democratic split, or, in other words, it is partly due to good luck; but in a career like his good luck is not distinguishable from skill.

He has, in fact, successfully availed himself of a good opportunity to put into the highest State office a personal adherent whom nobody but himself thought fit for it, and whom the Administration had insulted him by dismissing from a subordinate place in the Custom-house. This is much, but not all. He has brought to New York his two principal enemies in the Cabinet, for whom he has never concealed his contempt, Messrs. Evarts and Sherman, to speak for his nominee and their dismissed servant, and, in speaking, to throw overboard all the principles for which the Administration has hitherto stood, or has been supposed to stand, to repudiate civil-service reform, wave the "bloody shirt," and even call for "a strong man" in the Presidency. He has accomplished this, too, without taking any part in the canvass himself beyond making one speech to a select audience in Brooklyn, where he gave the finishing touch to his performance by producing Mr. Henry Ward Beecher to denounce "scratching" and receive from him a public embrace. He, however, leaves New York in the list of doubtful States for next year, so that he will not go to the convention with the easy assurance which he might have displayed if his entire ticket had been elected.

The Scratchers' Committee are about to place the results of their work before the public in a formal shape. They announce now, however, as what "they think they know," as the Organ says, that but for the Kelly vote Cornell would have been defeated by 20,000 majority; that he was behind his ticket by 4,000 in New York City, 2,500 in Brooklyn, and about 10,000 in the State, and that many Scratchers' votes have been covered up by votes cast for Cornell by the Tammany faction. We hope they will continue to stick to the Organ's "bark" during the winter and keep the Old Man awake and lively.

In Massachusetts, which comes next in importance after New York, Butler has been again defeated, but has on the whole held his own from last year better than his opponents. Last year, Talbot, the Governor on the Republican ticket, had 134,725, and Butler 110,000. This year Long gets 121,204, and Butler 108,237. Adams, the regular Democratic candidate, gets a trifle less than Abbott, his predecessor, or under 10,000. This is not a very brilliant victory considering what a "bad man" Butler has been discovered to be, and some Democrats are apparently trying to believe that if they had nominated some one else they would have carried the State. But there is no doubt that Massachusetts would in any national election prove a thoroughly Republican State, and just as little that Butler's "badness" gets him thousands of votes which a respectable man could not bring out. He owed a great deal of his strength to dissatisfaction with the set of men who have managed the Republican party in the State for some years, and whom many people have got into the way of hating because they give such glowing accounts of their own virtue. He owed more to the desire of a change of some sort, and not a little to the desire of the "boys" to have the fun of seeing "Ben" sitting cheek by jowl with the Harvard Professors and other stuck-up people who have been in the habit of looking down on him. He will now probably run for Congress again, and as likely as not, on the "bloody-shirt" issue, or he may come out as the champion of "State Rights" or a "Solid South."

Of the other States, Mississippi and Maryland gave Democratic majorities, the election in the former State having been a "quiet" one, as the Republican press sarcastically announces, and that in Maryland, according to the same authority, having been attended by Democratic slaughter of negroes at the polls, which would certainly be pushing this practice impudently near the Solid North. In Virginia the anti-Repudiationists appear to have met with their expected success. Minnesota gives a Republican majority of 10,000 in spite of reported vigorous scratching. Wisconsin, which the Democrats hoped at least to make "doubtful for 1880," gives the largest Republican majority since the last Grant campaign. Nebraska is, of course, Republican. The Republican majority in Pennsylvania is estimated at 50,000, which is unexpectedly large. The "doubtful States" of Connecticut and New Jersey went with the tide and increase the present Republican majorities in their legislatures. A number of the members of these hold over and will vote for United States Senators, so that the seats of Senators Eaton and Randolph will probably be lost to the Democrats. The Mississippi legislature just chosen will partly counterbalance this by electing a Democrat to Bruce's seat. It should be remembered that only in New York, Massachusetts, Minnesota, Wisconsin, and Maryland were governors voted for, and in several States much "apathy" is reported.

Kelly sacrificed the Robinson men and disappointed his followers by his vote in the city, which is apparently some fifteen or twenty thousand behind Robinson's and about the same as Cornell's. There was so much scratching done that the count proceeded with unexampled slowness, and at this writing it is not certain what local officers are elected. It appears tolerably clear, however, that Tammany has been thoroughly worsted, every effort having been made by Kelly to elect Gumbleton, who is probably very badly defeated. The Robinson county ticket is probably in the main successful, even Judge Miles Beach's election being at present conceded by the Republicans, who supported Mr. Root very vigorously. The Republican candidate for Sheriff is possibly elected, but this seems the only likely exception. So decided a success of the Anti-Tammany Democrats, who have of recent years been invariably obliged to depend upon a coalition with the Republicans, ought either to give Tammany its quietus or reduce it to subordination. It surrendered its regularity at Syracuse, and has now lost the voting strength upon which it then fell back.

Nobody has suffered so much in the contest as the Administration. No one, so far as we know, ventures to defend the performances of Messrs. Evarts and Sherman. Mr. Sherman went about the country stumping with Dutcher, the Appraiser, to whom he

had granted leave of absence for the purpose. The following is not pleasant reading:

Extract from President Hayes's Inaugural Address, March 5, 1877.

"I ask the attention of the public to the *paramount necessity of reform in our civil service*, a reform not merely as to certain abuses and practices of so-called official patronage, which have come to have the sanction of usage in the several departments of our Government, but a change in the system of appointment itself; a reform that shall be thorough, radical, and complete; a return to the principles and practices of the founders of the Government. They neither expected nor desired from public officers any partisan service."

President Hayes's Executive Circular, dated June 22, 1877.

"SIR: I desire to call your attention to the following paragraph in a letter addressed by me to the Secretary of the Treasury on the conduct to be observed by officers of the general Government in relation to the elections:

"'No officer should be required or permitted to take part in the management of political organizations, caucuses, conventions, or election campaigns. Their right to vote and to express their views on public questions, either orally or through the press, is not denied, provided it *does not interfere with the discharge of their official duties.* No assessment for political purposes on officers or subordinates should be allowed.'

"This rule is applicable to every department of the civil service. It should be understood by every officer of the general Government that he is expected to conform his conduct to its requirements.

"Very respectfully, R. B. HAYES."

Mr. Sherman to Appraiser Dutcher.

"SIR: Your application for leave of absence is hereby granted. I cordially approve of your taking part in the Cornell and Hoskins campaign, and will do all in my power to favor their election. I have no objections to the Government employees making contributions to the fund. Your suggestion that I should take part in the campaign by speaking in several of the prominent cities in your State I will answer at some future time.

"Yours respectfully, JOHN SHERMAN."

The local campaign in Brooklyn was enlivened by the appearance of several of Mr. Beecher's flock in the unexpected rôle of "youthful Scratchers." It is by no means clear that Mr. Beecher himself did not scratch. At all events, he was either unwilling or unable to prevent the Plymouth-Republican organ from openly hinting at the wisdom of scratching the Republican candidate for Mayor, and he permitted Mr. Shearman, whom a word from him could beyond question have calmed, to make animated speeches and write letters to the *Eagle* in favor of the same impertinent and youthful practice. He furthermore wrote to the *Eagle* himself, intimating that if he had to write over again a letter he wrote in 1873, expressing his "profound sense of the honor and integrity" of Mr. Woodruff, the candidate in question, he should write it very differently, and that even when he wrote that letter he "had no personal knowledge of the facts in the controversy." The controversy referred to was between the Treasury Department and the firm of Woodruff & Robinson, and Mr. Shearman made it one of the counts in his indictment of Woodruff upon the stump and in the press that the firm, being accused of defrauding the revenue in 1873, "paid $50,000 to hush up the charge." What he had most at heart, however, was evidently the fact that Woodruff was a witness for Tilton in the scandal trial, and was said to have threatened to "drive Mr. Beecher out of Brooklyn."

Brooklyn politics are peculiar, and no one need be surprised that a Brooklyn election should in a measure turn upon some private-public feud or other, but what we should like to know from Mr. Beecher is, on what ground he justifies the scratching of Woodruff by the young Plymouth Scratchers? The fact that he now doubts Woodruff's integrity is irrelevant; was not Woodruff regularly nominated by the indispensable Machine? and should not all opposition to regularity and all expression of personal preference cease after the primaries are held? Why should he have allowed Mr. Shearman to scratch the "slight efflorescence" on his skin produced by personal disregard for the regular nominee, instead of advising him to "accept, as that which is the best attainable, organization and body and candidates"? Are we to assume that only private reasons justify scratching, or that it is only when national issues are involved that we are to "stand in the line" and not "attempt to overrule those who have taken those pains and have done this work"?

The Organ appeared, just before the election, in a third and new character, that of a Sympathetic Friend, who loved reform as much as anybody, and saw its beauties, but had to give up fighting for it and tear himself away from its supporters from a stern sense of duty, being alarmed by "the Solid South." This, he says with tears in his eyes, is what keeps him to his lonely boating along the "shores of what he hopes he has learned." He intimates that some day he will be a reformer again, but declines to fix any date or to say in what particular year it will be safe to reform anything whatever. Just now he thinks that any countenance to civil-service reform in this State might produce the most horrid excesses in Mississippi and Louisiana, and he doesn't want to have innocent blood on his hands.

We said last week that in the beginning "Stalwartism made *all* voting at the South, and, in fact, the preservation of the peace at the South, matter of Federal concern." The *Press* of Philadelphia denies the correctness of this, with much vituperation, and challenges us to "name a single authoritative Republican declaration, or a single declaration of a prominent Republican, to the effect that the United States had a right to be present by its officers at a purely State election, either for the preservation of peace or the protection of the ballot-box." By employing a boy to run over the files of the last seven years we might fill a volume with such declarations. Two, issued only last year, occur to us at once. The Illinois Republican platform of June, 1878, called for the "permanent pacification" of the Southern States, and the "complete protection" of "*all* citizens in *all* their *civil, political,* and property rights" by the Federal Government. The Iowa Republican platform of the same month and year declared that the Republican party stands pledged, through the recent amendments of the Constitution of the United States, "to the complete protection of all citizens in *all* their *civil, political,* personal, and property rights." Moreover, the New York *Tribune*, differing from Mr. Sherman, declares (Nov. 5) "that the doctrine that it is none of our business what they (the Democrats) do inside of their own States, how they set up and overturn administrations, how they manage elections and count votes, *is a treasonable principle* not to be tolerated for a day." It would be well if the Stalwarts would come to some agreement about the meaning of "State Rights." We are not surprised that some Stalwarts should now wish to withdraw from this extreme position, as Mr. Sherman is doing, but they must not curse or call names and make a disturbance when any one draws attention to their retreat.

The Stalwarts have sustained a severe blow in the death of Senator Chandler of Michigan, which occurred very suddenly this week. If it had occurred a year ago the course of honest money among the Republicans would also have suffered considerably, for he was one of the very few prominent Republican politicians who never wavered or went astray about either paper money or silver. This some people have ascribed to the fact that he was a successful business man, but then some of the worst inflationists have been successful business men. It was due more probably to natural shrewdness. He entered the Senate just as the anti-slavery struggle was becoming hot, and was one of the first to meet Southern violence with violence. His politics, when the war was over, had become wholly combative and denunciatory. He was always hurling defiance at either England or the South, and apparently had no more taste for the conciliatory treatment of sedition and discontent than an Austrian archduke. Up to his appointment as Secretary of the Interior by General Grant he had little political reputation beyond that of a fierce partisan, but he took the Department in a corrupt and disorderly state from Mr. Delano, and performed in it a most praiseworthy work of purification. He was personally very

honest, and had little toleration for any gross form of corruption. The most notable part of his career was his Chairmanship of the Republican Committee during the last Presidential campaign, when he rendered the party a service, which none of the Republican papers now seem willing to acknowledge, in refusing to be cast down by "the face of the returns" on the morning after election. Everybody but he had apparently forgotten "the judicial functions" of the Returning Boards, and when he telegraphed to his agents to hold on to everything and wait for help, it was a stroke like that of Nelson at Copenhagen, when he put the glass to his blind eye and failed to see the signal of recall.

General Adams has telegraphed Secretary Schurz that he is confident of the success of his mission to the Utes, and will secure the unconditional surrender of the murderers of Agent Meeker and his associates and of those who were foremost in the attack upon Thornburgh's command. He had a long consultation on the 26th ult. with the White River Utes, who are willing that the guilty Indians be surrendered and punished. The main obstacle in the way of this is the possible inability of Ouray to compel the surrender, but General Adams has no fears on that score, and recommended the appointment of a commission of three, one to be a military officer, to make an investigation and determine the punishment to be imposed. Secretary Schurz had already telegraphed him instructions to this precise effect, and had designated General Hatch, Chief Ouray, and General Adams himself members of the commission. On receipt of these orders Ouray sent the White River Utes to Uncompahgre, where the murders will be investigated, and General Adams set out for Denver to take the testimony of the Meekers and of Mrs. Price. The commission will be ready to begin its work Saturday. If this plan should prove unsuccessful, General Sherman understands, as he telegraphed General Sheridan on the 24th ult., "that the civil authorities will stand aside and the military will take absolute control of this whole Ute question and settle it for good and all."

General Sherman discusses "this whole Ute question" very fully in his annual report to the Secretary of War, completed Monday. He gives a history of the Ute tribe and says it is composed of "the worst class" of Indians, who as long as game lasts will not work or attempt farming "except in the smallest and most ridiculous way, and that only by compulsion." He recounts the story of the recent troubles, and says that both Major Thornburgh and Agent Meeker "acted from beginning to end exactly right." Preparations are now made for every emergency, for, although the General "applauds the courage and energy thus far displayed by General Adams," he thinks extreme watchfulness demanded by prudence. The remainder of the report approves the recommendations of General Terry in the North and General Ord in the South for new posts, and General Schofield's suggestion that a number of cadets be educated at West Point each year for the militia of the United States.

Foreign specie continues to flow into the country, and the receipts during the week have raised the grand total since the resumption of specie payments to $61,479,907, of which $55,300,994 have arrived within the last three months. Notwithstanding this enormous accession to the currency, speculation has advanced prices of securities, shares, and merchandise, so that the New York money market has been for the week very stringent, as high as ⅜ of 1 per cent. per day having been paid for loans, in addition to 7 per cent. per annum. A short time before the first day of November the money market is always active, and sometimes stringent. This year, in addition to ordinary influences and to a rampant speculation, the Comptroller of the Currency selected the last week in October as a fit time to enforce a law which has been as dead as the usury law; and for a day or two his action bade fair to cause a panic, which would have affected speculators variously but would have had a bad effect on mercantile business. The law referred to is that which forbids check certification beyond the amount in bank on deposit at the moment to the credit of the drawer of the check. This law has stood on the books for many years, and it was known to every one having any acquaintance with banking affairs (including the Comptroller himself) that it was not obeyed. The sudden action of the Comptroller disturbed the money market and added to the stringency of loans for a few days, but it had but slight effect on the volume of business either at the Stock Exchange or the Clearing-house. The Secretary of the Treasury, on the other hand, surprised "the Street" by giving notice that he would receive proposals for the sale to the Government of $10,000,000 of United States 6 per cent. bonds for the Sinking Fund. This action was known on Saturday to a few, and to the public at large on Monday. If the bonds are bought $10,000,000 currency will be let loose from the Treasury, and this will more than repay the stock brokers for the bad treatment which they charge on the Comptroller of the Currency. The Stock Exchange markets were active, and as the result of the week's fluctuations prices advanced. The public debt was reduced $10,352,996 during the week. The price of silver advanced in London to 53¾*d.* per ounce, and closed at 53⅛*d.* The bullion value of the 412½-grain silver dollar at the close was $0.9010.

The signs that the Austro-German alliance is not to be purely defensive and peaceable seem to multiply. The London *Standard*, which is usually a well-informed paper, has a despatch from Berlin announcing that Prince Bismarck had asked to have 20,000 Russian cavalry now manœuvring in Poland withdrawn from the German border, which sounds like him. He began the quarrel with Austria just in this way, by asking what these military preparations meant, and refusing to accept a denial of their existence. The press on both sides keeps up the war of words vigorously, and Russia seems to be really uneasy. It is difficult to guess what he is aiming at, but the probabilities are that he aspires to settle the Eastern Question out of hand before he leaves the scene. He could hardly settle on anything worthier of his ambition, for it is four hundred years old, and has foiled many generations of statesmen.

His proposed tariff convention with Austria, which would bring 70,000,000 within the same Customs Union, has drawn out from a French economist, M. Leroy-Beaulieu, the proposal that the Latin nations—that is, Belgium, Switzerland, and Italy—should enter into a similar one, which would include about the same amount of population. That things are tending rapidly in this direction all over Europe there is no doubt. The great truth that political lines do not affect the profitableness of trade makes its way, though slowly, in spite of all obstacles, and the recent consolidations and annexations have done much to help it. It cannot, people see, make any difference, as far as money-making is concerned, whether the people you buy of or sell to in Alsace live under the French Republic or the German Empire; or in Naples, under King Bomba or King Humbert. Money is money, goods are goods, and cost is cost, no matter what flag waves over them. The area covered by free-trade in America is now vast and growing, and it will probably cover at least half the European continent in our day.

It would seem as if a crisis of some sort, and a more serious one than any which have yet occurred, must be impending at Constantinople, owing to the want of money. The pay of the troops is so much in arrear, and the supply of food and clothing is so scanty that the approach of the cold weather promises to bring about either mutiny or disbandment with attendant robbery. The Government is just now existing on small call loans, raised from the Galata bankers, and the customs duties are largely pledged as security for previous advances. The British Minister, too, seems at last to be getting out of patience about the reforms in Asia Minor, and the fleet has been moved up towards the Dardanelles in a threatening manner, and Mr. Cross, also, has avowed, on behalf of the Ministry, his belief in the atrocious badness of the Turkish Government, and his unwillingness to raise a finger in its defence. The probabilities are that the more the Austro-German Alliance becomes confirmed the more imperious the tone of England towards her Turkish protégé will become.

SOME POST-ELECTION REFLECTIONS.

THE result of the State election is unknown at this writing, but there are certain remoter consequences of the struggle which can be discussed with profit even now. Whether it be true or not that Governor Robinson is Tilden's instrument or agent, it is quite certain that the Tilden machinery has worked for him zealously, and that his defeat would be taken, and justly taken, as an indication that in all probability Tilden could not carry his own State in the Presidential election, and would thus loosen, or greatly weaken, his hold on the convention. In fact, it would make it almost certain that somebody else would get the nomination, and the Ohio election seems to have made it certain that this somebody would be neither Thurman nor Hendricks nor anybody else who had been prominently associated with the Greenback movement. It might even drive the Democrats into the nomination of some hard-money man of high character, and this, it must be admitted, would be a somewhat unfortunate thing for the Republicans; for nothing has of late done so much to brighten their prospects in 1880 as the apparent strength of the Tilden Machine. He has been so much discredited in all sorts of ways during the last two years that it was of very great importance to the Republicans, and especially to the Stalwarts, that he should retain his strength as a Democratic candidate. It would enable the Republican managers to follow their own tastes and prejudices, to carry out their own bargains at the convention much more freely than they would venture to do if Bayard or Hancock, or some such person, were put into the field against them. So that if Robinson be defeated, and Cornell elected by a handsome majority—for this purpose the handsomer the better—the reform element in the Republican party will have something to be thankful for. It will probably give them a better choice of candidates next year than seemed at all likely, even very recently.

Should Cornell's election, on the other hand, threaten to send Senator Conkling to the convention with the air of having the votes of New York at his command, it will probably give greater strength and cohesiveness to the Independents than they have been able to boast since they elected Mr. Hayes to reform the civil service. This open demonstration of Mr. Conkling's power and unscrupulousness has probably opened the eyes of a great many who could not previously see why he was so grumbled against, but who have been too much taken by surprise, or have considered the national bearing of the election too important, to offer on the present occasion any resistance. But these persons, we take it for granted, would not relish seeing New York represented at the convention by Conkling and Cornell, and do not really believe in the methods of these statesmen, and will during the next six months do what they can to prevent the support they have been now compelled to give the Machine from working further mischief. To this class we beg to offer a few considerations which we think will bear turning over during the winter. They are these:

If you are greatly troubled by the "Solid South" and its power in Congress, the first step towards a remedy is an examination of the causes which have given the South its present majority in Congress. You will admit that the Brigadiers did not seize the majority of the seats by force, and that the South itself could not send a majority of the Representatives or Senators to Congress, and that if it now controls the legislative branch of the Government, it controls it through the alliance of members sent from the North. Now, these members, which have given it its majority, were sent from the North in 1874 and 1876, and for the most part fill places which had for ten or fifteen years previously been occupied by Republicans. How did these Republicans come to be displaced by Northern constituencies, and forced to make way for Democrats? This is a very important question, because in the answer to it is to be found our best guide in deciding what is to be done now to get back the control of the Government to Republican hands. Why was it that Republicans in 1874 and 1876 refused to vote for Republican candidates, and thus gave the Brigadiers the opportunity to commit their late excesses? It was not because there was no "strong man" in the White House, for General Grant was President. It was not because the advice of leading Stalwart statesmen was not taken, for the late Mr. Chandler was Secretary of the Interior, and he and Senators Conkling and Morton were the principal counsellors of the Administration, and an effective control was still exercised over the Southern States through the troops. Moreover, the State government of the cotton States was in the hands of the local Republicans, and murders and disorders were of much more frequent occurrence at the South than they are now. What was it, then, which lost to the Republicans the great States of New York, Pennsylvania, Massachusetts, Illinois, and others? A plain answer to this will furnish every man with a list of both the things which the Republican party ought now to avoid, and which it ought to do in order to regain power. The problem is almost like a medical one. When a robust man falls suddenly sick the very best aid in restoring his health is a knowledge of the kind of life he was leading when he broke down.

We do not propose to answer this question to-day ourselves. It would probably wear in our pages the appearance of a piece of invective, and make comparatively little impression. The enquiry will be a great deal more useful if every honest man makes it for himself. It will not be laborious. The facts are of recent occurrence and of great notoriety. The newspaper files from 1870 to 1876 are full of them. Every one who voted during those years remembers them or can readily recall them.

Secondly, you must bear in mind that you cannot with effect, or even with decency, go into the campaign of 1878 with the two murders and one assault on which you have largely conducted the canvass which has just closed. The Chisholm murder occurred in 1877, and you used it in the elections of last year. You have now used it again, and came very near having to use it alone. The Dixon murder—a poor one at best, in which one bulldozing ruffian and gambler killed another—came to you in the nick of time, and so did the assault on the postmaster at Blackville. You must remember that in the late canvass you threw overboard every Republican doctrine or argument except distrust of the South. You got rid completely of civil-service reform, and you said nothing, or next to nothing, about the enormous volume of notes which the Government has still outstanding, or about the pile of silver coin which is accumulating in the vaults of the Treasury, and which possesses so much explosive power. You were silent, too, about State affairs. You fell back, in fact, almost completely on Southern lawlessness, and the danger now is that you will have to go into the Presidential canvass with the weapons you have used in this one.

But you cannot go into a Presidential canvass, or even go to the convention, and draw up the platform on Stalwart principles, with nothing but two old, and indeed one might say second-hand, murders. You will, therefore, need fresh ones during the coming winter, and two murders collected over an area as wide as the South and from a perturbed and semi-barbarous community will not be enough, even when dressed up with the best rhetoric at your command. You must have at least a dozen to support the dreadful picture you now draw of Southern society. The danger of this state of things is that your dependence on murders for your campaign ammunition, and your dislike to taking up anything else, will during the winter lead you first to welcome them, and then, by a process with which human nature is only too familiar, to desire them as necessary to the salvation of the party. That this wretched condition of mind ought to be guarded against all or most of you will admit, and it can only be guarded against by such utterances between now and next June as will satisfy the party managers that the game which has just been so successful within the party in this State cannot be played over again in the larger field.

A NEW FIELD FOR LECTURES.

AN interesting question is opened for discussion by the letter of "A. S. I." in last week's *Nation*, suggesting systematic courses of lectures. Such courses have long existed in other large cities. Our correspondent mentions the Humboldt Academy in Berlin. Another case in point is the Royal Institution of London, where

Faraday delivered his celebrated lectures on chemistry, but which by no means restricts itself to the physical sciences. Mr. Matthew Arnold's charming essay on "Equality," published in his recent volume of 'Mixed Essays,' was a lecture delivered before the Royal Institution. Manchester (in England) has a similar institution, where, some years ago, a most excellent course of lectures was delivered by distinguished men of science. Many of our readers probably know the pretty series of volumes of the Dublin "Afternoon Lectures on Literature and Art," most of which are well worth perusal.

There is really no reason why something similar and just as good should not be established in New York. It is true that the ordinary American lecture of commerce has never been in demand in our city, which is greatly to our credit. The average New-Yorker generally knows what he wants, and knows where to get it. If he wants to be entertained and amused, he has the theatres; if he wants to be instructed, he is well aware that he will fail of his object and waste his time by listening to one of the regular lyceum orators. All he will get is a compilation from sources accessible to every even half-educated person, interspersed with attempts at pleasantry. But if he is offered anything that is really of substantial value he will not be slow to appreciate it. He will listen with respectful attention to any one who knows what he is talking about and who only talks about what he knows. Tyndall and Huxley did not lack for hearers, and a fair patronage was extended to the German literary course of Bayard Taylor. A striking and familiar example of what can be done by one who has the courage to educate the market up to his wares instead of bringing down his wares to the level of the market is afforded by the great advance in the musical culture of New York effected within a few years, and in great part due to the single-minded and persistent efforts of Mr. Theodore Thomas. What has been done in the matter of music ought to be worth trying in literature and science. Schlegel's celebrated lectures on literature and philosophy were delivered before fashionable audiences in Vienna between 1810 and 1830; is it too much to assume that the intellectual digestion of New York is at least as robust as was that of the Austrian capital half a century ago? We think there is a perceptibly growing distaste in the public mind for rant and clap-trap, and a correspondingly increased desire for what is solid and genuine and honest.

That a great field of usefulness is open for such a course of lectures as "A. S. I." proposes hardly admits of a doubt. One great defect of American life is the severance between the educational period and the practical period. A young man on leaving college has no incentive and no encouragement to continue his education. The pressure is all the other way. He plunges at once into a crowd where every man elbows his neighbor out of the way, and where a suspicion is often forced upon him that the time he spent in getting his education is a greater loss to him than the education itself is a benefit. If the educated classes exert so little influence on public affairs, it is partly because they have not maintained their own place. Just as it has been said that an English statesman would become an object of suspicion and forfeit the confidence of the people if it were supposed that he could speak French faultlessly, it seems to have become a tradition that an American politician who is so unfortunate as to be a college graduate must conceal that accident as carefully as possible. How successfully this can be done is shown in the case of the late Senator Chandler, whom nobody suspected to be an educated man; but, as soon as he was dead, his friends announced it. After all, this is not so strange as it seems. A man who ceases to study when he leaves college will in a very few years sink to the level of his surroundings, and perhaps even below it; for what little he has learned may be just enough to close his mind to those sources of knowledge that men who are wholly self-educated are so ready to make the most of. It is a truism that no one is entitled to be called a man of education who is not continually adding to his stores of knowledge and constantly exercising his powers of reflection and reasoning—in other words, that education must continue through life. It is the habit of doing this that makes the public and intellectual life of England so rich and imposing. Mr. Karl Hillebrand, in his article in the October *Nineteenth Century*, says: "England is the only country where people read—where they read instructive books, I mean, not only novels. . . . The English alone find the leisure and the humor to read works of a general but serious character. . . . The leisure, coexisting with hard work, and the noble use made of leisure, are perhaps the most remarkable results of the enormous wealth which first strikes the eye of the foreigner in England."

Is it quite hopeless to introduce such a fashion among ourselves? That the American people already buy a great many books, whether they read them or not, is a notorious fact. Perhaps what they most need in this matter is some organized stimulus to mental exertion, and a systematic course of lectures might well serve such a purpose. From time to time courses of lectures are delivered in New York, but the subject is generally a matter of accident. If a celebrated astronomer happens to be here, we have a course on astronomy; if the visitor is a chemist, we have chemistry, and so on. Of course this is better than nothing, but it is not just the right thing. There is also a very good series of lectures every winter at the Cooper Union, but they do not form a connected whole.

What we ought to have is a series of courses of lectures treating scientific, historical, and literary questions in a serious, systematic, and exhaustive manner, requiring and inciting to study on the part of the audience, and capable of affording intellectual nourishment. A beginning could be made with such subjects as at once possess the greatest interest for the greatest number, and are of the greatest practical importance. We refer more particularly to political economy, financial topics, tariff and currency legislation, the constitutional and political history of the United States. These are matters of which even many educated men know but little, but of which it is essential to our national well-being that as many people as possible should know as much as possible, and of which everybody is anxious to know something.

We have among us many men who have already achieved distinction as writers and speakers on such subjects as the revenue, and currency, and wages, and the proper sphere of government, and American and European history. Along with the treatment of these graver subjects there should be courses on English and other modern literatures and language—the new "humanities"—not mere journey-work, but something conceived in the spirit and executed after the fashion of Hettner's work on the 'Literature of the Eighteenth Century,' or Rosenkranz's Diderot, or Morley's Burke, or Leslie Stephen's 'Hours in a Library,' or Matthew Arnold's Wordsworth and Milton and Heine. It is a suggestive fact that one of the most successful courses of lectures of last season in London was delivered by Mr. John Fiske, of Cambridge, Mass., on American history.

There is probably no city in the world of its size and wealth in which so little is done to stimulate and foster intellectual life as New York, or in which the class which can be called intellectual in its training, tastes, and habits takes so little pains to make its existence known, or to stimulate or encourage intellectual workers. There are rich libraries and fine collections of pictures and many able and successful solitary students, but there is little or no co-operation or interchange of sympathy or help among educated men, nor do they offer the best they have to the public in a shape that makes it easily accessible or very attractive. Such a scheme as we have sketched out here, if put in operation, might do a great deal to stimulate intellectual tastes and interests, and redeem New York from the reproach so often cast upon it, of over-absorption in material pursuits and indifference to all standards of value but the money standard.

It will probably suggest itself to some that the colleges should start it, but there are various objections to this, which we have not space to enumerate here. Not the least is the public fear that a professional teacher is not likely to be fresh.

LORD DERBY AND THE LIBERAL PARTY.

LONDON, October 18, 1879.

THE most important, or at any rate the most interesting, event in the party politics of England is the passage of Lord Derby from the Conservative to the Liberal side. This secession from his old colleagues and their friends has long been foreshadowed. It was intimated by the position which Lord Derby took in the House of Lords on quitting the Government. It is usual with members of either House who leave a cabinet in which they have held a place, through disagreement on a particular question without rupture of their general political connection and convictions, to remain sitting on the ministerial side of the House. In the Commons they take their place on the fourth bench above and behind ministers, which is usually reserved for "right honorables" out of office, while the party to which they belong is in power. Here Sir James Graham sat when, with reference to his almost giant stature and his patronage of Lord John Russell, Mr. Bernal Osborne described him as "the sweet little cherub that sits up aloft to keep watch o'er the life of poor Jack." Hither Lord John Russell himself retired during his temporary alienation from Lord Palmerston and his Government, using the elevation as a post of vantage from which to rain down missiles on his old colleagues rather than as a point from which to throw his shield over them. Here, with varied feelings, sat the old Whigs omitted from Mr. Gladstone's government—Sir George Grey, who declined office and who gave his old friends cordial help; Mr. Charles Villiers and Mr. Edward Bouverie, who were not asked to take office and who avenged themselves in their several fashions—the former by the airy malice of his incessant talk and ubiquitous social disparagement, the latter by vexatious parliamentary criticism, of which he has paid the penalty in exclusion from Parliament.

In the House of Lords a statesman of the first rank, not choosing to take office with his party, on quitting it usually places himself on the same side of the House with them, but below the gangway, as the passage is called which leads from the floor of the House to the benches rising one above the other. Earl Russell sat here while Lord Granville led the House during Mr. Gladstone's administration. Here Lord Carnarvon took up his post when, in January last year, he resigned the Secretaryship of State for the Colonies. It was noticed that when, two months later, Lord Derby followed his example in quitting office he did not take up a similar parliamentary position. The fact that he had resigned was, it is true, indicated by the discovery, on a certain evening late in March, that, instead of being seated with his colleagues on the front Ministerial bench, he was side by side with Lord Carnarvon on the first bench below the gangway. The news "Lord Derby is out" spread into the Commons, and there was a rush of the members of that House from their own chamber into the places reserved for them in the Lords. From this position he made his explanatory statement. But in the course of a day or two he quitted his seat for what are known as the cross-benches. These are seats which run across the House of Lords at its lower end, fronting the throne, at right angles to the long rows of benches on which Ministers and Opposition front each other. Peers who stand aloof from party ties, either on grounds of social necessity and decorum, as in the case of members of the royal family who have been "raised" to the House of Lords (if that is the proper term in this connection), or from individual independence or eccentricity, sit here. The Prince of Wales, the Duke of Edinburgh, and the Duke of Cambridge occupy this part of the House, where also Earl Grey sits, to indicate his equal dislike and distrust of Liberals and Conservatives. The position indicates absolute political neutrality—permanent in some cases, temporary and transitional in others. Hither Lord Derby presently betook himself. But it soon began to be understood, with pleasure and hope among the Opposition, with anger and apprehension by Ministerialists, that the cross-benches were simply a stage in Lord Derby's journey from one side in politics to the other. It is simply a half-way house in which he has rested.

Lord Derby's delay in openly joining the Liberal party is a tribute to decorum and the appearance of deliberation. But the signs of his intention have been conspicuous, and have been carefully chosen. First came his resignation of the presidency of certain Lancashire Conservative associations, whose reports and resolutions expressing enthusiastic approbation of the foreign policy of Lord Beaconsfield and Lord Salisbury, from which Lord Derby had felt bound to separate himself, gave him a pretext for retiring from them. The social indications of his political inclining have been as marked. Eminent Liberals visiting Lancashire have been invited to make Knowsley their headquarters. Sir Charles Dilke, Sir William Harcourt, and Mr. Grant Duff have been among Lord Derby's guests. But the decisive indication has only just been given. Lord Hartington and Mr. Bright—a conjunction which would have been deemed strange a dozen years ago—are to attend a great Liberal demonstration in Manchester this day week. Though Knowsley is near Liverpool, and not near Manchester, Lord Derby has invited Lord Hartington to be his guest on this great party occasion. Lord Hartington would practically be as near Manchester at his father's own seat of Chatsworth as at Knowsley. But the Manchester meeting is a great Lancashire electioneering demonstration in the interests of the Liberal party; and while Chatsworth is in Derbyshire Knowsley is in Lancashire, and Lord Derby is a great Lancashire land-owner, whose influence on opinion and votes in his own county is immense. For this reason Lord Hartington is ostentatiously invited to Knowsley, which lies some thirty or forty miles out of his way, and goes there in a very conspicuous fashion. The thing is really as significant, as regards English politics, as the conference of Count Andrássy and Prince Bismarck at Vienna, and may have results as momentous within a more limited sphere.

The bitterness among Conservatives is, of course, very great, and it found expression yesterday at the Manchester dinner to Lord Salisbury through the lips of Lord Derby's brother and heir-presumptive, Colonel Stanley, now the Secretary of State for War. Colonel Stanley, whose political importance is entirely due to his relationship to Lord Derby, and the manner of whose accession to office is a curious incident in family and political history which it might not be proper to narrate, contrasted his father's presence at a Conservative dinner in the Free-Trade Hall shortly before his death with his brother's absence, speaking of the latter as "one whom we have lost." But the truth is that the present Lord Derby is as much a Liberal by temperament and habit of mind as his father was a Tory. The late Earl began life, it is well known, as a Whig, but his temper and habit of mind broke through the long traditions of his house and his personal associations, and made him the leader of the Conservative party. The present Lord Derby has always been a Liberal, though a Liberal detained in the Conservative ranks by filial feeling, and afterwards by his strange friendship for Lord Beaconsfield. It was the doctrine of an old philosophy that everything in nature tends to its own place, and Lord Derby, on the rupture of the ties which held him back, began to tend to his own place. He used to make radical speeches—or, at any rate, speeches of the purest political rationalism—while he was nominally the Conservative member for Lynn, and his enforced vindication of the measures of Conservative governments to which he belonged alarmed Tories far more than the attacks of Liberals. They implied principles and a mode of looking at things more dangerous to an unreasoning Conservatism than the most ultra-Radicalism. Very early in his career the present Lord Derby, then Lord Stanley, was offered high office by Lord Palmerston, which he declined in deference only to the feelings of his father. He cultivated the society of Mr. Bright, and was fond of long talks with him in the smoking-room of the House of Commons, in the days when respectability shrunk from Mr. Bright almost as it does now from Dr. Kenealy. He at one time sat at the feet of Mr. Mill, and even learned something from Mr. Holyoake. This rationalism, however, in politics which made Lord Derby a Liberal among Conservatives, will make him in a certain sense a Conservative among Liberals. Sceptical and cautious, unwearied in the ascertainment of facts and rigid in his deductions from them, his strong good sense will operate as a check upon the more impulsive and ardent feelings of some of his colleagues. The course of events and the general direction of the measures which the Liberal party contemplate will not be changed by Lord Derby's adhesion to it. But things will be considered safe which he assents to, which might raise foolish alarm if they were supposed to spring from the restless initiative of Mr. Gladstone. Timid men of Liberal inclinations but of conservative apprehensions will be reassured by Lord Derby's association with the Liberal party. A Government presided over by Lord Granville and led in the House of Commons by Lord Hartington would profit by the social tact and the graceful suavity of its head, and the strong good sense and uprightness of his lieutenant in the Commons; but these qualities will need the reinforcement of Lord Derby's large knowledge and defined habits of mind. If the next Liberal Government contains, as it probably will contain, Sir Charles Dilke and Mr. Fawcett within the Cabinet, and Mr. Chamberlain and Mr. Courtney in considerable offices just outside it, it will need to be strengthened by the confidence which timid Liberals feel in Lord Derby's rank and wealth. It is possible that his action may be imitated by Lord Carnarvon, who, like Lord Derby, is a Whig by descent and a Conservative by his father's secession from the Whigs. These family considerations may seem to an American reader

strange influences in politics; but they are real. Social and political demarcations still largely coincide in England. The resentment among the Conservatives at the secession of Lord Derby and Lord Carnarvon was not expressed merely in the open world of public life. When, shortly after leaving the Government, Lord Carnarvon went from his house in Hampshire to Edinburgh to deliver the opening address before the Philosophical Society there, his way lay through a series of great Whig houses. The doors of the Tory peers and notables were practically shut in his face; and this experience was not a solitary one. †††

GERMANY, AUSTRIA, AND RUSSIA.

PARIS, October 17, 1879.

IT was thought at first that the visit of Prince Bismarck to Vienna only furnished an opportunity for what the diplomats still call, in their own phraseology, an exchange of ideas. But it is now believed in the best informed circles that there has been something more; that the visit had been prepared by a long and formal negotiation, and that the last act of this negotiation has been a positive agreement, made in view of well-defined eventualities. The truth will leak out in our days. When Count Cavour went to Plombières and arranged with the Emperor Napoleon the Italian war of independence, the official papers in Italy as well as in France denied that there had been anything more at Plombières than an exchange of ideas. When Prince Bismarck went to Biarritz, and prepared with Napoleon III. the war against Austria, which ended at Sadowa and which gave Venetia to the Italians and the German hegemony to Prussia, the official papers in Prussia as well as in France repeated again that there had been nothing at Biarritz except an exchange of ideas. We are quite familar now with the ways of the German Chancellor; we know that he is economical of his time, that he does nothing in vain; and we can hardly believe that the visit to Vienna was merely a visit of courtesy. In fact, we suspect that the most important questions received their eventual solution during this visit, and our belief rests not only on the well-known character of the Chancellor, but also on what Napoleon once called "the irresistible logic of facts."

This irresistible logic has gradually brought Austria back towards Germany. There has never been in Austria anything like a national feeling, owing to the great variety of races in the Empire. What Metternich once contemptuously said of Italy, namely, that she was but a "geographical expression," was perhaps true a hundred years ago; but now Italy has, under the influence of a few statesmen and writers, become a nation. Austria, on the contrary, has become a "geographical expression"; her real centre has long been the Empire, the Emperor; even now the popularity of Francis Joseph is very great—he is equally well received in the old Germanic provinces, in Tyrol, in Austria proper, in Pesth, in Dalmatia and Illyria; but this very popularity is owing to the fact that the House of Austria has never crushed one nationality at the expense of another; the Emperor was and is still considered as the natural protector of a number of peoples—some civilized, some semi-civilized. The court and the army have been everything; all the life of the large empire was centred in them. Even Polish Galicia has always looked on the Emperor with more complacency than the Poles of Posen on the King of Prussia or the Poles of Warsaw on the Czar. The political strength of Austria was in the freedom of the various races, not in a political or parliamentary sense, but in an ethnographical sense.

Notwithstanding this variety of races, the emperors of Austria have always contended for the German hegemony; this political hegemony was finally taken from them by Prussia. The first shock was severe; Sadowa was a terrible blow; but after a while it seemed natural, even to the Germans of Austria, that Prussia should become the centre of gravity of all the Germanic populations. Prussia was a purely Germanic power; she was the centre of German culture; the war with France and the conquests made in France only increased the sentiment of admiration of all German-speaking peoples for the Hohenzollern. Austria had been excluded, after Sadowa, from the new German Confederation; it became the desire of all Germans to unite her again in some form or other to the great "Fatherland." The house of Hapsburg could probably have made such a *rapprochement* impossible; the descendant of the old emperors could have sulked and kept aloof. Francis Joseph did not choose to do so; he had been brought up in the school of adversity; he had lost the magnificent provinces which his ancestors possessed in Italy; he had lost the leadership of the small German potentates; he did not choose to war against the gods. He submitted to fate in the interest of his peoples, and it became evident that, while he preserved a dignified attitude, he became more and more disposed to enter into some sort of arrangements with the new Emperor of Germany. The *rapprochement* was not direct at once; it was first tried in the form of that triangular alliance which has been called the alliance of the three Emperors, and which was seemingly only made for the general interests of Europe. It would have been difficult at first to make a dualistic alliance; the Emperor of Russia became unconsciously the connecting link between the two empires which occupy the central part of Europe.

The complete development of Italian unity was accomplished by force; but it has never been the intention of Prince Bismarck to complete German unification by force. It was probably not the intention of Cavour to conquer the kingdom of the two Sicilies; but in Italy there was a force which even Cavour could not master, the revolutionary force. Garibaldi's expedition to Sicily, his march from Marsala to Naples, are well-known events; the siege of Gaëta by the Piedmontese army was only the crowning incident of the war begun by the revolutionary army. The House of Savoy had to choose between an alliance with the revolution and war against the revolution. Time will show if the revolutionary elements which play so great a part in the development of Italian unity will not oppose its future consolidation. Without being an alarmist, it is impossible not to see in the state of parties in Italy something which is not satisfactory. The Government of the country has fallen into hands which are not the hands of such men as Cavour, D'Azeglio, Mamiani, Ricasoli. Parliamentary government has somewhat fallen into contempt, from the splitting up of the old parties into a confusion of small groups, which have no centre except the ambition of one man. The Republican party is not yet very strong in Italy, but it keeps up a desultory agitation, and it has lately taken the dangerous form of what is called "Italia irredenta." It claims for Italy the city of Trieste and the Tyrolese district called the Trentino, which belong to Austria.

The movement for German unity has not in our time been tainted in the least by the revolutionary element; it has been altogether what I might call an Imperial movement. The people, the army, have followed the lead of the statesmen; they have not led. The present Emperor of Germany witnessed the revolution of 1848, was himself obliged in 1849 to combat the revolution in Baden; he has no sympathy for the revolution in any form. When he accepted the crown offered him by the King of Bavaria, in the name of all the sovereign princes of Germany, he did not usurp the rights of any other sovereign; he only did what the first emperors had done. The form of his election was a return to the past, not an insult to the past. The annexations made by Prussia have never been sanctioned in the modern fashion by the suffrage of the populations. Napoleon III., when he received Savoy from the hands of King Victor Emanuel, thought that his title was not good as long as the majority of the Savoyards had not voted for him. The Emperor of Germany has never tied himself by such rules; he believes in the old-fashioned rights—in the right of conquest, in the right of cession from prince to prince. The relations which are now established in the confederation of Germany are all implicitly or explicitly derived from these old rights. The relations with the old German provinces still belonging to Austria will, in all probability, not be of a different character.

A conquest, pure and simple, would be as simple a solution as possible of the difficulty; but nobody thinks of such a conquest. After Sadowa Prince Bismarck carefully avoided robbing Austria of a single province; all he wanted was the leadership in the German Bund. He had conquered it; he did not add a single Austrian potato-field to his conquest. Austria was to be in future the great handle of Germany in the East; why should he break the arm which one day or other was to be necessary to himself? The great foresight of the German Chancellor has now become visible. Austria has renounced, and she has renounced for ever, the leadership of Germany; but she has not renounced her *rôle* in the East. She has exactly arrived at that psychological moment when she can be of the greatest use to Germany without endangering the work of unification undertaken by Prussia. She has renounced her old provinces in Italy, which were a perpetual cause of disturbance to her general policy; she has assumed her natural character; she can help Germany, she can withstand the Panslavist influences in the East; she is ready to take her share in the dismemberment of the Turkish Empire.

This situation does not, in my opinion, create any positive danger with regard to Russia. It is clear that Austria in a certain sense becomes a German sentry against Russia; but there are many reasons why there should be no conflict between Germany and Russia. Vigilance does not necessarily mean war. A war with Russia will always be a very ominous, hazardous enterprise. Some young and enthusiastic officer of the

German staff will tell you that if Russia began any concentration of forces, Prussia would, with her system of railways and of mobilization, concentrate a large army in a much shorter time; that she would seize at once the Baltic provinces and protect them by sea and by land. Then she would wait. She would not plunge, like the first Napoleon, into the fastnesses of Russia. She would simply throw arms into Poland; and, between the Baltic provinces, occupied by a German army, and an insurgent Poland, Russia would be completely helpless. Poland could be, perhaps, attached as a kingdom to the Austrian Empire, in the same character as Hungary and Bohemia; and Austria, having thus become more and more an Eastern confederacy, the German provinces of the Empire could be attached by some stronger ties to the confederacy.

Such plans are daily discussed in certain military quarters, and it is rather curious to see that Poland is always considered in such plans as one of the necessary elements of a war. Poland is a double-edged instrument. If Germany can use it, Russia can use it too. The heart of Poland is really not in Posen, not in Lemberg, nor even in Cracow. It is always in Warsaw. If Russia only did in the old kingdom what Austria has done at times in Galicia, she would soon draw all Polish hearts to her side. Prince Bismarck must know better than anybody how dangerous it is to play with the Polish question. All the plans of wars between Prussia and Russia seem to me to be useless dreams for the present. Russia is determined not to go to war. One of her diplomats said, a few days ago: "We shall remain at home for *forty* years." But if a war was forced upon her, her enemies would probably find to their cost that a Russian war would not be a seven days', nor even a seven months', campaign. For the present the alliance which has been formed by Prussia and Austria, and which also has attracted England into its sphere, is not an alliance for action. It cannot be said to be defensive, as nobody attacks those Powers. It may for the present be considered as merely protective.

Correspondence.

ADMINISTRATION OF THE PENSION OFFICE.

To the Editor of The Nation:

Sir: My attention has just been called to the notice in your issue of the 16th of my address on "Pensions" before the Grand Army of the Republic at Philadelphia on the 11th instant. Several suggestions and statements of your criticism are so far from being correct, and, appearing in a journal of such high character, are so liable to harm a branch of the public service which good men desire to benefit and not injure, that I beg at this late hour to call your attention to the principal errors.

It is said that my "prejudice" against lawyers has worked in favor of "shysters"; that the reduction of the claim-agents' fees to $10 per case has driven out all the respectable lawyers.

Without comment upon my "prejudice" these are the *facts:* The reduction in the fee was not recommended by either myself or any other responsible officer of the Pension Bureau or of the Interior Department, but was the voluntary suggestion and act of Congress (see proceedings H. R., May 24, 1878). If any "respectable lawyers" have been driven out of the business of prosecuting pension claims on account of the reduction in the fee, no such case has been made known to me, and it is equally true that pension claimants have made no complaint of the kind.

When the act was passed fully three-fifths of the cases which were represented by attorneys were in the hands of a few persons or firms, not exceeding fifteen in number, and, as far as I know, these still continue to file and prosecute claims.

The process of concentrating the pension-claim business in a few hands and freezing out the local magistrates and attorneys has been in full operation from as far back as 1870, and that process has not ceased operation since the passage of the supposed obnoxious act of Congress.

That mistakes and delays occur in the business of the office is not denied, but affirmed. That they will continue to occur under the present system for settling claims constitutes one of the chief reasons for the change which I advocated at Philadelphia, but that in deciding two "precisely similar cases" one is allowed and the other rejected, and so the action of the office rendered "wholly uncertain," is not true; and if among the more than half a million of decisions made by the office since 1862 individual instances of such inconsistency can be pointed out, they are *exceptional* decisions, and can have occurred only through accident, and when shown to the office will be corrected.

As to the alleged disorderly treatment of the arrears settlements, "late applications being paid before earlier ones," a word of explanation.

The earliest applications, to the number of several thousand, came from Washington and from other great cities having the advantage of the earliest news and shortest mail-routes. To have settled these in the order of their receipt would not only have prevented for many weeks the settlement of any cases from the agricultural districts and more distant places, but settled first the claims of the more intelligent and generally least destitute class, to the exclusion of the poor and ignorant.

Inasmuch as the right to arrears was in no way dependent upon the filing of an application, that having been required for the convenience of the office in selecting the cases from the files, it was determined to take up the applications in blocks of one thousand and upwards, taking at the same time a block of the earliest and a block of the latest filed, with one or more blocks from the middle ground. This resulted in a nearly equitable distribution of the settlements throughout the entire country, and included the ignorant and poorer classes as well as the wealthy and more intelligent.

I am very truly yours,

Jas. Bentley.

Pension Office, Washington, D. C., Oct. 25, 1879.

[It is certainly our object, as Mr. Bentley supposes, to benefit and not injure the Pension Office, but we do not think that this is to be accomplished by covering up its shortcomings. As to the responsibility for the law of June, 1878, reducing the fee to agents and directing that their fees should no longer be reserved for them, Mr. Bentley expressly stated in his address (referring especially to the latter point) that the law was recommended by him. The debate to which he refers shows that the bill of the Committee on Invalid Pensions fixed the fee at $25, and that on an amendment from Mr. Fuller this was reduced to $10. It was understood at the time that the final bill, and also the provision in the Arrears Law forbidding any fee to agents in arrears applications, met Mr. Bentley's approval; and this is strengthened by the opinion, openly expressed in his address, that claim agents are altogether unnecessary. This notion is, we are sure, a very mistaken one. Not one in ten of these applicants can even write an intelligible letter about his case; there is no class that needs the assistance of counsel more. As to whether respectable lawyers are prevented from appearing before the Pension Office by the inadequacy of the compensation, we think that Mr. Bentley can easily satisfy himself by enquiry amongst lawyers, and that the reply will be unanimous. In the arrears applications, in which no agent's fee was allowed, a large part of the work was done by "shysters," who took it because they had no reputation to imperil and charged twice as much as the work was worth. The idea that these applications, each of which involved nearly as much work as an ordinary deed, could be drawn by the illiterate applicants themselves, or by lawyers who would not wish to be paid, was surely ill-considered, and only resulted in throwing the applications into improper hands. The worst feature of the law of June was, however, the abandonment of the old system of securing attorney's fees. The innovation did and could do no good to honest pensioners; it only operated to enable the dishonest ones to cheat their agents. To make the claim-agent's business insecure, by encouraging fraud at his expense, is its sole object; and this law Mr. Bentley acknowledges as especially his own device.

We are glad to hear that any system was used in taking up the arrears cases, even one as imperfect as that described. In several of the cases that passed through most rapidly the applicants openly attributed their success to illicit outside influence, and the plan adopted seems especially open to that danger, and with little or no excuse in the fancied difference in the intelligence of applicants. Still, it was certainly better than no method at all. The blunders and delays of the Pension Office are far more numerous and serious than Mr. Bentley admits. Careless requirements of impossible evidence, and delays of many months in examining the evidence submitted, seem altogether indefensible, yet both are extremely frequent; and the difficulty seems to lie deeper. There is an actual hostility to the applicant, shown in refusing to furnish him with copies of papers filed and official records necessary to complete

his case; and frequently his case is rejected on the secret report of a special agent, which is not communicated to him, so that he is forced to fight in the dark against unknown charges. We have good reason to believe that the number of deserving claims improperly rejected by the Office is many times greater than the fraudulent ones that have gone through, which last, we think, have been greatly exaggerated. The talk about ten per cent. of the pensions being improperly obtained is the wildest guess-work.

With regard to Mr. Bentley's plan of travelling commissions of enquiry, it has been repeatedly before Congress and always rejected, and we do not think Mr. Bentley has any reason for charging in his address that the opposition to it has been "based upon a misunderstanding of its features, or consisted in the baldest misrepresentation." The plan was offered in the Senate last March, for example, and Senators Edmunds, Thurman, Voorhees, and others took part in the discussion, with scarcely a syllable in its favor, Mr. Shields styling it a sham that deserved a leather-medal. It was there pointed out that this new commission (whose only duty is to make up a case for examination by the Government, a labor which should be done by the applicant's attorney) would not help the soldiers at all, but, on the contrary, would delay them greatly in waiting for semi-annual visits of the commission, and cause them great hardship in bringing their witnesses before distant courts, most of them being very poor, besides serious minor difficulties. And on the Government side it would double the expenses of the Pension Office without any adequate corresponding benefit; for the two great difficulties in the office are the delays in taking up the cases and the inability to deal with them judicially when reached, and both of these evils would be aggravated. The time spent in accumulating evidence would manifestly be increased; and as the depositions would be filed not in their present condensed and pointed form but in the shape of long and confused verbatim reports of oral examinations, it would be idle to expect the office to unravel them, while nearly all the advantages of oral examination would be lost by not bestowing on the examining board any power of decision. It seems plain, therefore, that the present evils would be increased.

The Secretary of the Interior has reported that these evils do not arise from the want of additional clerical force, but from the incompetence of that employed; and Mr. Bentley seems to admit as much in his address. The remedy for them need not be sought, then, in anomalous and expensive commissions: it is right at Mr. Bentley's elbow. He has only to replace the incompetents under him by men of legal training and acumen, to lengthen his office hours, and, in short, to do what ordinary business men do when their business is not kept properly in hand, and he will find that the present evils will vanish. In cases where affidavits of importance seem suspicious, he can send one of the special agents now employed to examine the affiant before a magistrate after notice to the applicant's attorney, and thus without any of the cumbrous machinery of the new bill or the underhand, irresponsible spying now adopted reach the desired end. First of all, however, the Commissioner should understand that he is the almoner of the Government, not the enemy of the pensioners; and that the poverty-stricken suitor at his office is ill-treated if he does not have every advantage of counsel, of knowing the evidence against him, and of a competent judicial decision of his case.—Ed. Nation.]

MR. BERGH AS A COMMENTATOR.

To the Editor of The Nation:

Sir: In your issue of October 16 I called attention to Mr. Bergh's misapplication of a passage in Professor Colin's 'Physiologie Comparée des Animaux Domestiques.' This citation is one of many which have been given to the public for the purpose of throwing discredit upon experiments on animals in physiology. The passage in question had been quoted as showing that its author distrusted experiments of this nature and disapproved of them. But a reference to Colin's original language made it evident, on the contrary, that he fully approved of them and regarded them as valuable means of scientific research. Does not such a discrepancy need explanation? Mr. Bergh should not underrate the importance of this point. The quotations, as offered by him, are in the nature of evidence. They are used to show what have been the experience and opinions of certain eminent men in regard to vivisection. If this evidence is false it makes a difference in the conclusions to be drawn from it. May we not hope that Mr. Bergh will explain in some way his misstatement with regard to Colin?

Besides Colin, there is another eminent physiologist, still better known to American readers, who is arrayed by Mr. Bergh as opposed to physiological experimentation on animals. This is Dr. William B. Carpenter, late Registrar to the University of London, whose books have long been familiar standards in physiology and natural history, in England and the United States. In the New York *Evening Post* of September 12, 1874, Mr. Bergh refers to him as follows:

"Dr. Carpenter, than whom there is scarcely a higher authority, says: 'Take away an important and essential part of a living being, and it ceases to exist as such; it no longer exhibits even a trace of those properties which it is our object to examine, and its elements remain subject only to the common laws of matter.'"

This passage seems to have been taken, not from Dr. Carpenter's original work, but from Fleming's Prize Essay on Vivisection (London, 1866), which has been already shown, in the *Nation* of October 16, to be the source from which Mr. Bergh has borrowed much of his controversial ammunition. The quotation appears in Fleming's Essay, on page 50, accompanied by the introductory phrase: "Dr. Carpenter, than whom we could scarcely have a higher authority on this subject," etc., etc. Now, Dr. Carpenter's connection with the famous Prize Essay is a curious one. He was one of those who served upon the Committee of Adjudication for the competing essays; and, on examining Mr. Fleming's production among the rest, he found it so full of misrepresentations that, as a member of the committee, he felt bound to declare his disapproval. Accordingly, the printed document, as published by the Society, contains an Appendix, in which Dr. Carpenter corrects the false statements and inferences of the author, and repudiates the opinions attributed to himself. In the body of the essay references are made to the comments by Dr. Carpenter in the appendix; so that whoever reads the first is at once referred to the second. Thus, the passage quoted above by Mr. Bergh, on page 50 of the essay, refers by a foot-note to Dr. Carpenter's correction in the appendix, which is (page 75) as follows:

"I must entirely disclaim the general inference which the author bases on a limited proposition. I go as far as any one in the importance I attach to anatomical investigation, and in faith as to the value of the 'experiments prepared for us by Nature.' But the author ought not to ignore the explicit testimony I have borne to experiments in my chapter on the determination of the functions of the nerves."

Again, on page 23 of the essay there is the following passage by Fleming:

"The results achieved, however, looking at them from the most favorable point of view, be they valuable or otherwise, have cost an amount of suffering to sentient beings far beyond considerations of value or necessity, and which, when compared one with the other, fixes a perfectly just verdict of 'needless and cruel' against nine-tenths of the almost endless number of experiments performed by physiologists."

To this Dr. Carpenter replies in the Appendix, page 73, as follows:

"I entirely dissent from this statement. If we knock out of the existing system of universally accepted physiological knowledge all that has been learned from experiment, and what experiment alone can reveal, we should go back to a depth of ignorance which must cause a most lamentable increase in human suffering, through the maltreatment of disease and injury which would be the result."

So Dr. Carpenter's opinion, like Colin's, is in reality favorable to experimentation. No one could have the slightest doubt about it who should read his original work; and the above extracts show that the same knowledge is easily accessible to any one possessing a copy of Fleming's 'Essay.' But both Carpenter and Colin are paraded by Mr. Bergh as giving their testimony in its condemnation.

What shall we call this manipulation of the facts, used to convey an impression at variance with the reality? If we did not know that it came from a professional philanthropist we should be inclined to give it a very awkward name. It is plain that Mr. Bergh, in his eagerness to establish a particular point, has made use of means which are universally regarded as illegitimate. He has misapplied quotations, and even changed their phraseology, to represent opinions which are expressly repudiated by the authors themselves. Fortunately, a little expenditure of time and trouble will always be sufficient to detect a spurious issue of this kind and trace it back to its starting-point. Besides, it is somewhat of a relief to find

that these scientific luminaries, occupying "the loftiest pedestals in the Temple of Fame," have not, after all, been stultifying themselves so much as we feared. J. C. D.

NEW YORK, October 31, 1879.

Notes.

THE prospectus of the *Atlantic Monthly* for the coming year includes a new story by Mr. Howells, and reminiscences, dating back to the second Adams's administration, of political and social life at Washington.——On Nov. 11–13 the autograph letters and manuscripts of the late Col. Brantz Mayer, of Baltimore, will be sold at auction in Boston by Sullivan Bros. & Libbie.——Ginn & Heath announce for December a new edition of Goodwin's 'Greek Grammar,' considerably enlarged in the etymological portion; and for January a 'Brief History of Roman Literature,' from the German of Bender.——The chief interest of the last number of the Proceedings of the American Antiquarian Society centres in the paper by Mr. Ph. J. J. Valentini, on "Copper and Copper Tools of the Ancient Mexicans." The recent literature of Spanish American archæology contains but few contributions of equal importance. In it the learned "Américaniste" has made use of the paintings of Mexican origin to an extent and in a manner showing not only uncommon sagacity, but a thorough acquaintance with the principle and system of these contrivances. He illustrates forcibly the legitimate way to use them.——Among the contents of the *Oriental Church Magazine* for October we select for mention the first paper, a spirited account of Russia's great poet, Alexander Pushkin; an article on the influence of Hellenism, by Mr. Botassi, the Greek consul in this city; and the review of Russia's contributions to Arctic research, by Mrs. E. Vale Blake, the well-known editor of Capt. Tyson's 'Arctic Experiences.'——From the October number of the New York *Medical Journal* Prof. Burt G. Wilder has reprinted a very instructive article on "The Anatomical Uses of the Cat" (D. Appleton & Co). The author, following the late Jeffries Wyman, advocates dissection of this prolific, cheap, and easily obtainable animal, as the best possible introduction to the study of human anatomy, with which its own is peculiarly allied.——From the Bulletin, vol. v., No. 2, of the United States Geological and Geographical Survey, Dr. Elliott Coues reprints the second instalment of his unrivalled American Ornithological Bibliography, which has attracted so much attention abroad. This continues the previous list of formal publications relating to North American ornithology by adding those relating to the ornithology of the rest of America. Thus, the first title is a work on the natural history of Brazil, 1648. There are about 700 titles in all. Dr. Coues also contributes to the Bulletin an essay towards a bibliography of the *Passer domesticus alias* English sparrow, against which he warns the West as a pest comparable to the grasshopper, unless, indeed, having failed with the Colorado beetle, it finds the grasshopper palatable. Upwards of 150 titles, we should guess, have been here collected.——Charles Scribner's Sons have brought out in a neat pamphlet Dr. S. Wells Williams's paper on Chinese Immigration read before the Social Science Association at Saratoga in September. It is a valuable contribution to this vexed question, and noticeably free from sentimental considerations.——From the office of the Secretary of State at Albany we have received a solid volume entitled 'The Centennial Celebrations of the State of New York,' which speaks for itself. A good deal of local historical information is to be found in the collected reports amid matter not of lasting importance, and the illustrations include portraits of George Clinton, General Herkimer, and Philip Schuyler, as well as views of battle-fields, the old and new capitols, etc.——The death is announced of the Rev. Jacob Abbott, long to be remembered, and gratefully, as the author of the Rollo books, and of other juvenile literature which occupies the first page of almost every popular library catalogue in America. He had nearly completed his seventy-sixth year.——Dr. Busch, Bismarck's familiar, is publishing a new book of gossip, and Dr. Falk is said to be engaged on a work which also recalls the Chancellor by its title: 'Wir gehen nicht nach Canossa.'

—The Cincinnati Public Library has a large collection of the transactions of foreign learned societies—the memoirs of the St. Petersburg Academy, for instance, complete from 1728 to 1863 (according to the Bulletin for September, 1878; perhaps at present it has later volumes); also, with the *Abhandlungen* of the well-known Berlin and Vienna Academies, the publications by the Academies of Turin, Brussels, Modena, Lisbon, and others. Title-slips for the contents of these volumes have been written, and it is intended, we suppose, to publish them in the Bulletins as occasion may offer. The March Bulletin prints, in ten pages or twenty columns, the titles, alphabetically by authors, in the *Abhandlungen* of the Berlin Academy relating to "Philology and allied Subjects," including classical history, antiquities, etc., and the April number gives the titles relating to astronomy, meteorology, etc., and also those concerning philosophy in the same volumes, in three and a half pages or seven columns.

—The second week of Italian opera has shown a slight improvement, but it cannot be denied that the season is unusually devoid of interest and spirit. "Linda di Chamounix" was performed for the first time this season, and not having been given here for several years it attracted a numerous audience. Mlle. Valeria was acceptable in the leading part, and Campanini and Galassi were very good, as they always are. The first appearance in Mr. Mapleson's company of Miss Cary added to the interest of the occasion. Miss Cary is a great favorite with New York opera-goers, and she was very warmly received. She is nevertheless not exactly qualified for the part of *Pierotto*, which requires a genuine contralto voice, and her charming mezzo-soprano was not always equal to the demands of her part. Friday night "Lucia" was given for the first time. This opera, with Madame Gerster, Campanini, and Galassi in the cast, was Mr. Mapleson's great success last season, but of these three artists only Galassi took part in Friday's representation, and the difference was immense. We have spoken of Mlle. Valeria heretofore, and need only repeat what we have already said: she is an interesting young artist, but is distinctly not a prima donna, and "Lucia" demands a prima donna of the highest rank. As for Signor Aramburo, he has no title to the part of a leading tenor. He has some very fine notes, particularly the highest register from F sharp to C. He gave the B flat at the end of the first act with admirable effect, but this is nearly all that can be said for him. His school is bad; he has no idea of passing from a *piano* to a *forte*; his middle notes are unpleasant; and his enunciation, though painfully clear, is inartistic and wanting in polish. "Carmen" was presented Saturday afternoon, and "Faust," with Del Puente, a great improvement on M. David, as *Mephistopheles*, Monday night.

—It is probable that the personal popularity of General Hooker, who died at Garden City, Long Island, last Friday, has been greater and more enduring in the eastern portion of the United States than that of any other soldier of the late war. He was "Fighting Joe," and newspapers praised him and chronicled his doings, and soldiers when assembled shouted themselves hoarse in his honor. In our judgment this has been a remarkable instance of the worship of false gods, but it is not difficult to discover the reasons for it. In the first place, Hooker was a remarkably handsome, large, "well set-up" man. When he left West Point he is said to have dressed in black, to have presented a very modest exterior and to have been called "the chaplain," but soon after he was not only to be seen always in his uniform, but wearing it with great splendor, with his cap on one side, and evidently seeking success in other fields than those of war; to the end of his life he preserved a complexion of singular freshness. He was, moreover, very hearty and cordial in manner at all times, and when he was going into action or in contact with the enemy there was a serene and cheerful composure about him which it did one good to see. He liked fighting, and he was one of the first men in the East (where there was at first so much poor old timber among our generals, from brigade commanders up to corps commanders) who convinced our people, in the army and at home, that he "meant business" when he encountered the enemy. He had a most exaggerated idea of his own merits and importance, and in proclaiming them and in decrying the claims of other soldiers his voice was ready, sonorous, and voluble. His troops were so good, he was himself so much of a fighter, and his corps commander was so much of an old woman that he found it easy to persuade many people—indeed most people—not only that he was a gallant soldier, which was true, but that he was a great soldier, which was not true. Whether he was particularly civil to newspaper correspondents we have forgotten, if we ever knew, but we may hazard the conjecture that if he entertained those angels he did not entertain them unawares. He was about as insubordinate as a man could be who did not directly disobey orders. In the summer of 1862, for instance, he used to speak of McClellan, the commander of the army in which he had a division, as "a baby," and this before a mixed company of junior officers. He was most positive in his assertions, and his manner was so manly and attractive that his positive assertions were believed oftener than the facts warranted. He certainly did not always tell the truth, but his egotism was so intense that his errors in this respect may have been unintentional. At

any rate he was so likable that we prefer to believe this. There is ground for supposing that he owed his promotion to the command of the Army of the Potomac to his assertion that if he had not been wounded at the Battle of the Antietam he would have driven Lee into the Potomac. His testimony before the Committee on the Conduct of the War was to the like effect, and yet nothing can be more untrue. When the first troops of the Second Corps arrived on Hooker's battle-field, his corps had, for all offensive purposes at least, ceased to exist. Of his failure at Chancellorsville we have heretofore spoken at length (*Nation*, May 23, 1867). It is impossible not to conclude that Hooker's fame has been out of proportion to his merits. He failed utterly in his single great battle, and he never accomplished much as a corps commander. He was a brave man with a hearty love of fighting, and he was a good organizer. He was useful as a division commander in the early days of the war, but he was too selfish, too insubordinate, and too vain to continue useful to the end in that or similar positions. And he was, of course, not competent to hold supreme command.

—Mr. Charles S. Sargent, for the past seven years, and since its formation, director of the arboretum of Harvard University, has been appointed to the newly-created chair of arboriculture, which, as well as its aboretum, the University owes to the public spirit of the late James Arnold, of New Bedford. The arboretum, which is situated in the college property in West Roxbury, will comprise a living collection of every tree and shrub which the climate permits to grow in Massachusetts, museums illustrative of dendrology and forestry, and a library of these and kindred subjects. Such an institution, managed with energy and ability, may be expected to contribute not a little to the prosperity of the country through its influence, more or less direct, on the development and standing of American forestry. More immediate benefits will be a better and more genuine knowledge of our trees, both botanically and culturally; the introduction of new plants; increased and more correct taste in ornamental planting; and the facilities which the arboretum will afford botanists, landscape architects, and horticulturists for studying a large and comprehensively arranged collection of trees.

—A very important case is soon to come before the Supreme Court of Illinois. Walter L. Newberry left an estate, appraised at four million dollars, which in case of the death of his children was to be divided into two equal shares—one to be distributed among the surviving descendants of the testator's brothers and sisters, and the other to be applied by his trustees to the founding of a free public library in the North Division of Chicago. His last surviving child died sixteen months ago, but at that time the Supreme Court decided that the estate could not be distributed before the death of his widow, although she has renounced the provisions of the will on her behalf, taken her rights of dower, and has no further interest in the estate. If this decision is to be maintained, the city of Chicago may wait for its great public library for twenty years. But the court has recently granted a rehearing, and as it has been for some time known that three of the judges were in favor of delay, three in favor of distribution, and one undecided, this concession is supposed to indicate that the seventh judge has decided in favor of distribution, and that Chicago may shortly be the possessor of the best endowed library in the country.

—Southern vital and social statistics will form the most interesting feature of the census of 1880 and, it may be safe to predict, of 1890 also. We have derived some instruction even from the census of Wilmington, North Carolina, for the present year, which we find in the N. C. *Medical Journal*. This city is the seventh cotton port in the Union, and out of the 5,074,155 bales produced in this country in 1878–9 it received 135,270 bales as against 35,908 bales in 1868–9. It has a total population of 17,004 souls, against 13,440 in 1870, an increase of nearly 27 per cent., which may be called normal, as it corresponds with that between 1850 and 1860 (31 per cent.), whereas the result of the war was to cause a flocking of the unsettled population to Wilmington, giving it a temporary increase (1860–70) of almost 40 per cent. On the eve of the rebellion the colored population, from being very slightly in excess of the white in 1850, had fallen 16 per cent. below it; it now forms 60 per cent. of the total. Colored females are greatly in excess of the males—22 per cent. between the ages of 6 and 21; 26 per cent. between 21 and 45, at which period the white females fall just short of equalling the number of the males. Among white babies under eighteen months the females are 18 per cent. in excess; the colored, only 7; during the next period, from 6 to 21, the excess is for the whites turned into a deficit of 13 per cent., but for the blacks remains constant (6 per cent.) The infants' chances are evidently much better among the whites, and in the general death-rate for all ages the inequality is markedly in their favor—14.37 per cent. against 23.54 for the blacks. As for longevity, one white woman is recorded at 97, and one old "aunty" at over 100. The educational statistics are curious. One-quarter of the children of school age do not attend school, and one-half attend schools other than the public. Naturally, proportionately more colored children than white frequent the latter, but the numbers in attendance on private schools are nearly equal (1,203 whites, 1,280 colored), and in the public the two races are equally exemplary in attendance (whites 80 per cent., colored 78), and fairly divide the teaching force (white teachers 9, colored 11). The ratio of voters to the population in Wilmington is 4 7-16 per cent., in the State at large 5. Foreign vessels enter at the rate of one for every secular day (315 for the year).

—At a time when in this country some doubt has been cast upon the advantage of scholarships the French Liberals are hoping much for a recent establishment in the University of "bourses" of 1,200 frs. each, to be held for two years. The recipients gain their scholarship by a competitive examination, and lose it if they cannot pass certain other examinations. The *bourses* have been established only two years, and the number of applicants is not as yet large, but each provincial faculty has five or six of the new students, and it is believed that they will exert a most happy influence on their teachers. The professors, who have been accustomed to see no more auditors at their lectures than our professors of Arabic or of Chinese, and had fallen into the habit of filling up their hour with empty rhetoric or an unprepared and barren commentary, have already found that their new audience cannot be put off in this way, that a slip of memory, an inaccurate date, a poverty of thought and of real instruction, is quickly perceived. They have begun to re-write their lectures, and—a hitherto rare thing with French provincial professors—actually to publish. Probably it is not solely the scholarships and their holders that have produced this result. France was effectually awakened by the German invasion, and the interest in all matters of instruction has been a very different thing under the Republic from what it was under the Second Empire. Very sharp eyes even fancy they see a change since the cessation of the reign of "Moral Order," which may be doubted. The provincial professors are not the only persons who are to be benefited by the new system. The communal "colleges," corresponding in a way to our high-schools, or to schools like Exeter, and highly prized by the Liberals as a counterpoise to the clerical "seminaries," are in great need of good teachers. They pay wretchedly small salaries, but it is thought that if teachers were to be had who deserved better pay they would get it, and that in turn would increase the supply of applicants.

—Of the first number of *La Nouvelle Revue*, the new rival of the *Revue des Deux Mondes*, it can be said more truthfully than it is usually said of the beginnings of similar enterprises, that it promises well. It is also to be said that, as is probably almost invariably the case, its promise surpasses its performance. It has a kind of prospectus written by Juliette Lamber (Mme. Adam), articles by M. de Lesseps on the Geographical Congress, by M. Amédée Le Faure on "Les Grands Manœuvres," by General Turr on "Question d'Orient," by M. Henri de Bornier on "La Politique dans Corneille," by M. Demombynes on judiciary reform, and by M. Demitriadès on "Le Protocol XIII. du Traité de Berlin"; Mme. Henry Gréville begins a story, M. G. Duprez contributes the first part of some "Souvenirs d'un Chanteur"; M. Guillaumet, some "Tableaux Algériens"; and M. André Theuriet, some idyllic verses called "Les Paysans." The editorial departments discuss foreign and domestic politics, and there are a "journal de la quinzaine" and a bibliographical bulletin. It will be seen from this summary that we may expect good editing in the *Revue;* the range, variety, and selection of topics for treatment could hardly be better. There is a perceptible unity of tendency and essential agreement in not only the political articles, but in those which in any degree relate to national questions, that indicate that the Republic and Mme. Adam's *salon* have definite and settled views of public policy. Gambetta's hand may perhaps be traced in "It is the contest between the spirit of the Revolution and that of the Syllabus which is the culminating fact of the politics of the moment; it can almost be said that it is the whole of it, indeed." Whether or no there is enough in this idea to secure a success proportioned to that of the *Deux Mondes* remains to be seen; but the articles of the initial number have each a considerable specific interest and merit, independent of course of the main end of the *Revue*, which render this probable. We should say it might come to bear the same relation to the *Deux Mondes* that *L'Art* has to the *Gazette des Beaux-Arts*. At all events, we judge from Mme. Adam's somewhat ecstatic and ambitious

prospectus that its editor thinks it has a mission to perform, and common report credits her with ample means to pursue an experiment of the kind, and greater liberality than that of Buloz, who, according to Edmond About, "never paid for a first article and never accepted a second." Every well-wisher to the French Republic will desire its permanent establishment as something designed to endue the present régime with some of that dignity which its foes fear it lacks.

—As provided in the acts establishing the imperial supreme courts, the supreme court of the kingdom of Prussia passed out of existence on the 16th of September. Simultaneously with its dissolution appears a 'Geschichte des königlichen Obertribunals in Berlin' by one of its judges, Dr. Sonnenschmidt. Though the court lived two hundred years few of its decisions attracted much attention, but of these, one, being constantly referred to by German political writers, deserves mention here—namely, that of January 29, 1866, which struck at the root of parliamentary liberty. In February, 1853, a member of the House of Representatives made an offensive allusion to one of the ministers, on account of which the Government applied unsuccessfully for permission to prosecute him. It then, on its own authority, brought a suit in the court at Düsseldorf, which the court, citing the appropriate provision of the constitution, declared itself incompetent to try, as did also the court of appeals at Cologne, and, eventually (December, 1853), the supreme court at Berlin. In 1866, however, a change having meantime taken place in the procedure of the supreme court, the Government determined to try it again. By the new legislation the Minister of Justice could remove a case from the special decision of the court appointed to try it to a body composed of all the judges who habitually treated similar cases, and thus actions brought in East Prussia and in Berlin against the members Frenzel and Twesten, on appeal from the lower courts, were decided in favor of the Government January 29, 1866; the court now holding that the provision of the Constitution had reference only to "insulting remarks not of a libellous character." The decision is frequently referred to as that of the whole court, which then numbered some fifty members; but this statement is incorrect. The judges who sat in the case were but fifteen in number, and it was decided by a majority of one.

CLIFFORD'S LECTURES AND ESSAYS.*

IT is impossible to read these volumes without taking an even greater interest in the human character they reveal than in the matters of which they treat. The author was cut down last March at the age of thirty-three. Many who have read hastily and at long intervals the essays here gathered together may have caught the impression of a genius too iconoclastic to be sympathetic, too fond of paradoxical statement to be wise, too eager for battle to be fair; but the massive effect of all the essays taken together and combined with the personal account of Clifford in the introduction strongly modifies this feeling. We see a man profuse of gifts of body and mind, of "boundless human interests and sympathies," so intensely social that "personal enmity was to him a thing impossible"; of a genius in mathematics so original that we have heard an authority than whom none could be more competent say that he might have rivalled the fame of Newton had he lived; but, on the other hand, endowed with that sense for the color and human expression of things which poets have and mathematicians too often lack, and which irradiates every page he writes with humor and fancy; of insatiable curiosity, but as eager to give all he gained as to receive it; possessed of such reckless animal spirits that we find him now hanging by his toes on the crossbars of a church-steeple weather-cock, now performing the almost incredible feat of writing his articles on the 'Unseen Universe' and on Virchow's address each in a single night—we see all this, and we feel that, as Mr. Pollock says, his printed work must be a very slender representative of all he was to those who knew him, and that the incommunicable and indescribable thing called genius, *das Dämonische*, when it exists in a man as it did in him, transcends all his specific performances, and, "lightening the air his friends breathe," may very well justify them in making claims which to the distant reader sound exorbitant.

But even the distant reader must allow that Clifford's mental personality belonged to the highest possible *type*, to say no more. The union of the mathematician with the poet, fervor with measure, passion with correctness, this surely is the ideal. And if in these modern days we are to look for any prophet or saviour who shall influence our feelings towards the universe as the founders and renewers of past religions have influenced the minds of our fathers, that prophet, if he ever come, must, like Clifford, be no mere sentimental worshipper of science, but an expert in her ways. And he must have what Clifford had in so extraordinary a degree—that lavishly generous confidence in the worthiness of average human nature to be told all truth, the lack of which in Goethe made him an inspiration to the few but a cold riddle to the many.

But why, with all of Clifford's powers, does the result appear so small? Why do these lectures seem to the reader almost funny in the inadequacy with which they shadow forth anything fit to form a "creed" for modern life? Why, indeed, to put the case more broadly, would an almost impossible cumulation of faculties in a single man—Clifford's scientific faith and skill, a poetic craft equal to his poetic feeling, a faculty for public affairs which he never possessed, a genius for familiar oratory, an expansive communicativeness, and a humanity greater than his—why would all these aptitudes together certainly fail *now* to give their possessor that altogether incalculable sort of power over the mind of his generation which the prophets of the past have held? The answer to these questions is short enough. Our modern mind is nothing if not critical—the craving for consistency has entered into its soul, and nothing will deeply move it but a synthesis of things which is radically reasoned out. No array of separate gifts, with this synthesis still unachieved, will make a prophet now. Ever some vital factor of our mental life will rebel and refuse to be dragged the same way with the rest. The miraculous achievement, the achievement upon which we are all waiting for our faculties to burst into movement like mill-wheels at the touch of a torrent, must be a metaphysical achievement, the greatest of all time—the demonstration, namely, that all our different motives, rightly interpreted, pull one way. Now our Science tells our Faith that she is shameful, and our Hopes that they are dupes; our Reverence for truth leads to conclusions that make all reverence a falsehood; our new Good, survival of our tribe, is the one thing certain to perish with our planet; our Freedom annuls our opportunities for lofty deeds; our Equality with our brethren quenches all tendency to be proud of their brotherhood; our Art, instead of intimating divine secrets, becomes an intellectual sensuality, revealing no secrets but those of our nervous systems; our craving for personal recognition at the heart of things is flatly contradicted by our persuasion that we none of us possess any independent personality at all; in short, if we wish to keep in action, we have no resource but to clutch some one thing out of the chaos to serve as our hobby, and trust to our native blindness and mere animal spirits to make us indifferent to the loss of all the rest. Can the synthesis and reconciliation come? It would be as rash to despair of it as to swear to it in advance. But when it does come, whatever its specific character may be, it will necessarily have to be of the theoretic order, a result of deeper philosophic analysis and discrimination than has yet been made. He who makes it will indeed be a leader of his time; for then, in our author's words, will there be a "universe fresh born, a new heaven, a new earth, a new elysium open to our eager feet." Then, indeed, will *la vérité* be *toute pour tous*, in the phrase which the editors have placed as an epigraph on the title-page of these lectures. Then we can all re-echo with Clifford:

> "If a thing is true, let us all believe it, rich and poor, men, women, and children. If a thing is untrue, let us all disbelieve it, rich and poor, men, women, and children. Truth is a thing to be shouted from the house-tops, not to be whispered over rose-water after dinner, when the ladies are gone away. . . ."

But what sort of a figure does Clifford's own philosophy make when treated in this fashion? Surely there never was an intenser illustration than is spread out in these pages of the chaotic state of our contemporary thinking, or a creed on the whole less fit to be proclaimed to the people as the matured and clarified result of scientific thought. There are, of course, exquisitely simple and vivid statements of particular physical theories. It is hard to imagine better reading to inflame a boy with thirst for physics than the lecture on "Atoms," and the articles entitled "The Unseen Universe" and "The First and Last Catastrophe." The one on "Boundaries" in the smaller volume is marvellously clear; and the chapters on the "Philosophy of the Pure Sciences" in the larger form as luminous an introduction to mathematical philosophy as was ever written. Image after image of perfect felicity pursue each other through a style of which the only fault is too great ease and too many Saxon words for our degenerate ears. But in the fundamental ideas what mere subjective capriciousness! A scepticism which fears to call the axioms of geometry true, but which takes no umbrage at the self-contradictions of continuity and infinite division in space and time; a scrupulousness which

* 'Lectures and Essays. By the late William Kingdon Clifford, F R.S. With an Introduction by F. Pollock.' 2 vols. 8vo. London and New York: Macmillan & Co. 1879.

'Seeing and Thinking. By the same.' *Ibid.* (Nature Series.) 12mo.

speaks with all the unction of the theological vocabulary of the "guilt" and "sin" of believing even the truth before it has been scientifically demonstrated, but which fears not to lay down as dogmas, to be believed by all, such pure conceptions of the possible as the existence of primordial atoms of "mind-stuff" which are the true things *in se*, the impotence of feeling to influence action, and the rigorous fatality of human acts. Then as to Ethics: Clifford's great discovery is that what is objectively *good*, as distinguished from what is merely subjectively pleasant, is what conduces to the survival of the tribe. Loyalty to truth and all other virtues draw their nobility from being means to this effect. And the symbolic figure of the tribe is invoked as a substitute for superhuman deities, "a grander and nobler figure" than theirs, the figure of "Him who made all gods and shall unmake them":

"A presence in which one's own poor personality is shrivelled into nothingness, . . . which in moments of utter sincerity, when a man has bared his own soul before the immensities and the eternities, arises within him and says, as plainly as words can say, 'I am with thee, and I am greater than thou.' Many names of gods, of many shapes, have men given to this presence; seeking by names and pictures to know more clearly and to remember more continually the guide and the helper of men. No such comradeship with the great Companion shall have anything but reverence from me. . . . From the dim dawn of history, and from the inmost depth of every soul, the face of our father Man looks out upon us with the fire of eternal youth in his eyes, and says: 'Before Jehovah was, I am!'"

Surely splendid rhetoric; but observe the circle in the logic: "We must show piety to our race because our race is worthy" means, simply stated, that we must help it to survive because it *can* survive. But if it can survive, it will any how, and needs none of our help. Whilst, if it needs our help, it can't survive *per se*, and lacking, therefore, those attributes which we learn to call objectively good, can have no claim on our sympathy. In any case we may turn our backs upon it. It is beside the mark to say, "As a matter of fact we can't turn our backs; instinct forbids." Other instincts *bid;* and the whole use of open-eyed philosophy is to teach us how we ought to decide when our blind instincts clash. Prof. Clifford's fine organ-music, like the bands and torches of our political campaigns, must be meant for our nerves rather than for our reason. The entire modern deification of survival *per se*, survival returning into itself, survival naked and abstract, with the denial of any substantive excellence in *what* survives, except the capacity for more survival still, is surely the strangest intellectual stopping-place ever proposed by one man to another.

Take, again, Clifford's notion that high action means *free* action. Seating himself firmly on this high horse, he immediately proceeds with the utmost fury to chop off its legs. For he first defines free action as action from within, and then describes action from within as that whose immediate antecedents are molecular, and not the massive motions of distant bodies. Think of firing the popular heart for virtue by promulgating, as the only true and scientifically warranted moral law, the formula: "So act that all thy deeds have molecular, not massive, antecedents"!

Clifford's great metaphysical theory of units of mind-stuff forming things in themselves, and appearing to each other as molecules of matter, so far from clearing up our ideas makes confusion worse confounded for the present. It would really require a fourth or a fifth dimension of space to make an intelligible diagram of the relations between the thing, the thought of the thing, and the brain process subserving the thought, which this theory necessitates. But, as the author himself says, "the question is one in which it is peculiarly difficult to make out precisely what another man means, and even what one means one's self." Only we think a clearer grasp of this theory might have dispossessed from Clifford's mind that other theory, that our feelings are powerless to influence our deeds. The theory says that the atoms of mind-stuff, when they fortuitously coalesce in certain ways, form a consciousness, and in other ways do not. Now, noting that the conscious combinations tend the more to survive as their consciousness is more developed, what is more natural than to conclude that the consciousness as such aids them by its presence, and has a real utility, making self-preservation the end for which it actively *works*, by reinforcing all actions and feelings which lead thereto, and checking all the rest? But this conclusion would oblige us to ascribe to it just that causal efficacy which Clifford denies.

Far be it from our thought to cast a stigma on any of these beliefs. The beliefs which have moved the world have always been directed upon some material content, and have been quite indifferent to logic. When the true prophet arises the right will be sifted from the wrong in Clifford's doctrines, and in those of all of us. Till then we should all be left free to mix our mental porridge as we please. What we complain of is that Clifford should have been willing, with his ideas still in their *Halbheit* and unshapeliness, to use the conjuring spell of the name of Science, and to harp on Reverence for Truth as means whereby to force them on the minds of simple public listeners, and so still more unsettle what is already too perplexed. Splintered ends, broken threads, broken lights, and, at last, broken hearts and broken life! So ends this bright romance! But louder and more joyously than any of us would its generous hero have sung:

"Wo immer müde Fechter
Sinken im muthigen Strauss,
Es kommen neue Geschlechter
Und kämpfen es ehrlich aus."

SEARGENT SMITH PRENTISS.*

EITHER in the man, or in the memoir which is called for after the lapse of a quarter of a century since its first publication, there should be something to account for a compliment not often paid to biographies. Mr. Prentiss, however, though a man of precocious intellect, an indefatigable and enthusiastically admired stump-speaker, an able advocate, a prominent Whig, and for a short time a striking figure in the lower house of Congress, was not, even as portrayed by fraternal partiality—or we will do the writer the justice to say impartiality—a great character. Had he been ambitious, he might possibly have impressed himself on the destinies of his country as did his contemporaries Clay, Webster, Calhoun, and the rest. But the disgust of politics which his first experience inspired in him caused him to withdraw at the earliest moment from office-seeking or office-holding; and his disinterested political services as a party orator heightened his fame but were not essential to the success of the party. Of his numerous speeches very few were reported or have been preserved, and most of those which appear in this memoir are apologetically reproduced, as not justifying his reputation. There are, in fact, but one or two which can be read with any satisfaction or much profit; and perhaps the argument by which he maintained his right to a seat in the House of Representatives is the only discourse which fairly suggests his intellectual capacity. His style was fluent, and florid beyond present endurance, and would nowhere now be taken as a model for youthful orators, unless in certain parts of the South and West. More than one instance is given of a fatal readiness to speak without preparation at any time and on any theme, which certainly brought him under Carlyle's definition of the "commonplace eloquent speaker" who, "in any occurrent set of circumstances, can start forth, mount upon his stump, his rostrum, his tribune—his place in parliament, or any other ready elevation—and pour forth from there his appropriate, 'excellent speech,'" a windy marvel to the "poor, windy mortals round him," who cry bravo. His biographer deprecates such a description of him, as if to be windy was always to be insincere. Mr. Prentiss was, we may allow, sincere; and if we find him too willing to speak for the sake of speaking, as on the fine arts at New Orleans, or on the aborigines from the top of an Indian mound, all that can be said for him is that it was the failing of the times and especially of his section.

There is, to digress a moment, a pertinent example of this in the case of Webster, as narrated by Henry A. Wise on pp. 54, 55 of volume ii. At a dinner given to Prentiss by his Whig colleagues in Congress, all the great lights of oratory, Mr. Prentiss included, had burned miserably dim: Clay was flat, Webster resorted to bad punning, and the occasion had become positively stupid, when toasts were abandoned, and Gen. Waddy Thompson, smartly upbraiding Webster for his failure, appealed to him, as a Southern to a Northern man, to "touch the theme of the Union." Webster at one o'clock took the floor, and soon "brought forty men to their feet" in breathless attention. At the climax—"Shall *my* children be aliens to *your* children?"—

"The great tears rolled down many a manly cheek, and —— ——, of Georgia, exclaimed: 'There, now! didn't I know it? But my people wouldn't believe this! I'll tell them as soon as I go home!' In the midst of the excitement, —— ——, of Kentucky, in a perfect frenzy, seized an empty champagne bottle, and crying out 'Reform or Revolution! Liberty or Death!' threw it at Webster's head, which he would doubtless have hit but for my jarring his arm by catching at it as he threw."

Such were the rewards of "pumping" in 1838.

Mr. Prentiss's career as Congressman was in every way honorable to him. Still more so was his instant and steadfast opposition to Repudiation, when his adopted State took the lead in an infamy which has since almost become national. It is this chapter in his history which invests the memoir with a real freshness, and makes its widespread circulation especial-

* 'A Memoir of S. S. Prentiss. Edited by his Brother.' 2 vols. 12mo. New York: Charles Scribner's Sons. First edition, 1855; second edition, 1879.

ly desirable. Of his part in resisting the general demoralization in Mississippi only a fragmentary account could be given; but the editor has supplemented the record on this subject with liberal quotations from Jefferson—whose doctrine that one generation cannot bind another was eagerly taken up by a mixed and imported population—and from Calhoun, who earnestly combated such destructive notions. There is also an interesting correspondence with Wordsworth, whose wife's relatives were dependent on the dishonored bonds, in which Mr. Prentiss expressed his belief that repudiation could not succeed in Mississippi or in any other State; whereas, even as these volumes were passing through the press, the Trustees of the Peabody Educational Fund were reminding the world that the bonds (although dedicated to the restoration of the South) are still worthless It furnishes an instructive gloss on the modern notion of "honor" to learn that Mr. Prentiss, whose moral standard was so much sounder than that of the majority of his fellow-citizens on this subject, was addicted to the peculiarly Southern vice of gambling.

He had also been naturalized to the duello. As Col. Baillie Peyton relates:

"His chivalric spirit adapted itself to the times and country in which his lot was cast, not as a matter of choice, but from necessity. Public opinion had established the wager of battle as the only mode of settling points of honor, which no man could decline and maintain his position and usefulness in society. . . . He found himself among a people who, from education and other causes, looked upon the '*Yankee*,' as every New-Englander was called in the South, as almost of necessity deficient in this chief excellence of man—personal courage as proven upon the body of some knight of the pistol in the duello. . . . All things considered, it is not to be wondered at that a man of his temperament, of his proud spirit and lofty aspirations, should have resolved to accommodate himself to the spirit of the times; for, as to remodelling society and changing the tone of public sentiment on this subject, it would have been a vain attempt for any one—much more for him"

The moral courage which withstood Repudiation was here wanting, and considerations like the above led Prentiss to fight two duels with General Foote, and nearly involved him in another in New Orleans. Life, as he says, would have been "valueless to him, both in his own eyes and those of the community," had he declined to meet the challenge. But he had deliberately chosen his community, and the word "valueless" reminds the reader that Mr. Prentiss resisted the temptation to settle in Cincinnati because he was bent on making a fortune. On his first arrival in Natchez he thought he should "dislike to live in a slaveholding State," and the only advantage held out by it was the greater facilities for the accumulation of wealth. "The land of wealth, slaves, fevers, and mosquitoes," he afterwards calls the South, and the slaves are "a strong objection." Still later, "slavery is a great evil, there can be no doubt, and it is an unfortunate circumstance that it was ever introduced into this or any country, At present, however, it is a necessary evil, and I do not think admits of a remedy. But the situation of slaves—at least, in this State—is not half as bad as it is represented and believed to be in the North," etc. So the process of adaptation goes on till Mr. Prentiss becomes a full-blown "Northern man with Southern principles"; defends a Mississippi judge held for murder in Kentucky with a levity which, spite of his disclaimer, indicates that he really did regard the case as one between gentlemen and mechanics, the murdered men having been friends of a tailor with whom his client had quarrelled; lauds the "philanthropy" of Clay, the self-seeking owner of fifty human beings; denounces Polk for having signed the Oregon bill with the Wilmot proviso; and praises Webster's 4th of March bid for the Presidency. He was, perhaps, not a fanatic on the subject of slavery, but it never made him, like Jefferson, tremble for his country; and, with all his strong Union feeling, it is not certain that he would have sided with the Government in the rebellion.

In 1838, "a more upright, intelligent, and moral community cannot be found in the Republic" than Mississippi, was her representative's retort in Congress to a Treasury agent's libellous assertion of "a certain looseness in the code of morality" there. Two years later, Repudiation sprang up, certainly not without roots in the near past; seven years later Prentiss removed from Vicksburg to New Orleans, exclaiming bitterly of Mississippi, "I consider this State as disgraced and degraded, and I have sworn that I will not bring up my children within reach of its infamous doctrine." Partly, no doubt, the change of residence was dictated by the financial ruin which had overtaken him, in consequence of a land speculation based on a claim to property defended by the town of Vicksburg as commons. As early as March, 1834, he was employed as counsel by the claimants, and allowed to purchase an interest. Success in the first trials made him apparently very wealthy, as he desired to be—little, as he says, on his own account, but much on account of others. He was, in truth, a generous and even reckless giver, and was never weary of aiding his family and friends or responding to the demands of the needy. This side of his character is very attractive, and so is the affectionateness which distinguishes his not otherwise remarkable correspondence with his relatives. As a speaker he was singularly "magnetic"; no audience daunted him, and he seldom disappointed the expectations of those who knew him. To illustrate this we may quote an almost Homeric passage from Mr. Wise's reminiscences of Prentiss's arrival in Washington to contest his seat. "A party caucus was held to arrange matters, and it was proposed to take him and his colleague "somewhat in pupilage"; and "that some able and experienced members should be selected to procure for them the precedents, prepare arguments, and aid them before the Committee and the House." Mr. Wise continues:

"At this suggestion, Wm. C. Dawson, now Senator from Georgia, rose and said: 'Oh! gentlemen, you need be at no such pains; you will have no babes to nurse. One of those men is a host in himself, who can take care of Mississippi and rather help us to boot, than require our pap-spoons. He is not only full-grown, though low in stature and very lame in gait, but a giant, who is a head and shoulders taller than any man I know, here or elsewhere, for the task of prompting and defending himself. We need not say *Up-a-diddy* to him.'"

Such was the man whose biography is now revived. As for the book itself, it lacks all pretensions to literary excellence. Its chief merit is that in spite of its numerous reserves, which make its presentation inadequate, it raises no doubt of the editor's candor and conscientiousness. He has, with professional fidelity, improved every opportunity to point a useful moral to his brother's shortcomings or to the iniquity of the times. He fully shares Mr. Prentiss's detestation of the spoils system, and reinforces him in foot-notes and elsewhere. In this particular, as well as in the matter of repudiation, the book is still timely and has lost nothing of its interest by having suffered a temporary eclipse. Parts of it are worthy to be used as tracts or general ammunition by Honest-Money Leagues, Civil-Service Reformers, and Scratchers. Take, for example, the following extract from the speech on defalcations (Dec. 27, 1838), as bearing on Secretary Sherman and Appraiser Dutcher:

"Accordingly, he neglected his most important duties for many days, that he might use in the election that political influence of which the honorable Mr. H—— speaks with so much unction. The Secretary receives this excuse; recognizes its sufficiency, by not recommending his removal from office, as he had promised to do in case the reason should not be satisfactory; and has thus convicted himself of entertaining and practising the profligate doctrine that *interference in elections by an officeholder is not only justifiable, but involves a higher degree of obligation than the mere performance of official duty.*"

As a contribution, too, to the history of the country during the first half of the present century, this memoir has a decided value; and the interval between its former and its present publication (considering what has happened since Pierce's presidency) only renders it the more instructive to readers who have lost for ever some of the illusions of 1855. Its anecdotes of the public men of the last generation, or contributed recollections, and its occasional glimpses of the early state of society in the Southwest, make the want of an index keenly felt. Six pages of publishers' advertisements at the end of the work by no means atone for the omission, which even yet, however, may be repaired.

RECENT POETRY.*

MR. ARNOLD'S poem is in many ways the most "important" that has been published in English for some time. In both theme and treatment it is as ambitious as it is possible to be without pretentiousness; it is interesting enough to secure the popular favor which will miss its finer points, and as an intellectual performance its merit is unmistakable enough to secure the instant recognition of reflective criticism. It has, it may be said, a prodigious advantage in its theme. It might be called the Gospel of Buddha in verse according to Edwin Arnold, and the Gospel of Buddha is, as every one now knows, a very attractive thing. As Mr. Arnold says in his preface: "Forests of flowers are daily laid upon his stainless shrines, and countless millions of lips daily repeat the formula, 'I take refuge in Buddha.'" This is a little in the impressive vein of the London *Daily Telegraph*, of which Mr. Arnold is the editor, but it is scarcely misleading, and perhaps, all things considered, too much cannot be said in favor of the power and beauty of the story of Siddârtha as we know it. It not only has charm for all students and men of letters, and it is not only the gospel of "countless millions," as Mr. Arnold says, but to certain Occidental transcendentalists it has long

* 'The Light of Asia. By Edwin Arnold.' London: Trübner & Co.; Boston: Roberts Brothers. 1879.

afforded a comfort and assuagement, so to speak, that bear the highest testimony to its potency, though by a strange perversity its superiority is often attributed to its essential spiritual identity with the religion of monks and nuns. At all events, any one who selects it for a theme, and who can feel as much at home in it as Mr. Arnold—"Companion of the Star of India; Third Class of the Imperial Order of the Medjidie; Honorary Member of the Société de Géographie, Marseilles; formerly Principal of the Deccan College, Poona; Fellow of the University of Bombay"; author of Indian translations and various other literary works, besides being editor of the *Daily Telegraph*—is relieved of an important part of the poet's labor, and need concern himself only with construction and presentation. The general conception furnished, his imagination may expend its force upon details.

But the disadvantages of the theme are not perhaps less real, although they may be less obvious. Mr. Arnold has sought, he says, to depict the life and character and indicate the philosophy of the founder of Buddhism. He has "taken the imperfect Buddhistic citations much as they stand in Spence Hardy's work," and though he has "modified more than one passage in the received narratives," he has probably invented little with deliberateness. Nevertheless, his poem is certainly not lacking in the license which it is the invariable practice, as it is the privilege, of the poet to indulge. All that one need ask is that the color of the story be faithfully preserved. "I have put my poem into a Buddhist's mouth because, to appreciate the spirit of Asiatic thoughts, they should be regarded from the Oriental point of view," he says, "and neither the miracles which consecrate this record nor the philosophy which it embodies could have been otherwise so naturally reproduced." This proceeds upon the supposition that it is possible for an Occidental, himself the product of twenty ages of Christian culture, to "naturally reproduce" these things at all. In order to reproduce them artistically Mr. Arnold's selection of a Buddhist mouthpiece is undoubtedly wise, but we fear not only that this simple expedient does not of necessity secure a "natural" reproduction, but that neither it nor any other can adequately avail for the difficult task Mr. Arnold set himself. We do not say that he is not in as absolute sympathy with his subject as it is possible for any western man to be, though the qualification in his remark that the personality he writes of is the "highest, gentlest, holiest, and most beneficent, with one exception, in the history of Thought" indicates that he is not prepared to go to the length which has been arrived at in some instances as far west as this country. But in a matter of such dignity the presumption is against his successfully putting himself in the place of a religionist of another civilization; and the presumption is borne out by the poem. The editor of the *Daily Telegraph* is unmistakably devout, and to the fact that his devotion is traceable in kind and quality to Christian rather than Buddhist springs, is to be attributed the general air of the Gospel according to St. John which his poem has. It is not, perhaps, equal to that work in certain human and divine qualities, but, except for the doctrine of the Atonement, its views are similar, and its picture of "our Lord" copies with exactness the lineaments which St. John traced. There is a good deal of Orientalism in the accessories; there are elephants and tigers, and an Aladdin's palace, and a tournament with a princess for the prize, and scenes, harem and other, that might have been taken from 'The Arabian Nights' *passim*. But there are also many Gospel incidents interwoven with these—the miraculous conception, the gifts to the infant, the confusion of the elders, the temptation, and so on. Even the language now and then curiously recalls our later Scriptures—"throughly purge" (page 220), for example. And the note of the poem, pervading every page of it, is self-abnegation. In fine, we question if this poem would ever have been written if Mr. Arnold and his ancestors had never read the New Testament, by which we by no means intend to deny the parallelisms so often drawn between Buddha and Jesus, of course, but only to intimate the sense of its untrustworthiness as a natural reproduction of the life, character, and philosophy of Buddha with which this poem leaves one. On the one hand, therefore, Mr. Arnold stimulates small confidence as a synoptic evangelist, and on the other it is not wholly due to him that we have in his 'Light of Asia' a noble and touching story, which can only be compared with that of the New Testament, as it is so often observed, and any passable presentation of which would have attractions that few narratives possess.

Mr. Arnold's presentation of it is much more than passable, but we shall not venture to call it poetic. Parts of it appear poetic, such as the lyric in the third book, and some of the sermon of Buddha before the king in book eight, though this is sorely weighted with its philosophy, which last is far too simple in essence to be paraded with pomp as a discovery. All the rest of the poem is the "majestic English iambic"—some five thousand substantially consecutive lines of it. This certainly necessitates a poetic force properly to be described as prodigious. But Mr. Arnold does not seem to us to have poetic force, though at times he displays something very like it. He has poetic appreciation in abundance. The second line of the following, perhaps the most poetic in the volume, does not quite attain what it so evidently aims at:

> "The nautch-girls in their spangled skirts and bells,
> That chime light laughter round their restless feet."

Recondite and exact as that is, it is nevertheless unimpeachable, and there is nothing to say in reply to any one who maintains it to be a spontaneous imagery. But there is nothing else of the kind, that we have noted, which equals it. This, rather, is what one meets:

> "Came forth in painted car, which two steers drew,
> Snow-white, with swinging dew-laps and huge humps
> Wrinkled against the carved and lacquered yoke."

That is precise, even vivid; but one thinks of

> "—yon heifer lowing at the skies,
> And all her silken flanks in garlands dressed."

And though a comparison of Keats with a poet who composes his works in the intervals of writing able "leaders" for the *Daily Telegraph* is unfair, it emphasizes the distinction between Mr. Arnold's verse and poetry—why should we not say poetic poetry as well as *vérité vraie?* His ear is in general admirably accurate, and such a line as

> "The fish-tiger of that which it had seized"

is very rare. His literary faculty, too, is so excellent that the slightest offence against taste, such as the needless abbreviations of

> "—in the brake how fierce
> The war of weak and strong! i' th' air what plots!"

is a surprise. Of course, in a poem of five thousand lines, with the metrical conditions of this, nothing is more natural than that the writer should simply translate prose into metre in many instances, and speak of a gate

> "With brazen folding doors, which but to roll
> Back on their hinges asked a hundred arms";

but the amount of this in 'The Light of Asia' would be fatal to its poetic value, even if there were more than there is of something with a very different and far higher quality. We should, however, do much less than justice to it if we did not make it clear that in spite of having its conception furnished it, in spite of its untrustworthiness as a "natural reproduction," and in spite of the rarity with which anything like distinct poetry is reached in it, it not only has passages of power and passages of beauty, but it is altogether an intellectual performance of marked ability. Many a better poem indeed has been the product of a less gifted mind.

'Blanid' is the very secret of rhyming prose. Persons who have read the previous work of the author, 'Deirdré,' will not need to read it except for the story. It reflects the merits and defects of 'Deirdré' with an almost curious but, as we have found, somewhat wearying exactness. There are differences; for example, the rhymed ten-syllable couplet, in which, if we remember aright, 'Deirdré' was written undergoes the slight change into eight-line stanzas, the last two lines of which make a couplet and the other six rhyme alternately, and these are varied by interspersed lyrics, which are well done and have the genuine Celtic cadence and spirit. This is an improvement, and relieves the monotony which cannot fail to characterize a few thousand ten-syllable couplets carrying no more poetic message than that of 'Deirdré.' Still, what would best afford this relief is an occasional variation, not so much in metre as in quality of thought, and an occasional change from essentially prosaic narrative to poetic significance. This we have not observed in 'Blanid.' It is, like its predecessor, fluent, occasionally vivid, entirely intelligible, and just beyond the confines of that kind of easy writing which proverbially makes such hard reading. Dr. Joyce's vocabulary is, if not large, at least adequate so far as he is aware, we judge, and his ear for rhyme and rhythm is generally excellent. He is never pretentious and he never descends to mere doggerel. Qualities like these, enduing an intrinsically interesting story of the golden age of Erin, create an eminently respectable, not to say interesting, work, though they are not of a sort that prevent one from being reconciled to the sacrifice of them which would be involved in a prose version of the legend such as Dr. Joyce could undoubtedly make. The argument is concisely this: Blanid, daughter of the king of the Isle of Man, refuses all her suitors, but at length falls in love with the son of

'Blanid. By Robert D. Joyce, author of "Deirdré."' Boston: Roberts Brothers. 1879.

her father's most powerful enemy, Cuhullin. Cuhullin and the other princes sack the stronghold of Mana, but at the distribution of the spoils Blanid is won by a stratagem and taken away by Curoi, who subsequently defeats Cuhullin in a contest for her. The lovers, however, meet again and arrange for the slaying of Curoi, after which Cuhullin takes Blanid to Eman. Thither Curoi's minstrel follows them, and at a hunting-feast seizes Blanid and leaps with her from a precipice into the sea.

Mr. Strong's title should not prejudice any one against his volume, which is a collection that was worth making of what we take to be desultory verses written at odd moments. Their unpretentiousness is pleasant, although it is of a quality which intimates that neither the muse nor the needs of the author compelled him to the composition of them, which is saying that they have a noticeable amateurish air. Notwithstanding this and a kind of echo of much modern lyrical verse, which indicate that Mr. Strong has read and been very fond of the songs of the present generation of English poets, they have a stamp of their own. Their most prominent quality is their melodiousness, which is not only sweet, but has within its range considerable variety. The mere rhythmic cadence of many of them is delightful. Mr. Strong may, however, be said to sing as he goes for want of thought, and we find nothing of the sonnet nature in his volume so far as the elaborate polishing of an idea or a sentiment is concerned. He is very fond of out-of-doors and fairies and elves, and cobwebs glistening in the sun, "shadow and sunshine on the wall," "the green sea-waters in a glow," "the park with its satin sheen," and so on. The old romance is near his heart also, and one infers that he would be a good hand to turn 'The Three Spaniards,' say, into melodious verse. Not the least meritorious of the "midsummer dreams" are the *vers de société* at the end, several of which are not only smooth and musical but distinctly clever.

If every one who writes verses of the order to which the poems of Mrs. Beers and Mrs. Dorr belong should make a practice of collecting them, there would be a great many more pretty volumes which there is as little objection to as there is excuse for. Mrs. Beers is the author of the ballad "All Quiet Along the Potomac," and similar pieces of verse, more popular, perhaps, in the days when "Banty Tim" and its like were favorites than at present, and in their nature ephemeral, since they depend upon the reader's interest in the subject rather than upon the treatment. The "other poems" of the volume are collected from *Harper's Magazine* and *Weekly* and the *Ledger*, the preface says—the greater part from the last we surmise. "Friar Anselmo" is a gracefully-told incident of a monk's spiritual experience, conveying an excellent moral in an unobtrusive way. Its companions are various sonnets and short poems contributed to the magazines at various times, and having, many of them, a pensive tendency, not to say a deliberately pathetic intention. For such pieces as "Peradventure" (page 17) we predict popularity; it evinces just that refinement of feeling and literary facility which captivate the average household. Mrs. J. Luella Dowd also dwells much upon bereavement and such analogous matters as "Blighted Buds," "A Little Grave," "A Dirge," "In Grief," and so on, in her 'Wayside Leaves,' but we get few sensations from her exposition of them. On page 70 occurs a didactic poem entitled "Two Brothers," of which we give the opening stanza as an example of Mrs. Dowd's faculty:

> "There was a man who taught the creed,
> All orthodox was he;
> 'Jesus is Son of God,' he said,
> 'His death atones for me.'"

Of only slightly different quality are the poems of Mr. Ticknor, of whom Mr. Paul H. Hayne, in his introductory notice, says: "Technically speaking, his style is dynamic."

> "A summer Sunday morning,
> July the twenty-first,
> In eighteen hundred sixty-one,
> The storm of battle burst" (page 23);

and

> "Life's tapestry's woven so that it
> Shines just as you choose to look at it" (page 123),

may or may not illustrate what Mr. Hayne means. Mr. Ticknor was a minstrel of the Lost Cause, and of one of his ballads which celebrate it Mr. Hayne, doubtless knowing the excitability of his own people, exclaims: "Ah! how many thousands must still be living to whom this ballad, rounded and limpid as a tear, though simple almost to baldness in expression, must appeal with a pathos not to be resisted."

The anonymous author of "Fantasma," etc., is also of the warm South, as the abundant testimony of his verse witnesses. The best thing in his volume is a dozen lines on "Indian Summer," "written," says a note, "at a very early age; so early, indeed, as often to elicit *doubts* of so young a child's ability to think in rhyme, notwithstanding many well-known cases of more extreme precocity." "Fantasma" itself is an allegory in which figure a magician named Beauclerc, a victim, Lucia, her brother Florian, a poet who saves her from the magician's spell, his negro servant, Dan, very much attached to "po' Mas' Flo'," and a host of fairies, wizards, gnomes, witches, all of which the author casts into his caldron, and, after stewing them for a time to the music of his verse, lifts the cover and discovers a beautiful moral lesson about science, religion, etc. Two other long poems are equally exciting, but one's feeling is that the author should be forgiven if he will promise never to do so again.

The 'Cross' is a little volume of thirty-three short devotional poems, about which there is nothing bad at all; and though none of them probably will be incorporated in any hymnal there are many worse hymns in most collections.

'Midsummer Dreams. By Latham C. Strong' New York: G. P. Putnam's Sons. 1879.
'All Quiet Along the Potomac, and Other Poems. By Ethel Lynn Beers.' Philadelphia: Porter & Coates. 1879.
'Friar Anselmo, and Other Poems. By Julia C. R. Dorr.' New York: Chas. Scribner's Sons. 1879.

'Wayside Leaves. By J. Luella Dowd.' New York: G. P Putnam's Sons. 1879.
'The Poems of Frank O. Ticknor, M.D. Edited by K. M. R. With an Introductory Notice of the author by Paul H. Hayne.' Philadelphia: J. B. Lippincott & Co. 1879.
'Fantasma, and Other Poems.' Kansas City, Mo.: Ramsey, Millett & Hudson. 1879
'The Cross. By Charles F. Richardson.' Philadelphia: J. B. Lippincott & Co. 1879.

THE FIRST NUMBER OF THE AMERICAN SCIENCE SERIES:

ASTRONOMY. For High Schools and Colleges. By Simon Newcomb, LL.D., Supt. American Ephemeris and Nautical Almanac, and Edward S. Holden, M.A., Professor in the U. S. Naval Observatory. Large 12mo, $2 50. Specimen copies for examination with a view to introduction sent post-paid to teachers on receipt of $1 50.

HECTOR BERLIOZ: Selections from his Letters and Æsthetic, Humorous, and Satirical Writings. Translated by William F. Apthorp. 12mo (Amateur Series), $2.

THE MAGIC OF THE MIDDLE Ages. By Viktor Rydberg. Translated by A. H. Edgren. 12mo, $1 75.

*PRIMITIVE MANNERS and CUS-*toms. By J. A. Farrer. 12mo, $1 75.

*THE YOUNG FOLKS' CYCLOPÆ-*dia of Common Things. Large 12mo, illustrated, $3.

HENRY HOLT & CO., NEW YORK.

A Sweeping Reduction!

Any Sunday-school can now afford to supply its teachers with the *Sunday-School Times*, a sixteen-page weekly paper. Here are the new rates: From 1 to 4 copies, $2 each; from 5 to 9 copies, to one address, $1 50 each; from 10 to 19 copies, to one address, $1 25 each; 20 copies or more to one address, $1 each. No charge for postage. Proportionate rates for less than a year. Twenty teachers can be supplied for three months for $5. While the papers for a club must be sent in a package to one address, the publisher requires that each club subscription be accompanied with a list of the names and addresses of the persons who are to use the paper. The *Sunday-School Times* will be sent on trial to a *new* subscriber every week for three months for 25 cents. Specimen free. Send also for a free specimen of the *Scholars' Quarterly*, a forty-four-page scholars' lesson-help, containing colored map, etc. The *Quarterly* will be enlarged and greatly improved for 1880. Address JOHN D. WATTLES, Publisher, 725 Chestnut Street, Philadelphia, Pa.

$3 per annum. Single number, 30 cts.

PENN MONTHLY

For NOVEMBER, 1879,

Contains the following important articles:

HENRY CHARLES CAREY. With an excellent Phototype by Gutekunst. Robert Ellis Thompson.

THE ORGANIZATION AND MANAGEMENT OF STATE HOSPITALS FOR THE INSANE. G. Betton Massey, M.D.

THE PRESENT POSITION AND PROSPECTS OF POLITICAL ECONOMY. Prof. John K. Ingram.

LAFONTAINE AND HIS CRITICS.

AMERICAN NEWS CO., New York. } EDWARD STERN & CO., Publishers, Philadelphia.

THE RAINDROP.

A splendid Monthly Magazine of entertaining reading for young people. 32 pages, large, clear type. Language so plain, simple, and direct that even the youngest readily understand it. Especially adapted to deaf-mutes. A fine plate of the Manual Alphabet is on one of the covers. Intelligent and cultivated people will like it for their children. Teachers of Primary Classes, and Kindergarteners especially, may find it of great value as a reading exercise. Terms, $1 a year. Send 10 cents for a specimen. Address THE RAINDROP, Turtle Creek, Allegheny Co., Pa.

A VALUABLE CONTRIBUTION TO AMERICAN HISTORY:

Life of Benedict Arnold.

HIS PATRIOTISM AND HIS TREASON.

By Hon. Isaac N. Arnold. Crown 8vo, gilt top, price $2 50.

Manuscripts from the family of Arnold, in England and in Canada, and the Shippen manuscripts, have enabled the author to make new contributions to Revolutionary History of great interest. The unpublished manuscripts of General Schuyler, to which the author has had access, has thrown new light upon the expedition to Canada and the campaign against Burgoyne. The author does not, to any extent, excuse Arnold's treason, but aims to do full justice to him as a soldier and patriot. For Arnold, the traitor, he has no plea but "guilty"; for Arnold, the soldier and patriot, he asks a hearing and justice.

Sold by all booksellers, or mailed, post-paid, on receipt of price, by the publishers,

JANSEN, McCLURG & CO.,
117 and 119 State Street, Chicago.

SUBSCRIPTION AGENCY FOR
LA NOUVELLE REVUE,
REVUE DES DEUX MONDES,
European Periodicals.

Importer of Foreign Books, 146 Tremont Street, Boston.
Catalogues on application.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 13, 1879.

The Week.

THE election returns in this State are unusually slow in coming in. Even at this writing, a week after the election, the result as to most of the State officers is still in some doubt, and the official canvass will be required to determine absolutely who the successful candidates are. The Democrats, perfectly assured on the morning of the 5th of the election of their entire State ticket, save Governor Robinson, are naturally surprised and perplexed at the changes in their prospects worked by subsequent returns. Naturally, too, perhaps, they view with alarm the constant attention to business which the Republican State Committee still shows, notwithstanding the fact that the election is over. General Arthur has sent out a circular letter to prominent Republicans in every county of the State warning them to watch the supervisors' count closely, "and generally to look after the interests of the Republicans in the important work of the official canvass," whatever that may mean. It now appears probable that the Republicans have elected their whole ticket except Soule, the candidate for State Engineer. The latest revision of the figures, involving estimates of only a few scattered election districts, gives the following majorities: Hoskins for Lieutenant-Governor, 622—a very narrow margin which may yet be reversed; Carr for Secretary of State, 2,068; Wendell for Treasurer, 3,040; Wadsworth for Comptroller, 6,053; Ward for Attorney-General, 7,220; Seymour for State Engineer—the returns for which office are extremely backward—from 6,000 to 10,000 conceded by the Republicans. The result may therefore be set down as a substantial Republican victory with little to spare and nothing to boast of.

Any thorough analysis of the vote is rendered difficult by the various complications of the canvass. The effect of the young Scratchers' movement was undoubtedly considerable. The defeat of Mr. Soule is unquestionably due to it, though there is an inclination manifested in Machine circles to attribute this to the personal popularity of Soule's opponent, Mr. Seymour, and—now that his uncle has permanently retired from politics—to the "magnetism of his name." Its direct strength may be gathered by subtracting the vote of Soule, for whom none of the young Scratchers voted, from that of the next lowest on the ticket for whom they did vote—Hoskins, namely. Soule's majorities in the different counties foot up to 68,278, and Hoskins's to 71,683, so far as reported hitherto, which makes the number of votes cast by the professed Scratchers themselves something like 3,500. But their indirect strength amounts to much more than this, and their estimate of 20,000 votes lost to Cornell through their influence is probably not exaggerated. It is admitted that many Democrats voted for Cornell as the surest way of "smashing Tilden," and for Soule for obvious interested reasons, in the canal districts; so that it is evident that Cornell's actual minority of some 35,000, assisted as he was both directly and indirectly by Kelly and the Canal Ring, is due to vigorous scratching, which would undoubtedly have been less vigorous had it not been for the organized activity of the new movement.

The exact amount of this influence it is, of course, impossible to determine, but it is manifestly sufficient to encourage the Scratchers to preserve their organization, and is a significant warning to the Machine. The Kelly vote, which reached some 72,000, was a surprise to every one, and explains in a measure, it is charged, the heavy Republican gains in the Legislature. But though the Democrats are not precisely agreed as to whether this is due to the "infamous" Republican apportionment or to Kelly's trading, there can hardly have been enough of the latter to account for the great Republican gains in both houses and for the comparative smallness of Cornell's vote. We take it that few trading Republicans scratched Cornell even in favor of Kelly, and that the latter's thirty thousand votes outside of the city were cast by such foes of Tilden's household as did not vote for Cornell. Doubtless, also, many Republican farmers voted for Robinson and economic State government. That the Cornell-Kelly alliance amounted to something in this city, however, is sufficiently indicated by the success of the Tammany candidates for the important but generally overlooked positions of aldermen.

An open letter sent, since the election, by Mr. George Bliss to General Arthur considers a hitherto greatly neglected side of the Republican campaign, namely, reform within the Machine. Upon that subject Mr. Bliss has some rather sharp things to say, and though they savor of insubordination, and though it seems the height of presumption to offer engineering advice to so expert a Machinist as General Arthur, we are bound to say that if any one is qualified to do this it is Mr. Bliss. He appears in the light of a wronged and aggrieved follower of the Machine, and bases his complaint on true Machine grounds. Two Republican politicians of unsavory record—out of purely revengeful motives, it seems—"sold out" the Republican candidates for aldermen in one of the districts—evidently Mr. Bliss's own—in a particularly underhanded and nefarious way. Mr. Bliss rehearses their treachery at great length, but strangely omits to make the definite recommendation naturally to be expected, that these traitors be "disciplined" by expulsion from the Republican associations to which they now belong. He does not even suggest depriving one of them of the office he holds, "through the gift of the Republican party," as Mr. Bliss bitterly observes. He says he has "personally no complaint to make," and if General Arthur can stand it, and can afford to pass it by in silence, without himself "initiating affirmative action," he is sure he can. He adds significantly: "If you allow your tools thus to act unrebuked, should you not retract some of your denunciations of the 'Scratchers'"? This seems sound on its face, but we suggest that General Arthur is entirely competent to determine unassisted the proper kind of Scratchers to denounce. Mr. Bliss is evidently a little confused on this point, as he further betrays by the perplexing admission that he believes "in the right and duty of bolting," which is apparently equivalent to throwing up his case entirely.

Further news from Virginia indicates that the Repudiators, or Readjusters, as they call themselves, have elected a majority of the General Assembly, and though some of the backwoods districts will not be heard from for some time, the result can hardly be said to be still in doubt, as it is unlikely that the regular Conservatives will gain anything from later returns. The campaign was a very excited one, and the situation at present is considerably complicated. The people of the State appear now to be divided into two main parties by the McCulloch Bill, which the Repudiators desire repealed, and which is in reality, even as it stands, a compromise between the State and its creditors. The old Conservative party being thus at war with itself, and its different factions carrying their enmity into all questions, the Republicans will hold the balance of power on general political matters, and may possibly gain the seat of United States Senator Withers by trading the lucrative State offices for it. The Virginia election becomes at once, therefore, "of national importance." It is, however, of national importance in another sense, and must be a source of shame to all debt-paying communities of the country. The Repudiators seem to have been composed of the worst elements of the Conservative party and the negroes, led by General Mahone, who is a shrewd and active politician. The Richmond *Dispatch* says the property-holders voted largely in favor of the McCulloch bill, and that "if it had not been for the negro vote

there would have been scarcely a dozen Agitators elected." This may be exaggeration, but there is no doubt that the negroes voted solidly for repudiation. There is, however, an important general inference to be drawn from this which goes far to atone for the evident specific error of the negroes—the inference, namely, that they vote as they please and do not blindly follow any white Republican bellwether, on local questions at least. The white Republicans are all Debt-payers, and had no influence over the blacks, who, for some local reason of an intricate nature, conceived, we believe, that in voting for the McCulloch bill they would be voting against public schools. It is worth remembering, perhaps, that in Tennessee a month or two ago the virtual repudiation of the debt was not charged to the negroes and had not even as good an excuse as this.

The Philadelphia *Press* accuses us of "conspicuously garbling" the Illinois and Iowa Republican resolutions of 1878, to which we referred last week, because, after quoting what they proposed to do, by way of protection for all citizens, we said they proposed to do it by "the Federal Government." As the *Press* places the resolutions before its readers in full, we are forced to admit that it is probably stupidity and not dishonesty which has betrayed it into its behavior on this subject. The resolutions declare that "*the complete protection of all its citizens* [those of the 'Southern section of the Union'], *in all their civil, political, personal, and property rights*, is a duty to which the Republican party stands solemnly pledged"; and "in order to redeem these pledges it placed recent amendments in the Constitution of the United States." We need hardly say to most of our readers that neither the Constitution nor the amendments can afford any man any protection, complete or incomplete, for civil, or political, or personal, or property rights, except through Federal officers and tribunals. The Constitution gives a man no remedy in State courts for being defrauded at an election or for being assaulted or robbed. Anybody who says he is going to protect all the citizens' rights by means of "amendments to the United States Constitution" means that he will protect them through the Federal Government, if he knows of what he is talking. The *Press's* explanation that the Iowa Republicans meant that they were going to protect the people of the Southern States in *all* their rights by State authority, under "the inspiration of the principle laid down in the new Constitutional amendments," is too silly for discussion. Its impudent suggestion that our quotation from the New York *Tribune* of November 5 was not to be found in the paper of that date we perhaps ought not to notice; nevertheless, we shall repeat that it is to be found in its original purity and absurdity in the fourth column of the editorial page, in an article under the taking and appropriate title of "More Fun at the Fair."

We did, however, fall into an inaccuracy in our quotation last week, but it was one by which the Stalwarts benefited. The Iowa platform announces, in fact, not that the Republicans were going to protect "all citizens," as we incorrectly said, in all their rights, through the amendments to the Constitution; but they were going to protect all citizens "of the Southern section of this Union," which makes their position still more untenable, and reveals the idea which is always vaguely floating in the Stalwart mind, that "the Southern section" is conquered territory, and that the amendments were intended for it alone. The little invention of the *Press*, that they mean to use Constitutional Amendments only as a fountain of "inspiration," is very droll; but one does not argue over hermeneutics of this kind.

The English of Presidential proclamations is apt, like that of Queen's speeches, to be somewhat defective, and President Hayes's Thanksgiving proclamation has been justly criticised on this score. But the matter of it is so gratifying as well as surprising that the manner will attract but little attention. He announces as reason for thanksgiving that "the material prosperity enjoyed by *our whole country* has never before at this season been more manifold or more universal (*sic*), and that our hearts have been made glad by the *general prevalence of domestic tranquillity*, and the supremacy and security of the great institutions of civil and religious freedom." Now, it is not to be supposed for a moment that the President would make, in anything so solemn as an invitation to give thanks to Almighty God, statements which were exaggerated or incorrect, yet how are we to reconcile this account of the condition of the whole country with the stories told by his Secretary, Mr. Sherman, on the stump during the late canvass regarding the condition of the Southern half of it? One thing is certain—one or other of these gentlemen has been saying things which are highly offensive to God, and are well calculated to draw down a curse instead of continued favor.

The strangest events of the week have been the accidents to the steamers *Champion* and *Arizona*. The former ran into a sailing vessel on a clear night and sunk in five minutes, with the loss of thirty lives. The captain accounts for it, according to the newspapers, by saying that the sailing vessel ran into him, which is a pretty bold statement considering that it was his legal duty to keep out of the way of the sailing vessel. The case of the *Arizona* was more extraordinary but less tragic. She is one of the largest vessels afloat, and had three hundred passengers, including one of the owners, on board, and was making fifteen knots an hour in a smooth sea and a starlight night, when she hit an iceberg of the largest size, without a word of warning from any one aboard. Of all this there is no doubt, but the story that the boats could only be lowered after long delay, when it was feared the ship would go down, has perhaps another side to it. In both accidents there appears to have been either no lookout or no lookout that was of any value whatever, and in the latter no thermometrical observations. Both show how frightful the risks are which people run at sea through want of discipline and vigilance. The lookout men are sailors of a low grade, and looking out is an unpleasant duty, which they are no more likely to discharge faithfully without being watched by their officers than they would be in the army to advance under fire. It would appear, however, that they enjoyed on the *Arizona* at least abundant opportunity for shirking. She was saved by her water-tight compartments, and we believe, although the compartments are regularly advertised as a means of safety, she is the first damaged passenger steamer for which they have done anything whatever. It ought, by the way, to be possible nowadays to construct some kind of glass shelter on the bows for the lookout men, which would protect them from the weather and remove one great temptation to neglect of duty.

The feud between the Catholic clergy and the state on the subject of the public schools, which is raging in France and Belgium, has broken out in Massachusetts in a very malignant form. A certain Father Scully, at Cambridgeport, has begun to refuse the sacraments, as his Belgian brethren are doing, to parents who send their children to the public schools, or fail to send them to the parochial schools. An appeal of his parishioners to Archbishop Williams has been met with cordial approval of his course. The objections to the parochial schools are that the teaching is bad and a tuition fee has to be paid for it, but the priest puts against this the danger of eternal damnation. We do not know that it is to be regretted that the Catholic clergy are taking this bold stand. It is not to our minds nearly so objectionable as the practice of giving ecclesiastical toleration to things in one country for which the church in another consigns people to hell or purgatory, which in a teacher of such pretensions is very repulsive. It is in all ways desirable that the church should show itself everywhere and always under the same colors. Another priest in Massachusetts has been cast in heavy damages for keeping people, by threats of ecclesiastical censure, from employing a livery-stable keeper who had offended him. In Belgium the state schools are carrying the day, very few teach-

ers giving way under the threats of the clergy, and very few parents withdrawing their children. Nevertheless, the fight is one which the priests cannot be blamed for making.

Specie imports continue, and the total since the resumption of specie payments is now in round figures about $66,500,000, of which about $60,500,000 have arrived since the beginning of August. The larger part of the specie received has come out of the Bank of France, which lost about $30,000,000 between the beginning of September and the close of October; during the same time the Bank of England lost about $12,000,000 and the bank of Germany about $13,000,000. This heavy drain of specie from Europe to the United States, though natural enough in view of the short crops throughout Europe and our abundant supply of food products, has at last become so serious a matter that a movement has been made to check the flow of gold this way by advancing the rates for money at the European financial centres; the last to move was the Bank of England, which has put its discount rate up to 3 per cent. But foreign exchange still rules at figures which warrant gold imports, and there is little reason for doubting that fully $20,000,000 more foreign specie will arrive here between now and the first of January. So large have been the currency demands of the South and West on New York, and the demand for bank facilities to support the speculation at the Stock and other Exchanges, that even the enormous receipts of foreign specie have been insufficient to keep up the reserves of the New York banks, so that the loan market could not be easily manipulated by speculators. Accordingly money was locked up during the week, and rates for demand-loans early in the week advanced to as high as ⅝ of 1 per cent. per day in addition to 7 per cent. per annum. Relief, however, was given by reason of a purchase by the Treasury of $10,000,000 of United States bonds for the Sinking Fund. These bonds were 6s of 1881, and were bought at 106. The Secretary first invited proposals, and, as these were at too high a price, declined them all and gave notice that he would not pay more than 106, at which price the whole $10,000,000 were supplied. This purchase transferred $10,000,000 money from the Treasury to the banks, and made the money market easy at 6 to 7 per cent. Speculation in all departments continues wild, and the monetary stringency only temporarily repressed it. Silver advanced in London to 53⅝*d.* per oz. Here the bullion value of the 412½-grain silver dollar advanced to $0.9049.

What about the conference for the adoption of the universal bimetallic standard? When is it to be? What adhesions have come into it? Has Bismarck given anybody an account of his interview with Mr. W. D. Kelley? We have been in hopes Busch would have something about it, for, as Bismarck tells it, it is probably a good story.

There seems to be little doubt that the British Parliament will not meet before the usual date in February, and that it will probably not be dissolved before the close of the session in August. Things are by no means in a condition to enable the Ministry to face the country, and such signs as occur, like the result of the municipal elections, have of late been very unfavorable. Nevertheless the Premier seems to have been in his jauntiest mood at the Lord Mayor's dinner, and described all his undertakings as prospering. He dwelt with much emphasis on the partial revival of business, which is certainly likely to do something for him. The iron trade has sprung up remarkably under orders from this country, and many of the cotton-mills have begun to work on full time. Silver, too, is advancing, which is going to afford considerable relief to the Indian exchequer. Sir Stafford Northcote was able under these favoring influences to put on a bolder front about the finances than he has ventured on of late; but it is none the less true that he will be most savagely and destructively assailed on this point when Parliament meets.

The stern attitude towards Turkey assumed by the British ambassador seems to have been due to the appointment of Mahmoud Nedim Pasha, who is a mere tool of Russia, to the Grand-Vizirship, and the introduction into the Ministry of two other pashas who have been dismissed from provincial governorships for cruelty and rascality. Mahmoud Nedim has given the most solemn assurances, however, that his accession means no change in the foreign policy of the Porte. There is no agreement yet with the Greeks, and the Palace is at its wits' ends for money, as it is still living on small loans. The Sultan's personal expenditure is now estimated at $25,000,000 per annum, and the total revenue of the Empire does not exceed $70,000,000. There has probably been no more singular episode in modern history than the persistence of England in the outward show of belief in his turning out a reformer.

General Roberts has acted with great energy at Kabul, having hanged five men in the first week, some of them high personages, both civil and ecclesiastical, for complicity in the massacre of the embassy, and ordered all the inhabitants to surrender their arms on pain of death. The country around seems for the moment to be tolerably quiet; but the Amir has not only abdicated but is now accused of connivance at the revolt, and is himself a prisoner in close custody, which is hard on an ally who so lately signed the important Treaty of Gundamuck.

There is much dispute in France and Germany as to whether the treaty between Austria and Germany has been committed to writing. The Cologne *Gazette* asserts positively that it has, and attempts have been made to fortify this by stories of the enormous difficulty experienced by Bismarck in inducing the Emperor William to sign a treaty which seemed an offensive demonstration against his friend the Czar. Other papers, however, deny it just as stoutly, and affirm that there is nothing in writing but a protocol of the conversation between Prince Bismarck and Count Andrássy. The point is of no great consequence, however, as long as the agreement is admitted. On the Continent of Europe it excites interest not so much for its possible bearing on the fate of Turkey as for its possible bearing on the relations of France with Germany. While Lord Salisbury is filled with a childlike glee over it as a protection for him against the Czar, European politicians ask whether it is not meant by Bismarck as a defence for Germany against a Franco-Russian Alliance.

Lord Salisbury, in his Manchester speech, described the news of the Austro-German alliance as "glad tidings of great joy," and explained further that he looked on it as a guaranty against further Russian aggression against Turkey. These remarks naturally have given great offence at St. Petersburg, and the Russian press has commented on them with much severity for their unseemliness, when directed against a Power with which England is, outwardly at all events, on friendly terms. The way in which they have been received in Germany, however, is more important, and cannot be considered pleasant for the Marquis. The semi-official *Correspondance Politique*, of Vienna, contains a letter from Berlin correcting his statements. It says the understanding between Austria and Germany is not "the triumph of English policy; that its object is not to protect European interests, but the interests of Germany and Austria, which must hereafter be respected by everybody, and not simply by Russia or by the Slavs." This is a very severe snub, considering how jubilant Lord Salisbury's language was. It gave the Marquis of Hartington, in his speech of a few days later in the same place, the materials for the rather telling retort that if the alliance is such an important event and so complete a guaranty for the peace of the East, it only confirms what the Liberals have always said—that Germany and Austria were just as much interested as England, and even more interested than England, in checking Russian ambition, and were much better able to do it, and that there was, therefore, no occasion for Lord Beaconsfield's warlike attitude in 1877, or for his threats to fight Russia with 20,000 men.

NATIONAL SIGNIFICANCE OF THE NEW YORK ELECTION.

THE Republican papers have generally admitted, with a frankness which is very encouraging, that the late election in New York was from their point of view grossly mismanaged. They admit—with the exception of the *Tribune*, which as an Organ cannot admit anything—that it was not wise to pick out an exceptionally obnoxious person as a candidate for Governor and a convicted canal peculator as a candidate for State Engineer, and force them on the party, not even modestly or deprecatingly, but with insolence, jeers, and abuse. They acknowledge that scratching is not "voting in the air," and that managers need something more than "age and experience" to qualify them to make up tickets for a party which contains a fair proportion of the intelligence and morality of the community. Nothing, in fact, could well be more humiliating, from the manager's point of view, than the result. If it had not been for the Democratic bolt the Republican candidate would have been defeated by a majority of between 30,000 and 40,000; and he ran behind his ticket in nearly every district in the State. Mr. Soule, his companion in misfortune, ran so much behind his ticket, in spite of complete proof of his innocence furnished by the Organ immediately before the election, that even the Democratic bolt could not save him.

The rest of the State ticket, if saved, has been saved, after an unfortunately long count in the Republican districts, by majorities of a few hundreds. If the Republicans had entered into the struggle on State questions this would have perhaps been sufficient for their purpose, as it would give them possession of the State offices; but they entered upon it avowedly on national issues, for the exclusive purpose of producing a moral influence which would affect the Presidential election next year. They wanted a majority which would show beyond doubt that the State might next year be counted on for the Republican candidate for the Presidency. They have, however, obtained no such result. In so far as they have shed any light whatever on the condition of State politics, they have made it appear that the Democrats have only to re-establish "harmony" in order to carry the State for anybody but Tilden. Far from discouraging the Brigadiers, they have encouraged them. Far from inspiring confidence in the sagacity and foresight of the party management, as at present constituted, they have spread fatal distrust of it. In saying all this we are not using language nearly as strong as has appeared in some of the most faithful party newspapers. The original offence of the State politicians, too, has been aggravated, and its consequences made to flow over the State borders, by the unfortunate appearance of the Administration on the scene in the persons of Mr. Evarts and Mr. Sherman to defend and apologize for the local tricksters, and persuade the honest voters of the State that they would be foolish not to make Governor of New York a man who was declared by themselves incapable of filling a subordinate custom-house office, and not to make State Engineer a man convicted of canal frauds.

There is, however, another way of looking at the matter than the manager's way, and this undoubtedly makes everything, except the share of the Administration in the affair, both hopeful and encouraging. The Conkling mode of party management—or, as it is now called, "Conklingism"—is ten years old. It began with Mr. Conkling's success, about 1869, in securing General Grant's confidence and obtaining from him, as soon as he began to throw civil-service reform overboard, the full control of the Government patronage in this State. A machine of unusual vigor and efficiency was then rapidly built up, of which Mr. Conkling had complete command, at the cost—to use the New York *Tribune's* language—of "consistently aiding the least decent and praiseworthy element" in the party, and "covering up its rottenness." In this sort of work he has been trained from his boyhood. For politics in the larger and better sense of the term—that is, for the study and solution of questions of legislation or administration—he has never shown any taste or capacity. He, as a general rule, has always avoided such topics in Congress, and has evaded them continuously and successfully on the stump at home. His speeches in the local canvasses ever since he became prominent in public life have consisted almost exclusively of denunciation of the Democrats, and of appeals to the passions and prejudices left behind by the war. The circumstances of the time made this policy successful. As long as General Grant was in power it was eminently successful. But Mr. Conkling would have been more or less than human if prolonged command of a party majority through machinery on which public opinion acted feebly, if at all, and which worked in absolute separation from the social and economic problems of the day, did not breed in him arrogance and contempt for all forms of dissent or criticism. It would have done so even in a modest man, who had no taste for intrigue and no love of power. The change it was working in him was visible when he made Murphy collector of this port, and it has grown steadily ever since. One did not need much experience of either human nature or politics to foresee that it must culminate in some such outburst of insolence as the Saratoga nomination. No man of the Conkling type, even in its higher grades, has ever run very long a course of unbridled indulgence of personal ambition, caprice, and prejudice, surrounded by petty flatterers, without losing his head and doing something too outrageous for endurance. The ease with which he stepped into the Senatorship last year, after his quarrel with the Administration, was probably what led him to fancy that he need put no further check on himself, and might even put his horse in the State governorship without giving any better reason for it than that the state of things in Louisiana and Mississippi was not satisfactory to him.

The friends of good government have much reason to be thankful that he took his boldest step this year, and thus prepared them for the Presidential convention. Had he been modest and forbearing at Saratoga, and even feigned acquiescence in the more liberal tendencies of the party, he might easily have carried off the honor of the majority which a better ticket would probably have secured, and used it to aid in the nomination of somebody for the Presidency who would give him back the place in the Government he occupied from 1869 to 1876. As matters stand, he has roused an opposition which has revealed the fact that he does not control the State, and that it probably cannot be counted on for his favorite candidate, and that the power of the "Solid South" as a bugbear has probably been exhausted, or greatly diminished. He has, too, placed New York distinctly in the list of doubtful States—a fact which will probably have a most important bearing on the action of the Presidential conventions of both parties. What makes it doubtful is not that the main body of each party cannot be counted on to vote almost any ticket that will be presented to it, but that there exists a body of voters, large enough to turn the scale, who are not satisfied with the ordinary party considerations in the selection of candidates, and who demand of parties some sort of effort, be it never so small, to put the politics of the country on a higher level in their nominations and platforms. Next year, owing to the great weight of New York in the Presidential scale, if the Independents keep alive their organization and activity, each party will be warned by Conkling's fate into doing something to conciliate the body which can probably give it the victory. In other words, each party, instead of producing what ordinary men consider its most worthless and objectionable materials, will probably produce its best.

But no matter what efforts may be made by fragments of the party, no radical and permanent improvement, no real reform, can be looked for within the Republican party until the Southern question is relegated to its true position. It is now essentially a question of foreign politics. It relates to the moral and social condition of a community for which we legislate in only a small degree, which we cannot be said to administer at all, and which it is not in human power to improve suddenly by any law-making. To make it the one subject of our political thought, the great issue at all our elections; to cultivate a heated and even furious and credulous state of mind about it, and make a boast of implacability towards Southern men,

as the Republican regulars now do, is to foster one of the most odious and calamitous of human weaknesses. The Stalwart is inflamed against people whose burdens he does not propose to share, whose good qualities he has little opportunity of witnessing, whose prejudices and antipathies seem ridiculous because they are not his own, from whom he is widely separated by tradition and social, if not political, history, and whom in most cases he carefully avoids visiting. No healthy or rational politics is possible to any party which is greatly ravaged by this disease. No party in this or any other country can long produce great men or great measures that makes its chief motive a frantic preoccupation with the concerns of a community with which it has no sympathy. To bring the Southern question, therefore, into its proper position in Northern politics, and to establish a due proportion between the attention we give it and the action we can take with regard to it, is now the first work of reformers. It is almost as necessary to the right discharge by the Republican party of its duty to the whole country as silence is to rational discussion at a public meeting.

THE PACIFIC RAILROADS AND THE GOVERNMENT.

IN the *Nation*, No. 747, we referred to the decision of the Supreme Court affirming the constitutionality of the so-called Thurman Act, which requires the Union and Central Pacific Railroad Companies to provide a sinking fund for the payment of their subsidy debts to the Government. In our next succeeding number we published a letter of considerable length from Mr. C. P. Huntington, Vice-President of the Central Pacific Railroad Company, criticising with considerable severity both the act and the decision, and holding up the companies in the light of victims of the nation's injustice. We have since received the full text of the decision and of the dissenting opinions of Justices Strong, Bradley, and Field. The principles involved in the case, and the magnitude of the interests affected by it, warrant a more extended notice than they have yet received at our hands, and more impartial treatment than Mr. Huntington has accorded to them.

The Court at the outset lay down certain fundamental principles which we are glad to see again affirmed by the tribunal of highest authority. They say that the United States cannot, any more than a State, interfere with private rights, except for legitimate governmental purposes; that the United States are as much bound by their contracts as individuals; and that they cannot be permitted to violate them, or to legislate back to themselves rights which they have once granted for a valuable consideration. They say further that, although the right to alter, amend, or repeal the charters of these companies was reserved in the acts of incorporation (to which the companies themselves assented in writing), this right cannot be exercised to take away property already acquired under the operation of the charter, or to deprive the corporation of the fruits, actually reduced to possession, of contracts lawfully made. Yet "this reserved power may be exercised, and to almost any extent, to carry into effect the original purposes of the grant, or to secure the due administration of its affairs, so as to protect the rights of stockholders and of creditors, and for the proper distribution of its assets." The words quoted are from a former decision of the Court (Miller *vs.* the State, 15 Wallace, 498). Consequently—and here lies the gravamen of the present decision—whatever rules Congress might have prescribed in the original charter for the government of the corporation in the administration of its affairs, it retained the power to establish by amendment.

Is the requirement of the Thurman Act that a sinking fund be created for the extinction of the subsidy debt a regulation to carry into effect one of the original purposes of the charter? It was distinctly provided in the charter that this debt should be paid. All the grants, of every kind and description, hinged upon that. The Court hold that the Act of Congress in question was clearly within the rule laid down in Miller *vs.* the State, already cited, and that, so long as payment of the subsidy debt before its maturity was not required, but only the setting apart of funds to secure payment at maturity, Congress was the rightful judge of the means by which that end should be attained. If the State may lawfully require an insurance company, after its incorporation, to set apart funds to meet its losses by fire, instead of dividing all its premium receipts among its shareholders, so may Congress, under its reserved power, in this case make a similar requirement. They say further:

"The property of a corporation constitutes a fund from which its debts are to be paid, and if the officers improperly attempt to divert this fund from its legitimate uses, justice requires that they should in some way be restrained. A court of equity would do this if called upon in an appropriate manner, and it needs no argument to show that a legislative regulation which requires no more of a corporation than a court would compel it to do without legislation, is not unreasonable. . . . A legislative regulation which does no more than require them [the stockholders] to submit to their just contribution towards the payment of a bonded debt, cannot in any sense be said to deprive them of their property without due process of law."

The case of the Central Pacific Company is somewhat different from that of the Union Pacific, in that the former is a State and the latter a national corporation. But inasmuch as that company derived no powers from the State to build a road beyond the limits of California, and since it voluntarily submitted itself to the Pacific Railroad Acts of Congress by filing its acceptance of the same and receiving the lands and bonds of the United States, it must be held subject to the same requirements as the Union Pacific. That no substantial injustice results from this construction may be inferred from an examination of the fundamental law of California at the time the Central Pacific Company received its charter. By the constitution of the State no railroad company could borrow money to an amount exceeding its own capital stock, and for all money borrowed it was required to provide a sinking fund. The capital stock of the Central Pacific Company was only eight and a half millions of dollars. It borrowed money to the amount of more than six times its capital stock, and the power to do so must have been derived from Congress, which extended to it all the rights, privileges, and franchises given to the Union Pacific except the mere right to be a corporation.

Of the three dissenting opinions filed that of Justice Field is much the ablest. He addresses himself mainly to the case of the Central Pacific Company and its status as a State corporation. The opinion of the majority of the Court, according to Justice Field, goes to the length of holding that "the United States have only to make a contract with a State corporation, and a loan to it, to oust the jurisdiction of the State and place the corporation under their direction." He discusses also, at less length but with more clearness than Justices Bradley and Strong, the general principles underlying contracts between the Government and its citizens, but he fails, we think, to meet or explain away the doctrine laid down in Miller *vs.* the State. Justice Bradley attempts to do so by holding that the contract with the Pacific Railroad Companies is an executed and not a running contract, but he passes too easily over the fact that it was a part of the contract that the subsidy debt should be paid—a part which certainly remains as yet unexecuted. Justice Bradley's opinion is extremely acrimonious. The Thurman Act, in his view, "sets the example of repudiation of Government obligations. It strikes a blow at the public credit. It asserts the principle that might makes right. It saps the foundations of public morality." Such language from a judge who joined in reversing the legal-tender decision, and in laying down the doctrine that Congress may legislate backward indefinitely upon contracts between private citizens, is not calculated to promote harmony between the legislative and judicial branches of the Government, or to make an agreeable impression on the public mind. The main point in Justice Strong's opinion is, that the contracts between the Government and the Pacific Railroad Companies were not made by the acts of Congress of 1862 and 1864, but were subsequent to and independent of those acts; because, he says, the companies might have refused all Government aid and have built the roads with their own means exclusively. The contracts were made when

the subsidy bonds were issued and accepted, at various times after the passage of the acts, and hence are to be interpreted as contracts at common law. This appears to us the last extremity of hair-splitting.

Not much needs to be said in reply to Mr. Huntington. If the Pacific Railroad Companies have been anxious, as he alleges, to make adequate provision for payment of their debts to the Government, and have been making fair and just proposals to that end for several years back, the public have been singularly ill-informed. The only proposals which have been much discussed were proposals to extend the loan and allow it to pay itself, to a large extent, by the operation of compound interest running in favor of the companies against simple interest running in favor of the Government. It is an open question whether the companies, by their haste in pushing forward an inadmissible plan of settlement, did not stir up Congress to take action upon a subject which might otherwise have slumbered many years or indefinitely. "It is a matter of small moment," says Mr. Huntington, "whether the United States Government gets this subsidy repaid a few years sooner or later." As a matter of dollars and cents it is indeed of little consequence, but in all other respects it is of great moment whether the Government collects its dues from solvent debtors at maturity or not. A Government which does not allow a passenger's trunk to leave the dock till its claims for duties are paid, or a barrel of whiskey or a box of matches to depart from warehouse till the taxes are settled; which does not lose a moment in bringing suit on a defaulting beef-contractor's bond; which, in short, has no discretion but to pursue its property and its remedies with remorseless vigilance as against the poor and the rich alike, cannot forego or postpone its claims upon these great companies for any reason but inability to collect them.

THE THEATRES.

THE interiors of the theatres furnish a gratifying indication that their managers have regained that confidence in the commercial future of the country which, as economists know, is one of the essential conditions of progress in the dramatic art. The very close connection in New York between the prices of "active" securities and the success of the theatrical season has often been noticed, and the managers this year seem to have been gifted with a prophetic vision of the returning prosperity which has already had such a marked effect in Wall Street; for they have spent the summer in redecorating and refurnishing, in anticipation of a season of just the sort that the coming winter is now certain to be—a winter marked not by the painful if healthy process of "liquidation," but by a largely-increased expenditure on all forms of luxury and amusement. At Wallack's and Booth's no pains have been spared to make the interiors as gay and attractive as possible, and both have been quite transformed by the alterations; while Daly's, formerly the Broadway, is really a new theatre, the pretty arrangement of which helps to obliterate from the mind the painful memory of the collection of stuffed birds and beasts of an earlier period. Mr. Daly is, above all other things, an enterprising manager; and if he has often failed in hitting the taste of the public, he has also often succeeded. His first venture this winter, "Newport," was certainly not successful, but he has now hit upon a new dramatic vein which might, we should think, be worked to great profit. "Wives" does not profess to be anything more than an adaptation from Molière. It has rather a confusing effect at first to see on a New York stage a number of Molière's best-known characters and types, acting in English, and decidedly modern English at that. The old guardian with the young ward whom he has brought up in ignorance of the world and its ways to be his wife, and who knows quite enough of them to make an egregious fool of her preceptor, and to select her husband for herself; the delightfully unscrupulous valet who manages his master's love-affairs for him; the gallant but not over-brilliant lover whose brains have to be supplied by the valet—all these are types of French comedy of the seventeenth century, and it required a good deal of boldness to attempt their reproduction in English at the present day. But the result proves their remarkable vitality and inherent truth to nature; for "Wives" certainly makes a very amusing comedy. It is very broad comedy, as all the comedy, whether English or French, of two centuries ago necessarily seems now to us. It even becomes farcical at times, and from the point of view of the purist much might be said in criticism of the very clever actress who plays "*Agnes*—with a song." But we confess having laughed too heartily at "Wives" and at Miss Lewis's *Agnes* to be critical about them. We trust that this new kind of French adaptation may be persisted in; for though it may tend to vulgarize Molière it will give us plays quite as amusing and more wholesome than modern French dramatic literature is likely to afford.

At the Union Square "French Flats" (*Les locataires de M. Blondeau*) is having a run. This is essentially a farce, not less so, except that it is longer and has more plot, than "Slasher and Crasher" or "Poor Pillicoddy." It is a French farce, however, and therefore more amusing than English farces are apt to be. "French Flats" is the story of a retired *bourgeois* who determines to spend the latter part of his life in peace and quiet with his young and pretty wife in a house of his own—or rather a "flat" of his own, for he means to derive a rent from that part of the house which his family does not occupy. He has every prospect of peace and happiness before him; he has engaged his daughter to an old bachelor whom he considers a good match; the house pleases him, the other flats are well rented, and everything promises repose and happiness. Unfortunately, the hair-dresser who has one of them turns out to be a man who knows the fatal secret of *M. Blondeau's* career—that he too has once been a barber; the tenor who inhabits another has been the successful rival of *M. Blondeau* in the affections of a lady, has in retaliation been hissed by *M. Blondeau*, and has vowed a deadly vengeance if they ever meet; the young and poetical clerk of another of *M. Blondeau's* lodgers, a lawyer, is madly in love with *M. Blondeau's* daughter, and she returns his passion. This merely gives a faint hint of the complications which ensue. All the acting in "French Flats" is very good. It seems rather a degradation to give such a good comedian as Mr. Parselle a part like that of *M. Blondeau*, but it would be difficult to imagine it better done. Mr. Stoddart, as *M. Bonay*, is an excellent attorney—and it does not make much difference in an adaptation of this kind whether an attorney was precisely the kind of lawyer the French author had in mind or not; Mr. Lemoyne, who in farcical parts has an abundance of *vis comica*, makes the elderly but apparently unreclaimed bachelor, the intended son-in-law of *M. Blondeau*, very funny; while Mr. Polk's *Riffardini* is a masterpiece of burlesque acting. It is also something better than mere burlesque, for there is a distinct conception of the character burlesqued behind it. Mr. H. Courtaine as the *Marquis de Barrameda*, and Mr. Walden Ramsay as *Billardo*, the poetical and unscrupulous clerk, are both good enough to make the success of an ordinary play. The great secret of the remarkable success of the Union Square has lain in the thorough training of the actors, and an excellent illustration of this occurs in the course of "French Flats." One of the minor characters is *Pluchard*, an old clerk of Bonay's, who is discovered in one of the scenes seated on a high stool writing at his desk. He is stone deaf, and his whole part consists in getting down from his stool, when his cue is given, putting on his hat and coat, and leaving the room. This little piece of acting was done by Mr. T. E. Morris in such a way as to show that he had really considered how a deaf old clerk would be likely to get down from his stool and leave a room. It is an indication, too, of the profitableness of careful acting that this minute bit of "business" brings down the house.

At Wallack's, "Contempt of Court," after a fairly successful run, has been replaced by Byron's "Our Girls." The first play was immediately on its production denounced by the press as "immoral," and certainly it is not the sort of play to instil a love of virtue into the minds of the young. But it belongs to a class of plays which we supposed had, like opéra bouffe, established their right to a place on the English stage. The central idea on which this sort of drama turns is that a public masked ball is an entertainment to which married men of established social position, slightly disguised by means of false noses, occasionally resort for the purpose of "making a night of it," and that their wives are apt to follow them in dominoes; wives and husbands once there, there is, of course, every opportunity for complications which a playwright could desire. Such a situation may be made as immoral as you please, but in "Contempt of Court" it is not so much made bad as made amusing. As a play it can hardly be said to deserve serious attention. It is, like its congener, "Forbidden Fruit," simply a succession of absurd situations. The acting of Mr. Beckett as *Clicquot* did much to make a success of the play.

"Our Girls" is the first modern English comedy with a serious purpose which has been produced this autumn, and as such is entitled to more consideration than such trifles as "Contempt of Court." Mr. Byron is one of a very small but deserving body of men who are doing what they

can to elevate the English drama from the slough into which it has sunk, by writing real modern comedies. "Our Boys" was so successful a comedy that it may fairly be said to create a presumption in favor of "Our Girls." The play is very well put on the stage. The acting of Mr. Beckett as *Plantagenet G. Potter*, of Mr. Edwards as *Mr. Clench*, of Madame Ponisi as *Mrs. Clench*, was all that could be desired; indeed, Mr. Beckett shows in his part talent of a very uncommon order. Miss Rose Wood and Miss Stella Boniface acted the parts of the two girls fairly well, and Mr. Barrymore came off very creditably as the sculptor. On the whole it is safe to say that if "Our Girls" does not run very long at Wallack's, it will be due to the play, not the acting. The plot is of the simplest. *Mr.* and *Mrs. Clench* are an elderly couple who have both been married before and have each a child, for whom, of course, they respectively desire all the happiness in life. *Mrs. Clench* brings up her child on the romantic theory of life, that real happiness is to be found not in money, or in what money can give, but in true love and affection. *Mr. Clench's* theories of life are quite different. He has struggled with adversity and learned the value of money, and knows that without money life is a dreary treadmill. He accordingly determines that his daughter shall make a rich match. The first defect in the play which reveals itself is in the part of *Mr. Clench*, whose sordid views do not comport at all with his real character, which is, as almost at once appears, entirely unselfish. That a fond father with a good heart should marry his daughter to a hopelessly vulgar and selfish brute like *Potter* is absolutely out of the question. But, however that may be, *Potter* does marry *Mabel Clench*, and takes her off to help him spend his money, while *Clara Merton*, the daughter of *Mrs. Clench*, marries the young and poor sculptor, *Tony Judson*.

The first act ends with the ratification of the two engagements by the parents, and is very good. The machinery is a little old-fashioned, perhaps, the characters representing the good and bad tendencies of the plot being matched in evenly-balanced pairs, but the idea is very well carried out and the interest well sustained to the end. Of the second and third acts, however, this cannot be said. As somebody once very justly observed of another dramatist, if Mr. Byron could write a play, it would be a very good play. The difficulty with him as a dramatist is that he is clearly unaware that a play without action is a contradiction in terms. His theory seems to be that a play ought to be all dialogue, the action taking place between the acts or behind the scenes. Undoubtedly Mr. Byron understands dialogue very well. If he did not, it would be impossible to act "Our Girls" at all. The second act is almost all dialogue. *Potter* has married *Mabel*, and *Tony* has married *Clara*, and *Potter* and *Mr. Clench* have been speculating unluckily (behind the scenes), and *Old Jonas Somerville*, the uncle, whose heir *Tony* considers himself to be, has been marrying again (between the acts), and *Tony* and his wife are going to give an afternoon tea-party, which never comes off, and there is a long series of family altercations, disputes, threatenings, insults, which come to nothing except a grotesque climax, in which the ruined *Potter* discovers that his rich uncle has married again, and sinks in a heap into a chair. In the third act we have the whole family reduced to great destitution, all living together, *Potter* having disappeared from the scene, as has also *Lord Aspland*, who was a firm friend of *Tony's*, but who, in a fit of absence of mind, has gone to the centre of Africa to shoot buffaloes. Meantime *Potter's* wife, who, during the period of his prosperity was an unhappy woman, has become in his absence devotedly attached to him. *Mr. Clench* has turned out to be a man of the greatest delicacy of feeling and generosity of character, sitting up the greater part of the night to work, so as to get together a little sum of money for his son-in-law's rent. At this stage of the play it is difficult to imagine how Mr. Byron's good-nature will induce him to end it. The way which he selects is most extraordinary. He introduces *Potter*, sunk to the last stage of poverty and degradation (the work of ruin has been accomplished behind the scenes)—neither more nor less than a tramp, thoroughly repulsive in appearance, and evidently a hopeless wreck as to character and habits, and effects a reconciliation between this brute in the form of a man and his wife. Then of course *Lord Aspland* returns from the centre of Africa, the news is brought from behind the scenes that *Jonas Somerville's* wife is dead, and all ends happily. There is no well-defined and sustained character in the play except *Potter*, who, whether as a prosperous "cad" or a maudlin tramp offering himself as a model for Diogenes, is true and thoroughly good. As a whole, the play has no coherence or meaning, and can hardly be expected to have a long run.

SOUTHERN REGENERATION AND THE ENGLISH LAND QUESTION.

Kansas City, Mo., November 5, 1879.

AMONG the many rising towns of this country it is tolerably safe to say that there is not one which just at present affords so much food for reflection to an observant tarrier as Kansas City. Situated on the extreme western border of Missouri, at the junction of the river of that name with the "Kaw," as the inhabitants pronounce the Kansas—built upon a high bluff, scarred and seamed with deep ravines which seem designed to make civilized streets impossible—a sudden outgrowth in the very hot-bed of the old border-ruffian stamping-ground—Kansas City is interesting from many points of view. Two only of these, however, do I now wish to refer to, but these deserve attention. Kansas City is a species of meeting-point at which the active, commercial enterprise of the North has come in contact with, and is struggling for ascendency over, the traditional Southern element. But, while the representatives of the two opposing social systems which have divided this continent are thus quietly, and indeed unconsciously, measuring strength, they unite their efforts in actively developing certain interests which seem likely to produce results for others scarcely less momentous than those brought about for themselves through the slaveholders' rebellion. There is a cloud, ominous for some one, gathering over the Plains west of this city; and here, more completely, perhaps, than anywhere else, one realizes the character of the danger which is threatening the landed interests of Great Britain. It seems strange that it should be so—and the fact affords proof striking enough of the always growing solidarity of modern interests—but apparently the English question of land-tenures is being most rapidly solved, or rather forced on to a solution, by the course of events west of the Missouri.

As respects the first of the two matters which have been referred to—the struggle between the two social systems which have here met—it is curious to see the extent to which an original leaven makes itself felt. Before the war Kansas City did not exist. It was simply Westport-Landing—a forbidding spot on the southern bank of the Missouri, consisting of a few warehouses, planters' dwellings, and negro shanties, scattered loosely along the river levee, with a tavern for its most prominent feature. A mere steamboat stopping-place, it was no more important than a dozen others up or down the stream, and immeasurably less important than several. Insignificant as it was, too, the place shone but with a borrowed light. Here persons and merchandise were landed to toil, or be painfully hauled, up through the steep ravines to the summit of the bluff before striking the old Santa Fé trail, which began six miles farther on at Westport. All this is changed. Westport, then a thriving town, and more lately the head-centre of much that was worst in the last days of slavery, is now a picture of desolation. Its business is gone; its warehouses are closed; its inhabitants have departed or are idle. Meanwhile the volume of exchanges effected at Kansas City is simply marvellous. Unmistakable signs of business activity are everywhere seen. Whole streets are being built up at once, as in Chicago or Boston after the great fires. All this is Northern. Underlying it, however, and everywhere cropping out on the surface, is Missouri unthrift. Of private enterprise there is abundance; nowhere are there any indications of public spirit. The streets are unpaved and inexpressibly filthy; they are cut up by railway tracks, upon which are run the dirtiest of street-cars in the utmost disregard of public convenience; they swarm with hogs, and the sidewalks are suggestive of the gravest peril to limb, if not to life. There are few public buildings; no public squares; no attempts at beautifying. The citizens seem to be absolutely devoid of pride, except in regard to the business their city does. All this is obviously due to the presence of the old Southern element; and yet its results will be apparent just so long as the place exists. They cannot hereafter be eradicated. In every respect, except commercially, the city is starting on a wrong plan; and what is now being done cannot presently be undone.

Yet here, if anywhere at the South, it might have been supposed that at the close of the war outside industry and enterprise could have flowed in and found an unoccupied field open and free for its own development. It was nothing of the kind. The outside enterprise did come in, and has worked wonders; but none the less, socially and traditionally, the place remained what its surrounding population was. Such it is to-day. A little leaven has leavened the whole loaf. From its negroes, its mules, and its hogs to its streets, its market-place, and its public buildings, the city is a Southern city; and a Southern city it will for years continue to be. All this is very suggestive in connection with the Southern problem,

now awaiting solution; for here certainly the conditions existed in their simplest form, and yet what an overwhelming preponderance of sheer force was necessary to regeneration is even yet apparent to the most careless observer. This, too, in a perfectly peaceful struggle, into which the negro element entered in a comparatively small degree. If such a preponderance has proved necessary in the case of Kansas City, leaving little to spare, what will suffice in that of the entire South ?—and where will it be found ? The complete absence of any approach to violence and coercion has made possible what has been accomplished here. Looking at the results, however, the prospect elsewhere is not encouraging. That, further South, the soldier and the sheriff could do anything more than make bad worse, I do not believe any sane man not a politician would ever suggest. But, measured by Kansas City results, the length of time which must be required for the gradual influx of the well-nigh incalculable mass of outside influences necessary to even a partial regeneration of the slave-holding States as a whole, is well calculated to tax faith as well as patience.

Turning now from this struggle for social ascendency, the material movement going on beneath it all will be found, while not less interesting, far more pregnant with future consequences. Indeed, as I have already said, it bids fair to result in something very like a revolution, the principal sufferer from which will be what is known as the foreign landed interest. I see it stated in the papers, how correctly I do not know, that the Duke of Beaufort was so impressed during a recent visit to this country with its grain-producing capacity, and the crushing nature of its competition with the English farmer, that he has advised the latter to give up the struggle and to devote himself wholly to raising cattle and sheep. If the Duke of Beaufort is indeed giving the English farmer any advice of this nature, the latter would do well, perhaps, before following it to bear in mind the ancient adage as to the relative discomforts of the frying-pan and the fire.

For several years I have had occasion to watch pretty closely the progress of cattle-raising on the Western Plains, and it now seems to me to be rapidly approaching what must prove to be a culminating point. Beyond the Missouri River, stretching to the Rocky Mountains on the west and from the Dominion to Texas on the north and south, is a vast region over which, until within the last few years, grazed almost countless herds of buffaloes. This region has at length been penetrated in almost every direction by railroads, and the buffalo has practically disappeared. Herds are no longer met with, and the few survivors from them have to be sought for to be hunted down. The original occupants of the region having thus been exterminated, domestic cattle have gradually taken their place. These have been brought up in vast droves from Texas, and the breed then improved by the importation of blooded stock from the East. The grasses natural to the eastern slope of the Rocky Mountain range, though very nutritious, afford but little pasturage, so that each head of stock requires a large space to graze over. The increase of the herds has, however, been very rapid, and now the country is full of cattle. The buffalo are gone and their place is occupied.

How is this change destined to affect the price of animal food? Hitherto its influence has been but little felt, owing to facts which at Kansas City become quite apparent. During the last ten years scarcely any business in the country has, it is safe to say, made such regular and enormous returns to those engaged in it as the cattle-raising of the Plains. The herds had an ample, unoccupied region for pasturage ; they increased as fast as the cows could bring forth calves ; they required no care in summer, and, without shelter or attendance, lived on the dried herd's-grass in winter. No rent had to be paid for land which no one owned, and no outlay in barns and expensive out-houses or tools was called for. All the ranch-owner needed in the conduct of his business was a shanty and a few horses upon which to mount his herders; and his possessions increased of themselves. Each year he selected from his flock the mature cattle to be forwarded to the markets at Chicago, Kansas City, or St. Louis; and if the prices there obtained were satisfactory to him, or he required ready money, he sold ; otherwise he discontinued his shipments, held his cattle on the Plains, and allowed their number to increase. There was room for all, and none were old. The profits on the business under these conditions, and so long as they continued, were simply enormous. They were estimated at fifty, seventy-five, and even one hundred per cent. per annum. The market never was glutted.

These conditions, however, cannot always continue. The country must at last become filled with cattle, through their natural increase, to the full limit of its capacity to pasture them. Once that point is reached any further increase must annually be disposed of at some price, or they must die for want of food. If the market will not absorb this supply at the present prices, the price must fall until additional demand shall be created which will absorb it. In any event, the increase can no longer be held on the Plains. As soon as this limit of subsistence is reached, therefore, a crisis in the cattle market is inevitable. The too prosperous ranchmen must lose their control over it. They have got to forward their stock whether they like the price they are getting for it or not. This changed condition of affairs has got to come. The only questions are, How soon will it come ?—and, when it does come, what is going to happen ?

Though inevitable in the not remote future, it would be premature, perhaps, to assert that this change of conditions is now at hand. The overflow of stock is being forced up into the valleys and parks among the mountains, and is finding yet unoccupied pastures in the extreme northern sections of the country. From Wyoming to Texas, however, the country is practically full. By whatever line of railway you cross the plains—whether the Union Pacific, the Kansas Pacific, or the Santa Fé—you never lose sight of the herds. For long distances the simple cause for wonder is where such numbers of cattle are able to find water and forage. The pressure, also, is beginning to make itself felt on the markets. It would seem as if it could not fail to become greater and far more seriously felt with every recurring season.

In what will this result ? The appliances for moving fresh meat, both upon the hoof and dressed, have been immensely improved during recent years. The growth of the traffic every one is familiar with, and it is yet in its infancy. Both the refrigerator-car system and the ocean carriage of live stock have but just begun. As the grazing region of the West becomes overcrowded, the live-stock markets at Kansas City, St. Louis, and Chicago will become glutted; as they become glutted the price of meat must fall ; new markets, both at home and abroad, must then be reached, and the appliances for reaching and controlling those markets must be perfected. The result is obvious. By means of improved appliances and low rates we have, during the last few years, secured for America the control of the bread-markets of the world. Other wheat-producing regions have been bankrupted, and what has been going on in Iowa and Chicago has been, perhaps, more severely felt in southern Russia and Odessa than anywhere else. It is the turn of the grazier and landholder of Great Britain next. How he is to escape the danger so plainly threatening him from the Plains west of here I do not see. There is the cloud, and it has been gathering for years. Any one may see it. No one starting from here and ascending the slope to the mountains can help seeing it. Its culmination is a mere question of time. It is the Malthusian law of population applied to cattle—that and nothing more.

It is not, therefore, easy for one looking out from this standpoint to resist the conviction that a revolution is now not remotely distant in the supply of animal food which will produce results impossible at present to forecast. Meat will, in the first place, be brought into much wider and more frequent consumption than has heretofore been known. This will undoubtedly result from that decrease in its price which will bring it into successful competition with other forms of food. Such a result, however, cannot be brought about without hurting some one. Those who can produce meat at the lowest rate and in the largest quantities will drive those who try to produce under other and less favorable conditions out of the market. They will bankrupt them, just as others have been bankrupted before. How can it be but that the ranchman, who has no rent to pay and who does not have to winter his stock, can and will undersell the foreign grazier, burdened with the rent of costly lands and compelled to provide fodder during half the year ? Strange and improbable as it at first sounds, therefore, it is not easy for one familiar with the aspect of affairs to the westward, as seen from here, to resist the conviction that, the Duke of Beaufort to the contrary notwithstanding, the English grazier has quite as much ground for uneasiness in regard to the future as the English wheat-grower. Nor are the old landed gentry of England themselves any too secure. On the contrary, they are in imminent danger of receiving at the hands of the ranchmen of Colorado the most deadly blow that has yet fallen upon them. Great Britain will yet be given up to cities, parks, dairy-farms, and kitchen-gardens.

SOUTH-GERMAN VILLAGE LIFE.

STUTTGART, October, 1879.

AMONG the new railway lines opened this year in Germany none so much deserves the attention of the tourist in search of the picturesque as that which now leads from Stuttgart to Freudenstadt, and

which, when completed, will form the most direct line to Switzerland, and the shortest route to Strassburg and the west. Although Stuttgart has long had the reputation of being the most beautifully located of German capitals, its claim to this title was never shown in so strong a light as when this new line was opened. The train, after leaving the magnificent depot, the finest in Germany, with the assistance of two locomotives slowly creeps along the vine-clad hills that shut in the city on all sides. As it gradually describes a wide curve the tourist gets ample time to view the city below him from a dozen different points of view, the scene being rendered still more piquant by the fact that the city repeatedly disappears for a moment as the train passes behind an embankment or through a tunnel, and when it comes into sight again it appears to have been rearranged as in a kaleidoscope.

A newly-opened line like this affords a good opportunity for visiting some of the old-fashioned villages that are scattered along or near its course. The civilizing influence of the locomotive has not yet had time to rub the paint off the quaint old customs of the place; while on the other hand you are not obliged to subject your skeleton to the slow torture of being tossed about for three or four hours in a stiff old coach. In going to a place not touched by the railroad it is a good plan, though somewhat more expensive, to take "extra-post," a vehicle which is rather more comfortable and respectable in appearance than the coach. You will then have the advantage of being taken for a man of wealth and distinction, and the peasants will stop from their work in the fields and politely take off their caps as you pass—a thing which they no longer do to ordinary passers-by. What first strikes the attention of the American tourist is the absence of fences around the fields, and of houses and stables for the peasants and their animals. The peasant goes to his home in the village every evening and in the morning returns to his field, which for the rest of the time is practically left without supervision. A sort of country-policeman, called Landjäger, is indeed supposed to take care of the fields and the orchards, but I have never been able to set my eyes on one of them, although I have more than once "borrowed" some of the apples and prunes that grow along the road. But as most of the natives are honest, and no water-melons are raised hereabouts, no special detective is needed for each field. The best orchards are in the immediate vicinity of the village, adjoining the flower-gardens of the well-to-do burghers; and the centre of such a garden is usually adorned with a simple but neat little garden-house, consisting of a roof and five or six windows chiefly, in which the family on a summer afternoon are apt to take their coffee or lunch, even though it be five minutes' walk from the house.

These suburban garden-houses are always the neatest and pleasantest part of a Suabian village. The interior of the village, though quaint enough, is anything but attractive. The time may come when, at least in smaller towns where space is not so valuable, the American habit will be adopted of reserving a plot in front of each house for flowers and shrubbery; but the locomotive will have to whistle a good many more times before it will have scattered these ugly congregations of houses, which the exigencies and dangers of mediæval feudal times seem to have piled together into one close heap, like a flock of sheep seeking protection from wolves. The streets are accordingly all narrow, and a window well exposed to the sun is a rarity. Besides being narrow, the streets are crooked enough to delight the heart of a Bostonian; but there is no excuse for this crookedness, as in the case of Boston, for over here the cows are kept in the stable all the year round, and cow-paths, therefore, are non-existent. This habit of always keeping the cows in the stable and never letting them out except when they are driven to the fountain for a drink, or hitched to a wagon, does more than anything else to give the South-German village a nasty appearance. For the stable is either part of the dwelling-house or adjoining it, and even in the main street the manure is without ceremony thrown out by the front door, where it accumulates in large, spreading heaps, and compels everybody to abandon the sidewalk and seek refuge in the street amidst the cow-drawn wagons, the scantily-dressed children, and the flocks of geese and ducks, which are everywhere raised in large numbers, less for their meat than to supply the demands of the feather-beds. One would infer from this state of affairs that the interior of the houses and the personal habits of the people must be rather filthy and uncanny, but such is not the case. The rooms are kept neat and clean, and are frequently adorned with flowers, or even pictures. I once saw this want of consistency in æsthetic taste neatly illustrated by a pot of beautiful flowers standing on a window-sill directly over a huge dung-hill. What makes it so difficult to make the villager realize the full hideousness of the nuisance in question is not so much custom, which blunts the edge of the olfactory nerve, as the absurd superstition, quite prevalent here, that the effluvia of the stable is conducive to health! As the contrary is true, a Suabian village cannot, in its present condition, be recommended as a resort to those who in summer seek relief from the close and mixed atmosphere of a large city. This is to be regretted, for many of these villages are not only healthily but very picturesquely located amidst wooded hills and brooks, and are otherwise rendered attractive; as, for instance, by a well-preserved mediæval chapel, or proximity to the remains of Roman roads and other structures.

Living also is fairly good and very cheap in any one of the taverns which usually line the main street of a German village. They are easily recognized by the sign of a stag, a lion, a star, a sun, or a tree, cut out in metal or wood and suspended into the street. Latterly, however, the custom has come into vogue of printing the name of the tavern on the house, so that the guests are no longer in danger of mistaking a lion for an ox, or of imagining they are in the tavern "Zur Linde" when they are in the "Sun." The room you receive is clean and comfortable, but if you go to bed with the intention of sleeping late you will certainly find yourself deceived. After three o'clock in the morning the streets begin to get noisy in a decidedly unpleasant manner. In larger cities coachmen and ox-drivers are forbidden to crack their whips without occasion, and it seems as if in the villages they wished to make up for lost time. Drivers of all sorts vie with each other to see who can crack oftenest in half a minute; and while some appear to imitate the rifles on a battle-field, set off by the occasional boom of a cannon, others, more peacefully inclined, show their skill in cracking little tunes—that is, the rhythm of them—in a manner which under other circumstances would be worthy of all admiration. Under such a régime you will be apt for a time to become a convert to the theory of early rising, and to while away the first hours of the morning you may put your head out of the window and observe what is going on at the fountain across the street, whither the water is conveyed from a neighboring hill. Here the servant girls bring their salads and their potatoes to be washed for dinner, and to carry back a bucket or a little tub of water for home consumption. This is always carried on the head, balanced with great skill, and it is most amusing to observe two or three of these women gossiping for five minutes and longer, without ever thinking of meanwhile taking the heavy load off their heads. Some of these girls are rather handsome for girls of their class, not so plump as the Bavarian or so angular and plain as the North-German women. In fact, next to the Rhine provinces I believe the finest-looking girls in the Empire are to be found in and about Stuttgart—the reference being here chiefly to the better classes of society.

A peculiar element of beauty here which has often struck my attention is that so many of the ladies, be they blondes or brunettes, have very long and dark eyebrows and eye-lashes, a custom which is worthy of imitation by the sex in general. In brightness and vivacity the Suabian girl is sometimes deficient, and her chief mental characteristic, as of the men, is still her *Gemüthlichkeit*, a word which has no English equivalent but may be described as a mixture of genuine kind-heartedness, naïveté, and a certain amount of greenness or optimism based on want of experience. But if the Suabian girl seldom reads the newspapers and takes more time to attain her social qualities, she is more industrious than her transatlantic cousins. Indeed, I have often wondered what becomes of all the stockings and other things they are always busy on, day and night, while the men, less industriously inclined, devote the afternoon and evening to old-woman's gossip in the tavern over half-a-dozen glasses of beer or wine. The common notion that wife and children usually accompany the husband to the tavern is incorrect. This happens on Sundays or on festive occasions, but generally the men go alone and return late in the evening, not infrequently in an exhilarated condition. That such a practice, the temperance and economical aspects aside, cannot have a pleasant effect on home-life is evident. True, in South Germany more weight seems to be attached to near and remote relationships than anywhere else in the world, but of genuine, sympathetic family life I believe there is more in an American than a German village, in spite of all *Gemüthlichkeit* of the latter.

The Germans are known as great eaters, and certainly the villager is not an exception. To him nothing is so incomprehensible as that we Americans should get along with three meals a day. He himself has no less than five or six: (1) Coffee and bread in the early morning, (2) lunch of cold meat or sausage and beer at ten, (3) dinner at twelve, (4) coffee again at two, (5) second lunch at four, and (6) supper before seven. Then

he goes to the tavern and drinks his beer, be he rich or poor, for a German always has money for beer. The cooking as a rule is good; but the most conspicuous thing on the table is still their everlasting veal, or beef used as soup-meat and deprived of all juice. The lower classes prefer quantity to quality, four glasses of bad beer to two of good; and the bakers complain that they are not allowed to make light bread, for their customers complain that it does not "fill up" so well as when it is heavy. The first rule of hospitality is to treat the visitor to something to eat and drink, and the thing is carried so far that in case of esteemed visitors the *Hausfrau* will confine herself to the kitchen all the time, so that it almost seems as if you had come to test her skill as cook instead of to see her personally.

In the way of amusement, the German villager has little to speak of; but some of the villages maintain a few traditional mediæval practices which to a foreigner are quite amusing. I may here mention two of them only, for want of space—the *Nachtwächter* and the Trombonists. Those who have heard Wagner's "Meistersinger von Nürnberg" will remember the comic effect produced towards the close of the second act by the old watchman with his lantern and cow-horn, who, coming slowly down the street, informs the sleeping citizens in a sing-song voice that the clock has struck "ten," always in the same stereotyped words: "Hört ihr Leute und lasst euch sagen, Die Glock hat zehn geschlagen," etc. Well, this self-same individual may be heard at any hour of the night, at a certain village near Stuttgart, only his voice is not so pleasant nor his song so well modulated as that of the *Nachtwächter* in the opera just mentioned. In fact, after he has repeatedly roused you from sleep to tell you what time it is, you are apt to vote him a nuisance, and his voice seems more harsh than it actually is. But the villager does not mind him any more than the whip-cracking in the morning. His fathers had him, his grandfathers had him—why should not he have him? In a word, he is a conservative, and I am afraid it is also owing to this fact, rather than to an appreciation of the beauty of the custom, that he persists in keeping his Trombonists. These are four men, usually common artisans, who three times a day mount the church-steeple, trombone in hand, and blow on each of the four sides an old German choral, in four-part harmony, so that it can be heard all over the village. This, which is literally a high-toned performance, is not always so figuratively; for, when I heard it, neither the instruments nor the players were of a high order of excellence. But in Stuttgart, which is in many respects nothing but an overgrown Suabian village, this custom fortunately is also in vogue, and the players being, of course, good musicians, the effect of their solemn strains is very impressive, and decidedly more edifying than the sound of a bell. I am aware that great poets have written most beautiful verses on the charms of bells; but these charms entirely rest on association, and not on any intrinsic qualities of the bells. From a musical or æsthetic point of view bells are a nuisance, and I believe that the more refined generations of the future will abolish them and substitute trombone-players for them, as is partially the case at Stuttgart. Certainly there is no other way of appealing so powerfully to two of the main elements of religious feeling—the sentiment of the grand and the majestic—as by means of the old Protestant chorals played on trombones from such an elevated position. I wish some enterprising minister in New York would set a good example by engaging a trombone quartet as a new species of church-music.

Correspondence.

THE CHAMBERS LIGHTNING-ROD.

To the Editor of The Nation:

Sir: In your last number is an article in which you ventilate the "Chambers" lightning-rod swindle, which is of special interest to me. In my endeavors to warn the public against its use I have incurred the enmity of some of the State papers as well as of the "Lightning-Rod Company." In a recent issue of the College *Quarterly* I denounced the rod as a "humbug" and a "fraud," and the company has commenced a law-suit against me in the United States Court for $50,000 damages. Hence the proof-slip which I enclose. As you see, the aforesaid rod is not only a "humbug," it is "dangerous," in the opinion of our most eminent scientists. This rod is now in use on several high-school buildings in the eastern part of Iowa, and many others of a private or public character. The agents of the company manage to get endorsements from prominent unscientific persons in each town, buy up the newspaper reporters and get a puff in the paper, and then on the strength of these they manage to swindle all sorts of people. I have seen their "experiments," and they are utterly valueless and prove nothing at all. Any person at all informed in electricity can immediately point out the errors in the experiments. This is unquestionably one of the most stupendous swindles before the public. I have six different circulars and pamphlets issued by the company, in which I learn that agencies have been established in the Western and Southern States and in New York. The enclosed proof-slip is an article which will appear in the next *Quarterly*, and I intend to give it such a circulation that the Lightning-Rod Company will always find it in advance of their agents.

Yours respectfully, J. K. Macomber,
Prof. of Physics I. A. C.

Ames, Iowa, November 3, 1879.

[This lightning-rod was very properly refused a patent at the Patent-Office.—Ed. Nation.]

THE SOUTHERN MIND.

To the Editor of The Nation:

Sir: I for one protest against your referring to the 'Earl of Mayfield' as "an indication of the specialties of the Southern mind." You might just as well talk of the speeches of George Francis Train being "an indication of the specialties of the Northern mind." This is on a par with the performance of Mr. Froude in getting together a good many crimes committed in Ireland, and putting them in a chapter headed "Irish Ideas." The author of the 'Earl of Mayfield' wrote another book some time ago, called 'Col.' something—I forget what. They were both published at the North and were recommended by fulsome "opinions of the press." I never heard of any one in the South that had ever read either of them; and I believe that the people of the South are less given to reading such stupid books than you imagine.

Respectfully, U. M. Rose.

Little Rock, Ark., October 27, 1879.

THE MARYLAND ELECTIONS.

To the Editor of The Nation:

Sir: Will you give a regular reader of your paper a little space in your next issue to correct a gross and unjustifiable misstatement which appeared in the New York *Times* and other Republican journals the morning after the late State elections? I ask this favor with less hesitancy because you allude to their statement in your paper of November 6. These papers stated that the election in Maryland, and especially in Baltimore city, was the scene of the wildest disorder, and that the negroes who attempted to vote were shot down at the polls. It is a familiar adage that "one has to go away from home to learn the news," but the statement in the New York *Times* of November 5 to the above effect was certainly news to all Baltimoreans. The election here was one of the quietest and most orderly ever held. So far from negroes being shot down at the polls, the worst accident that befell voters, either white or colored, was a few black eyes. Not a single voter in Baltimore was seriously injured. The election in the counties was conducted in the same quiet manner. These grossly untrue statements only show to what ends the Stalwart papers are willing to go in vilifying and abusing the South for the sake of party capital.—Yours respectfully,

Stirling Pennington.

Baltimore, Nov. 8, 1879.

EXTRA-COLLEGIATE LECTURE COURSES.

To the Editor of The Nation:

Sir: A correspondent in your issue of October 30 suggests a way in which our city colleges may largely increase their influence and do a real service to "the constantly increasing class of young clerks, merchants, and university graduates." His idea is an excellent one, but not entirely novel to us in the West. Readers of the *Nation* may be interested in knowing that for several years just such courses of lectures as "A. S. I." suggests have been delivered annually in St. Louis under the auspices of Washington University. Five years ago a sum of money, amounting at present to $30,000, was given to the University by one of her oldest and best friends, Mr. William Henry Smith, as a lecture-endowment fund, the interest of which is used yearly for the support of courses of lectures intended to give those persons in the community not connected with the institution the results of the latest and freshest thought upon matters belong-

ing to science, literature, and art. The most of these lectures are given by members of the University faculty. A small entrance fee is usually charged, as much to secure an interested audience as to add to the usefulness of the fund. The results have been very gratifying. Business men, professional men, teachers, and mechanics have taken advantage of this opportunity, and the numerous enquiries made at this season of the year about the courses for the winter attest the public interest in what is no longer regarded as an experiment, but as a part of the regular and by no means least useful work of the University.

Our fund is, to be sure, not a large one—we are hoping for more some time ; but if we, with the comparatively small means at our command, in a city whose people have a reputation for staying away from lectures, can accomplish so much, the field must be an encouraging one in such cities as New York and Philadelphia, some of whose wealth might easily be turned into so profitable a channel. S.

St. Louis, Nov. 7, 1879.

[A similar course has since 1876 been delivered in Baltimore under the auspices of the Johns Hopkins University. The lectures, of a high order, have been given in one of the halls of the University, generally from 5 to 6 P.M. The attendance at some of the courses has been very large.—Ed. Nation.]

LIFE OF VICTOR EMMANUEL II.

To the Editor of The Nation :

Sir : Permit me to correct an error in the criticism of the 'Life of Victor Emmanuel' in the *Nation* of October 2. The writer says "the chief defect of the book is in chronological distinctness," and the only example he gives is the following : "Chapter xxx. embraces, without either pause or transition, the Œcumenical Council of 1867, the Barsanti incident, March 24, 1870, and the Franco-Prussian war."

The fact is, that all these events occurred in the same year; though the Œcumenical Council held its inauguration meeting in December, 1869, its business was not concluded till late in July, 1870, and therefore it occupies its proper place under that date.

The typographical errors—which the critic rightly conjectures are owing to my absence from England—I extremely regret, but even the misprint of "7" for "9" in the opening sentence of chapter xxx. can hardly account for such an assertion as that of which I complain. A reference to a dictionary of dates would have made the matter clear.

I am, sir, yours respectfully, G. S. Godkin.

Florence, Oct. 20, 1879.

PROGRESS OF THE WOMAN SUFFRAGISTS.

To the Editor of The Nation :

Sir: As you have thought it worth while to add one more to the many right interpretations you have given to the questions relating to women, I take the liberty of saying a few words in support of your last article. So few women raise their voices against the Female Suffragists that it may be well for some of us to speak out, even though there is little or nothing new to say. The contribution of an open support to opinions put forth by men, and, as you admit, inspired by women, is certainly not without its value.

I pass by the regular points of the discussion, and shall speak only of certain matters of fact.

The burden of a new duty is one of the chief objections which thoughtful women make to the suffrage. They are well aware that their present duties are not properly fulfilled. I say nothing of the duties of maternity, for that aspect of the question often seems to gall the advocates of female suffrage. I pass to the next duty placed specially upon women—that of social life. This is their own province, as they all admit, and the power it gives them is greater, is it not, than any other in the world ? What hinders a new regeneration—which some philosophers have dreamed—but women's failure, as yet, in their own special work ? And if they fail in promoting, to the extent of their present power, the *ends* of all government, all political effort and action, all wars and toils and sacrifices, of what use is it for them to step down from their present vantage ground and fight in the arena for results they have hitherto missed their opportunity to attain ?

All this seems rather vague, however. We must begin at the beginning, and ask ourselves how we do the duties that are nearest to us. How do we do our housekeeping, rule our servants, and minister to others, whether relations, guests, dependents, or sufferers ? Not certainly as men do their business—that is, methodically, thoroughly, for the best results with the least expenditure—in fact, not as a *business* at all.

Next, how do we use our influence, that vast power placed in the hands of women—our influence upon our children ? upon other women ? upon men ? I suppose few women can lay their hands upon their hearts and say that the management of their children has not been, in a greater or less degree, a compromise with their consciences. What a falling short of a possible result ! For the power that moulds a man is not the discipline nor the instruction of his life so much as the influence of his home. It is surely not too much to say that if the women of this century had been doing their duty to the world, Mr. Evarts and Mr. Sherman would not have done their last week's work.

The influence of women upon each other, or perhaps I should say the absence of all such influence, is the worst feature in their lives. There are many friendships among them so faithful, disinterested and supporting that they are among the best of human affections, but they are exceptional. At any rate, I speak now of the general relation which women bear to each other in society. Every candid woman is ashamed in her secret soul of much of her own conduct towards other women. How little we support each other as a sex in the duty of uplifting social life ; how unfair our interpretations ; how ready we are to injure each other's influence—indeed, it almost seems as if we did not know the nature of our power, since we neglect and destroy it as we do. We are a band of units ; not a body like men, who support each other through *esprit de corps*. It is true that women have each a world of their own where they are isolated, and in which they are jealous of interference or instruction. Nevertheless, our greatest need is for a public opinion among ourselves as to the nature of our power, and the use that we may make of it. Men are not in the dark as to their sphere or their duty ; and the other half of the world should clear their minds, and get a public opinion of their own as to theirs. Through them must come a new revelation : only it is not new, it is old—nearly nineteen hundred years old.

One does not like to use cant words—words that almost raise a laugh in some minds—and yet *the truth is this:* when women publicly and privately make intelligent, liberal, and living application of the principles of Christianity, and use their influence under the wise control of purity and love, we shall have reached the days of social and political reform.

The influence of women upon men—the greatest power for good that there is in the world—I shall not discuss here. It is a topic that seems to aggravate rather than inspire the advocates of female suffrage. I shall only say (though it seems a truism), that when women share in the active political duties of men, of which the right to vote is the outward and visible sign, they abdicate this power, and must take their chance in the rough-and-tumble of life, with no more influence for purity and the things that make for righteousness than men have—and not as much.

I would add, also, in a rather disjointed way, that since women have an appointed sphere through which to govern the world, it is an administrative error to seek to do the work of the business managers.

But in fact, and finally, the whole discussion is practically useless. Nature is unchangeable. Women may fail for ever in training themselves to the full use of their distinctive powers, but they *cannot* grasp and hold other powers against the laws of their own being. The "higher education" (for which, in many ways, I have the utmost sympathy) must always be limited by their physical condition ; and in like manner their part in the government of the world is appointed by the great natural facts which underlie their whole being. It is an ever-new surprise to see a few intelligent women frustrating the enormous power they actually possess, and fighting for that which "would be a positive injury to" women, and introduce into the world "a fresh obstacle to what" we know to be "right living." What a comfort that it *can't* be done !

In conclusion, permit me to say that women recognize their obligations to the *Nation*. Through many years it has told us stern truths, by which many of us must have profited, but the innate respect shown to us (along the lines and between the lines) has been to us, above all, a "liberal education." A. L. E.

Boston, Nov. 1, 1879.

To the Editor of The Nation :

Sir : I read your paper every week with that faithfulness which includes advertisements, and week by week lay it aside with a renewed feeling of gratitude that, amidst the partisan fury and blind hobbyism

which characterize the newspapers of the day, a fair and candid spirit can yet be maintained. Hence, when in the *Nation* of October 30 I read the editorial on "The Last Report of the Woman Suffragists," while I felt disappointed at its tone, I believed that the desire of the *Nation* in this matter, as in others, is to know the truth, and to present it without prejudice.

As I understand your article, you say that the arguments used in replying to Mr. Parkman are invalidated—*first*, by the fact that they are presented by the same persons who have for twenty years been leading this movement; and, *second*, by the paucity of facts which can be adduced to illustrate the increase of believers in their doctrines. You intimate that were there any but the old leaders of the movement with the interest and ability to reply to Mr. Parkman, to such new converts would have been assigned the task. Is this probable? In the controversy regarding slavery, years after the first preachers of abolition had gathered to their ranks many and great minds, was it not always expected that Garrison, Phillips, and Sumner would meet all new antagonists? Similarly in theological discussion, when the Unitarian faith could count by the hundreds and the thousands followers to whose hearts and lips the faith (with reasons therefor) of Parker and Channing were familiar, still were not Parker and Channing summoned to resist any new or mighty opponent? To resist every new attack is the proper function, so long as they retain power to perform it, of the *first* advocates of any cause. To their names belongs a certain prestige, to their words a peculiar power, which no later convert can boast.

You say: "What the world wants to hear now is some account of the progress they [the Suffragists] have made in converting men and women to their views." "This [you add] is the more important because there is a widespread and, we believe, well-founded impression that the cause is losing ground." You say further, as if the fact were in disparaging contrast, that the advocates of the higher education of women, and of a wider range of employments for women, *can* illustrate their principles by practice, and *can* show an increase in the adherents to their respective causes.

The demand which you make for facts in the case is reasonable, and in so far as I can I desire to answer it. First, I wish to remind you of one fact, which you apparently overlook when you speak of the successes of the advocates of woman's higher education, and of woman's entrance into the trades, professions, and general business of the world. These very successes *are* the triumphs of Suffragists. The leaders of the suffrage movement are leaders in both these causes, which are included with suffrage in the struggle for woman's progress and recognition. Colonel Higginson has for twenty years been, in this country, at the head of the demand for woman's higher education. Julia Ward Howe is more closely identified with the struggle for higher culture and with literature than with this *one* reform. Mrs. Stanton has more lectures on girls' training and education and on woman's work and responsibility than on suffrage, and delivers them oftener. These leaders have known very well that one of the most direct paths to woman suffrage is education and opportunity. Girls who know United States history and the American Constitution, who have taken equal per cents with boys in examinations on both, see the absurdity and feel the indignity of that clause in the last document which ranks them with the idiotic and insane. Women who have entered into any business like as well as any one the money equivalent and the power to protect their earnings. As soon as a woman earns and accumulates money she is interested, at least, in taxation—to that extent interested in the ballot. Boston University, Cornell, and Ann Arbor are three institutions which have done as much, perhaps, as any to give equal chance to boy and girl. Many of the professors in all, and the presidents of two are, I think, acknowledged believers in equal suffrage as well as in equal education; and, however it may be at the other two, I am informed that at Ann Arbor most of the lady students are believers in suffrage. The number of women in trades and professions has largely increased within fifteen years—many occupations have within a much less time been opened to women; all women lawyers of whom I have ever heard, most physicians (already a numerous body), and a majority of those engaged in any fixed business of which I know, except teachers, are Suffragists. Many teachers, both men and woman, are Suffragists, and some of high rank. T. W. Harris, Superintendent of Schools in St. Louis, and Mr. Tarbell, Superintendent of Schools in our city, are Suffragists; I think neither was such fifteen years ago; nor do I believe they are rare exceptions among gentlemen holding similar positions to-day. As to the growth of the belief in the principles of equal suffrage among average men and women, and the desire for the ballot by the latter, I give a few statements of fact. Last year the names of over forty thousand men and women were appended to a petition to the United States Congress for a Sixteenth Amendment, which would confer on women the power to vote. Over twenty members of the Senate were in favor of such an act, and the majority in opposition treated it respectfully, and discussed it as a question meriting serious argument. I have been told by the gentleman who first presented that measure before Congress some ten years ago that at that time the majority treated it with boisterous ridicule, and less than a half-dozen members would support it. There is a proof of growth.

I will add that I looked through one list of 128 names attached to the petition for a Sixteenth Amendment, which were the names of acquaintances or friends with whose opinions on this subject I had been familiar, and of the 128 more than 100 were *five* years ago anti-suffragists, some of them bitter and contemptuous ones. I do not suppose this was an exceptional list, and think it another instance of growth.

Again, within the last decade it has been true that the announcement of a woman-suffrage convention in any city has been the signal for punsters and paragraphers to sharpen wits and pencils in order to do justice to what they deemed the absurdities of the meeting. Last May, in St. Louis, when the National Suffrage Association held its annual convention there, the hall was crowded at both day and evening sessions with intelligent and attentive audiences. The business men of the city, as individuals and collectively, paid courtesies to the delegates; and the press gave its sessions as much space and as fair a representation as it would have given to a political convention of men. And several gentlemen, old residents in the city, lawyers and judges, told the writer that such a meeting would have been quite impossible there ten or even five years ago. This proves growth. In my own city five years ago I seldom saw the subject of woman suffrage, or the names of the leading Suffragists, mentioned without some sarcastic or disparaging comment. Now, month by month, notices and reports of the monthly meetings of the local E. S. Society are as full and as respectful in papers of both parties as are those of any other local organization. This proves growth.

During the last week the A. C. W. T. U. has held its annual convention in our city; so far as I know or can ascertain not one of the women now prominent in the temperance work was ten years ago a Suffragist, but the wider work in that field, as elsewhere, has taught women to believe that the ballot is a desirable instrument, and at the election of officers Frances Willard (herself not a Suffragist ten years ago) was elected president by a majority vote of 99 out of 143 votes cast. Every one of those 99 votes was the expression of some woman's belief in suffrage (at least on the temperance question, if no further), for every one knew that Miss Willard believes in fighting intemperance by the prohibition law, and that she expects to get the prohibition law through the votes of women. This means growth, and it is a sign of marvellous growth, too; for these women are nearly if not all orthodox Christians, conservative on all points, and but a few years, nay, months ago, many of them would have thought that to fight alcohol with a woman's ballot was to fight devil with fiend. Nor do the 99 votes alone tell the increase; each of these represented a constituency of like opinions, the result of like growth. Further, on the Sunday following the convention, 72 ladies took part in the pulpit exercises of the various churches of this city—some praying, others preaching; and a majority of the 72 believe in suffrage. That they believe in suffrage solely on the temperance question does not weaken this evidence of the growth of suffrage principles. In the West, Unitarians and Free Religionists are rapidly increasing. I cannot give, without investigation, the figures which would show the numbers of these people ten years ago and now; but I believe the figures would show an increase of several hundred per cent., and I speak advisedly in saying that a large majority of Western Free Religionists and a small majority of Western Unitarians are believers in woman suffrage.

I think it is true that believers in suffrage speak of it less frequently and less vehemently than they did ten years ago, but *not* because the interest in this matter is dying out, rather because the advocates feel so assured of its speedy coming that conscience either permits them to rest or drives them to use their strength in preparing women for the responsibility which the power to cast a vote will bring. The intellectual activity among women the country over is surprising; clubs and classes for the pursuit of various studies are numerous. The writer knows that in this State and in two adjoining States there are many classes of women studying history with a conscientious desire to obtain an understanding of the principles of government and the growth of law; knows of at least two companies of women who are studying constitutional and political history of our own country, spurred thereto by a sense of their duty to know the

principles of a Government which they expect their voices will soon aid in supporting. *Advisory* school committees, committees on work in charitable institutions, and visiting committees of women are the fashion of the day. This line of thought is easy to most women: "If women are to serve in libraries, schools, and institutions it would be more fair to have them elected to this work, as men are, than to let such women serve in these capacities as may be chosen thereto by their gentlemen friends in office." "If women can be elected to such offices, surely it is just that women aid in election." And thus the channels of new philanthropies, the widened opportunities for culture, the higher and more remunerative demands of varied labors, and the greatly-stirred intellects of women, all point to their recognition of themselves as worthy of full citizenship, and to their demand for such recognition.

I submit these proofs of growth of suffrage doctrine as the rapid gleanings of an inconspicuous believer in equal suffrage from the limited field of her experience and observation.—Yours very truly,

MAY WRIGHT THOMPSON.

INDIANAPOLIS, Nov. 3, 1879.

Notes.

FORDS, HOWARD & HULBERT have in preparation 'Camp and Cabin,' sketches of life and travel in the West, by R. W. Raymond; and a children's book by the same author, entitled 'The Merry-go-round.' ——Moses King, of Cambridge, Mass., sends us the prospectus of his *Harvard Register*, a monthly periodical of twelve pages quarto, whose general aim is "to give every person interested in any manner whatsoever in the workings of Harvard University, as a whole or in any of its parts, the information desired on every current topic." This information, we observe, will extend even to recording the marriages and deaths of graduates. The *Register* may easily prove very useful.——Bulletin No. 51 of the Boston Public Library gives in its usual appendix the bibliography of Mysteries, Miracle Plays, Moralities, and Religious Dramas; continues that of the Renaissance—Part II., Political History; concludes that of Genealogy—third paper; and notices a variety of sources—books, pamphlets, periodicals, and public documents—of light on the question of the Chinese in America.——"A Coloradian Landowner" writes us that he thinks we ought to expose the untrustworthiness of the estimates of the profits of cattle-ranching set forth in a recent article in *Harper's Monthly*. We do as much as we did, or intended to do, by the article in question, in giving place to this warning without comments.——The Military Service Institution of the United States, formed at Governor's Island, N. Y., in July, 1878, is composed of officers of the Regular Army and professors at the Military Academy. It aims to promote professional unity and improvement by correspondence, discussion, and the reading and publication of papers, to secure the ultimate establishment of a military library and museum, and generally to advance the military interests of the United States. The first number of the journal of the Institution has just been issued. It is a handsome pamphlet of some 125 pages, containing an account of the origin and progress of the society, its inaugural address delivered by General Schofield, papers on marches, on cavalry, on the Articles of War, and not a little miscellaneous matter, mostly of limited interest to the general public, but likely to be welcome to the Army.

—The announcement is made that the Anthon cabinet of coins is to be sold at auction, and that the first instalment will be sold by the Messrs. Bangs & Co. during the current month. The present owner of the collection, which he has made himself at the expense of twenty years of watchfulness, study, and liberal outlay, is Charles Edward Anthon, Professor of History and Belles-lettres at the College of the City of New York ever since its foundation in 1849. He is also President of the American Numismatic and Archæological Society. The catalogue before us announces itself as No. 1 of a set of five. Five sales are set down for five successive autumns: the sale of 1879 will include "coins and medals of the British Empire, excluding its Oriental Dominions"; the two sales of 1880 and 1881 will complete the disposition of the coins of Modern Europe; the sale of 1882 will be of ancient coins exclusively, chiefly Greek and Roman; and the fifth and last division will include American coins, Oriental and miscellaneous. With each sale go the books of description and reference which more particularly belong to it. It will be seen that Professor Anthon makes an unreserved sale of his collection. The magnitude of it can be approximately estimated by means of the present year's list, which is of 940 lots, not including the books. There are coin sales almost every week in New York, but few are they who dare buy at them on their own knowledge; nearly all the business is done through agents and dealers. This sale has seemed worthy of special mention because of its extent and quality, and because the collection and the collector are known.

—The catalogue itself merits such mention. Each piece is described, and of some the description forms an interesting essay. We fix upon No. 152, a copper medal of Charles Edward, the Young Pretender. The inscription, Lætamini Cives (Sept. xxiii.) MDCCLII., has caused allusion to that date, and quotation is made from a former archæological catalogue, whose author confessed himself unable to explain "the seeming reference to an actual visit of the Pretender to Britain on the day mentioned"; which reminds one of 'Redgauntlet,' and the interesting preface to its later editions. Why should not one of these abortive attempts "to which the unfortunate prince, at least as late as 1753, still looked with hope and expectation," have been set down for September, 1752? There are nine medals of the Stuart Pretenders, or relating to them, one bearing the bust of Charles Edward as King Charles III., and (what is peculiar) the bust of his wife as Queen Louisa. This piece is not, however, set down as "rare." The collection of medals and tokens of eminent persons is large, and many of the pieces are exceedingly curious. There are many coins of the British North American colonies, apparently caught up from circulation in the provinces; and a small and very incomplete, but choice, collection of pieces from the British West Indies. The pieces of the Tudor sovereigns of Great Britain seem unusually numerous, valuable, and fine.

—Mr. George E. Waring, jr., who is engaged as "expert and special agent" upon the collection and classification of the social statistics of cities for the Tenth Census, has issued a circular setting forth the character of various additional statistics which it is proposed to incorporate for the first time with the usual enumeration of the population, industries, and financial standing of the principal cities of the country. The work as laid out is extremely comprehensive, but it is to be hoped that it will not be restricted and curtailed by lack of co-operation on the part of the public. It is to be subject to whatever revision may be found necessary in the course of its prosecution, but no subject is considered irrelevant. The history of each city is especially sought in such particulars as: first settlement; geographical position; topography; public works, including water-works, sewerage, gas-works, etc.; education and recreation, which include matters of general interest concerning public and private schools not contained in the usual statistics; first cost and yearly expenses of public parks and squares; cost and date of construction and seating capacity of theatres and other places of amusement; the number, kind, and influence of disreputable places of resort, and what restrictions are imposed upon them by the city government; public protection, including police and health regulations, food supply, markets, scavengering, etc.; amount of public debt, amount and kind of bonds, sinking funds, manner of levying and collecting taxes, and cost of the principal departments of the public service; commerce, manufactures, rates of wages, employments of children; and, in fine, everything which a guide-book or cyclopædia of the largest dimensions would admit, will be acceptable. When collected and arranged these statistics will be further illustrated with maps, charts, and tables. Mr. Waring's address is, of course, Census Office, Department of the Interior, Washington.

—In 'Topical Shakespeariana' Mr. H. H. Morgan has grouped together some 2,500 references to books and articles arranged alphabetically under 47 such heads as Aphorisms, Art, Authorship, Beauties, Bibliography, Botany, Characters, etc. The make-up of the book is singularly bad; not quite as unsatisfactory as Malcom's 'Theological Index,' but very nearly. It is, indeed, typographically more correct, but the introductory remarks are almost unintelligible. The list of the topics is not given as "Contents," where it could be found, but hidden away in the middle of the Preface, where no one would look for it; and the running title is a meaningless repetition of the title of the book, instead of showing the particular topic that is treated of on the page. It would have made the work considerably more convenient to use if there had been some indication whether the less-known works (and nine-tenths of the works referred to are little known to ordinary readers) are English or American, old or new; but this would have increased the labor of preparation and the expense of publication, and for such labor, as the author says in his prefatory note, one "cannot expect any pecuniary remuneration." Greater fulness would, perhaps, have resulted in pecuniary loss.

The purpose of the 'Shakespeariana' is good, and with all its defects it ought to be in every library where any attempt is made to encourage the readers to substitute the investigation of subjects for aimless reading.

—It has rarely been the good fortune of this country to extend its hospitality to a more distinguished literary visitor than Friedrich Bodenstedt, who arrived in this city a fortnight ago. He has come to enlarge the sphere of his knowledge and experience, already so remarkably varied and extensive, and, fortunately for us, to instruct as well as to learn. We understand it is more particularly the 'Songs of Mirza-Schaffy' which will form the theme of his lectures, both in German and English, and we shall thus hear from the poet's own lips the story of that charming creation. It is now well known that the "Lieder des Mirza-Schaffy" —the fiftieth edition of which appeared in 1875, and which have been translated into almost all the languages of Europe, and even into Hebrew —are, with few exceptions, original poems, although inspired by the veritable Mirza-Schaffy, the sage of Tiflis, who at the time of Bodenstedt's stay in Caucasia acted as his instructor. In his 'Tausend und Ein Tag im Orient' (Berlin, 1850) Bodenstedt weaves these songs into a fanciful prose picture—half real, half poetic—of his wine-bibbing Tartar mentor and his optimistic philosophy. Although Bodenstedt's fame rests chiefly on these songs, where his mastery of language displays itself in rhymes the ease and beauty of which are only approached by Rückert's 'Makamen,' his numerous works are all worthy of his reputation. Thus, his 'Völker des Kaukasus' (Frankfort, 1848), written when he was about twenty-six years of age, has to this day remained without a rival, although in the composition of this work, as in all his subsequent labors, he was chiefly guided by his poetic instinct, discarding system and routine methods. As the fruit of his intimate acquaintance with the Russian, he published his masterly translations of Pushkin, Lermontoff, and others. His labors in the field of English literature will enhance his attraction for American audiences. He has rendered Shakspere's sonnets into inimitable German, and as a translator of Shakspere's plays he has accomplished the difficult task of improving upon Schlegel and Tieck. Twenty years ago he was professor of Old-English literature in the University of Munich, and his works on "Shakspeare's Zeitgenossen und ihre Werke" (Berlin, 1858–60), and "Shakspeare's Frauencharaktere" (Berlin, 1874) testify to his familiarity with our language and literature. We can only briefly allude to the strange vicissitudes of Bodenstedt's life: to the abject poverty of his youth, his Russian experiences as tutor in the house of Prince Galitzin, his Caucasian adventures, his connections with Asiatic sages and European princes—among them King Ludwig I. of Bavaria—his tribulations as editor at Trieste and Bremen, and as theatre-director at Meiningen, etc. Altogether, in characterizing Bodenstedt's life and works, and their curious blending of Eastern wisdom and Western culture, we are tempted to borrow Goethe's famous epithet and call him the West-Easterly poet of Germany.

—The critic's duty in reviewing the performances of the Italian Opera Company this season is monotonous and unprofitable. We have said so much in praise of Messrs. Campanini, Del Puente, and Galassi that it is needless to state that every part undertaken by these excellent artists during last week was performed in the most admirable and conscientious manner. We can only repeat that Mlle. Valleria is a pretty and sympathetic young artist, but is no prima donna, and that Signor Aramburo has four or five very fine tones in his voice, but that his style is very bad and his acting exaggerated and thoroughly inartistic. Colonel Mapleson affords us no opportunity of speaking at greater length and with more praise of the performances of his company. From Verdi to Donizetti and from "Carmen" to "Faust" runs the tedious circle of this season's répertoire. The "Trovatore" was reproduced on Friday last. "Faust" was given in Saturday's matinée performance. Gounod's popular opera undoubtedly shows the whole company to greatest advantage. Flotow's "Martha" was given on Monday night for the first time, and introduced Mr. Behrens, a German artist, a very good basso and a capital actor.

—The Philharmonic Club for the performance of chamber-music gave their first soirée of the season on Wednesday week in Chickering Hall. Both programme and performance were in every respect superior to any concert given by this society last winter. The first number was Beethoven's Quintet in C major, Op. 29, for two violins, two violas, and violoncello. The artists of the Philharmonic Club have made good use of their long summer vacation, and their ensemble playing has much improved. Mr. Arnold, the first violin, has not a very powerful tone, but he plays with exceedingly good taste and a very good knowledge of the exigencies of chamber-music performances. Miss Florence Copleston, a very promising young pianist, made her début on this occasion in Bach's Concerto in A minor, for piano, flute, and violin, with quintet accompaniment. Miss Henne sang three German songs, by Curschmann, Mme. Schumann, and Robert Franz, in her usual charming and sympathetic manner. The concluding number, a quartet by Grieg, in G minor, Op. 27, was heard here for the first, and let us hope for the last, time. It is a composition utterly devoid of merit, and tries by eccentric, sensational effects to supply what it lacks in originality and harmonious beauty.

—The first of the Symphony Concerts under Dr. Damrosch, which took place in Steinway Hall on Saturday last, was a genuine success. The programme was of great interest and sterling merit, and the performance was finished and artistic. The opening number, Beethoven's great Symphony in A major, Op. 92, seems, on account of its bright and festive character, particularly well adapted to inaugurate a season of orchestral music. It was given by Dr. Damrosch's orchestra with remarkable fire and precision, and, though perfectly familiar to regular concert-goers, produced again a profound impression. Raff's "Walpurgis-Night" forms the second part of one of his latest symphonies, "Frühlingsklänge (Sounds of Spring), which was given here in its entirety two years ago in one of Dr. Damrosch's symphony matinées. The movement is perfectly complete and finished in itself, and can be fully appreciated and understood without the other parts of the composition. It is an interesting work, though neither very original nor very strong, and bears a marked resemblance to the last movement of the same composer's well-known "Waldsymphonie." Wagner's "Faust Overture" has of late years been frequently performed, and has often been discussed; it may suffice here to say that it was rendered on Saturday evening in a most satisfactory manner. The concluding orchestral number, Liszt's symphonic poem, "Festklänge" (Festival Sounds), which, according to the programme, was performed here for the first time, is, as its name indicates, a work of a particularly joyous character. The orchestra had not exhausted its strength when this composition was reached, and rendered it with great spirit. In spite of many eccentricities in harmony and rhythm, we have little doubt that Liszt's symphonic poem will become a great favorite with our amateurs. It is thoroughly original in conception, and, like all Liszt's orchestral works, very full and brilliant in instrumentation; the choral-like conclusion is very majestic. The two vocal numbers were both new and interesting. The first, a fantasy for alto voice with orchestra, is a most delightful composition of Shelley's poem "To the Night" by the Hungarian Robert Volkmann. The solemn, elegiac nature of the words is admirably interpreted by the composer, and Miss Anna Drasdil's beautiful, deep voice is peculiarly adapted for music of this plaintive and melancholy character. Similar, both as to words and music, was the second number, Schubert's "Heimweh" (Longing for Home), which Miss Drasdil sang in her usual dignified and finished manner, with a very artistic instrumental accompaniment by Dr. Damrosch.

—The late Alphonse Royer left behind him the MS. of a 'Histoire du Théâtre Contemporain en France et à l'étranger,' which has recently been published in Paris as the fifth and sixth volumes of his 'Histoire Universelle du Théâtre.' The four earlier volumes were put forth in 1868 and and in 1870 during the author's lifetime. They brought the history of the theatre down to the beginning of this century. The work was then interrupted by the war and the Commune, but, as we learn from the date of the preface, it was completed in 1875. M. Royer was well trained in the technicalities of the art he was describing, being himself a dramatist and author of the librettos for "Lucia di Lammermoor" and "La Favorita," which are good specimens of the pre-Wagnerian opera-book. He gives us, what no other French author has yet attempted, an orderly statement of the rise and the results of the Romantic revival which was led by Victor Hugo and the elder Dumas about 1830. The so-called 'Histoire du Romantisme' of Théophile Gautier was only a posthumous collection of newspaper articles in which the poet-critic had from time to time recorded his opinion of the leaders of the movement as they had one by one dropped off. M. Royer, while greatly inferior to Gautier as a writer, like him took part in the struggles he has described, and his narrative, unlike Gautier's, was deliberately prepared as a history. It is possible to glean from the pages of these two volumes a number of instances of the international borrowings which the stage has at all times seen, although never more often than in the last half-century. Victor Ducange in 1821 used Scott's 'Guy Mannering' as the basis of his "Sorcière," which shows us

that a French dramatist saw the theatrical capabilities of *Meg Merrilies* long before Miss Cushman was cast for the part. Anicet Bourgeois took his "Vénitienne" in part from Cooper's 'Bravo.' The elder Dumas in his "Alchimiste" and Frédéric Soulié in his "Clothilde" both made use of Dean Milman's tragedy "Fazio." Rowe's "Jane Shore" was imitated by Lemercier in 1823. Alfred de Musset's "Barberine" is very similar in plot to Massinger's "Portrait"; this is perhaps because they were possibly both suggested by an Italian tale. Of the chapters which M. Royer devotes to the modern English and German stage it is charity to say nothing; his knowledge of them seems to be wholly second-hand, and he has not had reference to the best authorities.

—The "Customs Department" of the Russian Government has recently published a series of tables showing the number and nationality of all persons entering and leaving Russia during the twenty years, 1857–1876. From an abstract of these tables, which appeared in the *Journal de St. Pétersbourg*, we derive the following facts, which are not without value as bearing upon the history and prospects of that country: In 1857 the whole number of travellers registered at the frontiers was 230,767, or 113,815 arrivals and 116,952 departures. The passport system was somewhat modified in 1858, and the number of travellers amounted in consequence to 485,839, with 23,057 more arrivals than departures. In 1876 the whole number was 1,679,947, with a gain to the country of 40,349 permanent residents. The sum total for the twenty years was 18,313,894, divided into 9,398,578 arrivals and 8,915,316 departures. Of this number the Russians form rather more than a third, with 453,287 more departures than arrivals. This decrease is attributed not so much to emigration proper, of which there is very little in Russia, as to the absenteeism of the rich and the large numbers who are compelled on account of their health to seek the more favored climes of southern Europe. Over against this loss, however, is to be set a gain of 936,549 foreigners out of the thirteen millions who have entered and left Russia during this same period. These are divided into fourteen different nationalities, the Germans, of course, heading the list, followed, in the order given, by the Austrians, Rumanians, Turks, French, English, Greeks, Italians, Swiss, Belgians, Americans, Dutch, Danes, Swedes, and Norwegians. The number of American travellers was 13,103, of whom 1,205 appear to have settled permanently in the country. The largest number of emigrants from one nation were Germans, 557,395; the smallest number, 287, was from Sweden and Norway. It is a somewhat strange fact, considering the enmity between the Russian and the Turk, that forty per cent. of the Turks who pass the frontier come to stay, a proportion far larger than that of any other nation except that of the Greeks, which is thirty-six per cent. The most important fact to be noticed in connection with these figures is that the immigration into Russia during the twenty years ending with 1876 was nearly a million souls, with a yearly average at present of about 70,000.

FERDINAND LASSALLE.*

THERE are few living men whose words and deeds have excited such general interest in Germany during the last two years as those of Lassalle, and yet he died in 1865. For the freshest characterization of the principles and issues of Socialism students are everywhere referred to his pages along with those of Marx. He lived the eminently public life of an agitator, and yet not only his motives and the tendency of his theories but his sincerity, and even his private character, are seriously called in question. Brandes, in a painstaking monograph, eulogizes him as the great protagonist of unity for the Fatherland and freedom for the people, who "transformed the Germany of Hegel into the Germany of Bismarck," and who sketched the policy of the latter five years before the incorporation of Schleswig-Holstein; while Mehring holds him largely accountable for Social-Democracy, which he thinks is an exoteric weed in German soil, and describes him as degenerating from a scientific statesman to an agitator, and finally to a disappointed and lying demagogue. When he died at the age of thirty-nine he was pronounced the most brilliant man of his time, and Humboldt is said to have called him the most surprising genius of the century. A few Socialistic leaders still compare him in their perorations to Jesus and to Paul. His picture is found in the homes of half the workingmen of Leipsic, Hanover, and Berlin, and he has been made the hero of a popular though stupid drama. Professor Wagner has lately edited, with an appreciative introduction, his letters to Rodbertus, and just now a little book has rushed to a third edition in a few weeks, revealing more fully the causes of the duel which caused his death.

Lassalle's life is all drama and romance. Born of Jewish parents, endowed with a foppish taste and a domineering spirit, a friend of the poet Heine, who addressed him as his brother-in-arms, and writes to him, "In comparison with you I am nothing but a modest flea," he first attempted to open an academic career for himself by a critical elucidation of Heraclitus, which still remains the best work on the subject. He was attracted to this philosopher because his vagueness challenged his ambition, because he seemed to him to furnish the key to Hegel, and because in the man who "banished rest from the world" he found or fancied much that was akin to his own stormy soul. At the age of twenty-one he met the Countess Hatzfeld, a somewhat strong-minded but more abused woman, twice his age, who had for years quarrelled with and vainly sought divorce from her outrageous husband. With characteristic ardor and energy he threw everything aside and espoused her cause before the courts. He studied and was admitted to the bar in six months, and carried her case from one tribunal to another for eight years and through thirty-six trials, suffering all sorts of obloquy from friends, and persecution and even imprisonment from the party of the wealthy count, till at last she was divorced with a handsome settlement. This, he declared, was the event of his life of which he was most proud. He had come to see in her individual lot "the purest microcosm of all social misery and oppression." It will now, however, hardly be questioned that this experience gave a wrong direction to his whole life and character, and that, constantly attending and influencing him as she did to his death, whatever their personal relations (a question of ceaseless interest to the prurient), she became really his bad angel.

He next essayed dramatic authorship. In his "Franz von Sickingen" he attempted to illustrate that the drama, as "the highest form of commending any given subject-matter," as Humboldt had called it, might represent the conflicting principles which determine the fate of nations, and not merely, as heretofore, that of individuals. Lassalle's own character, in its constant oscillation between personal and ideal aims, is nowhere so fully and frankly portrayed as in the character of the central figure, *Ulrich von Hutten;* but in every detail of form the piece is indescribably deficient.

His chief work, which no student of political science can afford to neglect,* is an excellent illustration of the oft-quoted remark that it is impossible to approach modern political philosophy without getting a touch of Jacobinism; yet he never attempted to draw the practical consequence of the radical theories of this work. He argues with vast erudition that property, and more especially the modern institution of bequest, is not a logical but an historical category. The Roman testament bequeaths the will rather than the property of the legator, and the heir is primarily to *act* and only secondarily to have. It was an attempt to preserve a personal and mundane immortality for the ancestors whose ashes were buried, and whose manes still dwelt with the family. But if the soul in no sense survives, then the Roman will has no validity; if it does, then Adam, or the first legator, is the only owner. According to the old Germanic conception, on the other hand, the family is the possessor. The ownership of the heir begins with the begetting of him, and is not essentially confirmed by the death of the parent. With advancing freedom the idea of absolute ownership was developed, and property came to be regarded as individual. Thus, exclusive ownership is not a natural but an historical or acquired right. The foundation of all right, Lassalle continues, is might, much as we may wish the reverse to be true. Thus, every revolution creates new rights, which are only "new *consensus*." Positive and natural rights, however, are reconciled by the fact that the *Volksgeist* thinks far more profoundly and consequently than the individual. Thus, no age or race can judge or should be judged by another. Every law which affects the individual only by organically changing society itself may react, since by general consent men may be dispossessed of merely acquired rights without legal processes and without indemnification. Property must be acquired through conformity to the existing constitution of political and social life. Hence, and in so far as this latter changes and assumes new forms, the right of private possession may be modified even to the extent of an expropriation of all property, provided always that the consensus is general; while testamentary power is only the arbitrary disposition by society of one of the many charges left to its care, and the modern notion of it is a grand misconception. Even on his own soil the

* 'System des erworbenen Rechts,' 2 vols., 1861.

individual cannot say, Here I am sovereign; for his every contract implies as its condition that the laws remain unchanged. Machines, stock companies, public works, etc., set more and more objects out of the sphere of private property, which modern culture and progress are ever limiting. A more perfect and detailed philosophy of right shows us a more purified income—property proportionate to service.

This and Marx's well-known work on 'Capital,' which bases all classes of society and all institutions, legal, political, and religious, upon economic relations as creations of production and exchange, are the most scientific of all German Socialistic works, and mainly constitute the basis of the *Katheder*-socialism of the universities, which, as represented by Wagner, Conrad, and Treitschke, is infinitely removed from that of Becker, who styled himself the President of Humanity, or of Düring, who, forgetting the almost Hegelian *horror pleni* of most Socialistic apostles of the future, has, with great minuteness, detailed the coming Socialistic state, wherein even genius and talent shall be voted no condemnation, but be paid in work-tickets of enhanced value.

Lassalle's many other shorter writings are far less scientific. He argued for general suffrage, for state credit, for productive associations; for the unification of the Fatherland by arms if need be, but on a democratic instead of on a dynastic basis; for the economic emancipation of the workingmen from the iron law of competition for wages, from which he declared ninety per cent. of the population of Germany were suffering. He tells the workingmen that all forms of capital originate in their ten fingers; that the great industrial centres are the germs of the future state, in which the capitalistic shall be superseded by the Socialistic method of production, and that all progress comes from a clearer idea of the state. But he hated his own Semitic race, made war upon the press, appeared in ball costume to address the workingmen, courted arrests and made elaborate harangues in his defence, and, above all, failed to distinguish, as every one who aspires to political influence must constantly do, between exoteric and esoteric reasons and motives. He predicted that one hundred thousand workingmen would join his association, and contribute yearly one hundred and fifty thousand dollars; but scarce five thousand actually enrolled themselves. He was fretted by delinquent payments, by quarrels and misunderstandings. The fool and the wise, he exclaims, can be influenced, but the half-cultured can be neither forced nor led by gods or men. "If my reform is not ripe, I am a lost soul," he writes. He hoped the party of progress would affiliate itself with him, and then that Bismarck would make terms with the leader of the fourth estate, and he also predicted a reaction; but nothing of the sort occurred. He had quarrelled with Marx, and had still less in common with Schulze-Delitzsch. He grew domineering and would rule alone; his character became all color and form as his cause grew desperate.

It was at this point in his life that he met Fräulein von Dönniges, daughter of the Bavarian ambassador at Rome, at an evening party. Both loved on the instant, and an engagement was assumed from that hour. The girl's father hated Lassalle, and, when arguments were unavailing, cursed and disowned his daughter. She no less passionately gathered her jewels, went late in the evening to Lassalle's hôtel, telling him they must fly and be married on the instant or never. The man who never scrupled before, now hesitated and finally lectured her severely; said he would compel her parents to consent, and brought her home, where she was locked up in solitude, scolded and half-starved into writing, and then declaring before witnesses, that her love for Lassalle was dead. He, meanwhile, was writing to the bishop and supposed confessor of the girl, and inducing her father's superior to threaten him with loss of position, etc., to give his consent. The affair had already in part become public when her letter and message arrived. His pride was so wounded by the ridicule of his enemies that in a fit of desperation he challenged a rival suitor to a duel, in which he lost his life. The girl married his antagonist, and only now, since the latter's death, reveals the whole of the melodramatic story, declaring that her love for Lassalle never wavered. Strangely enough, a Russian lady had shortly before published "a love episode in Lassalle's life," of which she was the heroine, with a series of ardent letters from him, written to her during the same two last years of his life, the authenticity of which is vainly disputed by his apologists.

Among the many views lately taken of his many-sided character we concur with those who make personal ambition his leading motive. He could love any woman who passionately admired him, espouse any cause which he could lead, contend against the most formidable odds if the contest brought him *éclat*, attempt literary tasks for which he had not the slightest aptitude, to win the repute of versatility; born aristocrat though he was, he could work for and among the masses whom he loathed, because he hoped as their leader to win consideration and position among the political chiefs of the day, and even do the severest scientific work if the applause of the learned world was tolerably certain. But some good he has done, and in the mythic halo which already encircles him in the popular imagination his figure is now, since worse leaders have succeeded him, as beneficent as it is unique.

Rabelais. By Walter Besant, M.A. [Foreign Classics for English Readers. Edited by Mrs. Oliphant.] (Philadelphia: J. B. Lippincott & Co.)—This little book continues the series as we described it lately in speaking of the 'Montaigne,' and is not ill adapted to its purpose of giving the general reader an idea of a writer of whom it is not very easy to judge for one's self. It does seem as if a more categorical style, a more formal analysis in more synoptical order would leave behind it a clearer conception of what Rabelais' great work really consists of. But that would not be very readable, nor often read, whereas this book is quite amusing, and can be read through like a story. Rabelais' work differs from all other books of equal power in that the offence in it is so prominent and so impossible to overlook that no one need read it who does not wish to; no one need hesitate to avow that, for him, the offence overcomes the charm. The charm is of the strongest, of the most enduring; the man of less shrinking mind who cares for it at thirty will care for it always, and will be as little repelled by the scattered passages of coarser mediæval buffoonery as the lover of Chaucer is by the catastrophe of this or that farcical story. But the passages are there, very many of them, and the world of readers will always be divided into the two classes, neither of whom has any right to say that the other party is wrong. As Browning's hero, who had bored himself with a heavy book,

> "Went in doors and brought out a loaf,
> Half a cheese, and a bottle of Chablis,
> Lay on the grass and forgot the oaf
> Over a jolly chapter of Rabelais,"

so is there a large enough following for Maître François of admirers who take up no book so readily as his. But we may admit that the French style of allusion to him has become a little too enthusiastic of late years. Let us insist that there is wisdom in his books, and insight beyond his time into life and the needs of life; that nowhere else is the glory of the Renaissance, its boundless ambition for good and its vast and vague dreams of a splendid future for man, better, or so well, expressed; that in the sense of what religion is, as a thing of the soul, and belied by most of those external contrivances of pompous bigotry and stupid monkery which men insist on confusing with it, he was three hundred and more years ahead of his time; and we must still admit the more reasonable view of the case which Sainte-Beuve holds, rather than the unmeasured criticism which puts Rabelais by the side of the few great men of all time—rather than the rant of Victor Hugo, classing together Homer, Æschylus, Sophocles, Dante, Shakspere, Rabelais, Molière, and Corneille.

This question, of the proper rank of Rabelais as a man of genius, as one of the world's poets and creators, is not discussed with any thoroughness in Mr. Besant's book. Nor can we feel great surprise at that; it would have been a task worthy of Matthew Arnold in his best vein, and not to be undertaken even by that subtle analyst in connection with a wholly popular account of the plot and the people, the meaning and the nature of the great romance. This easy lesson in Rabelais Mr. Besant does give, and very well; and we think that he manages even to make clear what is the nature of that most wonderful broad-farce, of which the world never can get tired. To say that it satisfies people *qui savent leur Rabelais* would be to say too much, but then it was not meant for them.

The Poetical Works of Geoffrey Chaucer, to which are appended Poems attributed to Chaucer. Edited by Arthur Gilman, M.A. In three volumes. (Boston: Houghton, Osgood & Co. 1879.)—This long-promised edition of Chaucer's poetical works completes the collection of more than a hundred volumes of the British poets begun many years ago by Little, Brown & Co. There was then no text of Chaucer's poems up to the standard established for the series, and it was deemed best to wait until, by the reproduction of the best existing MSS., the requisite material should be supplied for a critical text. Though the MSS. of the "Troilus and Cressida" have not yet been printed by the Chaucer Society of London, and other important aids of various kinds toward a standard edition are yet to come, all readers of Chaucer will welcome the advent of this edition, which, taken altogether, is, for general use, the most satisfactory edition of the complete poetical works yet published. In

addition to the poems whose authenticity has been established, this edition contains the numerous poems that have been, until quite recently, wrongly attributed to Chaucer, namely, "The Romaunt of the Rose," "The Court of Love," "The Flower and the Leaf," "The Cuckow and the Nightingale," "A Goodly Ballade of Chaucer," "A Praise of Women," "Chaucer's Dream," "Virelai," "Chaucer's Prophecy," and "Go forth King." One of the many important results of the establishment of the Chaucer Society has been the separation of the authentic from the apocryphal works, even to the extent of detecting the spurious twelve-line ending to the "House of Fame" (shown to have been added by Caxton). Another important result, towards which much has already been done, will be the establishment, as far as that is possible, of the chronological order of the works—all-important as an aid to the study of the poet's growth.

The Introduction (pp. xix. to xcii) treats, (1) of "the outer life," (2) "the social life," (3) the "poet's life," (4) "the poet's works," (5) "the poet's genius"; pp. xcii. to cv. are devoted to peculiarities of the language, the pronunciation, etc.; pp. cvi. to cxxiv., to astrological terms and divisions of time in the poet's works. The editor has availed himself, therein, of the latest results arrived at by the labors of Chaucer scholars, which have been of recent years so encouraged and stimulated by the Chaucer Society of London, whose leading spirit is its founder and enthusiastic and indefatigable secretary, Mr. F. J. Furnivall.

The arrangement of the "Tales" and of the other works, devised by members of the Chaucer Society, is in this edition adopted for the first time. But the editor strangely omits to designate and characterize the MSS. on which the texts of the several poems are based. In the Advertisement, p. iv., he states vaguely that the Ellesmere MS., "now considered better than any other known," "forms the body of the text now presented to lovers of the great poet." A Chaucer scholar would know that he means the text of the "Canterbury Tales"; one not a Chaucer scholar should not be presumed to know this. In regard to the originals of the other texts, how they have been made up, and the extent to which those originals have been adhered to or departed from, the reader is left quite in the dark. It may be simply stated here that the leading, being the most approved, texts of the Chaucer Society's Parallel Texts, are followed, but not so closely as is the Ellesmere in the text of the 'Canterbury Tales,' the latter needing less to be doctored from other MSS. A careful collation of the "Prologue" with the Ellesmere print has shown a faithful adherence to the latter. It is devoutly to be wished that future editors of the poet's works will abstain from forming mosaic texts by picking out of various texts what *they* like best, and that they will rather adhere, with a reasonable closeness, to some one good text, and present at the foot of the page the various readings of the other texts.

The only departures from the Ellesmere MS. noticed in the Prologue are: v. 74, "was" for "weren"; vv. 131, 132, "breste" and "leste" for "brist" and "list"; v. 219, "selfe" for "self"; v. 338, "verraily" (according to Harl. MS. only) for "verray"; v. 497, "that" omitted after "afterward"; v. 557, "His" for "Hise"; v. 607, "yshadwed" for "shadwed"; v. 612, second "and" added; v. 613, "lerned hadde" for "hadde lerned"; v. 751, "hooste" for "hoost"; v. 752, "han" (not in MSS.) is added—the verse is better without it; v. 778 is similar; v. 803, "selfe" for "self." Such a loyal adherence to a good text is to be warmly commended. There are a few readings of the Ellesmere MS. which the editor might wisely have departed from, with notices of his departures; *e.g.*, in v. 92, "in" should be "is," as in all the other MSS.; v. 148, the "oon" or "one" of the other MSS. is better than "any" of the Ellesmere; v. 332, for "heed" all the other MSS. have "berd" or "berde," which is no doubt what the poet wrote; v. 383, for "boille" the other MSS. except one, have "broille" (with a variation of spelling)—no doubt the right word; v. 525, for "waiteth" the context requires "waited," as the other MSS. have it.

The explanations of words in the text are given at the foot of the page, and are generally confined to single words. The editor has, perhaps, erred on the side of too little, rather than what is more common in these days, of too much help, seeing that this edition is designed for the general reader, who cannot safely be supposed to know the true force of many a word or phrase whose meaning is a thing of course with the adept in Chaucer's language. Some of the explanations are open to the charge of a want of precision, or of their not bringing out the basal ideas of the words explained. Occasionally an explanation is questionable, and occasionally wrong; for example: v. 341, "His [the hospitable franklin's] breed, his ale was alweys after oon"; "oon" is explained as "one o'clock"; but "after oon" means after, or according to, one style or quality—*i.e.*, alike good, and dispensed in the same free and generous manner. The same phrase occurs in v. 1,781: "But weyeth pride and humblesse after oon"—*i.e.*, after, or according to, one mode or standard, without distinction. A few such slips presented themselves during a hasty run over the foot-notes. Altogether the editor is to be commended for the manner in which he has done his work, and the public to be congratulated in having the best texts of Chaucer's complete poetical works that have yet been published, put within easy reach.

THE FIRST NUMBER OF THE AMERICAN SCIENCE SERIES:

ASTRONOMY. For High Schools and Colleges. By Simon Newcomb, LL.D., Supt. American Ephemeris and Nautical Almanac, and Edward S. Holden, M.A., Professor in the U. S. Naval Observatory. Large 12mo, $2 50. Specimen copies for examination with a view to introduction sent post-paid to teachers on receipt of $1 50.

HECTOR BERLIOZ: Selections from his Letters and Æsthetic, Humorous, and Satirical Writings. Translated by William F. Apthorp. 12mo (Amateur Series), $2.

THE MAGIC OF THE MIDDLE Ages. By Viktor Rydberg. Translated by A. H. Edgren. 12mo, $1 50.

PRIMITIVE MANNERS and CUSTOMS. By J. A. Farrer. 12mo, $1 75.

THE YOUNG FOLKS' CYCLOPÆDIA of Common Things. Large 12mo, illustrated, $3.

Historical Essays. Vol. III.

By E. A. FREEMAN, D.C.L., LL.D.

CONTENTS: First Impressions of Rome—The Illyrian Emperors and their Land—The Goths at Ravenna—Race and Language—The Byzantine Empire—First Impressions of Athens—Mediæval and Modern Greece—The Southern Slaves, etc. 8vo, $3 50.

Vols. I. and II., $3 50 each.

NEW EDITION OF DR. FOSTER'S TEXT-BOOK OF PHYSIOLOGY.

A Text-Book of Physiology.

By M. FOSTER, M.A., M.D., F.R.S., Prælector in Physiology, and Fellow of Trinity College, Cambridge. With Illustrations. Third edition, revised. 8vo, cloth, $3 50; sheep, $4 50. A cheap edition in 12mo, uniform with 'Huxley and Martin's Biology' and 'Foster and Langley's Elementary Physiology,' will be ready in a few days.

WORKS BY THE LATE PROFESSOR W. K. CLIFFORD, F.R.S.

Lectures and Essays.

Edited by LESLIE STEPHEN and FREDERICK POLLOCK. With Introduction by F. POLLOCK, and two Portraits. 2 vols. 8vo, $7 50.

"Many a friend first taking up these volumes, and remembering his versatile genius and his keen enjoyment of all realms of intellectual activity, must have trembled lest they should be found to consist of fragmentary pieces of work, too disconnected to do justice to his powers of consecutive reasoning, and too varied to have any effect as a whole. Fortunately, their fears are groundless. . . . It is not only in subject that the various papers are closely related. There is also a singular consistency of view and of method throughout. . . . It is in the social and metaphysical subjects that the richness of his intellect shows itself most forcibly in the variety and originality of the ideas which he presents to us. To appreciate this variety it is necessary to read the book itself, for it treats in some form or other of nearly all the subjects of deepest interest in this age of questioning."—*London Times.*

Seeing and Thinking.

HARPER'S
Young People.

AN ILLUSTRATED WEEKLY.

The publishers of this journal propose to furnish the boys and girls of America with a first-class illustrated weekly, full of amusement and instruction, at a price which will place its advantages within the reach of every family in the country.

It will contain attractive serial stories, beautiful illustrations, short tales, poems, anecdotes, sketches of foreign countries, narratives of daring and adventure, suggestions for games and athletic exercises, wit and humor, Editor's Post-Office Box, etc.—in short, everything that can stimulate and satisfy the intelligent curiosity of boys and girls. Every effort will be made to furnish variety, and to make each successive Number more attractive than its predecessor.

HARPER'S YOUNG PEOPLE will be issued every Tuesday, beginning on the 4th of November, 1879.

TERMS.

Four Cents a Number.

Single subscriptions for one year, $1 50; five subscriptions, one year, $7—payable in advance. Postage free.

Subscriptions may begin with any Number. When no time is specified, it will be understood that the subscriber desires to commence with the Number issued after the receipt of the order.

Remittances should be made by Post-Office Money Order or Draft, to avoid risk of loss.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 20, 1879.

The Week.

THE newspapers have been much exercised during the week with the question, What shall be done with Grant? which may be called the principal conundrum of the day. The Chicago *Tribune* suggests that, inasmuch as the British Parliament voted several millions in cash and a dukedom in the peerage to Wellington, the American people may justly esteem themselves yet heavily in arrears to General Grant. The New York *Herald* learns that the Rothschilds of Paris are prepared to subscribe one-third of the capital of the proposed Nicaraguan canal on condition that General Grant accepts the presidency of the company. Another set of Froudes and Macaulays assign him the presidency of the combined Pennsylvania and Texas-Pacific Railways. Mr. Richard Smith, of the Cincinnati *Gazette*, mentions, "as the opinion of those nearest to Grant," that a third Presidential term (but no more) would be considered by him gratifying and not unhandsome. Mr. Frye, of Maine, according to the *Herald's* "regular" Washington correspondent, thinks that Grant will not be nominated unless the people are impressed with the idea that there will be trouble again in counting the electoral vote—in which case they will nominate him, believing that he will declare himself elected and thus avoid the necessity of any count. Col. Crawford, of Georgia, who is described as a heavy loser of slaves and other chattels by the war, writes a letter proposing that Grant be elected President by Southern votes in order to secure rest and freedom from political turmoil—his previous terms of office having been noted as periods of tranquillity and repose in that much-disturbed section of the Union. Indeed, it seems to be generally agreed by those who are making the loudest noise that, although General Grant drove the Republican party into a minority, he is just the man to restore it to its pristine vigor; that although the Stalwarts want him in the capacity of a Field-Marshal for the South, the South also desires him as her physician and colporteur—in short, that round pegs are always best fitted for square holes, and that the devil is fond of holy water. The Chicago *Tribune's* remedy for such a lot of paradoxes —three millions in cash and a dukedom—although desperate, seems not unreasonable.

If one asks what the Grant "boom" at the South means we think the answer is not difficult to find. The Southerners wish a quiet life, and the restoration of their material prosperity and harmony with the North with as little humiliation and as little change in their habits as possible. They will not submit to negro ascendency in States in which the negroes are in a majority, and they resist it in their old wild, brutal way. They found in 1875 and 1876, when they began to come back to Congress in force, that the Republicans were determined not to let them come back and share in the government on equal terms. Blaine, Morton, and all the rest began at once to taunt them and "draw" them as ex-rebels. When Senator Gordon raised his voice in favor of civil-service reform, Morton reminded him that if he and his friends had had their way there would have been no civil service to reform. When a committee containing several ex Confederate officers pried into Mr. Blaine's railroad transactions, he shouted lustily that he was assailed by rebel Brigadiers, who were through him making another blow at the life of the nation. Provocation followed provocation, and when the Democrats got into power folly followed folly, the Stalwart chiefs fanning the flame of discord carefully, and the Southerners exposing their flanks like so many bulls in the ring. Finally it has come to such a pass that Mr. Foster, the Governor-elect of Ohio, has declared on the platform that he does not want Confederates in Congress unless they confess formally, like naughty children, that they were wrong and wicked in rebelling, and that their dead relatives died like fools or criminals—a performance which would make every right-minded American ashamed of them not only as countrymen of his, but as men. There was a great deal of truth in Mr. Hill's observation in his late letter, that no Southerner has been able to attach himself to the Republican party hitherto without the sacrifice of his self-respect. They probably think now that Grant would spare their prejudices and weaknesses, and that they might under him move about as citizens of a common country, and not as people who ought to have been hanged —a position which may be as good as they deserve, but in which no one stays longer than he can help.

The Louisiana Republicans have, as everybody knows, made a veritable new departure. They have made up a ticket for the approaching election containing names of men of high character in no way identified with the old carpet-bag and officeholding set, and have drawn an excellent platform, containing no "bloody-shirt" or "Strong-Man" allusions, and full of good sense and good promise. They bid fair on this tack to win over the best part of the white population from the old Bourbon ways and aims. They have sent urgent appeals to the leading Stalwart orators at the North, who are so much occupied with the condition of the South, to come down and help them in the canvass. So far they have, it appears, been completely unsuccessful. Mr. Sherman's answer to the invitation has been published, and it is certainly a curious document to emanate from a gentleman who has been giving the account of "the Solid South" which he gave in the late canvass in this State. He, of course, cannot go; but he is sure that if Republican principles were fairly presented to the people of Louisiana and the Southern States "much prejudice . . . would disappear." "The same class of men," he says, "who in the South are Democrats are Republicans in the North." There has been a feeling throughout the North that free political discussion was not tolerated at the South, and he would "like to test this allegation" by going down himself, and seeing others go, to make such speeches as they recently made in Ohio. "The effect of such a discussion," he adds, "would probably be to show that there are more points of agreement between the citizens of different States than of disagreement," and would "tend to lessen party animosities."

The vote of this State has not yet been canvassed, and the counties of New York, Kings, Delaware, and Erie are yet to be heard from officially. The apparent majorities do not differ greatly from those we gave last week, such revisions as are reported, however, tending to increase the votes of all the Republican candidates. This circumstance is deemed suspicious by the Democrats, who betray some chagrin at the "apathy" of the general public in the matter. The latter feeling is possibly due to the difficulty of forming any precise opinion as to the cause of the delay and of the difference between the various reports from some districts. How is one to account, for example, for the discrepancies between three Associated Press reports of the 11th and 12th instant from Orange County, and between these and the reported official canvass, each succeeding one of which increased the majorities of Carr, Wadsworth, Wendell, and Ward, and finally showed a gain of ninety votes for Soule, while the vote of Cornell remained a constant quantity? The Democratic theory is obvious, and is the more boldly maintained for the discovery of barefaced attempts at fraud in Albany County, where the returns were clumsily "cooked," and Wendell (Rep.) was given 225 votes not cast at all and Mackin (Dem.) deprived of 272 which belonged to him. The majorities of the Republican candidates are so small that only a few successful efforts of this kind would be needed to account for them. The Super-

visors of this county are having a good deal of trouble in determining their duty, the Corporation Counsel having informed them, to their discomfiture, that irregularities which are not matters of substance should be neglected, which seems to impose upon them the exercise of more or less judgment.

Upon the whole we are justified in assuming that Maine just now affords a more comfortable spectacle of the badness of Democrats than New York. In that State the Governor and Council, who are Democratic and Greenback, propose, as the Republicans charge, to "count out" the Republican majority in the Legislature recently elected, or, as the Democrats retort, to canvass the vote strictly according to law. There is no doubt that the Republicans elected a majority in both Houses, and none, we presume, that if the Governor and Council were Republican they would so decide officially without any strenuous opposition on the part of the Democrats. But many of the Republican candidates were elected by very small majorities, and there seems to be no dispute that in these cases there were a good many technical irregularities, such as the posting of two notices of election in one town instead of the required three, and the posting of notice six days instead of seven in another. If such errors as these are considered by the canvassers the Senate will stand 19 Democrats and Greenbackers and 12 Republicans instead of the exact reverse, as it has been heretofore supposed it would. This clearly amounts to a disfranchisement of a large number of those who voted at the last election, and the only ground taken by the Democrats is that any other course would be illegal. There is, of course, great excitement, and the statesmen of Maine have gathered in great force at Augusta to endeavor to prevent the "stealing of the vote of a sovereign State," and, in General Arthur's happy phrase, "generally to look after the interests of the Republicans in the important work of the official canvass." The presence of Messrs. Blaine, Hamlin, Morrill, Chamberlain, Dingley, and Davis is certainly formidable, and we notice that a Republican journal expresses a doubt if Governor Garcelon will have "the nerve" to commit the contemplated "infamy." The affair has, of course, revived the memory of 1876 and other returning-board "infamy"; but as to whether there is any real analogy between the two the Democrats are as yet naturally in some doubt.

The Supreme Court decided on Monday three cases growing out of prosecutions for violation of the United States statutes relating to trade-marks, which had been brought up on certificates of division from the Circuit Courts of this State and of Ohio. The question involved was the constitutionality of these statutes, for which authority was sought to be found, but was not allowed by the Supreme Court, in the power of Congress "to promote the progress of science and the useful arts" by copyright and patent, or in the power "to regulate commerce with foreign nations and among the several States." The Court held that nothing of invention or discovery inhered in trade-marks to bring them within the scope of the Constitutional provision, and that the statutes in dispute do not limit the use of trade-marks to inter-State or international commerce, but refer to all trade and to commerce between all points, which "is obviously the exercise of power not conferred upon Congress," though the Court expressly leave untouched the question of the Government's treaty-making power over trade-marks, and the consequent legislation of Congress. The statutes having been thus declared invalid and unconstitutional, it would be a mistake to suppose that trade-marks no longer afford any protection, or that anybody is free to use an established trade-mark. The truth is that the only right heretofore resulting from the registration of a trade-mark in the Patent-Office (beyond *immediate* ownership in it) has been the right to bring suit in a United States court for the enforcement of the trade-mark. United States courts have been so overloaded with business that trade-mark suits have been frequently brought in the State courts, by preference. The fact should not be overlooked that the common-law rights of parties in the trade-marks which they have adopted and established are unaffected by the late decision.

Judge Westbrook has just rendered a decision in the so-called Coppers case, which excited a good deal of comment last summer. Coppers had purchased a lot in Calvary Cemetery in 1873, and had buried several members of his family in it. When he came to die himself, however, the trustees of St. Patrick's Roman Catholic Cathedral, who own and control the cemetery, stopped his funeral procession at the entrance to the grounds, and, in conformity with the rules of the Roman Church, refused interment to his remains for the reason that he had been not only a Protestant but a Freemason. The body was placed in a receiving-vault pending an appeal to the trustees of the Cathedral, who promptly ordered the relatives to remove it under penalty of having it buried in unconsecrated ground by the trustees themselves. The relatives, seeing that Coppers had paid $75 for his lot and that $7 had been accepted by the cemetery authorities for opening a grave for his body on the 16th of August, and having a desire to respect his natural wish to be buried with his family, obtained a temporary injunction against the threatened removal, and applied for a mandamus to compel the trustees to open the grave which they had been paid for opening. Judge Westbrook decides in favor of the plaintiffs, and unless the case is appealed the bones of the heretical and Masonic Coppers will repose by the side of his orthodox mother, wife, and children. It seems that there is another case of an analogous nature, in which the remains of a Protestant, Mrs. Chovey—whose niece is, curiously, the wife of Coppers's brother, by the way—are now in a receiving-vault at Evergreens Cemetery, having been refused interment in the Calvary lot in which Mrs. Chovey had buried two Catholic husbands, and on the decoration of which she had expended, it is said, $500. Now that it is decided that, however incontestable the right of cemetery trustees to order their own cemeteries after their own fashion, they have no right to play fast and loose in a matter of contract and deny to the dead what they appeared to grant to the living, the Chovey case will probably take the same course as its predecessor. The proper thing for the Calvary trustees to do, we should say, is to make their reservations in their bills of sale, and not, after getting their grounds improved to the extent of sundry hundreds of dollars, interrupt funeral processions in a way that is not only unseemly but brutal.

Foreign gold continues to flow into the country, and the total specie imports since the resumption of specie payments have now mounted up to more than $67,000,000, of which about $61,000,000 have arrived since August 1. Although money is somewhat dearer in London, and sterling exchange here has advanced half a "point," the rates still favor gold imports. The local money market worked easily during the week, and the New York bankers have gained about $6,500,000 in their reserves, or sufficient to give them about $5,750,000 more reserve than the national banks are required by law to carry against deposits. Speculation in all departments continues to rage in a manner that recalls the times of the Mississippi, the South Sea, and other bubbles. So high have the prices of exportable products been carried in the domestic markets that the volume of exports has been diminished, which has caused a temporary scarcity of commercial bills, and that in turn an advance in the rates of bankers' foreign exchange. At the Stock Exchange the speculation has been most furious; the transactions have aggregated an average of more than 500,000 shares (par value of $50,000,000) daily, and prices have jumped from 1 to 24 per cent., the last-named advance having been in the shares of a Southwestern railroad company which has not yet demonstrated its ability to pay the interest on its preferred debts. Buyers of stocks from all parts of the country throng into Wall Street and buy anything that is offered, taking no note of values, but acting on the calculation, which has served well so far this year, that some one else will buy at a higher price to-morrow or next week. When all this will end it is

difficult to say, but sooner or later values will govern prices as surely as water will find its level, and then those eager to be suddenly rich will curse Wall Street roundly, and many homilies will be aired about the immorality of stock-gambling and the thieving character of the whole Stock Exchange fraternity. Silver bullion has fallen from 53⅛*d.* to 53⅝*d.* to 53½*d.* per ounce; and the bullion value of the 412½-grain silver dollar has receded to $0.8933.

The details of the naval battle between the Peruvian ram *Huascar* and two Chilian men-of-war show it to have been one of the bloodiest and pluckiest sea-fights on record. The *Huascar* had had a remarkably successful career, owing to her speed and the skill with which she selected her odds, and to her had been mainly due the advantage which, previous to her capture, the allies had obtained over Chili. She was at last surprised in-shore by the *Blanco Encalada* and the *Admiral Cochrane*, and found herself obliged to fight or surrender. There seems to have been no thought of the latter alternative, and after a brief action she was boarded and her flag hauled down. The loss of the Chilians is reported—by themselves—to be trifling, but that of the *Huascar* was tremendous. Of the two hundred and sixteen men with whom she went into action but eighty-six survived, and these were almost all wounded and *hors du combat*. Among the dead are Admiral Grau, Captain Aguirre, and Lieutenant Rodriguez; and after the death of these Lieutenant Palacios, who assumed command though sorely wounded, repelled one attack of boarders, and only surrendered when the turret was blocked with the dead, the vessel riddled with shot and completely unmanageable, and no fighting force left. The Peruvians, so far from being disheartened by their loss, are raising money to purchase a new ram, the women contributing their jewels; Admiral Grau is to have a street named after him and a monument erected in his honor, and the war is to be continued to the bitter end. The *Huascar*, in spite of all the damage done her, can, it is said, be made serviceable for her captors. We are getting little by little an idea of what a great naval battle will be with the new ships, and it seems as if it would, as far as manœuvring is concerned, be very like the fight at Salamis.

The Rumanians have at last submitted to the demands of the Powers with regard to the Jews, and Article 7 of the Constitution has been revised so as to abolish all civil and political distinctions based on religion, and to permit the naturalization of all foreigners of whatever creed, either after ten years' residence and on proof of ability to support themselves, or immediately if the applicant has introduced a useful industry or invention into the country, or founded a great industrial or commercial establishment, or has given proof of distinguished talents, or if, being a native of the country, he has never claimed or enjoyed foreign protection, or if he has served in the late war.

The debates on the address to the Crown in the Vienna Reichsrath show a considerably altered state of Parliamentary affairs in Cis-Leithan Austria. The Constitutional party, representing mainly the German element, and rigidly adhering to the dualistic basis of the Monarchy as created by the readjustment of 1867, is in a minority in the Lower House, being now for the first time since that year confronted by a solid phalanx of Federalists, or, as they are now termed, Autonomists. The principal spokesmen of the latter party are the Czech representatives of Bohemia, who, by abandoning their long-continued policy of abstention from participation in the Reichsrath, have turned the scales. They are conditional supporters of the new Cabinet. As Count Clam-Martinitz, the able leader of the Czech landlord fraction, stated it, they have, by taking the oath, pledged themselves to uphold the Constitution, but without giving up their convictions as to the historical rights and natural claims of Bohemia, or the objections they have both to the substance and form of the new fundamental compact. A change of it by legal processes is, they hold, demanded by the interests of the Monarchy no less than by those of the Czech nation. The same ideas were expressed, but in very vehement and aggressive language, by Rieger, so long known as the second, in Slav agitation, of his father-in-law, the famous Palacky, now deceased. Side by side with the Czechs, though not fully united with them by party bonds, the Poles of Galicia make vigorous assaults on the Constitutionalists. The latter, badly beaten in the last elections in consequence of their many dissensions, would probably be unable to stem the tide of Autonomist reaction, had they not, quite unexpectedly, a majority in the Upper House. And thus the curious spectacle is presented by the Reichsrath of a conservative Cabinet supported by a coalition of almost revolutionary fractions in the House of Deputies, and successfully combated by the lords, in spite of its receiving the votes of the archdukes and bishops.

Lord Salisbury's imprudent speech at Manchester, besides the just offence it has given to Russia as a power with which England is at peace, seems likely to involve the Ministry in a fresh complication by causing a most undesirable coolness with France. When he spoke of the Austro-German alliance as "good tidings of great joy," it appears that he knew nothing about it except what he had seen in the newspapers, and had not considered what it might mean beyond being a menace to Russia. The French, however, in common with the rest of Europe, consider it in the main an alliance against France, or a precaution against France taken by Bismarck, and they were therefore a good deal surprised and chagrined to hear the English Foreign Secretary shouting with joy over it. In fact, it is now a question whether the *entente cordiale* of the last ten years has not come to an end or been greatly cooled. There is no more news about the dissolution of Parliament, but the Opposition feel very confident it will take place before the Chancellor of the Exchequer submits his next budget, which it now seems certain will exhibit an amazing deficit of $100,000,000. The Liberals have had in Manchester one of the greatest meetings ever seen, Mr. John Bright being the principal orator.

Sir Henry Layard seems at last to have lost patience with the Turks, and the appointment of Mahmoud Nedim and belief in intrigues with Prince Labanoff, the Russian ambassador, led him to order up the fleet by way of menace. This partly frightened and partly exasperated the Sultan, but the explanations made by Musurus Pasha, the Ottoman ambassador in London, seem to have proved sufficient, and the fleet is not to come up for the present and the "reforms" are to begin immediately. The fact is said to be that Sir Henry has at last become satisfied that the influence he supposed himself to possess with the Sultan does not exist or has been exhausted; that the Pashas expected the Asia Minor Convention to bring them a handsome loan or subsidy from England, and now perceive that they have been deceived, and are willing to throw themselves into the arms of Russia or anybody who will save them from being pestered by the British about "reforms"; and that intrigues or negotiations with a view to that have been going on. Unfortunately, England can now get at them a little more rapidly than Russia. Another cause of trouble is the joint protest of the ambassadors against any more pledging of the customs as security for small loans. The customs have been pledged already several times for this purpose, and the Powers naturally think it is time to stop. There is a widespread feeling that the crisis is at hand. All semblance of government seems to have ceased in Asia Minor. The troops and zaptiehs have turned brigands; every traveller goes with an armed guard hired by himself, and the villages begin to be fortified. The robbers, too, have begun on the European side to rob up to within a short distance of Constantinople. Indeed, it may be said that every one interested is waiting with painful anxiety to see which of the Powers will first propose to the Turks to leave Constantinople.

THE REAL OBSTACLES TO FREE-TRADE.

IT was a curious fact that nobody at the Free-Trade dinner given to Mr. Bayley Potter the other night made any allusion to the proposed Austro-German Zollverein, which would establish free-trade between 70,000,000 of the most industrious, ingenious people in Europe, besides that, through Austria, Bosnia at once, and probably Montenegro before long, would be covered by it. In fact, should Bismarck's scheme be carried out it would be the greatest triumph for free-trade yet achieved. Nor was anything said about the probability that, should it be carried out, a similar union would probably take place between France and Italy, and Belgium and Switzerland, which would give free-trade for all practical purposes to 70,000,000 more of an equally ingenious and industrious population. Both Mr. Potter and Mr. Wells, who were the only speakers who devoted themselves to the free-trade question, talked very much as if it were the affair of Great Britain and the United States solely, whereas it is the affair of the whole civilized world; and they placed in the forefront of their case a prediction that very serious consequences would ensue under our present system from a bad harvest next year here or a very good harvest in Europe, or both. Predictions, however, are always rather ineffective as arguments, and they fall with great lightness on the ears of the prosperous; moreover, the area of agricultural production in the United States is now so enormous, and the facilities for transport so great, that predictions of bad harvests are very hazardous. We have been expecting one with some anxiety since 1870, but it has never come, and is less likely now, to a degree that would seriously affect us financially, than it was ten years ago, so that people are not likely to incline to a low tariff by way of preparation for this particular contingency.

The great difficulties in the way of free-traders in this country are three in number: one is the name itself, and another is the deep-seated belief of the average man that free-trade cannot be carried on across political boundaries with profit for both parties. The term has become synonymous in his mind, even when he is not a hereditary Whig, with foreign hostility to American growth, and largely because free-trade has meant, during the greater part of the tariff controversy, free-trade with one power, and that one particularly odious to the generations which managed American politics and business down to the outbreak of the civil war. It was always understood that when the lowering of the tariff was called for, it was in order that British goods might obtain easier access to American markets. It was with British rivals almost exclusively that American manufacturers, in the three great fields into which they were most attracted, the iron, cotton, and woollen industries, found themselves obliged to contend from the very earliest days of American industry. So that it was not surprising that free-trade should have almost from the beginning been known as "British free-trade"—that is, a device of British contrivance for British profit—and that Henry C. Carey and Horace Greeley found it easy to accuse free-trade orators and writers on this side of the water of being stimulated by "British gold." So true is this that we doubt very much whether to this day ten per cent. of the Americans who think about free-trade at all, think of it as anything but unrestricted commercial intercourse with England only, in which Englishmen—or, in other words, the old enemies first of American independence and then of American growth and progress—would reap all the profits. In fact, the term "free-trade" connotes in the popular mind of America to-day, even among those who have not been brought up in Whig traditions, some kind of degrading dependence on England; so that the question of free-trade is in this country by no means a purely fiscal or commercial question, as most English propagandists are apt to imagine; it is half political, and you may get the best of the economical argument ten times over and still leave the stronger half of the protectionist case untouched. If it were not for this there would be something a little ludicrous in the impression which the very mention of free-trade produces on a great many Americans, who are in all other fields fond of general ideas, and are attracted by all movements which seem to make for universal peace and the reign of human brotherhood. It sounds to them like a proposal that they should engage in piracy or smuggling, or some other venture of great profitableness but undoubted criminality; and the effect of this is heightened by the free-trader's claim that his dogma is a direct offshoot of the fundamental rule of Christian morality.

The second difficulty in the way of the free-trader here is the enormous size of the area which is given up to free-trade under the American Constitution. As a matter of fact no government has as yet established free-trade between so many people as the American Government, and it has so happened that this American free-trade covers a greater variety of soil and climate and national product than the free-trade of Great Britain; and, what is more, it is absolute free-trade, not partial. This has really made Americans perfectly familiar with all the elementary principles of the free-trade gospel. They know and practise over the area of their own country nearly all Bastiat's theories. No Northerner ever thinks of asking for protection against the products of Southern heat and sunshine. The Pennsylvanian iron-master and coal-master know well that they must take their chance against the mineral wealth of Missouri. The Eastern farmer submits without a murmur to be driven out of the markets by the wheat and fruit of California, and the corn of Indiana and Iowa. The Massachusetts spinner has nothing to say when he hears of successful mills springing up in Georgia and Illinois; he is as mute and resigned as John Bright or Richard Cobden could wish. So that really there is no American who does not possess complete acquaintance with free-trade as an economical theory by actual practice before his eyes. No European has had the same opportunity of witnessing its working. The trouble which it is bringing on the British farmer, and by which he is at this moment so dazed, is one with which the American farmer in all the Eastern States has been familiar for over twenty years, or ever since the railroads began to tap the prairies. Moreover, the American home market for everything grows with unexampled rapidity. The manufacturer witnesses every year an enormous increase in the number of farmers he has to clothe and supply with tools and wheels, and the farmer finds wherever he settles that within a few years he has a large town population within easy reach to buy his produce. The great influx of European capital, too, into American railroads ten years ago did a great deal to prevent the rise of interest in foreign free-trade among the agricultural population. In the natural course of things the Western farmer ought not until now, if even now, to have had the means of access to European markets. The railroads which have for ten years been supplying him with it could not have been built on a purely commercial basis. They could not and did not pay when constructed. But they were built largely with foreign money, under the influence of an immense delusion, and have been working diligently for a good many years at a heavy loss, which has fallen mainly on foreigners. The result has been tantamount to the payment of a heavy bounty on the export of American produce. It has enabled American farmers to reach markets which no change in the tariff could have enabled them to reach, and relieved them of all necessity and of all temptation to think or talk about free-trade.

The one remaining difficulty in the way of free-trade, here as everywhere, is the notion that trade carried on across political lines is less advantageous than, or not so advantageous as, trade between people living under the same government. That the wonderful success of free-trade between the several States of the Union has not destroyed this notion, and has not, for instance, created an overwhelming opinion in favor of the admission of Canada, at least, to a customs union with us, seems strange at first blush; but it is we believe, accounted for by the fact that the country which has always been associated most closely with free-trade in the popular mind has, as we have said, been one to which popular antipathy was very strong, and whose eagerness for anything made the advantage of that thing to the United States seem doubtful. But it is a prejudice which is still very deep-seated—witness General

Grant's belief when President (and on matters of this sort he may be considered an average man)—that we lost heavily by trading with San Domingo while it was foreign soil, but would make much money by trading with it if annexed. Nothing will do so much to eradicate it as the multiplication of commercial treaties, and the formation of large Zollvereins, such as Prince Bismarck proposes, including several independent states. These things will furnish the actual experiment which, in a question of this sort, has more popular value than any number of books or lectures. There is probably no country in the world so interested now in throwing down all barriers to commercial intercourse as the United States, owing both to their wonderful and now easily-accessible natural resources, and the remarkable bent of the national genius towards both trade and invention. In open competition it is very difficult to say what nation will be able to find a market here thirty or forty years hence for anything but tropical products, and just as difficult to see what markets Americans can then be kept out of.

DISAPPEARANCE OF THE REFORM ADMINISTRATION.

THE prolongation of the count will perhaps justify one more attempt to point the moral of the late election in this State. Our concern is not this time with the voter nor with the Machine, but with the Administration and its part in the canvass. We printed, a fortnight ago, side by side, an extract from President Hayes's inaugural address, urging "a return to the principles and practices of the founders of the Government," who "neither expected nor desired from public officers any partisan service"; an extract from the same President's Executive Circular, forbidding Federal office-holders to "take part in the management of political organizations, caucuses, conventions, or election campaigns," or even to "express their views on public questions" if it should "interfere with the discharge of their official duties"; and finally Mr. Sherman's letter to Appraiser Dutcher in "cordial approval" of his "taking part in the Cornell and Hoskins campaign." Whatever the opinions of men may be as to the wisdom or sincerity of the civil-service reform plank in the Cincinnati platform, or the famous endorsement of it in Mr. Hayes's letter of acceptance, or the regulation laid down in the Executive Circular just cited, we do not believe that any high-minded and candid Republican could read without a blush these contradictory official utterances, from the highest sources in the Government, within three years from the time when the President declared "thorough, radical, and complete reform" in our civil service to be a "paramount necessity." Those who appreciated the difficulties in the way of this reform, or who wholly doubted its practicability, may have expected to see President Hayes's endeavors thwarted, as Grant's were, by the politicians, and his ardor chilled to death by public apathy; but they did not look to see him eat his own words. Failure to carry out his intentions might have illustrated either the gravity of the undertaking or the folly of it, but would have left his character untouched. Failure to stand by his solemn appeals, or to enforce an order entirely within his competence, must lower the President even in the estimation of his enemies.

Perhaps the worst blow that could have been dealt civil-service reform was to give it the air of humbug. Mere delay, due to the forces arrayed against it, would not have harmed it, and would have been improved in educating the people to a proper sense of its nature and importance. A consistent attitude towards it, however feeble, would not only have entitled Mr. Hayes to a moral acquittal, but would have enabled the reform to hold its own and to count upon future steady progress. Had he and Secretary Sherman been defeated in their effort to get Cornell out of the Custom-house, Mr. Conkling might have enjoyed a momentary triumph, but the cause would simply have received one of those checks which are like the winding of the mainspring of a watch. It would have gathered fresh strength from the resistance. They were, however, in the end successful, after a struggle which had none of the appearance of a farce, and which led outsiders to suppose that a hard and fast line had been drawn, if not between Reform and the Machine, at least between the Administration and Messrs. Conkling and Cornell—the one an insulting and defiant opponent, the other a servant dismissed for cause. Pride might have been reckoned on, if honor failed, to prevent any reconciliation between the two sides to this controversy which did not proceed from the defeated party. It must, therefore, have shocked every man of sensibility who knew that Cornell's nomination for Governor was distasteful to the Administration, that it was forced by Mr. Conkling and was meant to be a snub direct, and that it was semi-officially deprecated at the Convention by Vice-President Wheeler, to see Mr. Evarts ridiculing the Scratchers, and Mr. Sherman offering a thousand votes (if he had them) for Cornell, and quoting the President with authority as ardently wishing his election. We are every day reminded how much the American reputation for humor is belied by what is tolerated in the sphere of politics; we will not, however, admit that these performances have failed to provoke a melancholy smile among all who have the American good name at heart.

We do not think we shall be accused of pessimism when we say that the Administration's part in the New York canvass destroys all hope of any further gains from it to the cause of civil-service reform. Its strength of purpose in this direction has been tested, and found to succumb to the temptation of State elections having a national aspect—that is, those which take place on the eve of the Presidential year, and in which the voter is accustomed to sacrifice to a supposed necessity, diligently cried up by the party managers, his gathering independence and all the fruits of "off-year" discontent. There is nothing surprising in the Administration's desiring a Republican inheritance, nor in lending its moral weight to the party supremacy in State as well as in national elections. While party exists, no matter what becomes of the civil service, the sympathy of those in power will be with those who placed them there. There was, nevertheless, in Mr. Hayes's case, a peculiar expectation that he would keep aloof from unseemly participation in the choice of his successor. While the Republicans have never committed themselves to the one-term doctrine, and gave it no countenance in their Cincinnati platform, Mr. Hayes (whose perception, by the way, of the relation of this doctrine to that of civil-service reform has never been manifest) did announce in the beginning his fixed resolve not to stand for a second term, and so made it reasonably sure that a certain kind of corruption would not attach to his Administration. This did not, indeed, hinder him from rewarding with office a too large number of unfit characters, whose sole claim upon him was having helped to "count him in" in the doubtful Southern States. A President seeking re-election would have done the same thing, it is true, and these appointments were, as far as they went, open to the charge of having been made if not for personal for party ends. They raised, too, questions of delicacy and decency not different in kind, and hardly in degree, from those which Grant's appointments so freely gave rise to; but, after all, there was a difference, and we pass them by. What was to be expected from him was that he would not conspicuously send messages of cheer and encourage his Cabinet officers to take the stump in any State, under the auspices of so-called Republicans and on the pretext of the national bearing of the election (making it, in fact, a part of the Presidential canvass of 1880), when in order to do so he had not only to throw aside his personal and magisterial dignity, but such impedimenta as formal and repeated pledges to the cause of civil-service reform, and acts in its behalf whose abandonment was the very Caudine Forks of Executive humiliation.

Mr. Sherman and Mr. Evarts were unhampered by any declarations or scruples in regard to a second or even a first term. But both were bound by the attitude of their chief, and Mr. Sherman as well by his immediate connection with Cornell's removal, to stay away from New York during the canvass, and to do and say nothing to discredit the Scratchers, who were, on any manly interpretation of the Government's position, the real Administration party for that election; who were, by reference to the Cincinnati platform, the only Republican party for that election. Such a desertion of its

own principles marks the end of the Administration as a force devoted to the elevation of the party. It also marks the extinction, in the same quarter, of that nice sense of honor—the other side of which is a capacity for shame—which maintains the tone of public life, and which makes even bad politics consistent with national self-respect and international esteem. Mr. George Bliss, the other day, in his letter to General Arthur, held that "it must be a very exceptional case which would justify an honorable man in bolting after taking part in a convention" and being beaten. That evidently depends on whether the convention is a game, as he seems to regard it, in which of course "heads I win, tails you lose" has no place; or whether it is an opportunity for deliberate comparison of opinions as to measures and men, according to a common standard of political belief and public morality. No such doubt can exist as to the binding force upon a party, and upon the chief of that party, of the solemn profession of faith which we call a Presidential platform. The candidate of the national convention which frames the platform may be the *pis-aller* of a small majority—the real choice of only an insignificant minority; it is enough, other things being equal, according to Mr. Bliss, to make every honorable partisan do his best to elect him. The platform, on the other hand, the result of a compromise in which each faction may have been consulted, commonly represents that residuum of doctrine which results from concessions on the part of extremists. It has, therefore, a much more sacred character than the candidate, and cannot be betrayed by those who profess to stand upon it without a measure of dishonor which we will leave Mr. Bliss to determine and to stigmatize as it deserves. This betrayal began, as we pointed out at the time, as soon as the canvass was opened in 1876, and it reached its culmination in the open, unreserved, and "cordial" support given by the President and his two leading advisers to the ticket imposed by Conkling and headed by Cornell; and yet the career of the Administration is only a little more than half ended. There was a time when we might have hoped that, if it had not accomplished much towards reform, it would at least go out of office with a becoming adherence to it:

> "—se la stanza
> Fu vana, almen sia la partita onesta."

These anticipations have not been realized. It is even doubtful whether we shall owe it the retention of the civil-service reform plank in the next Republican platform, and whether even what we do owe it—the purified atmosphere of the White House, an honest and generally efficient and business-like conduct of the departments without scandal or jobbery, and a very hopeful beginning of Custom-house competitive examinations—will save us from the return of the Silent, Strong Man to Washington, with no "letter of acceptance," no talk of "paramount necessity" in his inaugural address, no "Executive Circular" to office-holding Machinists, and plenary indulgence for the Dutchers and Cornells of the third-term era.

PUBLISHERS AND INTERNATIONAL COPYRIGHT.

IT is generally understood that a vigorous push is to be made this winter at Washington to secure some provision for international copyright. This attempt will be made under circumstances of a peculiar and novel character. Hitherto the agitation has been mainly promoted by authors. Now, however, for the first time in its history, a strong and united pressure will be brought to bear by the large publishing-houses. In all previous discussions on the subject in this country the argument in favor of some international recognition of authors' rights has been mainly rested upon abstract considerations of justice and fair dealing, and it has been taken for granted that the present condition of the law was for the pecuniary advantage of the United States. In this instance, however, important business interests prove to be at stake. Hitherto, again, it has been generally assumed that international copyright, though not yet given a place in the statute or treaty law of the United States, was still making a steady advance in public opinion, which would sooner or later produce its effect in legislation. The system of royalties paid to foreign authors by leading publishers—a growth of the last thirty years—has been often pointed to as a cheering proof of this tendency. It now appears, however, that the growth of public opinion is being sapped, and the system of royalties itself threatened in its weakest part, by a new and serious danger, which, if not checked, must in the long run reduce foreign authors' rights to the pitiful condition in which they stood thirty years ago, give a general license to piracy throughout the United States, and remit the enactment of an international copyright law to a period too remote to be a matter of interest to any of those who are now on the stage.

Ever since the beginning of the present year there has been a constant cross-fire of pamphlets, letters, and articles on the subject of copyright, and some of the main points at issue were presented in a *symposium* published not long since in *Macmillan's Magazine*. The magazine undertook to give on the one hand an American view of the copyright question, and on the other English objections to that view. The first was put forward by Mr. S. S. Conant, whose connection with the publishing interest is so well known that his opinions may fairly be treated as identical in substance with those of such representative firms as the Harpers or Appletons. The substance of his argument, very shortly stated, is this: Public opinion in this country favors justice to authors, but it also favors the American system of book-manufacture—*i.e.*, it insists on cheap books. It recognizes the justice of the foreign author's claim to be paid for his work, but it insists that if he is to be protected by our laws he must get his protection in such a way that it will not interfere with the right of the American public to have books provided for them cheaply. Now, it is admitted on all hands that English books are not cheap, and consequently it follows that to make them so they must be published here. The only sort of international copyright law that is worth considering, therefore, is one securing to the foreign author the protection of our laws on condition of first publication here by a citizen of the United States. To this Mr. Conant's English critic replies that if this is the sort of international copyright proposed we may as well abandon all idea of its being adopted, because England will never consent to it. In the course of his argument he refers to the novel and important fact which has given the copyright agitation its new chance of success. Mr. Conant in his remarks dwells upon the "pressing" character of the question, and refers to the open letter addressed some months since by the Harpers to Mr. Evarts, suggesting an international conference. But why, says Mr. Conant's critic, has the matter become "pressing"? What has lately happened that has made one of the greatest American publishing-houses come forward with such a suggestion? According to Mr. Conant's account the system of royalties for advance sheets had reached such a pitch of perfection that English authors who made the proper arrangements were paid nearly as much as they would be under any copyright system; and no American publishing-house has any rational motive for desiring to pay more. If the question has become "pressing," some explanation of the fact is required.

The explanation correctly suggested is that the system of securing the right to publish foreign authors' works through the "courtesy of the trade" has broken down. This system has been a very simple one. The house that desired to reprint a foreign book for the American market gave a sort of informal notice of its intention, and thenceforth was recognized by courtesy as having the right to republish that author's work without interference from other publishers. Not long ago, however, it occurred to some enterprising publishers of what would be called in England "penny dreadfuls," that they might reprint in an extremely cheap pamphlet form books protected by the courtesy of the trade. They accordingly began to bring out at a price slightly in excess of the cost of manufacture current English books. Issuing them in this form, at regular weekly intervals, and numbering them consecutively, they succeeded finally in having them classed by the Post-office authorities as periodicals, and therefore entitled to the cheapest rate of postage. The effect of this was of course to threaten the royalty system in its most vital part. Such houses as the Harpers could not afford to go on paying foreign authors a royalty if books were placed on the market at such a price as to make the system unprofitable. The only way to meet this new danger was to insist at once on an international copyright law which would absolutely prevent piracy, and enable them to keep the control of the market. Undoubtedly the "pressure" somewhat obscurely referred to by Mr. Conant arises from this necessity. There may be those who think that there is something wrong in the desire of publishers to do away with this new and dangerous form of piracy, and to believe that a mere statement of the facts is enough to lay bare the insincerity of the proposed scheme. But we must say at the outset that there seems to us nothing sinister in the project—unless, indeed, we consider sinister every attempt

by one man of business to prevent himself from being undersold in the market by another. It must be remembered that copyright in this country cannot any longer be discussed as an abstract question. A system has grown up, bad in its origin, no doubt, but which does in a measure secure to foreign authors their rights through a sort of publisher's good-will. This system inures to the profit both of authors and publishers, and is now in danger of being supplanted by absolute and unrestricted piracy. This clearly would be an evil, and, as we have suggested above, an evil which once established would probably never admit of a cure. If standard books were to be regularly reprinted here at a twenty-fifth of their cost in England, the public, once accustomed to such an unheard-of luxury, would not readily give it up. It is therefore perfectly fair to say that the protection of foreign authors has acquired a new and pressing urgency. This urgency presses upon all publishers who have been in the habit of paying royalties to foreign authors, and has already forced one well-known firm into adopting retaliatory measures by republishing the books on which they pay foreign authors, and which by "the courtesy of the trade" belong to them, at a price entirely unremunerative. Of course this cannot continue. Hence, almost by accident, it has suddenly become for the direct pecuniary interest of some of the largest publishing houses in the United States that international copyright should be established with all possible speed.

Before considering any plan for international copyright on its merits it is important to bear in mind that there are three parties whose interests have to be considered, or who have at least to be conciliated, in order to bring any copyright law within the range of possibilities—first, foreign authors; secondly, American publishers; and, thirdly, the American public. To begin with the last, it may safely be assumed that no measure which threatens to increase the price of books seriously can be got through Congress. Whether this difficulty grows out of the popular love of knowledge or out of some less noble feeling, is unnecessary to discuss here. Congress considered the question as lately as 1873, when Senator Morrill introduced from a committee having the matter in charge a report in which the following passage occurs:

"In view of the whole case, your committee are satisfied that no form of international copyright can fairly be urged upon Congress upon reasons of general equity or of constitutional law; that the adoption of any plan for the purpose which has been laid before us would be of very doubtful advantage to American authors as a class, and would be not only an unquestionable and permanent injury to the manufacturing interests concerned in producing books, but a hindrance to the diffusion of knowledge among the people and to the cause of universal education."

Since this report nothing has been done. For the present purpose the temper of Congress is that of the public, for it is with the temper of the public as represented in Congress that we have to deal. With regard to the rights of American publishers who have obtained the good-will of foreign authors, every consideration of justice and expediency points to the necessity of not arbitrarily depriving them of a business which our system of legalized piracy has encouraged. If it is urged in reply to this that they cannot have acquired rights by a system which was originally based on simple piracy, the conclusive answer is that no copyright for foreign authors can ever be secured without their assistance. Finally, no plan is likely to succeed which does not command the assent of foreign authors.

But the great and important question is, How will the proposed plan be likely to work? The immediate result of the proposed scheme, supposing it to be legalized, would be that all English authors who could make an arrangement with an American publisher would be able to secure an American copyright. We take it for granted that the recommendation of the British Copyright Commission that a British author shall not be debarred from acquiring British copyright by foreign publication will be made law by Parliament. It should be observed that an essential part of the plan suggested by Mr. Conant was the total manufacture of the book in this country by a citizen of the United States. Some weeks before the date of the Harpers' letter to Mr. Evarts the matter had been called to the attention of the public in an address delivered by Mr. G. H. Putnam, who also urged, on behalf of a house which had from the first identified itself with copyright reform, the appointment of an international commission. Mr. Putnam's recommendation, which probably now more nearly represents the views of the publishing interest than Mr. Conant's, was that the book, to secure protection, must be printed and bound in this country, the privilege being accorded of importing foreign stereotypes and electrotypes of cuts. Supposing this, then, to be the plan actually carried into effect by international agreement, the probable results are not very difficult to foresee. By a system of co-operation between the publishing houses of the two countries, which is already to a considerable extent in operation, the markets of both countries will be secured to the author. Through this co-operation, and the guaranty against piratical competition afforded by the law, the cost and risks of production of the English as well as the American edition will be considerably reduced, leaving a larger margin of profit from which to compensate the author, and also make it possible to give the book to the consumer at a lower price.

Though English publishers would probably in the long run be benefited by the growth of international business produced by a copyright treaty, there appears to be among them now a hostility to any change. This probably grows out of a dread lest the amount of their direct exportations to the United States may to some extent be curtailed. It is also their honest belief that any restrictions on copyright as to manufacture are in themselves unjust.

There is a way of effecting the end in view, however, without taking English publishers into the account, and, considering the great danger with which the latest form of piracy threatens all foreign authors, we think there would be ample justification in trying it. For any international system of copyright the consent of both England and the United States is required. But it is not so for the purpose of securing foreign authors' rights in this country. There is nothing to prevent Congress of its own motion from establishing these by law without a step being taken in Great Britain. It might be objected that the Constitution does not grant Congress power to secure exclusive publication to foreigners; but the words used are as broad as language can make them. They include all "authors," and to decide in advance that the Supreme Court would hold this to mean only authors who were also citizens seems entirely irrational. And if Congress cannot do it, how can a treaty do it? It cannot be seriously believed that a treaty is of higher obligation than the Constitution, or that the treaty-making power can exercise prerogatives in violation of Constitutional limitations. There can be little doubt that with the powerful support of the publishers such an act could be passed without serious difficulty, and almost as little that it would be speedily followed by some enlightened and permanent system. The only class that could possibly object to such an act would be foreign publishers; and the interests of foreign publishers we are not bound to protect. Curiously enough, such a statute has been introduced into Parliament by the British Government, in accordance with the recommendations of the Copyright Commission. This bill provides that any alien, wherever resident, may acquire English copyright by first publication in the British dominions. When such a law as this is being favorably considered in Parliament, and a reciprocal scheme is being advocated on this side of the water by the only great interest which may be expected to have the opportunity of influencing legislation in Congress, it seems as if the day of international copyright ought not to be very far off. The alternative now is either international copyright or a system of piracy compared with which that practised hitherto would seem like even-handed justice.

THE MEMOIRS OF MADAME DE RÉMUSAT.

I.

PARIS, October 31, 1879.

THE 'Memoirs of Madame de Rémusat (1802–1803)' will take a place among the most important documents concerning the history of France at the beginning of the nineteenth century. They show us the real Bonaparte, the man, not the Napoleon who has been transformed by legend and poetry. The correspondence of Napoleon I. published by Napoleon III., under the direction of Prince Jérome Napoleon, will always remain the most important document for the historian. Future ages will study Napoleon in this voluminous correspondence as we now study Henri IV. in the seven folio volumes of his 'Lettres et Missives' published by the Government, and as we study Richelieu in the collection of his letters and despatches. But the general public will probably never read the correspondence of such men, and will rather turn to such books as the 'Memoirs of Madame de Rémusat.'

M. de Rémusat, who took an important part in our parliamentary life under the reign of Louis-Philippe, and who accepted from M. Thiers, after the unfortunate war of 1870, the post of Minister of Foreign Affairs, is well known to the literary as well as to the political world. Since his death his son, M. Paul de Rémusat, has published two works of his father's, both historical dramas—one on Abélard, the other on the Mas-

sacre of Saint Bartholomew. In less troubled times these two dramas would certainly have been more noticed, as they are both works of great merit, showing a very intimate acquaintance with philosophy and with history. M. de Rémusat was somewhat shy; he had never published these dramatic essays himself; he had not published the 'Memoirs' of his mother, who had been lady-in-waiting to the Empress Josephine. He sometimes read extracts from them to his most intimate friends, but he thought that the time for their publication had not yet arrived. His son, however, gave long extracts of the 'Memoirs' to the *Revue des Deux Mondes*, and now the first volume of this important work has just made its appearance.

From what we read in the preface it seems that M. de Rémusat the elder had once wished to publish the 'Memoirs' after the Revolution of 1848, but that the return of the Empire seemed to him an insurmountable obstacle: "The book," he says, "would have been considered either as flattery addressed to the son of Queen Hortense, who is much *ménagée* in it, or, on other points, as a direct attack on the dynasty."

Let me first say a word of the author of the 'Memoirs.' Madame de Rémusat was the daughter of a M. de Vergennes (related to the famous Vergennes, who belonged to a younger branch of the family), and who, though favorable at first to the ideas of the Revolution, died on the scaffold, in 1794, three days before the fall of Robespierre. His wife was left with two daughters, and one of them, Claire, married M. de Rémusat, who belonged to a parliamentary family of Aix. They lived at Saint-Gratien (near Paris), in the neighborhood of Sannois, a place which has been made famous by the 'Confessions' of Jean Jacques Rousseau and the 'Memoirs of Madame d'Épinay.' Madame d'Houdetot herself lived quietly at Sannois during the Revolution with M. d'Houdetot and with Saint-Lambert. Madame de Vergennes was poor, as the fortune of her husband had been confiscated. M. de Rémusat, her son-in-law, was obliged to try to obtain an office, and by the influence of M. de Talleyrand he got a little place in the direction of the *Contentieux* (the department where all matters of litigation are treated) of the Foreign Office. At Saint-Gratien Madame de Vergennes made the acquaintance of Madame de Beauharnais, and it was through her influence that in 1802 M. de Rémusat, who was only a clerk in the Foreign Office, was named *préfet du palais*, and that shortly afterwards his wife was named *dame pour accompagner* Madame Bonaparte—a title which was afterwards exchanged for *dame du palais*.

M. Paul de Rémusat, who publishes the 'Memoirs,' takes great pains to prove that, in accepting these functions in the household of the man who was the avowed chief of the Revolution, his grandfather and grandmother did nothing wrong. "Their royalism," says he, "was merely veneration full of pity for King Louis XVI." They shared in the universal admiration for the young hero who had obtained so many victories for France, and who had re-established order and put an end to the bloody rule of the Terrorists. M. de Rémusat, the father, took the trouble to write to Sainte-Beuve a letter, which is now published, in order to explain, if not to excuse, the conduct of his parents:

"It was not from necessity, or weakness, or the effect of a temporary temptation that my parents attached themselves to the new régime. They freely and confidently thought that they could unite their fortune with its fortune. If you add to this all the gratifications of an easy worldly position which took them out of a state of poverty and of obscurity, the curiosity, the amusement of this new sort of a court, and, in the end, the incomparable interest of the spectacle of a man like the Emperor, still young and amiable, you will easily understand the attraction which led my parents to forget the slight conformity with their tastes, their reason, and even their true interest, which this situation really had. At the end of two or three years they found out that a court is always a court, and that all is not pleasure in the service of an absolute master, even when he pleases and fascinates. However, they were for some time satisfied with their fate. My mother, especially, was extremely amused by what she saw. Her relations with the Empress were agreeable, as she was very graceful, and she *exalted* herself (*elle s'exaltait*) to the Emperor, who always treated her with great consideration. She was almost the only woman with whom he conversed. My mother said sometimes, at the end of the Empire: 'Va, je t'ai trop aimé pour ne point te haïr.'"

This sentiment is very visible in the portrait of Napoleon which opens the volume. There is in this long and minute delineation of Napoleon a curious application of the "odi et amo" of Catullus. This portrait is of extraordinary interest, and it adds something to our knowledge of Napoleon's character. It is certainly interesting to know that he was naturally sad and dreamy; that he was fond of ghost-stories and liked melancholy music; that he preferred the music of Paesiello, "because it is monotonous, and repeated impressions are the only impressions which become masters of us." He was always analyzing his own emotions and the emotions of others. His manners were not good. "It seemed," says Madame de Rémusat, "as if he had been irrevocably born to live under a tent; . . . he does not know how to enter a room or how to leave it. His gestures are abrupt, like his way of speaking. In his mouth Italian lost all its grace. Whatever language he spoke, it always seemed unfamiliar to him." His choice of books was limited. When he married the Archduchess Marie Louise he presented her with 'Les Contemporaines' (a novel by Rétif de la Bretonne), so that "she might form an idea of the feelings and usages of society."

Napoleon despised women. He did not often speak to them, and always did so with some embarrassment. To be sure, the women he knew under the Directory could not give him a high opinion of their sex. The old society was gone, and he only met the wives of contractors and of Terrorists. "He would have willingly advised that, in a well-organized society, we should be killed, as some insects die, as soon as we had accomplished the work of maternity." He had, however, had some affection for his first wife. He saw in her the instrument of his fortune. She made him general through her influence over Barras. She was of a good family, and he was proud of her. "Though he preferred her," continues Madame de Rémusat, "I have seen him in love three or four times; and it was then that he gave the measure of his despotic character. How angry the least obstacle made him! How rudely he treated the jealous uneasiness of his wife! 'You must,' said he to her, 'submit to all my caprices, and find it quite natural that I should give myself such distractions. . . . I am apart from all the world, and I accept nobody's conditions.'"

I am somewhat embarrassed in relating the details of the life of Napoleon and his first wife. Madame de Rémusat was only twenty-two years old when she was appointed lady-in-waiting to Madame Bonaparte, and she became the witness of very singular incidents. The Consul dined alone with his wife at Saint Cloud usually. Twice a week he had some guests, and once a month he gave a great banquet to a hundred persons in Paris in the Diana Gallery in the Tuileries. At these banquets he wished the guests to be dressed with much splendor. Madame Bonaparte was very jealous. She could have no children, and she was always trembling for her future. The family of the Consul detested her, as well as all the Beauharnais, who belonged to the old régime. "Sometimes I found Madame Bonaparte in tears," says Madame de Rémusat; "and then she began bitter complaints against her brothers-in-law, against Madame Murat, and Murat himself, who tried to excite in the Consul momentary caprices and who favored his secret intrigues. I perceived very soon that if Bonaparte loved his wife it was because her ordinary sweetness gave him some repose, and that she would lose her empire by her agitations."

One of the beauties who attracted for a brief season the attention of Bonaparte was the actress Mademoiselle Georges, who played in tragedy.

"Madame Bonaparte learned by the valets, who had become spies, that Mademoiselle Georges had been several times secretly introduced into a little apartment of the château. This discovery threw her into great disquietude, which she shared with me, and began to weep more than this passing affair required, in my opinion. . . . Her discontent led me to think that there was some exaggeration in the bitterness of her complaints. If she was to be believed, 'he had no moral principle, he concealed his vicious propensities because it was for his interest to do so, but by and by the world would see him abandoning himself to the most shameful passions. Had he not seduced his sisters one after the other? Did he not believe that he was so placed in the world that he could satisfy all his fantasies?' She was always afraid of a divorce. Bonaparte wanted an heir. 'But, Madame,' said I, 'it seems to me that the child of Madame your daughter repairs this misfortune; the First Consul loves her, and finally will adopt this child.' 'Alas!' said she, 'it is my wish; but the jealous character of Louis Bonaparte will always be an obstacle. His family have told him the outrageous lies which have been spread about on the subject of my daughter's conduct and the birth of this child. Calumny attributes this child to Bonaparte—that is enough; Louis will never consent to an arrangement with him.'"

Madame de Rémusat informs us that as soon as Bonaparte was occupied with another woman he became very harsh to his own wife. He cruelly informed her of it, and "he showed an almost savage surprise when she did not approve these distractions, which he demonstrated to her almost mathematically were allowable and necessary. 'I am not like another man,' said he, 'and the laws of morals or of conventionality are not made for me.' As soon as his caprice was gone he became again good, almost tender, to his wife."

"Bonaparte had still," writes Madame de Rémusat, "the habit of remaining every night with his wife; she had cleverly persuaded him that his personal security was interested in this intimacy. . . . Every night she only left us when she was advised that Bonaparte was in bed. But when he took this fancy for Mademoiselle Georges he sent

for her very late. . . . One evening Madame Bonaparte, more anxious than usual, had kept me with her, and spoke to me of her troubles. It was one o'clock in the morning. We were alone in her drawing-room; the Tuileries were silent. Suddenly she starts. 'I cannot bear this,' said she. 'I am sure Mademoiselle Georges is up-stairs; I must go and see.' I did all I could to stop this resolution. 'Follow me,' said she. . . . There we were, walking silently, Madame Bonaparte first, very excited, and myself behind her, ascending slowly the small staircase which led to Bonaparte's room. A slight noise was heard; Madame Bonaparte exclaimed: 'It is perhaps Rustan, the Mameluke, who guards the door. This man will perhaps kill us both.' I was seized with a ridiculous fear, and, without thinking that I left Madame Bonaparte in utter darkness, I went down again with the candle and returned rapidly to the drawing-room. She followed me a few minutes afterwards: when she saw me she began to laugh, and so did I, and we abandoned her enterprise."

It is almost necessary to apologize in translating such stories; but I suppose that I can say as much as this young *dame d'honneur* of twenty-two. Besides, such stories are very characteristic; they throw a great light upon Bonaparte and his family. Poor Josephine has remained very popular in France notwithstanding her just jealousy; among the people it is believed that she was the good influence, that Bonaparte was happy as long as he kept her, and that fortune abandoned him when he abandoned her.

THE SITUATION IN AFGHANISTAN.

London, Oct. 29, 1879.

GENERAL ROBERTS has effected an advance upon Kabul at an earlier date than I anticipated when I wrote to you a month or six weeks ago. This advance was accomplished by means of a very desperate device on the part of the Indian Government. My estimate of the time that would have to elapse before a force sufficient to march to Kabul was collected in the Kurram Valley was based upon the difficulty of collecting baggage animals. At the time when Major Cavagnari and his companions were murdered the camels with the Kurram Valley force were dying at the rate of three hundred and fifty a week, and it seemed to me impossible, in the drained condition of the Punjab, to make good this appalling waste. The impossibility of doing so very speedily became apparent to the Indian Government also. But there were many hundred camels in the desert between the Indus and the Bolan Pass which conveyed supplies and linked the troops at Kandahar with their base at Sukkur. Despairing of any other way of obtaining the requisite transport, the Government of India transferred all these camels from General Stewart to General Roberts. This transfer renders it impossible to despatch reinforcements to Kandahar if there should be a rising in that part of Afghanistan, but it enabled General Roberts to march to Kabul. The advance, as it turned out, was brilliantly successful; but the peril was great. General Roberts (I calculate) had not more than five thousand men with him, and his carriage was so scanty that in the advance upon Kabul the troops had no food with them except what they carried in their haversacks. Had the Afghans been sufficiently united and determined to have held the heights in the rear of Kabul for two or three days, want of food would have obliged General Roberts to retire. For the moment, however, he is secure in Kabul, and the difficulty now is to know what we are to do next.

The Ministry are steadily pursuing their foolish and dishonest policy of withholding the true state of things from the nation. Newspaper correspondents were not allowed to accompany General Roberts's march, and no particle of information appears in the London journals regarding Afghanistan which has not passed through official channels. This information is simply worthless, except to those who, having been in Afghanistan, can read between the lines; and much which was authoritatively stated from Simlah has already been falsified. There is a purpose in the continuous stream of prevarication which flows from the seat of the Government in India. It is to minimize as far as possible the extent and intensity of the hostility aroused against us in Afghanistan. But the endeavor to suppress the actual facts becomes, with every succeeding day, increasingly difficult. The tribes that swarm in the Kurram Valley are all up against us. The troops on the summit of the Shutar-Gardan have been withdrawn to Kabul, their position there being no longer tenable. They were beleaguered by swarms of hostile Afghans, who actually at one time obtained possession of their water, and were so confident of destroying the entire detachment that they sent a message to the officer in command, offering to spare their lives if they would lay down their arms. The timely arrival of a force from Kabul caused the besieging tribes to disperse. But the whole country between the Shutar-Gardan and British territory is in a state of insurrection, and the English detachments in the Kurram Valley are to be withdrawn close to our own frontier. Consequently, that part of the "scientific frontier" which consisted in the right to garrison the Kurram Valley we have already virtually abandoned. The prudence of this conduct no one can question; the road across the Shutar-Gardan is already closed by the approach of winter, and our troops, if retained in the Kurram Valley, would be merely a butt for the hill tribes to practise their rifles upon. But could a more striking proof be given of the fraud practised upon the nation in the matter of the "scientific frontier"?

General Roberts's communications with India now lie *viâ* Jalalabad and Khybar. At present these communications do not exist. A few hundred men have, it is true, occupied Jalalabad, but the want of carriage has prevented the advance of a large force through the Khybar. The road between Kabul and Jalalabad passes through the passes of Jugdulluck and the Khoord Kabul, in which General Elphinstone's force perished in 1841; and these are now said to be occupied in force by many thousand Ghilzais, as well as several of the regiments which opposed General Roberts's march upon Kabul. I do not, however, anticipate much difficulty in clearing these passes of Afghans. Our difficulties will commence later on when these passes are choked with snow, and convoys of supplies have to be conveyed through them for the use of the garrison at Kabul. This will be a duty of the most harassing description, in the execution of which both soldiers and camp-followers will suffer heavily. Meanwhile, to restore the lost communications of the Kandahar force, a light railway is being constructed across the desert as far as Dadur, and beyond that a tramway is to pass through the Bolan Pass to Quetta. This work is to be executed under the direct superintendence of Sir Richard Temple, the Governor of Bombay. He may be reckoned upon, with perfect certainty, to spend an immense quantity of money and to do the work as badly as it can be done. Sir Richard is the greatest master of the science of "eye-wash" that India has ever seen. No genuine work has ever been extracted from him, but of profitless energy the man has a superabundance, and what he will do on the present occasion will be something of this kind: He will ride, periodically, upon relays of horses between Sukkur and Dadur in very brief spaces of time; he will construct a *brummagem* railway, which the first week of rain will render unserviceable; he will write a long report, and not improbably be made a peer. But not more than this is to be expected of him.

So much for the military situation. A disaster such as happened to us when last we occupied Kabul can hardly happen again, because that was occasioned by the almost incredible imbecility of the men in chief command. But we have before us a costly and harassing winter campaign, in which the endurance of the soldiers will be sorely tried, and the mortality in the native regiments and camp-followers cannot fail to be very great. But when we turn to the political aspect of affairs the outlook is dark indeed. There is, to be sure, one line of policy which would extricate us from our embarrassments with comparative ease, but there is not the least chance that it will be adopted. The abdication of Yakub Khan might become so far an advantage to us that it effaces the last vestige of the ridiculous treaty of Gundamuck. It leaves the Government at liberty to reconsider their policy *ab initio* in the light of present experiences. They might take advantage of this to summon Abd-al-Rahman Khan from Bokhara, invest him with the dignity of amir, and withdraw from the country with all convenient speed. Abd-al-Rahman Khan is the son of an elder brother of the late Amir Shir Ali, and a man of military ability and force of character. In the wars which followed the death of Dost Mohammed he bore a conspicuous part, defeated Shir Ali in a pitched battle, and for some time exercised the authority of amir in Kabul. He has a large following among the Afghans, and, if assisted by a subsidy from the English Government, would probably have a better chance of re-establishing order than any other chief. But there is no chance of this course being adopted. We shall remain in Afghanistan in order (according to the official phrase) to "reorganize the government." What we shall actually effect is to prolong the disorder. We are ourselves the cause of the anarchy prevailing in Afghanistan, and until that cause is removed the anarchy will continue. There are two reasons which render it impossible that we should restore order: we have neither officials to whom to give orders, nor the troops which would be necessary to get our orders obeyed. Our mandates in Afghanistan will be obeyed within the range of our Martini-Henry rifles, and not an inch further. Beyond that range each tribal chief will do what seemeth right in his own eyes.

All this time in India the horizon is heavily overcast. The joy of the North Indian Mohammedans over the catastrophe at Kabul was too great

to be concealed. It was openly expressed everywhere, and a very small cause would suffice to induce them to make common cause with their co-religionists beyond the frontier. This cause will shortly be supplied. The Government of India are already busy devising new taxes to meet the expenses of the war, and it is expected that these will take the form of a duty on one or more of the necessities of life to an Indian—such, for example, as tobacco and sugar. It is the only way in which fresh revenue can be raised; but I know also, on authority of the highest kind, that any such tax is expected to be followed by insurrection. Already that mysterious rite is being performed in India which preceded the outbreak of the great mutiny in 1857: I mean the passing from village to village, through vast tracts of country, of a "chupattie"—a kind of cake made of flour and water. It is a warning sent to the people to be alert and ready for some great event about to happen. The agitation, moreover, both in India and Afghanistan, will be largely fomented by the large bodies of troops which Russia will set in motion next spring in Central Asia, in order to avenge the serious defeat she has sustained at Geok-Tepe at the hands of the Tekke-Turcomans. There can be no question that she will make a great effort to subjugate entirely these marauders, and probably to occupy Merv. Should she succeed in this a cry will be sent up by our own Russophobists that all is lost unless we hasten to occupy Herat; and if we attempt that the beginning of the end will have come. With a half-subdued Afghanistan on our hands, we shall be confronted by mutiny in our native army and rebellion in India.

Correspondence.

MORAL OF THE VIRGINIA ELECTION.

To the Editor of The Nation:

Sir: I have been a reader of your paper for some time, and have been impressed by its calm and liberal views. Although differing from you on some important points of political opinion, I have thought that perhaps a few reflections upon the recent remarkable election in Virginia may not be deemed too unimportant to occupy a portion of your space.

The result of the election has been contrary to the expectation of the Debt-paying (or, as you call them, the "anti-repudiationist") party on the one side, and has exceeded the most sanguine hopes of the Readjusting party on the other. It is far more important than either side believed it a few months ago. A question of local interest has brought about a state of affairs which may change the entire current of politics in Virginia and become of national moment. Its effects may be summarized about as follows: The color-line is broken, and the negro as a class is henceforth a subordinate factor in Virginia politics. Secondly, by the loss of the class which has heretofore been its principal support, the Republican party has, after an outing of a decade, sprung, as if by magic, from utter insignificance into a position from which, provided it possesses the requisite virtue and prudence, it can control the State. And, lastly, Virginia may become once more a power in national politics.

The "true inwardness" of this contest in Virginia has not been what the outside world believed it to be. It has not been merely the question of the payment of the State debt, and the result should not be accepted in its *prima-facie* aspect. Whilst the repeal of the bill known as the McCulloch Bill, passed by the last Legislature to refund the State debt at a diminished rate of interest, has been the ostensible issue, and whilst the "Debt-paying" wing of the party, composed of the real taxpayers of the State, has honestly been striving to carry out the provisions of the act and prevent further agitation of the question, the other wing has really been fighting to obtain control of the State Government and secure the United States Senatorship, having possibly at the same time an eye to the management of one of the great railway lines of the State. The repeal of the new Funding Bill has been used by this party merely as a means to this end. Although an earnest supporter of the McCulloch settlement, I am constrained to admit that I do not consider it in danger from the successful party. Having used it before the people, and by its pretended terrors secured the almost solid negro vote, other objects now engross their attention. Even should they be able to retain the co-operation of the Republican Readjusters, they would have a bare majority in the General Assembly, and the Governor would veto any bill they might pass disturbing the settlement; and before they could go again to the country the bonds will probably all be funded and safe within the protection of the Court of Appeals. This the Readjusters understand, so that, although they may agitate the question this winter and force a veto to use as capital before the people at the next election, any panic about the repudiation of the debt is groundless.

The election, therefore, has not affected the status of the debt; but it has produced other grave results. It has destroyed the color-line and killed the Conservative party. I do not mean that the great principle of the Conservative party—devotion to Virginia and her old traditions—is dead, for the new party which will arise will probably inherit, or rather take, that with it; but the Conservative party, as it has existed for ten years past, is probably defunct. Having some virtues and not a few sins to its account, broken at last by dissensions within itself, it has literally gone to pieces, and its fragments drift helplessly at the disposal of any salvager who has the sagacity to save and use them. Its history is a curious one. Born more than ten years ago of the necessities of the time, bold, defiant, intolerant, chivalrous in its aims, unscrupulous in its methods, it claimed the virtue of the cavalier and employed the arts of the Jesuit. Cut off by the Federal Government from any share in the national patronage, it compensated itself by monopolizing the spoils of the State offices. Without fear of opposition success has naturally grown into excess, and at length the party has split into two factions, each striving for the supremacy. After a bitter contest between them, in which, like rival prelates of old, each, claiming to be the only true, lawful, and apostolic party, has excommunicated the other with all the solemnities of bell, book, and candle, the event has found them too far apart ever to unite again, and each is too weak to enjoy the fruits. In this condition either wing is willing to offer terms to the Republican party, and there is no reason why a coalition may not honorably take place. The causes which necessitated the organization of the Conservative party two years ago no longer operate. The carpet-bagger has disappeared or become assimilated; the color-line demarcating the Republican party is obliterated. One of the demonstrated facts of this election is that, no matter which side the majority of the respectable whites espouse, the majority of the negroes will take the opposite; and in this very contest they arrayed themselves against the whites, notwithstanding the efforts of the leading Republicans of the State, backed by the Government in Washington, to fling them on the side of the maintenance of the public faith. It is apparent that the Government has lost its hold on them, for the present certainly, and this is the best thing that could have befallen the Republican party. With a respectable proportion of the best white citizens of the State ready to enter into terms with it, the Government can afford to let the negro go, whilst, on the other hand, the whites are willing to appease the ultra radicals at the North by making such substantial concessions to the negro as admitting him into the jury-box and repealing the capitation-tax amendment.

With reasonable skill and temperance the Republican party can, by waiving technicalities of nomenclature, secure the best people of Virginia, possibly even get a Republican Senator this winter, and perhaps obtain her eleven electoral votes in 1880. By altering the insane tone of the press, instilling a moderate amount of humanity into the Stalwart orators at the North, and treating us at the South at least as fellow-beings, it may make her Republican in fact if not in name. If it does this the "Solid South" is broken for ever, and with the Solid South goes the Solid North. The Republican party will control the country; but the opposing party will be strong enough to compel it to be virtuous and liberal, and the result will be an era of prosperity and progress unprecedented in the annals of the Union.

Virginius.

Richmond, Va., Nov. 10, 1879.

THE *NATION*, THE SOUTH, AND THE DEMOCRATIC PARTY.

To the Editor of The Nation:

Sir: I have been a subscriber to your paper for a good many years. Perhaps no better proof could be given that it was to me generally satisfactory. But of late there has been, in my opinion, such a fall from grace that I may be driven to the extreme measure of stopping my subscription. Before dealing so severe a blow, however, it may be well to give the particulars of my complaint.

The general course of your editorials satisfies me that you, like myself, are far from being a thorough admirer of either of our great political parties. You will probably agree with me that popular ignorance is an important factor in our politics, and perhaps also agree with me that it operates mainly in favor of the Democratic party. The Irish day-laborer is inevitably and invariably a Democrat under all circumstances, and whatever question may be at issue. His name is legion, and his ignorance is Egyptian darkness. According to my observation, the optimists

who call themselves philosophical politicians habitually leave this element —viz., of popular ignorance—entirely out of view. They close their eyes to it, and obstinately refuse to see it, or to acknowledge its existence. Yet of all the elements that enter into our politics it is the most permanent and invariable. It is the element which gives permanence and stability to the Democratic party, and makes it substantially certain that while the Federal party, the Whig party, and the American party—indeed, all other parties—must successively disappear and become things of the past, the Democratic party will always be "on hand." Not only so, but wherever there is a large accumulation of popular ignorance; wherever the darkness is the thickest; wherever the dangerous classes are the strongest, the Democratic majority is the strongest and the most obstinate.

The practical result of all this is that Democracy means Tweed and Judge Barnard. It means Jim Fisk and Judge Cardozo. Without claiming any superhuman virtue for Massachusetts, and acknowledging that Ben Butler is the growth of our soil, I still claim that she has not yet produced any monstrosities to rival those just named. The corrupt judge is a thing unknown among us, and though our thieves may have plundered the public enemy they have not yet been detected in stealing from our own treasury. When this State becomes Democratic we may perhaps take a new departure.

Far be it from me to deny that the Democratic party has had its statesmen and its great men. Perhaps it has such now, though who they are may be somewhat uncertain. It is undoubtedly true that the people of this country, without distinction of party, desire that the government of its affairs should be honestly and faithfully administered. In the absence of any clearly-marked issue at the present time between the two parties, the question of civil-service reform has become peculiarly prominent. Is it possible that you can delude yourself with the chimera that any such reform can have one moment's consideration from the Democratic party? Why should you indulge yourself so perseveringly in sneering at the Cabinet and the Administration for the reason that, in the midst of enormous disadvantages and impediments, it has not yet cured evils that have grown nearly inveterate, and has not yet done all that was hoped for in the proposed reform? It has at least made a beginning and accomplished something to put down the patronage so long usurped by members of Congress. It is the only party that even promises such a reform. We all know that if the Democratic ascendency is restored all prospect and possibility of such a reform is buried deeper than plummet ever sounded.

You have a right to turn Democrat if you choose, but what right have you to misrepresent the moral which the other side undertakes to draw from the Southern atrocities? We at the North have no right to object if our Southern neighbors have a taste for murdering one another, and if Southern juries can see nothing criminal or improper in such amusements. The lawlessness and barbarism of the South are nothing new. But while you are sneering at the "bloody shirt," and speaking contemptuously of "second-hand" murders in Mississippi, you miss the point of the argument. We care "precious little" if one ruffian shoots another in Georgia or South Carolina; but honest voting, and honest counting of votes, are an entirely different matter. We hear much of the "solid South" about this time, and if that unanimity is fairly and honestly produced nobody can complain of it. But unanimity produced by force and violence; the suppression of minorities by intolerance and by threats; the discouragement of opposition by shooting its candidates, all this we object to. I regret that in this objection you do not seem to concur.

Respectfully your servant, J.

Boston, Nov. 10, 1879.

To the Editor of The Nation:

Sir: During the past decade of reconstruction, carpet-bag and negro rule, rapine and stealing, Federal armed interference and oppression, and steady ruin of the Southern States your ably-edited paper has justly been regarded by our at times almost hopeless people as one of the few conservative, liberal, independent journals published in the North; and during those dark days many of us became subscribers, or at least regular readers of it, recognizing in it an evidence that sectional hatred had not entirely poisoned the journalistic mind of the whole North and swept away every vestige of justice towards a brave people. But a radical change came over your paper about a twelvemonth since—a complete somersault was executed by it; and we find it during this period vieing with the extremest Stalwart organs of East and West—viz., the New York *Times* and *Tribune*, the Cincinnati *Gazette*, the Chicago *Times* and *Inter-Ocean*, and Col. Harper's Okolona *Southern States*—in its wholesale vituperation and abuse of the South and Southern people, differing only in its more dignified style and language, but thereby carrying more weight with its deliberate, unjust, and untruthful aspersions of the entire people of the Southern States—notably in your weekly articles on the Chisholm and Dixon affairs, in which you, without a knowledge of the characters of the parties or the attendant circumstances, unhesitatingly branded the people of entire counties and a whole State as murderers and outlaws. Twice I marked articles of this nature with the intention of returning the paper, accompanied by a request for its discontinuance; but your foreign correspondence is always of interest and your literary criticisms able and instructive, and hence we still *tolerate* in our household the *Nation*.

This is plain, hard language, but I am a Southern man and feel keenly the injustice when it comes from a source which professes to be *independent* and *conservative*.

I am pleased to note a marked change in the tone of your every article on Southern subjects in your issue of Oct. 30. Until the *Nation* ceases to follow the lead of Stalwart organs, and treats Southern questions with fair-minded justice, it cannot expect increased circulation in our midst.

Respectfully, Subscriber.

Natchez, Miss., Nov. 5, 1879.

[The phenomenon which "J." calls our "fall from grace" is apparently the same which "Subscriber" calls a "radical change" and "complete somersault." The accounts which these two observers, one witnessing it in Natchez, Miss., and the other in Boston, give of it differ so widely, however, that we feel that it is too obscure in its nature and origin for us to hope to throw any light upon it. That something remarkable has happened to us within a twelvemonth seems clear from the testimony of these two highly respectable witnesses watching us at points fifteen hundred miles apart; but whether it was our joining the "extremest Stalwarts," or allying ourselves with the Democrats, is something we are not competent to decide.

We shall, however, say in reply to some of "J.'s" remarks that while we agree with him in thinking the Democratic party essentially the party of ignorance, and likely to remain so (an idea which we have set forth in these columns a hundred times at least), and therefore expect little or nothing from it in the way of reform, we do not agree with him or with many other good Republicans in thinking that for this reason nothing in the way of reform ought to be expected from the Republicans either; and yet this is a doctrine which the Stalwarts are constantly forcing on us. What they say, in substance, is that the Democrats are so bad that all the Republicans can do is to denounce them vigorously and keep the offices for themselves. We, on the other hand, believe that the duties and responsibilities of the Republicans grow in the ratio of their moral and mental superiority to their enemies; that it is not only their duty to live up to their own platforms, but that their best chance of keeping their hold on power lies in appealing to the highest intelligence of the people through good government. They have no right to throw civil-service reform overboard and flinch from honest treatment of the finances, or seek safety from puzzling problems in the arms of "a Strong Man" because the Democrats are so wicked and ignorant; nay, the wickedness and ignorance of the Democrats make it unwise, from the party point of view, to do so. For instance, no good that such a person as Silas B. Dutcher could possibly do by half a dozen stump-speeches can make up for the scandal and disappointment and damage to the cause of reform worked by the abandonment of its own principles, when the Administration allowed him to leave his official duties to become a roving campaign orator. The badness of the Democrats does not excuse this—it aggravates it.

As to "murders," they are proper party ammunition when it is proposed to adopt some measure of legislation or administration with a view to their prevention—as, for instance, Irish murders might be in the British Parliament, or Sicilian or Neapolitan murders in the Italian Parliament. Murders might, in fact, if too numerous or difficult of detection for the existing judicial machinery, properly become, in such cases, a party question on which power

might rightly be lost or won. Murders, too, may properly be used to discredit a party which fails to punish them, as in the present case here; but when no party action with regard to them is proposed, mere denunciation of them cannot be allowed to be made the sole work of the party, and a sufficient substitute for attention to all the interests with which the party is called on to deal directly by legislation. The use of them for this purpose is odious and ridiculous, and may be wicked and brutal. The last canvass in this State was conducted by the Republicans solely on two murders at the South, which they did not pretend to have or have had the power to punish, and the connection of which with politics was very slight, if such connection existed at all, while everything for which the party is really responsible was kept studiously out of sight. To "J.'s" insinuation that we have no objection, or have concealed our objection, to the production of unanimity at the South by violence and intimidation, we can only reply that in making it he is guilty either of careless reading of our columns, which we do not think a grave offence, or of gross misrepresentation of what he has read, which is a very grave offence.—Ed. Nation.]

SILVER AND THE SILVER CONFERENCE.

To the Editor of The Nation:

Sir: Since my return from Europe I have been made acquainted with the satirical reflections of my friend Mr. Halstead, of the Cincinnati *Commercial*, on a short note which I addressed to the *Nation* from Wiesbaden on the 10th of July last. In that note I stated my conviction that there had been no change of public sentiment in England or France to warrant the expectation of their entering a new international silver conference. A few days later the Kelley-Bismarck interview was published, whereupon Mr. Halstead aimed sundry arrows in my direction, which of course went wide of the mark, as I had not committed myself to any opinion whatever respecting the attitude of Germany.

It would not be justifiable to return to so old a controversy for its own sake, but, as the subject is still fresh and is likely to come before Congress soon, I will add a few words to what has gone before. The Kelley-Bismarck interview may have been important to Mr. Kelley and Mr. Halstead. I do not think it was important to anybody else. I visited Berlin some weeks after the interview was published, and I noticed a degree of sluggishness and indifference to silver in the public councils of the Empire truly amazing when compared with the glowing periods of Mr. Kelley and the sparkling witticisms of Mr. Halstead. It is well known that a special commissioner of the United States, of the highest character and attainments, visited Berlin in the month of September in the interest of the proposed international monetary conference. If the adhesion of Germany to the conference had been obtained, doubtless Mr. Kelley and Mr. Halstead would have heard of it before this time. Such adhesion may, perhaps, be secured at some future time, but for the present I think that the London *Economist* is very near the truth when it says (October 18) that, "although they [the Germans] are not likely to retrace their steps"—*i.e.*, to adopt a double or alternative standard—"they are willing to make a much larger use of silver in their currency than was at first contemplated." It is plain to any traveller in Germany that there is a scarcity of silver subsidiary coinage, the five-mark banknote being still in circulation everywhere, although much tattered and begrimed, and although long ago called in for redemption. These dilapidated bits of paper would not circulate if there were a sufficiency of silver; and, in fact, I heard frequent complaints at hotels, railway stations, and theatres of a lack of small change. To fill up this gap will probably be the first endeavor of the German Government. Whether they will go any further is at least doubtful, Mr. Kelley and Mr. Halstead to the contrary notwithstanding. Frankfort bankers with whom I conversed said roundly that a return to the silver or silver-and-gold standard was impossible.

At all events one thing is certain: neither England nor France nor Germany has yet signified its assent to a new conference. Congress must this winter take notice of that fact. If the silver-men believe that further efforts to bring those countries in are likely to be crowned with success, it is obviously their wisest course to stop temporarily the coinage of silver dollars, in order to put as much pressure as possible upon them, and especially upon England. The price of silver is now advancing, and the more it advances the less interest is England or any other country (even our own) likely to feel in artificial measures to "restore its value." Our coinage of two millions per month not only imposes a useless burden on the mints and the Treasury, but it relieves to that extent the pressure upon the foreign silver market, the Indian exchanges, the German treasury, etc.

If, on the other hand, there is no probability of a new international conference, then certainly we ought not to coin any more silver dollars until a use is found for those we now have. The Director of the Mint, himself one of the hot advocates of the Silver Bill in Congress, says in his current annual report that "if European nations continue to decline overtures for an international agreement in regard to the coinage of silver, the expediency of opening our mints to the free coinage of their present stock of silver, and inviting its speedy demonetization or export here, is questionable." Rather! He goes on to show that whatever may be the situation and needs of other countries, there is no doubt that the United States can obtain enough gold for all their purposes. In other words, England, France, and Germany may be so distressed as to require the remonetization of silver, but the United States are able to help themselves to the world's stock of gold with the utmost freedom, so that "the commercial disaster and depression threatened or feared as the result of restricting the commercial world to one metal are more likely to fall upon the nations that initiated and are responsible for the movement." This is perfectly true, and it might be called "taking a high position." For my own part I think we have been soliciting foreign attention long enough—that, for a country which admittedly has nothing to fear from a short supply of gold, we might be in more dignified business than dancing attendance year after year on the finance ministers of Europe. The exclamation of another Ohio sage, "What have we to do with abroad?" has now some pertinence.

We have now coined forty-five millions of silver dollars, all but a fraction of which remain an inert mass in the Treasury, and the people are taxed two millions per month to add to the stock. The question is asked how long this process can go on without causing disaster—that is, without bringing us to the silver standard. I answer that it can go on as long as the people are willing to pay the two millions per month and provide vaults to hold the resulting silver dollars. When they get tired of the game it will probably be stopped, and then there will be a dispute as to what shall be done with the accumulated stock. If it shall then be decided to sell it off, as is not unlikely, I trust that Mr. Halstead will step up like a man and pay his share of the loss, proportioned to his share of the responsibility for incurring it.

Horace White.

New York, November 17, 1879.

MR. BERGH AS A COMMENTATOR.

To the Editor of The Nation:

Sir: In my previous enquiries into the curious change of front sometimes shown by quotations in the hands of Mr. Bergh our attention was occupied by the cases of Colin and Carpenter.* Both these gentlemen are foreigners, one of them being a Frenchman, the other an Englishman. But there is another eminent physiologist, who, though French by birth, has spent so much time in this country that he is not only widely known to us by reputation, but is personally familiar to many in the United States. This is Dr. C. E. Brown-Séquard, at present occupying the Chair of Medicine in the College of France as the successor of Claude Bernard. Dr. Brown-Séquard's studies have been mainly devoted to the nervous system, and he has sought, with great skill and untiring industry, to unravel its secrets by the experimental method.

It is unnecessary to say that experimental investigations in the nervous system require the greatest care in their performance and application. The structure of the parts is so complicated, and the possibility of their sympathetic reaction so constant, that every precaution is necessary to avoid uncertainty or failure. Nevertheless, success in this department, though difficult, is not impossible; and, with everything that still remains in doubt, a certain number of important facts with regard to the nervous functions have been established to the satisfaction of all. Dr. Brown-Séquard has won his reputation, in great measure, by investigations on the spinal cord—a part which is at once of fundamental importance in the nervous system, and also less complex in structure than the brain and its appendages.

According to Mr. Bergh, Brown-Séquard has an exceedingly low opinion of experiments on the spinal cord; and he quotes him, in the New York *Tribune* of September 26, 1874, as expressing this opinion in very plain terms. The passage is as follows:

* The *Nation*, October 16 and November 6.

"Even Dr. Brown-Séquard himself, the very prince of experimenters, says: 'I must say that it is impossible to know, while we make a section of parts of a spinal cord, what is the precise depth of the injury; it is mere guesswork.'"

Evidently, then, there can be no use in making the section. As the whole object of such an experiment is to learn what nervous endowments belong to a particular part, if we do not know what part has been reached by the section we can get from it no useful information. But why did Brown-Séquard go on making such experiments when he knew that it was impossible to learn anything from them? Perhaps he can tell us.

The above quotation is from Dr. Brown-Séquard's 'Lectures on the Physiology and Pathology of the Central Nervous System' (Philadelphia: 1860). It is to be found on page 42 in a foot-note. Mr. Bergh gives the quotation correctly, so far as it goes. The trouble is, he does not give the whole of it. The entire passage is as follows:

"I must say that it is absolutely impossible to know, *while* we make a section of parts of the spinal cord, what is the precise depth of the injury; it is mere guesswork. But if we study well the phenomena, and then, after having killed the animal, if we put the spinal cord in alcohol, we render it hard, and we can ascertain exactly what is the extent of the incision. This is the means that I always employ in my experiments, and it is also the means employed by the committee appointed by the Société de Biologie in 1855 for the investigation of my researches on the spinal cord."

So it appears that Dr. Brown-Séquard has no doubt about the exact spot reached by his incision in the spinal cord; and no one who has the opportunity of reading his original passage can have any doubt about it either. Would it be too much to say that the audacity of curtailing his language to give it an opposite sense has something about it almost ludicrous?

I will touch upon an additional instance of this sort, more on account of the great name involved in it than because it is very different from the rest. In the New York *Herald* of September 30, 1879, Mr. Bergh denies that Harvey was the first discoverer of the circulation of the blood, and maintains that it is only a popular error to think so. But in any event, he assures us, it was not by the aid of vivisection that Harvey accomplished what he did; and, to make the matter sure, he quotes the great author himself. Mr. Bergh says:

"While correcting this idea of Harvey's discovery, my principal purpose is to show that it was not to vivisection that he owes his fame, for nowhere, so far as I can learn, does he assert that he discovered the circulation by vivisection. On the contrary, he tells us: 'When I first gave my mind to vivisections as a means of discovering the motions and uses of the heart, and sought to discover these from actual inspection, I found the task truly arduous—so full of difficulties that I was almost tempted to think that the motion of the heart was only to be comprehended by God. My mind was greatly unsettled, nor did I know what I should conclude'; and he adds: 'It was reflection which led to the discovery.'"

Now, if any one can be presumed to know by what means Harvey reached his discoveries, such as they were, it is probably Harvey himself; and if he tells us, as implied above, that vivisections only left his mind "greatly unsettled" on this point, so much the worse for vivisections. But Mr. Bergh stops in his quotation at a very convenient place. If he had continued to the bottom of the page the effect would have been different. The passage is from the 'Works of William Harvey, M.D.' (Sydenham edition, London, 1847), at the commencement of chapter i., page 19. The succeeding paragraph is as follows:

"At length, and by using greater and daily diligence, having frequent recourse to vivisections, employing a variety of animals for the purpose, and collating numerous observations, I thought that I had attained to the truth, that I should extricate myself and escape from this labyrinth, and that I had discovered, what I so much desired, both the motion and the use of the heart and arteries; since which time I have not hesitated to expose my views upon these subjects not only in private to my friends, but also in public in my anatomical lectures, after the manner of the Academy of old."

There is no such additional remark ("it was reflection which led to the discovery") anywhere in this chapter.

I think we must allow, therefore, that Harvey does attribute his discovery to the results of experiment, notwithstanding Mr. Bergh's difficulty in finding the assertion. J. C. D.

New York, Nov. 14, 1879.

ARMY RECRUITING.

To the Editor of The Nation:

Sir: In your remarks upon "R.'s" letter in your issue of October 9 you say: "R. overlooks the fact that our army and the English are the only ones in which the ranks are filled exclusively by volunteers, and therefore by men who, as a class, may be said to have failed, or despaired of success, in civil life." One of the premises from which you reason seems to be wanting. It must be either that there is no hope of success or advancement in the army, or that there is something degrading or dishonorable in military service. You advocate the promotion of deserving men from the ranks to the grade of commissioned officers to correct the present deplorable condition of the rank and file; and if your views were carried out there seems to be no reason why the army should not receive into its ranks as privates "the kind of recruits from which civil institutions, firms, and corporations draw their servants for the lowest grades." But we must first secure deserving men to promote, and grade the non-commissioned rank up to the commissioned by suitable rates of pay, and by attaching to the different grades facilities for self-respect and self-improvement.

By our present system of recruiting, offices are opened in the different large cities, not always in respectable localities, and the officers in charge consider their duties performed by accepting such recruits as present themselves who are physically qualified, and who show no marked symptoms of moral depravity. When the wants of the service have been for the time being supplied, the offices are closed until there is a further demand for recruits. It is evident that such a system would wreck any business corporation that should adopt it; and I think we need look no further for the "something wrong." It ought to be entirely practicable to procure from a nation of forty millions of people a sufficient number of recruits for an army of twenty-five thousand men, of fair intelligence and education and of good moral character, who have not "failed, or despaired of success, in civil life." In my experience I have not found that "the recruits to the army during the last five years have shown a high standard" either in education or morals. I have been captain of a company for seven years; during this time about two hundred men have served in my company. Out of this number but nine have had sufficient education to enable them to perform ordinary clerical duties, and of these nine four were of intemperate habits. More than fifty per cent. of the whole number by actual computation have been either intemperate in their habits or of depraved moral character. I have no reason to suppose that my company is exceptional in any respect, and, as far as my observation of other troops has extended, they have seemed to me to be composed of about the same class of men.

The only chance for improvement is to commence at the bottom and endeavor to fill the ranks with men from whom it may be possible to make promotions without danger of degrading the service.

A Line Officer from the Ranks.

October 22, 1879.

AN IMPORTANT DISCOVERY FOR MEXICAN ANTIQUITIES.

[We are permitted to print the following letter addressed to Mr. George H. Moore, Superintendent of the Lenox Library.—Ed. Nation.]

Dear Sir: Before leaving this city I beg to submit to you in writing, as agreed upon, the preliminary results of investigations on the subject of the documents found in your library under the title of 'History of the Mexican Indians' ('Historia de los Indios mexicanos'), by Juan de Tovar (or Tobar). They consist, as you had already stated, of a fragment of the said history, and of two letters, one from the Jesuit father Joseph de Acosta to the Jesuit Juan de Tobar, and the latter's reply thereto. There is the strongest probability that these letters were written between the years 1587 and 1589, whereas the historical fragment itself is of older date, as I shall hereafter relate. I can but repeat here the statements made by me to the Historical Society of New York on the 4th instant.

These documents derive their chief importance from the fact that they demonstrate a class of writers on Mexican topics, hitherto scarcely known except to very few students, to be the most authentic, truthful, and therefore reliable authors on aboriginal Mexican history and ethnology. These authors (whose works are now known to us to exist) are: Juan de Tobar (between 1569 and 1587), Diego Durán (1579 and 1581), Joseph de Acosta (1587 to 1590), and Fernando de Alvarado Tezozomoc (1598). The first two of these four were mestizoes, Acosta was a Spanish Jesuit, and Tezozomoc was an Indian.

These four historians agree most remarkably in their picture of the state of culture, mode of life, and social organization of the Mexican aborigines, as well as in most incidents of their history. On the other hand, they differ on many of the most important points from the other sources known to us since the sixteenth century. Whereas the groups of

historical writers, whose standard-bearers may be looked for in Gomara and Torquemada, paint for us an Indian monarchy based upon feudal tenure and mixed up with Oriental despotism, the four authors above named exhibit to the careful and critical reader the picture of a military democracy with communism in living. If the former treat of a Mexican nation, state, and empire, the latter mention sedentary Indian tribes, speaking dialects, engaged in constant warfare with each other except where (as was the case in the valley of Mexico) a confederacy of tribes was formed for the purpose of preying upon their neighbors. Gomara and Torquemada, however much we must admire them and their labor in gathering material, present to us only *European* versions of Indian stories, whereas the others give us the Indian side of them, and Tezozomoc even tells the tale in Indian "speech." The question as to whether full faith and credit should be given to the latter group of authors or not is therefore one of unusual interest.

Until lately the view of ancient society in Mexico taken by Torquemada and the bulk of writers since the sixteenth century has evidently prevailed. This was due principally to the fact that the sources whence they derived their knowledge were indicated in their works so profusely that we relied upon their authenticity without much critical examination. Many things were "taken for granted," and while it was admitted that the pictorial records of the aborigines, their tales and songs, were the foundations of these historical works, few attempts were made to investigate the true nature of that foundation and its connection with the authors who have built upon it. In fact, it is only now that we begin to see how Gomara relied upon Motolinia, and the latter in turn drew from that collection of native material *saved* between 1528 and 1540 at the instigation of the much-abused Bishop Zumárraga. (This point will be fully cleared up, I hope, by my distinguished friend, Señor Icazbalceta, of Mexico.) Torquemada's sources were known to be principally of Tezcucan origin, and it has been detected lately that he copied to a great extent, besides, from his clerical brother, Mendieta, who in turn was a plagiary of the Licentiate Zurita (1549–1569). There is furthermore a remote filiation to the Mendoza Codex (about 1549).

Of the four authors whom I have mentioned as representing views distinct from those of the two preceding ones, Acosta has stood quite alone in public prominence for two centuries. He was always esteemed, but the points in which he differed from Gomara and Torquemada were passed over as unexplained variations of minor interest. Little, if any, interest was taken in the question of *his* sources. For three centuries we have read in his book that the Jesuit Tobar, his contemporary, had taught him "these things," and that Tobar in turn had gathered his knowledge from paintings, and from songs and narratives which the viceroy, Martin Enriquez (1569 to 1582), had caused to be collected. Instead of looking up this book of Tobar it was preferred to listen to the politely-formulated accusation of Davila-Padilla that Acosta had copied, without acknowledgment, from the Dominican Diego Durán—thus implying that he had been dishonest, and was therefore unreliable.

About thirty years ago Lord Kingsborough incorporated the uncouth "Mexican Chronicle" of Tezozomoc in the ninth volume of his monumental collection. This prolix "Indian talk," endorsed by Veytia as "the most authentic version" of Mexican ancient history extant, I attempted to translate into the English language. Not only the peculiar view taken by Tezozomoc of ancient Mexican society struck me forcibly, but also his argument with Acosta. Applying thereupon to Señor Icazbalceta, of Mexico, for bibliographical and biographical information, this gentleman kindly sent me the first part of Durán's history, which had been found in Spain and published by the late Señor J. F. Ramirez in 1867. It wonderfully agrees with Tezozomoc. Finally, I received through the same friendly hand the print by Señor Vigil, edited by Señor Orozco y Berra, of an anonymous MS. saved out of the wreck of the Franciscan convent at Mexico in 1856, which MS., now known as the "Codice Ramirez," is evidently the source from which Acosta condensed the seventh book of his 'Natural and Moral History of the Indies.' The Mexican antiquarians have, therefore, come to the just conclusion that the "Codice Ramirez" is Tobar's work; only, as Durán states that he framed his own history in part out of a translation of a MS. written in the *aboriginal* language (Nahuatl) of Mexico, they have inferred that the "Codice Ramirez" is not an original composition, but a translation. This question is now fully solved.

The correspondence in your possession tells us that the Viceroy Enriquez caused the pictorial records of the natives to be gathered, "and those of Mexico, Tezcuco, and Tulla . . . brought them to him." These paintings he sent to Tobar through Dr. Portillo, and Tobar out of them compiled "for the king" a history which Dr. Portillo took with him to Spain about 1573, unable to fulfil his promise to leave a copy of it in Mexico. In compiling his work Tobar used the greatest discrimination. Not only did he have "the wise men of Mexico, Tezcuco, and Tulla" explain to him the system and value of their pictorial records, but he actually compared and confronted their testimony, thus securing not only thoroughness but impartiality.

Unable to secure a copy of his work, and seeing that the plague of 1575 swept away all the older natives to whose memory the traditions of the past were committed, Tobar, after 1581, wrote a *second* book on the subject. In this he was assisted by the history which a Dominican friar, his "relative," had written about it, though independently, and which (he says) "was most conformed to the ancient records which I have seen." This friar is evidently Diego Durán, who, like Tobar, was a Mexican half-breed. This second book of Tobar, Acosta, in the letter in your possession, acknowledges having read. He does not say, however, that he *kept* it.

I have now carefully compared, as you know, the "Codice Ramirez" and the historical fragment in the Lenox Library. There is not the slightest doubt *that both are the work of one and the same man.* While they are so nearly alike as to permit, as I had the honor to show you, omissions in either text to be supplied from the other in many instances, they still are *not identical.* The Lenox document is somewhat more brief than the "Ramirez." The latter is of greater finish; it almost appears to be a more mature and, therefore, *later* production. This, coupled with the fact that the title of your fragment closes with the words, "Made by Father Juan de Tovar, of the Company of Jesus, sent to the King our Lord in this original written by hand," has led me to infer that the Lenox text was that of Tobar's first work, written between 1569 and 1573, whereas the "Codice Ramirez" is the later compilation. Still, I must leave the question undecided, and limit myself to the affirmation that they are both works of one and the same author, and, therefore, not, as we have all supposed, one of them (the Mexican text) a translation of a "Nahuatl" chronicle underlying the work of Diego Durán.

We must look elsewhere, therefore, for the source of the latter, and I would suggest that a comparison of Durán with the "Anales de Cuanhtitlan," better known as the "Codex Chimalpopoca," might give more satisfactory results. At all events, we have two contemporaneous authors, Tobar and Durán, who have both arrived, though independently, at the same results, while resting on the most reliable foundation which can be desired in the case—namely, that of a careful and impartial, and therefore critical, sifting of aboriginal sources. One of these authors has been followed by Acosta; the other one, Durán, has probably exerted a direct influence on Tezozomoc. To *these four* now the endorsement of Veytia must be extended—namely, that they are "the most authentic versions extant of the ancient history of Mexico."

Finally, I can but repeat to you the statement made before the Historical Society, to the effect that the pictures themselves which the viceroy, Martin Enriquez, had gathered, and which Tobar (and Durán) consulted, are not all lost. The "Codex Vaticanus" (and, of course, that incomplete copy thereof called "Codex Telleriano-Remensis") dates back to *after* 1562, whereas it was sent to Rome, so Acosta tells us, *prior* to 1589. Its arrangement agrees singularly with that indicated in the title of the Lenox fragment for Tobar's book. Of course there is not a full agreement in facts, neither in dates; but such an agreement could not even be expected, since the codices mentioned formed at all events but a part of the paintings consulted by Tobar.

Hoping to be able to communicate to you more positive results shortly, I have the honor to remain, sir, with the highest respect, your very obedient,

AD. F. BANDELIER.

NEW YORK, Nov. 6, 1879.

Notes.

HARPER & BROS. will publish 'Art in America,' by S. G. W. Benjamin; 'Studies from the Great Poets,' by Prof. Symonds; and 'Young Mrs. Jardine,' by Mrs. Mulock-Craik.——'Aloha: a Hawaiian Salutation,' by the Rev. George L. Chaney; 'Stories of the War, Told by Soldiers,' edited by the Rev. E. E. Hale; 'The Faith of Reason,' by the Rev. John W. Chadwick; and 'Causerie,' selections from the department of that name in the Boston *Transcript*, by Wm. A. Hovey, are in the press of Roberts Bros.——Chas. Scribner's Sons will issue during this season the 'Life and Works of Gilbert Stuart,' by George C. Mason; and the

'Letters of Charles Dickens,' collected by his daughter and Miss Hogarth. They have embalmed the 'Complete Poetical Writings of J. G. Holland' in a handsome octavo of 509 pages, bound in bevelled boards, and furnished with a wealth of illustration, scarcely less interesting, perhaps, than the text. The designers are Reinhart, Hennessey, Griswold, Abbey, Thomas Moran, and Mrs. Foote, and among the engravers the curious will notice that Mr. Linton lies down with Mr. Smithwick and Mr. J. P. Davis, so that the "legitimate" and the "latest" methods may be easily contrasted. Messrs. Eaton and Cole provide as a frontispiece a characteristic portrait of Dr. Holland, who is therefore added to the series of leading American poets drawn and engraved by these gentlemen for *Scribner's Monthly*. From Scribner & Co. we have received bound volumes of *Scribner's Monthly* (XVIII.) and of *St. Nicholas* (VI.) In contents they compare favorably, as far as our memory serves us, with those which have gone before them. On the pictorial side they are, as usual, without superiors. ——Fords, Howard & Hulbert will be the American publishers of the sumptuous English work called 'The Lives and Portraits of the One Hundred Greatest Men of History.'——An exhibition of the works of the late Wm. Morris Hunt is now open at the Museum of Fine Arts in Boston, and will close Dec. 15. The catalogue, which embraces no less than 200 oil-paintings and 121 charcoal-drawings and pastels—an unprecedented collection for an American artist, unless we are mistaken—is adorned with a fine photograph of this lamented artist. A life of Mr. Hunt is in preparation by his brother, Leavitt Hunt, of Brattleboro, Vermont. ——A life of another New England artist, Seth W. Cheney, is being undertaken by his widow, Mrs. Ednah D. Cheney, who would be glad of any material that might be lent her for that purpose. Her address is Forest Hills Street, Forest Hills, Mass.——Messrs. G. P. Putnam's Sons have issued, with their imprint and in admirable style, the three-volume translation of Molière's dramatic works made by Mr. Charles Heron Wall and published in England in one of Bohn's Libraries. This is the third appearance of an English Molière in America within two years; the earlier two being the successive editions of Mr. Van Laun's translation in Philadelphia and New York. In reviewing these in the *Nation* (No. 738) we said that Mr. Wall's translation was much better than Mr. Van Laun's. He has a better idiomatic command of English and a better understanding of the duties of a translator. The ideal version of Molière would be an eclectic, the result of the use of the labors of all previous translators, utilizing whatever felicities of expression any one of them may have happened on. Failing this, Mr. Wall's translation is much the best now before the public. He follows the edition of M. Louandre; his notes and comments are brief and to the point, and the short biographical sketch prefixed is founded on fact and free from legend, although M. Loiseleur's researches, published since this sketch was written, might have been used in this new edition to correct the statements about Molière's funeral.——Mr. George H. Calvert has just put forth (Lee & Shepard) 'Shakspeare: a Biographic Æsthetic Study,' in 212 duodecimo pages. It begins with the "babe asleep in his cradle," whose "forehead was cool, and his cheeks, flushed by the healthy currents from his heart, glistened with the warmth of the midsummer noon," and concludes with some verses "On first seeing, in Central Park, the Statue of Shakespeare, by Ward." It appears to be due to a suddenly renewed sense in its author that Shakspere was a great poet.——'The Egotist,' by Henry T. King, of the Philadelphia bar, is announced by Claxton, Remsen & Haffelfinger.——We have received from Peter G. Thomson, Cincinnati, a 'Catalogue of a Gentleman's Library,' with prices marked, which deserves the attention of art-book collectors in particular.

—If the American people remain ignorant of the science and art of preserving the health it will certainly not be due to inactivity upon the part of either writers or publishers. Within the last few months G. P. Putnam's Sons have issued a cheaper edition of Fothergill's excellent 'Maintenance of Health'; the compendious 'Treatise on Hygiene and Public Health,' edited by Dr. Buck and published by Wm. Wood & Co., has been recently noticed in these columns; and sanitary information in a simpler and—to speak physiologically—more readily assimilable form is now presented from three different sources: Dr. J. Mortimer Granville's little papers on 'Common Mind Troubles' and 'The Secret of a Clear Head' come from The Naturalist's Agency; D. Appleton & Co. reprint the English Health Primers; and the American Health Primers are in course of publication by Lindsay & Blakiston. If all the eighteen volumes of this series by American authors are as readable and instructive as Dr. Osgood's 'Winter and its Dangers,' they are cheap enough, if regarded only as entertaining literature. Nevertheless, since people who are ready enough to pay largely for the *cure* of disease often hesitate to invest a much smaller sum for its prevention, we think it a pity that money and bulk were not economized by combining two or more of these fifty-cent books into single volumes of moderate size and cost.

—The indirect result of the competition which the Messrs. Harper have been waging for the past two years in their Franklin Square series with the makers of cheap reprints from English books, has been, we hope, to diminish the sales of the equally cheap sensational or nasty literature which, being abundantly produced on our own soil, is not concerned about international copyright. There remained a field in which a similar competition of what is pure in tone with what is vile was possible and highly needed, and that was the supply of reading for the young. Professor Sumner lately sounded the alarm in regard to the villanous trash now offered on the stalls to our boys and girls, and perhaps we ought to discern a conscious missionary enterprise in *Harper's Young People*, an illustrated weekly, of which the first number appeared November 4. It is an eight-paged paper bearing a family resemblance to the *Weekly* and the *Bazar*, and the publishers' name is an assurance that it contains and will contain nothing objectionable or calculated to fill a child's mind with false or low ideas of life. We hope it is superfluous to wish it success; at the same time we must confess that we prize it more in consideration of what it replaces than in and for itself. It seems to us very doubtful if periodical literature is wholesome for children who can have access to books and good advice in reading; and finding it hard to praise even juvenile monthlies, we naturally look with still less favor on a weekly. Nevertheless, we may even see the *Boys' Daily* before we pass away.

—A wonderful array of portraits accompanies the opening paper of *Harper's* for December, entitled "The Fortunes of the Bonapartes," which gives a good popular account of the kingly tribe from the First Consul to Prince Jerome. The writer might on another occasion dwell a little more on the American chapter in the lives of several of them. Of the amiable Joseph, during his stay at Bordentown, Dr. Lieber used to relate that he would often in the most unaffected manner introduce a reminiscence with the phrase "Quand j'étais roi d'Espagne," or "Quand j'étais roi de Naples." Mr. Ernest Ingersoll continues his Georgia studies with an account of the City of Atlanta, and any one unduly despondent concerning the regeneration of the South will be much comforted by his description. The second instalment of "The Connemara Hills" hardly equals the promise of the first. Mrs. Champney's "Sea-Drift from a New-England Port"—to wit, New London—shows in parts a clever historical imagination, but is on the whole as heterogeneous as its name implies, and as local antiquarian papers of this sort are wont to be. Some of the engravings for this article are of rare beauty of execution. A characteristic book summary rather than review, such as we expect in *Harper's* from time to time, is made here from Dr. Thomson's 'The Land and the Book' in the article called "The Palestine of To-day." The poetical feature of the number is a poem by Longfellow on an iron pen, "made from a fetter of Bonnivard, the prisoner of Chillon, the handle of wood from the frigate *Constitution*, and bound with a circlet of gold, inset with three precious stones from Siberia, Ceylon, and Maine." This odd mixture of relics offered as a theme for a poem reminds us of a kind of social puzzle in which, for example, you are asked to compose a distich containing the words *Pleiades* and *snuff*, and an answer to the question, "When shall you be fifty?" It is needless to say that Mr. Longfellow's success in this task could not readily be equalled by common versifiers.

—The contents of the *Atlantic* for December resemble the miscellany of a Sunday newspaper closely enough to avoid dulness entirely, if not to preserve the severe dignity of a monthly magazine. Some "Reminiscences of George Grote" are contributed by Mr. George Washington Greene, who, though he spent a month in daily intercourse with Grote, kept no record of his conversations, to his present regret, and is able to give only general impressions and a letter. "Three Interviews with Old John Brown" are described with ultra circumstantiality by W. A. Phillips; "The Man who was to have Assassinated Napoleon" is an anonymous sketch of an interesting life, though its title begs the main point at issue. The writer would have been saved several mistakes by consulting the documents printed in the 'Mémoires du roi Jérôme.' Thus Maubreuil received his orders not from the Emperor Alexander but from Talleyrand's secretary, Laborde. The Baron Brokenhausen, from whom he had credentials, was not "the Prussian Minister" but a Russian officer, chief-of-staff to the Russian commandant, Baron Saken. The stolen property, moreover, was not found boxed up at the bottom of the Seine in 1817, because the jewels had been delivered to an agent of the Count of Artois

April 22, 1814, and were restored to the Queen during the Hundred Days. Mr. Grant White writes entertainingly though minutely about "English Manners," and leaves his subject "but half exhausted," so that we may expect more next month; "Some of Us: A Southwestern Sketch" is more successful in its reproduction of local dialect than in its other intentions; "Kansas Farmers and Illinois Dairymen" has value as well as interest, and Mr. George E. Waring, jr., explains the functions and limitations of the National Board of Health in answer to much hostile criticism which that body has provoked. "The Greatest Novelist's Work for Freedom," by Clara Barnes Martin, is a fresh and interesting account of Turgeneff's life and work. We note a not important error: "the greatest novelist" is not a nephew of the celebrated brothers Turgeneff, Nicholas and Alexander, as Mrs. Martin says, but only a distant relative. The "Club" contains a poem by Daudet, and an explanation, by the author, of Rosamond's character—who Rosamond is it would be superfluous, apparently, to relate. Further light on it is thrown by a sequel to the original story in the body of the number, entitled "The Conductor and Rosamond," which is very well done. There is one poem full of dashes that are explained, perhaps, by the circumstance that it is supposed to be spoken by a dying woman. Of the first article, "Thirty-seven Hundred and Fifty-eight," we can make little; it describes the archæological discoveries of the New-Zealander in the year 3758, and essays both satire and solemnity, but it is oddly destitute of the humor which has hitherto been the excuse for writing it. It is, however, to be continued, and its worth may become plainer.

—The current *British Quarterly Review* has an interesting and, if we may say so without offence to the scientific world, timely article by Mr. R. Caird on Father Curci's work, 'The Modern Dissension between the Church and Italy.' Father Curci is as much of a Liberal Catholic as it is possible to be and avoid the contempt of Vaticanism or even of orthodoxy. He advises that the Church "lay aside her theory of legitimism, acquire a predominant influence in journalism and in education, and so reappear once more in the van of civilization." This seems a radical, not to say revolutionary, programme. How difficult it would be to carry it out, or so much as interest the ruling powers of the Church in it, appears quite plainly in several recent orthodox utterances. Mr. Caird does not think much of Father Curci himself; he closes the latter's book, he says, "muttering, with a clenched conviction, *Semel Jesuita, semper Jesuita.*" But we imagine his mutterings would acquire positive sonority if he should read the evidence furnished by the *American Catholic Quarterly Review* of the way in which the majority of Catholics regard such liberalism as Father Curci's. The *Quarterly* must express the views of the majority of Catholics, of Catholicism itself we may say, since evidently it can have no other excuse for existing, and we accept its statements as authoritative. The Rev. J. Ming, S.J., has an essay in the last number on "Modern and Ancient Philosophy Compared," and the Very Rev. James A. Corcoran, D D., a review of the Holy Father's recent Encyclical, from which we judge that, unsatisfactory as Father Curci is to Mr. Caird in his reliance upon the dicta of St. Thomas Aquinas, no such scheme as that of a discontented and dismissed Jesuit for the reappearance of the Church in the van of civilization is likely to be popular. According to Father Ming, "Catholic philosophy has during the past twenty years more and more returned to the scholastic system," and he fears in consequence "the raillery of infidels and generally of those outside the Church." "To prevent or reject such charges it will be necessary," he adds, "to contrast modern with ancient philosophy." Therefore he proceeds to examine with considerable causticity "modern philosophy." With conspicuous conservatism he accounts as modern philosophers of any importance only Descartes, Kant, Fichte, Schelling, and Hegel. His exposition of their systems is elaborate, but the reverse of enthusiastic. Descartes he does not admire, but observes sarcastically, "The idealists"—*i. e.*, the modern philosophers—"have no reason at all to be pleased with his theories," since he not only believed in God, but "also highly esteemed supernatural faith, of which he would not allow the least doubt." Kant "has fallen into just those errors which he pretended to overcome," and his successors have succeeded no better. "Is it not useless to criticise them?" asks the writer, their "absurdity is so evident to common-sense." "Atheism, Materialism, and Nihilism are their genuine offspring," and "even the political errors of our time are based on idealism." They have even led, we learn with surprise, to the neglect of philosophical studies in Germany. The remedy is that insisted on by "our glorious pontiff"—namely, "a still more complete adoption of the tenets of St. Thomas Aquinas."

—The performance of Verdi's "Aïda," which was reproduced on Friday last, was certainly by far the best thing which Colonel Mapleson has done here this season. More superb and appropriate costumes and more beautiful scenery have perhaps never been seen on the stage of the Academy of Music. Chorus and orchestra had been strengthened for the occasion, the leading parts were in the hands of distinguished artists, and it is really refreshing, after all the complaints that have been made about this season's performances, to record a genuine success and to congratulate Colonel Mapleson on so artistic and thoroughly smooth a representation. Signor Campanini was an excellent *Rhadames*, the fiery, passionate character of this part being particularly well suited to his style. Signor Galassi acted and sang *Amonastro* to perfection. Miss Cary has often been heard here in the part of *Amneris*, and delighted the public again by her fine artistic interpretation of this interesting rôle. Mlle. Ambre, as *Aïda*, was perhaps the weakest part of the cast; but she was, if not very strong, most charming and sympathetic in the lyric portion of her performance. We must again speak warmly of the eminent services of Signor Arditi, who handled the chorus and orchestra in a masterly manner. "Trovatore" was given at Saturday's matinée, and a really excellent performance of "Faust" on Monday night. Mlle. Valleria is becoming a great favorite with the public, and, as she gains confidence and sees herself more appreciated, she improves both in her singing and acting. Her performance of *Margherita* was really excellent.

—The ninth *fasciculus* of Koolman's 'East-Frisian Dictionary' has appeared, beginning vol. ii. (H–Jok). The merits and demerits of this work continue the same: wealth of vocabulary, definitions, quotations, and proverbs on the one hand; on the other, an excessive amount of "padding," in the shape of comparative philology. For instance, why consume an entire column of a dialect-dictionary in giving the Sanskrit, Zend, Greek, and Slavic cognates of a word like "grim"? Or do we need to be informed that Low-German "grîs," High-German "greis," is connected with French "gris"? Yet, despite its inflation, the 'East-Frisian Dictionary' will be a great help to students of English etymology. Our lexicographers, trained to the use of High-German, have neglected our Low-German kinsmen, who are much nearer to us in structure and idiom. We hope the time may soon arrive when every English lexicographer will be forced to master thoroughly the distinguishing features of Low-German.

—As a sort of companion-piece to Koolman's 'Dictionary' we may notice Professor Hewett's 'Historical Study of the Frisian Language and Literature' (Ithaca: Finch & Apgar). This pamphlet of sixty pages gives a résumé of the sources of our information upon Frisia and the Frisians, in classic or in monkish Latin, and in early German; also a résumé of the literature (chiefly legal), and an abridged grammar of the language. The author has taken much pains to arrange material previously scattered far and wide, and to present his subject in a clear and attractive shape. In examining his synopsis of the grammar, however, we observe with disapproval that he follows the older theory of Grimm and Heyne respecting the Germanic vowels, and speaks of *i* and *u* as "primitive," and of *e* as coming from *i*. This theory has been completely supplanted by the views of Müllenhoff, Scherer, Sievers, and others. In like manner, the author's reference to the Anglo-Saxon Beovulf-lied is at once meagre and inaccurate. Yet these are minor defects. The pamphlet as a whole evinces a high degree of sound scholarship.

—The growth of periodical literature has been slow in Germany, but the success of the *Deutsche Rundschau*, which has just entered upon its sixth year, has been complete, at least from a literary point of view. The best writers of Germany, in almost every branch of letters, have contributed to it, and, to judge from an address to his subscribers which the editor issues with the October number, its high standard will be maintained in the coming year. Works of fiction are promised by men like Wilbrandt, Heyse, Auerbach, Roquette, and others; essays on subjects of political, scientific, and social interest will be contributed by Karl Hillebrand, Reinhold Pauli, Nachtigal, Haeckel, Kapp, Frenzel, etc.; Dr. Hanslick and Louis Ehlert will write on musical topics, and in the field of fine arts and belles-lettres we meet with such names as Lange, Pietsch, Lorenz, and Sachau. The October number itself is of unusual interest and merit. The first paper is a charming little story by Theodor Storm. In a review of Taine's work, 'Les Origines de la France contemporaine'—Vol. I. 'L'Ancien Régime,' and Vol. II. 'La Révolution'—Prof. Heinrich von Sybel gives a sketch of the period from the beginning of the reign of Louis XVI. to the end of the Revolution. Karl von Scherzer contributes an article of interest on German life and

work in foreign countries, from which we learn, among other things, that one hundred and fifty years ago, in 1730, a German, Johann Peter Zenger, published a weekly newspaper in this city, in which the abuses of the English Government were attacked in savage fashion. Dr. Friedrich Kapp has an article on Berlin journalism in the last century; an anonymous writer gives a sketch of the life and work of Mr. Andrew D. White, our present minister at the Court of Berlin; and there are excellent reviews of current literature and art.

BAYNE'S 'LESSONS FROM MY MASTERS.'*

HIS title is both the best and the worst thing about Mr. Bayne's book. We find nothing in it which indicates a juster perception of the literary worth of Carlyle, Tennyson, and Ruskin, of whom he makes elaborate studies, than the candid acknowledgment conveyed in 'My Masters'; that is to say, nothing in the way of discriminating eulogy which equals the tribute implied in his deferential title. We by no means write ourselves down disciples of Mr. Carlyle or Mr. Tennyson or Mr. Ruskin in admiring Mr. Bayne's frank admission that he is a pupil not only of one, but of all three of these writers. Only, when a clever writer such as Mr. Bayne finds it in his heart to make public profession of his deference to older and abler laborers in the field of literature, his hero-worship for his contemporaries at a time when the exact reverse is so common ought to be put down to his credit. At the same time and on the other hand the elevation to the rank of heroes of one's contemporaries has in it something sentimental which is inevitably prejudicial to soundness of judgment. It is impossible to speak of contemporaries with the same certainty and dispassionateness which one exercises with regard to historical figures whose perspective is already fixed, and of which, whatever differences of opinion there may be, we all acknowledge the premises and the facts. There is, perhaps, nothing in Mr. Bayne's book upon which one can put his finger and say, "This is prejudice, this is a judgment warped by propinquity; there is a sad lack of perspective in this," and so on. Nevertheless there is not only an almost fatal presumption against its sureness of judgment for the reasons we have mentioned, but there is distinctly evident in it a sentimentality which even its outspokenness and cordiality cannot prevent one from thinking a little too deferential in an LL.D. to be real criticism. When he began his studies of his masters, Mr. Bayne says, it was his intention "not to sit in judgment upon them, not to rise from the pleasant place of listener and learner at their feet and assume that of critical censor"; but he found it impossible in writing to divest himself "of the critical function so completely as I had purposed. When I differed in opinion from the eminent men whose works I surveyed I could not help saying so, and to say so without reason assigned would have seemed unjustifiable assumption." But even in these trying circumstances it will, he trusts, be found that he has in no instance controverted an opinion of his masters "without its being evident that my respect and affection for them continued unimpaired." Even on such occasions it is evident that he is not justly to be accused of bumptiousness. As criticism, therefore, it should be clear that Mr. Bayne's book is handicapped by his sentimentality.

This is shown in various ways, but in none more conspicuously than in its title, as we have intimated. What nexus there is between Carlyle, Ruskin, and Tennyson it is difficult to discover. They all write in English, to be sure; they are all opposed to "the materialism of the age," as the phrase is; they all believe in spiritual forces and do not value "cash payment" greatly as a cure for present ills; they are all poets in certain senses and they are all artists of the first class. A writer of impressionable susceptibility finds these circumstances sufficient to make a kind of contemporary triumvirate of literary heroes of them. But this very association indicates a curious blindness on his part to the vital characteristics of each of them; it implies that he has of each of them an enthusiastic and somewhat superficial rather than a quick and discriminating appreciation. Fancy Mr. Carlyle, after his pamphlet on "Model Prisons," founding a St. George's Society, or, after crying 'May the devil fly away with the fine arts!" going mad about Turner. Fancy Mr. Tennyson,

> "Turning to scorn with lips divine
> The falsehood of extremes!"

writing a poem on Mahomet or Timour the Tartar, or celebrating in his capacity of laureate Oliver Cromwell as the last ruler of England who "believed in a God." Imagine Mr. Ruskin interested in the theme of "Maud" or "Locksley Hall," or Mr. Carlyle sympathizing with "the love of poor curates for women above them." One cannot but ascribe a kind of looseness to Mr. Bayne's hero-worship, and conclude that he built and garlanded his altars before hitting upon the divinities to preside over them.

This does not at all imply that Mr. Bayne is not full of his subject—or subjects. Quite the contrary; he has evidently not only read and, in a sort, digested every written line of his "masters," but he has also a beautiful optimistic delight in their utterances. And it does not follow that he is undiscriminating in his eulogy because it so distinctly appears in his differences from them that his "respect and affection for them continue unimpaired." The reader only superficially acquainted with them cannot fail to get from his book a far better notion of the writers treated of than he has hitherto had. Each essay is nothing if not exhaustive. That on Carlyle, for example, is composed of twenty-one chapters, and not only gives a sufficient biography of its subject and a critical exposition of all his writings seriatim, but attempts a philosophical consideration of his aims and accomplishments, has a great deal to say about his apparent pantheism, etc. It endeavors to go to the very bottom of the matter under discussion, and leaves nothing "in the air," as Carlyle himself would have done, perhaps—*e.g.*: "I look upon this ['Sartor Resartus'] as one of the very few books produced in Great Britain in the present century deserving to be styled a true, original, and important contribution to metaphysics. It connects itself in a very interesting manner with Kant's speculations on space and time, and with Sir William Hamilton's philosophy of the Infinite; but it is distinctively Carlyle's, and cannot be claimed by the disciples either of Kant or of Hamilton." It is even written in a Carlylese dialect; and to any one who misconceives Carlyle, as so many do, it must be, we should say, a valuable exposition. The same is true of the essays on Tennyson and Ruskin. Mr. Bayne is so thorough that he may be said to hunt to their fastnesses even the vagrant fancies of his "masters," and he is so complete that he leaves unnoticed no side of them which is visible from his view-point. But this is not criticism in any serious sense. To find slight and superficial flaws in the works of one's "masters," which only point and emphasize their fundamental excellence, is merely a semblance of criticism; it is the advocacy of Jacobinism in disguise—that Jacobinism which, as it has been said, "loves a Rabbi." And Jacobite eulogy of contemporaries invariably inspires distrust. We are in no way disturbed by the criticism which calls Shakspere "the greatest artist the modern world has known," since the grounds of Shakspere's superiority are too well understood for a loose statement of them, even by an eminent literary authority, to be of importance. But when, having reviewed Tennyson, Mr. Bayne comes to the consideration of Ruskin with the words, "After the great artist, the great critic," we reflect upon the unwisdom of assisting the currency of stock notions that yet need to be sifted carefully before they come to be accepted. Seeing that Mr. Ruskin is not at all a critic, and has none of the qualities which go to the making of a critic, and is first of all an artist—not an artist in the sense that Mr. Tennyson is, but nevertheless an artist whose pre-eminent merit is his imaginativeness—we at once conclude that spite of all his enthusiasm for and acquaintance with his "masters" Mr. Bayne has simply looked about him for "masters" to visit his "respect and affection" upon. We do not say that his admiration is not wholly sincere, or that it is not within certain limits discriminating, only that, notwithstanding this, it does not escape perfunctoriness.

There is much to commend and much to object to in the details of Mr. Bayne's book as well as in its general conception. There is now and then an acute remark which can only spring from saturation with one's subject, so to speak; and with most of what is said, whether it is in the nature of disclosure or not, it will be possible for readers who hold the same fundamental propositions as Mr. Bayne, to agree warmly. His sentimentality, however, enters detail, and characterizes chapter and page as well as the work as a whole. He, somehow, seems to lack the humor which would have saved him from this. He explains Carlyle's celebrated ostrich figure in the last chapter of the 'Life and Letters of Cromwell' thus, for example: "You see how the idea strikes him, lays hold of him, moves him to peal after peal of wild, sad laughter, will not leave him till he has worked it out from the sticking of the ostrich-head into the bush to the awakening of the bird under the birch-rods of destiny." We confess Mr. Bayne has for us done his best to spoil for ever the passage he here comments upon. He seems to tend naturally to heroics; to find portentous, or at least sonorous, explanations of very simple matters. Of the "In Memoriam" he says: "It aims at embalming a private sorrow for everlasting remembrance, at rendering a personal grief generally and immortally

* 'Lessons from My Masters. Carlyle, Tennyson, and Ruskin. By Peter Bayne, M.A., LL.D.' New York: Harper & Brothers. 1879.

interesting. The set eye and marble brow of stoicism would cast back human sympathy; the broken accents and convulsive weeping of individual affliction would awaken no nobler emotion than mere pity; it was sorrow in a calm and stately attitude, sorrow robed in angel-like beauty, though retaining a look of earnest, endless sadness, that would draw generation after generation to the house of mourning." One cannot but esteem this as exegesis very immature and pompous of a text needing no such elaborate commentary. And this is how he speaks of Ruskin's St. George's scheme: "To me, after long pondering, the most comprehensively just and accurate way to describe his scheme of reform is as"—but surely we need quote no further to show how valuable as criticism of Ruskin the "long pondering" of his political economy can be. Neither is it pertinent for us to examine Mr. Bayne's criticism in detail, which would simply amount to a profession that we should have written differently of the writers he considers if we had attempted his task. What we have endeavored to point out is merely that criticism of any permanent value, criticism that is worth making a volume of, must be written in a very different spirit from Mr. Bayne's. Even bumptiousness is not worse than an exaggerated deference which indicates that the critic has no ideal of his own by which to admeasure his "masters" as best he may, but looks to them for such light as they can furnish him, and feels most at home when his intellectual conscience will permit him to follow them implicitly.

THE GIST OF THE KORAN.*

WHEN, as in these our days, aggressive civilization is brought into so close and so frequent contact with Mahometans, it is only natural that curiosity about their religion and its founder should be more than usually active. In presence of this curiosity, the work of the late Mr. E. W. Lane, now republished in an amplified form, is very welcome; and not exactly unwelcome is the Introduction which Mr. S. L. Poole has prefixed to it. Of Islam, in its practical outcome, Mr. Poole's estimate is anything but favorable. To recite his verdict, which no personal observer can deem inequitable, its adherents have passed "down an increasing scale of infamy and corruption, until it seems almost impossible to reach a lower level of vice." Yet this opinion does not wittingly forbid the essayist's entertaining the most exalted conception of the Arabian prophet. "There is something," he writes, "so tender and womanly, and withal so heroic, about the man, that one is in peril of finding the judgment unconsciously blinded by the feeling of reverence and well-nigh love that such a nature inspires. He who, standing alone, braved for years the hatred of his people, is the same who was never the first to withdraw his hand from another's clasp; the béloved of children, who never passed a group of little ones without a smile from his wonderful eyes and a kind word for them, sounding all the kinder in that sweet-toned voice. The frank friendship, the noble generosity, the dauntless courage and hope of the man all tend to melt criticism in admiration." The charges brought against Mahomet of being cruel, lustful, and insincere, his vindicator refuses to hear of. Summing up his hero, he intrepidly declares, with much more in a similar strain of eulogy: "Surely the character of Mohammad has been misjudged. He was not the ambitious schemer some would have him; still less, the hypocrite and sham prophet others have imagined. He was an enthusiast, in that noblest sense when enthusiasm becomes the salt of the earth, the one thing that keeps men from rotting whilst they live."

Treating of the reasons by which the diffusion of Islam and the fanaticism of Islamites have been accounted for, Mr. Poole remarks: "Others allege the low morality of the religion, and the sensual paradise it promises, as a sufficient cause for the zeal of its followers. But, even were these admitted to the full, to say that such reasons could win the hearts of millions of men who have the same hopes and longings after the right and the noble as we, is to libel mankind. No religion has ever gained a lasting hold upon the souls of men by the force of its sensual permissions and fleshly promises." It is observable that, of all men, one acquainted with Mahometanism should so directly beg the question as it is begged here. Moreover, the assumption that our fellow-beings, taken in the generality, have any preponderant aspiration after "the right and the noble" assuredly has little warrant in the history of the human race from the time when Adam donned his apron. But, concupiscence apart, if any evil propensity is more innate than another, probably it is the propensity to cruelty; and this alone, sanctioned as it is by the teachings of Mahomet, would have sufficed to render intelligible the extensive acceptance of his specific doctrines, and the tenacity with which their professors cleave to them. Given the belief in a Tartarus as the portion of all but the faithful—that is to say, of all but those who symbolize with one's self—supplemented, at the suggestion of self-conceit and the vindictiveness which too often attends it in unregenerate affections, by a sense of the congruity of administering a temporal prelibation of eternal torments to dissidents, and we are already provided with the groundwork of a religion which must needs multiply, and must present irresistible attractions to those who embrace it. Small is the wonder, therefore, that Mahometanism has found widespread and enduring favor. To Mr. Poole, far from being a fiendish superstition, vital simply by virtue of its harmony with the lowest and most bestial impulses, "it is a form of pure theism, simpler and more austere than the theism of most forms of modern Christianity, lofty in its conception of the relation of man to God, and noble in its doctrine of the duty of man to man, and of man to the lower creation." Were it so, only an ironical Providence can have ordained that it should bring forth so foul and fetid fruit, at best very apples of Sodom, hitherto.

Regarding the various translations of the Koran, Mr. Poole observes that "there are very few people who have the strength of mind to read any of them through." It might be said about as appropriately that "strength of mind" is a desideratum to those who shrink from grappling with Calprenède or Sir Archibald Alison. The Koran being a volume of formidable size, chaotic, tediously iterative, obscure, and very nasty, and yet calling to be known more or less, Mr. Lane did excellent service in culling out its essential portions for general readers. His renderings of these portions are such as, we suppose, one may accept with the firmest confidence in their critical accuracy. Mr. Poole, like Mr. Lane, deserves our thanks, despite his attitude as a special pleader. Where not argumentative, he is commendable. To his style we shall not object its occasional unconventionality. For the rest, though it is stiff and awkward here and there, and slightly tinged with affectation, these defects are partially compensated by its nervousness and animation. We would also suggest that our current vocabulary is not appreciably enriched or improved by such words as his "unindwellable," "aloneness," and "sunland." Lastly, the method of translettering Arabic, adopted by him and by Mr. Lane, is a thing which, as being unscientific, cumbersome, and hideously unsightly, it is high time to lay aside.

Darwinism, and other Essays. By John Fiske, M.A., etc. (London and New York: Macmillan & Co. 1879. 8vo, pp. 283.)—It is a very pleasant thing to be able to take up a new book with the assurance from its authorship that it will be made up of clear thoughts clothed in pure English. We have learnt to expect this from Mr. Fiske, and the expectation is not disappointed even when the volume is mainly made up of book notices like the present one. It is dedicated to Huxley, the great naturalist, "in remembrance of three happy days at Petersham, among the Blue Hills of Massachusetts, and of many pleasant fireside chats in London"; and the first four articles are on the Darwinian theory. They do not, perhaps, contain much that Mr. Fiske has not said very well before; but there is so much misconception of the subject still that it was well enough probably to reprint them. The interest in the dispute has faded now that the contest is over, but it is still curious to see how the strong natural instinct which Darwinism had to meet from the first has sullenly yielded, conquered but unconvinced, to the irresistible fiat of the little knot of specialists. They gave few reasons for their verdict, and yet it is really the final decision of this jury, and not the argument of counsel like Mr. Fiske, that has won the day. Besides these there are articles on "Inspiration" and "Spiritualism," and "Buckle" and the "Harvard Library." Mr. Buckle has been so thoroughly abused already that there is sadly little of his reputation left for Mr. Fiske to demolish, but he clearly points out some of the brilliant historian's more important errors. He gives no indiscriminate blame. More than once he supplies the missing parts of Mr. Buckle's argument, or shows the truth within certain limitations of laws false in the too sweeping state in which their author left them. Yet, looking back to the first appearance of the 'History of Civilization,' that dull time when the English dread of philosophical theory had left history without a guiding principle, and remembering the powerful influence it had in stimulating thought, one cannot help regretting a little that criticism should fall so heavily on that marvellous book.

The essay on the "Librarian's Duties at Harvard College" is interesting to those who care for this subject, and Mr. Fiske speaks with the

* 'Selections from the Kur-án. By Edward William Lane, Hon. Doctor of Literature, Leyden, etc., etc. A new edition, revised and enlarged, with an Introduction, by Stanley Lane Poole.' London: Trübner & Co. 1879.

weight of personal experience; but he does not convince us that there is not some unnecessary red tape at the College Library. In almost all libraries now the distribution of the limited funds between books and administrative expenses is a question of the first importance, and in too many the expense of the care of the books is enormously disproportioned to that of the books bought. Harvard College is not nearly so bad now as many other institutions in this respect, but not even the weight of Mr. Fiske's authority can make the four distinct contemporaneous catalogues seem incontestably wise and prudent.

The articles on "The Races of the Danube" and on "Chauncey Wright" are the best in the book. Mr. Fiske has a special talent for history, and we wish sometimes that he had selected that rather than metaphysics for his specialty. His tribute to the great thinker, from whom he differed so widely, is very fine. But this and the article on the Immortality Symposium of the *Nineteenth Century* show some of the vital defects of Mr. Fiske's philosophy. He sees clearly the close connection of Spencer's Cosmism with Berkeley's Idealism, and he rightly objects to calling the first materialistic. But he does not see as clearly that Cosmism is but a form of Idealism, and that its alliance with Positivism and modern experimental science is illusive and spurious; the one founding theories on nature, while the other founds them on the laws of thought. Positivism calls a law established when it, and it only, can fully explain the material phenomena embraced. Cosmism calls it established when its reverse is incredible or unimaginable in thought. Mr. Fiske tries to save the evolution philosophy from the charge of one-sidedness, by referring to Spencer's notion that the law of evolution is united with the opposite law of decay by a mystic rhythmic harmony, reminding one of the old song of the spheres to which the planets were once supposed to dance. He does not see that this rhythmic harmony is a mere name, hiding the absence of an idea under its sounding title, and that the only way really to reconcile the two is simply to acknowledge the fact (as Mr. Wright does, to Mr. Fiske's dissatisfaction) that there is no universal law of evolution or dissolution, but only an infinite variety of movements, part up and part down, according to the varying opportunities the occasion presents; altogether, filling the whole scale of being, but only separable into two general tendencies by a convenient but misleading fiction—a fiction not at all gotten rid of by giving it a grand rhythmic title.

Columbia and Canada: Notes on the Great Republic and the New Dominion. A Supplement to 'Westward by Rail.' By W. Fraser Rae. Second edition. (New York: G. P. Putnam's Sons. 1879.)—Mr. Rae visited this country at the time of the Centennial Exhibition, and has told what he saw in a good-natured, chatty way, with abundant comments of his own. Landing in New York, he found the most conspicuous changes in that city since his last visit in 1869 to be the downfall of Tweed and the shooting of Mr. James Fisk, jr.; that the city debt had been trebled "while the city remains a specimen of maladministration"; that two new religions (Theosophy and Comtism) had been provided; that various new buildings had been built; that wild beasts had been collected for exhibition in the Central Park; that an aquarium had been erected in Broadway; and that "a railway carries passengers above the streets, instead of, as in London, underneath them." Comparing the journals of New York, the *Tribune* is "one of the most notable"; the *Herald*, "which pants after a reputation for omnipresence, is foremost in circulation and popular favor"; the *World* "is written with great vigor"; the *Sun* "prints what people in general hesitate to utter"; the *Nation* "treats political, social, and economic topics with a freshness of tone which is most gratifying, and an acerbity which does not always give pleasure."

In Philadelphia the regularity of the city has for Mr. Rae the drawback of monotony. The Exhibition he considers equal to the best of those of Europe. Of the displays, "though very far behind some nations in particular things, the United States occupied a front rank when their performance was regarded as a whole." The grievances of the citizens of the District of Columbia in having no representation he thinks "as great in principle as those of the inhabitants of the thirteen Colonies when they embarked in the struggle for independence." He is greatly troubled that, as a rule, the leading city of a State is not made its capital, and thinks it quite possible that before the end of a second century Washington will have ceased to be the capital of the Union. With Boston he was greatly pleased, though shocked at the "new social commandment, 'Thou shalt not drink anything more potent than lemonade,'" which was in force at the time of his visit. He holds "the legislation which aims at making all men sober by preventing any man from practising the virtue of temperance," to be an evil hardly less deplorable than that of drunkenness. Bostonians welcome a stranger with a hospitality which, he thinks, is not the rule in the United States. At Saratoga, discussing the capitulation of General Burgoyne, he asserts that the revised edition of Bancroft's History, which puts the number who capitulated at 5,791, and "seven short histories of the United States" which range be-5,000 and 6,000, are all wrong, but that "there can be no doubt" that the accurate number is 3,500. At West Point "the cadets are drilled and taught with a thoroughness which cannot be surpassed at Sandhurst, St. Cyr, or Berlin." At Portland he was assured "that intoxication was not an extinct vice."

On reaching Canada Mr. Rae discovers the intelligence of the inhabitants to have been generally underrated; that the new scheme of confederation is knitting it closely together; that there is an increasing jealousy of the United States; and, "considering that there is an unfriendliness on the part of the United States towards her northern neighbor," he sees no possibility of annexation. He was surprised at the desire which the Canadians showed for a protective tariff. He concludes with the suggestion of a scheme which by an act of the Parliament of the United Kingdom and an amendment to the Constitution of the United States is to give to subjects of the Republic and to subjects of Queen Victoria common citizenship in the Anglo-American Empire. "After, as before it, the two countries would preserve their identity and independence; but their inhabitants could then cherish the assurance that they stood in closer fellowship to each other than to the rest of the human race, and that, though representing two nations, they were in reality but one people. Continuing to be rivals everywhere, they would cease to be aliens throughout that vast area of the globe where the star-spangled banner and the union jack bear witness that it is consecrated to freedom."

Mr. Rae's book, though not very substantial, is readable and entertaining; but why ten pages should be devoted to a history of the Philadelphia *Public Ledger* is incomprehensible. The long account of the development of steamships and the discussion of free-trade doctrines also seem rather out of place.

Brunhild: A Tragedy from the Nibelung Saga. By Emanuel Geibel. Translated by George Theodore Dippold. Preceded by a brief account of the Nibelung Epics and Sagas. (Boston: Ginn & Heath. 1879)—The Nibelung epic has had a varied fortune. After the close of its most brilliant epoch, during the era of the Hohenstaufen emperors (1138–1254), it became suddenly obliterated from the memories of the people. With the decay of knighthood it lost the foundation on which it had flourished so luxuriantly. For nearly five hundred years scarcely a mention was made of it, and the few sporadic references to it were passed by unheeded. Not until the middle of the eighteenth century was it brought to light again, but since that time it has won for itself a surprisingly wide circle of friends and admirers, especially in Germany and Scandinavia. The various versions in the Middle High-German and old Norse tongues have been collected and published again and again in the original, and the number of translations and commentaries is legion. Since Carlyle wrote his enthusiastic essay on the 'Nibelungen Lied,' English literature has gradually been enriched with translations and analyses. Thus, no fewer than four poetic versions have been produced in England, besides William Morris's 'Sigurd the Volsung,' in which he has combined the various old Norse and Middle High-German materials. The first American edition of the 'Nibelungen Lied' was issued in 1877 by Auber Forestier, who gave us in a volume entitled 'Echoes from Mist-Land' a graphic transprosing of the story and a somewhat elaborate article on the Nibelung literature. Mr. Dippold pays a glowing tribute to 'Echoes from Mist-Land,' and recommends it to his readers who desire to know more than his book supplies in regard to the material of which Geibel's tragedy has been constructed.

In Germany sixteen different dramas have grown out of the Nibelung literature, exclusive of the musical tetralogy produced by Richard Wagner. Five of these embrace the whole Nibelung story; four are so-called Kriemhild-dramas; four, so-called Rudiger-dramas; and three, Brunhild-dramas. Emanuel Geibel's 'Brunhild' belongs to the last-named class, and is justly regarded as the most successful attempt hitherto made at giving dramatic form to this heroic epic of our Teutonic past. It has become exceedingly popular in Germany, where a fourth large edition has been published; and in this country it has won for itself much popular admiration through the successful representation of *Brunhild* by the Bohemian actress Fanny Janauschek.

The first of the five acts opens at the royal castle at Worms, in the early morning after the double marriage of *Gunther* and *Siegfried*, and the fifth act ends with the suicide of *Brunhild*, where she stabs herself with *Siegfried's* dagger. The time is, of course, before the introduction of Christianity into Germany. The translation by Mr. Dippold is exceedingly faithful to the original both in spirit and in form. As a specimen we quote here *Brunhild's* last words, which are addressed to her rival *Kriemhild*, page 112 :

"Dost thou so stern enforce
Thy right the corpse to guard, relentless one!
Well then! Love's last poor greeting mayest thou
Deny me, and the cold hand's pressure too;
But yet my will thou never shalt restrain.
For strong is longing, like the gods themselves.
O Siegfried, Siegfried, what can part thee now
Henceforth from me? Not here, not in the dust,
Which but the mortal suits, I longer seek thee.
There is a realm, a silent, where no bond
Excludes another, for there love and hate
In cognizance divine have passed away,
And all that's great mates with the great. Oh! there,
In sacred twilight by the noble shades,
There art thou mine, beloved. Hark! It seems
From yonder dark abode I hear thy call,
And feel a rustling round me as of wings.
Wilt give me greeting, or art angry now,
Impatient that I tarry here and wail,
Instead of doing what alone beseems?
Well, then, thou shalt not wait. For me the steel!
Through blood and flame the pathway thither leads;
Thou went'st before, I follow—
(*She stabs herself with Siegfried's dagger.*)
Welcome me!"

Mr. Dippold's book contains a short preface, an introduction giving a brief but very lucid and concise account of the Nibelung epics and sagas, and a few explanatory notes. Upon the whole it is a model translation, and the publishers have put it into attractive and convenient form.

Catalogue of Scientific Serials of all Countries, including the Transactions of Learned Societies in the Natural, Physical, and Mathematical Sciences. By Samuel H. Scudder. (Cambridge: Library of Harvard University. 1879. 8vo, pp. 357.)—By far the greater and more important part of the literature of natural science has found its way to the world through the journals of societies and other serial publications. The number of these serial reports is now so large that the greatest difficulty that besets the path of the investigator is the task of learning what has been done by other students. The first step towards a codification of the labors of naturalists is, clearly, to find the names and extent of the various journals that have been or are still in existence. Although several attempts have been made to compile such a list, this is the first successful effort toward this end. The catalogue of the Royal Society covers about the same ground, yet there are only fourteen hundred titles in its list as against six thousand in Mr. Scudder's volume. This admirable work will enable all collectors of this class of books to pursue their labors in an intelligent manner. It will also provide the student of science with a guide in the search for the work of his predecessors. It is one of the highest praises of any work to say, as we may of this, that it points the way to greater and more profitable labor. Every naturalist will hope that this list may be the foundation on which some association of libraries may proceed to compile a synoptical index of all serial publications of a scientific nature.

The typographical fashion of the book leaves nothing to be desired. A careful plan of presentation has been aided by a well-considered choice of type; the cross-referencing and indexing are most satisfactory.

How Two Girls Tried Farming. By Dorothea Alice Shepherd. (Boston: D. Lothrop & Co.)—This narrative has the charm which belongs to imaginative conceptions applied to actual life, and we have no doubt that two women with unbroken health, unvarying spirits, liberal relatives in the immediate neighborhood, and each woman mistress of a trade whereby she earns ready money through the winter, might do the greater part of what is here described. These "Two Girls" live with the utmost frugality, are indifferent to the looks and the furniture of their house, and by unremitting labor contrive to keep even with the world, and to bring their farm into excellent condition. There is room in the world for all sorts of experiments of living, and health and independence are prime factors in the sum of happiness; but these ladies do not mention anything laid by against their inevitable off-times, and we submit that the same labor, self-denial, and intelligence spent in any employment might expect as much success. The real point of the book is in the last paragraph—"such a relief, such a restoration to health and youth even, to rise in the morning one's own mistress! This unspoken yet ever-uttered 'By your leave' is *so* wearing." The book is beautifully printed.

Young Folks' History of England. By Charlotte M. Yonge. (Boston: Estes & Lauriat. 12mo, pp. 415.)—This is without doubt the best history of England for children that there is. Miss Yonge has all the qualifications for the work, in her thorough familiarity with the subject and her well-known powers of narration. What children want is the picturesque view of history and acquaintance with its great characters, and they could not get these better than in this volume. Of course the author is an ardent upholder of church and crown, but we cannot see that she is unfair in depicting events, although her sympathies are clearly enough shown; for instance (p. 278), Charles I. "thought there could be no real church without bishops, as our Lord himself had appointed." The account of ship money (p. 265) is strangely incorrect. It is introduced in the early period of Charles's reign, and described as a usual, if irregular, proceeding, instead of as being specially devised at a later period for Charles's emergencies. The illustrations are excellent; we would especially note the portraits of Raleigh, Pitt, Henrietta Maria, etc., and Vandyke's picture of the three children of Charles I.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 27, 1879.

The Week.

THE volume of business at the Stock Exchange during the week was unprecedented, and the extent of the fluctuations in prices has only been equalled in the great panics of the past. The business was so large that only an imperfect record of it could be made, but this shows that about 3,500,000 shares of stocks changed hands, the par value of which is $350,000,000. On one day the recorded transactions were nearly 700,000 shares, of the par value of $70,000,000. Prices fell during the early part of the week, the largest decline having been on Friday from 3 to 29 "points"; the fall by percentage was much larger. Of this decline there was a recovery on Friday and Saturday afternoon of 1 to 18 points; a good part of this, however, was lost on Monday and Tuesday, although there was comparatively little excitement after Saturday. If speculation had been confined to the narrow limits of the last few years it would have burst long ago, but several times before have the professional and semi-professional speculators sold out only to see the outsiders, who have been aptly called the "lambs," carry prices higher by their purchases. The class called the "lambs" are numbered by tens if not hundreds of thousands, and almost every town in the country of ten thousand inhabitants contributes one or more representatives to their number. The story of their latest misfortune has been fully narrated in the daily press. The enormous growth of business reported from all parts of the country makes any prolonged depression in the stock market unlikely. The foreign-specie imports during the week amounted to about $4,000,000, which makes the total for the year about $72,000,000, all except about $6,000,000 having arrived in the last three and a half months. The market for foreign exchange advanced so that no new imports can be made. The advance in sterling exchange was caused by the rise in the prices of exportable products so as to prevent exports, and therefore diminish the supply of commercial bills. Silver in London was steady at 53¼*d.* to 53⅜*d.* per ounce; here the bullion value of the 412½-grain silver dollar was $0.8933.

The panic in the market is ascribed on all hands to a combination of speculators owning what is called "the Wabash System" of railroads, in company with Mr. Jay Gould, who had sold the coal stocks "short" heavily and had to depress the market on pain of great loss. Their *modus operandi* is said to have been the propagation of a story that Mr. Vanderbilt had sold to the "Wabash System" an enormous amount of New York Central stock, and then, when alarm about the Erie stock had thus been created, throwing a large "block" of the latter on the market. The necessary preliminary feeling of uneasiness, however, was created by the rumor of the sale by Mr. Vanderbilt, but whether it had any, and if any what, foundation, we are unable to say. The story was produced in a very positive form in the New York *Tribune* the very day of the panic. It has since the panic acknowledged that it was untrue. The New York *Times* charges it with complicity in the raid. We do not; we know of nothing on which such a charge can be based; but we do say, and in no unfriendly spirit, that having been instrumental in helping an operation by which thousands of innocent people have been stripped of their money, and which on the surface is in no respect morally distinguishable from the worst tricks of a gambling-house, the *Tribune*, like any other great newspaper, owes the public an explanation of its course. If it has been imposed upon by the jobbers, it ought to give them up to public indignation and rid itself, at any cost, of all appearance of an understanding with them. The only defence of the public against the unscrupulous men who now "manipulate" railroads is the press, and the press cannot afford to allow its fidelity to be suspected for a moment.

The official canvass of the votes cast at the late election in this State was completed Friday. The *Times*—which has direct reports from the county clerks of the various counties, except four whose returns are taken from the local publication of the official count—gives the following results: Cornell's plurality is 42,782, but his vote is 34,768 behind the combined vote of Robinson and Kelly, and his actual minority under all candidates 59,423. Kelly's vote reaches 77,550. The following are the pluralities of the rest of the successful candidates on the State ticket: Hoskins, 188; Wadsworth, 5,927; Carr, 2,029; Wendell, 2,683; Ward, 4,426; Seymour, 14,051. Hoskins's plurality is the smallest by which the head of a ticket—as virtually he was in this instance—was ever elected in this State, we believe.

The Scratchers' Committee have issued an address to the public giving an account of what they believe to be the result of their labors. They say that without the help of the 75,000 Kelly votes Cornell would have been defeated by above 30,000 votes; that he ran behind his ticket 3,820 in New York City, 2,837 in Brooklyn, and "correspondingly in nearly every part of the State"; that Mr. Secretary Sherman estimates those who scratched Mr. Cornell at 30,000, but that this is likely to be an overestimate, as probably many Republicans voted for Robinson; that "it is probable that 20,000 Republicans rejected Mr. Cornell, some such votes being offset or obscured by Tammany and Canal votes." Mr. Soule, they say, was (in spite of his "vindication" by the Organ on the eve of the election) buried under a "9,000 minority." The Committee throw the responsibility of "endangering the pivotal State" on Mr. Conkling, and congratulate the Independent Republicans on the significance of the result. "'Fair notice has been given to the Machine that the party must rule it, and not it the party." It appears plain, they add, that the balance of power in 1880 will lie with the Independent voters, and "the 'strong man' needed to carry New York is a candidate who will attract and not repel Republicans of conscience, intelligence, and memory." The New York *Times* points out, however, that they do not explain satisfactorily why the vote of the Republican candidate for Lieutenant-Governor, whom the Independents profess to have supported, added to that for his opponent, was less than the total vote cast for Governor. It also draws attention to the fact, which the Organ ought to discuss and explain, that ever since 1875 the Republican strength has been steadily declining. It had nearly 49 per cent. of the vote cast in 1875, and only 46 per cent. this year. What is the use of very old men as managers, if they cannot do better than this? The Scratchers raised by subscription from Republicans $5,215 95, a fact of some moment when it is considered that Gorham, the late Secretary of the Senate Committee, testified before a committee of Congress, last August, that of the $106,000 he raised for the whole Republican canvass two years ago $90,000 came from unfortunate office-holders by means of "assessments," and only $16,000 from the general public.

There is a most painful doubt spreading among the Stalwarts as to whether General Grant is a Stalwart after all. The *Evening Post* has put together some very strong documentary evidence showing that he is not really hostile to the South. But Stalwartism is a term which covers more than hostility to the South. It also includes indifference or hostility to civil-service reform, and a willingness to let "the boys" have a good time with the offices. The Stalwarts do not demand of their champion any line of action towards the

South, for they know that none is possible. What they require is that he shall occasionally shake his fist in that direction and give no offices to Southern Democrats, and no countenance to "molly-coddle" schemes at the North for keeping office-holders out of electioneering; so that it is possible that Grant might satisfy them without any denunciation of the South at all. He apparently stands by his old friends as firmly as ever, in spite of the reports of the change worked in him by European travel. Belknap was warmly received by him at Chicago, and was in the procession. Boss Shepherd is said, on excellent authority, to have ha da special invitation to go on and meet him there. We have no doubt that they will all turn up gradually, if fortune favors them, and be again the happy circle they once were, and enter on their political duties with their old war-cry: "Glory to God! regards to Babcock."

Mr. Sherman's admission in New Jersey that at State elections people may cheat as much as they please for all the Federal Government cares, is not the only sign of modification in Stalwart ideas about State rights. We drew attention last year, at the time of their promulgation, to the extraordinary doctrines of the Illinois and Iowa Republican platforms, without attracting any notice from Stalwart papers, so unobjectionable did these doctrines then seem. Our reference to them now, however, has called forth several denials or disclaimers and explanations. The Stalwart papers say the resolutions must have been "garbled," or construed too "technically," or separated too much from the "context" (*i.e.*, another resolution in which the State is mentioned as a participant in the Government). They will not admit that the Republicans of two prominent States can have really entertained such strange ideas. The ideas, however, were by no means strange, even a year ago. They sprang naturally from the feeling, of which the true Stalwart has never entirely rid himself, that the South is conquered territory, and the Union therefore not restored. It was this which led Mr. Boutwell to report three years ago in favor of the reduction of the Southern States to military districts governed by martial law. It is found still lingering in such phrases as the President's "leniency" towards the South, and the South's "ingratitude" towards the President, both terms borrowed from the nomenclature of military monarchies. There is, we need hardly say, no such word known in American polity as the "leniency" of an executive officer to anybody but a convicted criminal. Towards all other persons and corporations he does his *duty* by executing the law. Nor is there such a term in American polity as "gratitude" towards an executive officer. The law prescribes his duty, and he is sworn to obey it. If he excites "gratitude," it must be by some unlawful course. By his use of these two terms one can always detect what is passing in the mind of a Stalwart.

The Comptroller of the Currency tells in his report a tolerably well-known tale as regards the refunding of the public debt and the resumption of specie payments. But he produces some novel and interesting facts with regard to the currency. He estimates the total amount in existence on November 1 at $1,165,000,000, or $380,000,000 more than at any time between the suspension and resumption of specie payments. But he does not believe that much addition has been made to the amount in circulation by resumption—not more than $120,000,000, and of this he thinks a large amount is, and has long been, hoarded, and that the amount of coin and paper now in circulation is not greatly in excess of the average of the last five years, there being, it must be remembered, $158,000 of gold and $50,000,000 of silver in the Treasury, and $30,000,000 of coin in the bank-vaults. He emphatically recommends the withdrawal and destruction of the redeemed greenbacks, on the ground that the Treasury cannot keep them afloat, and as long as they lie in its vaults they furnish a constant temptation to extravagant appropriations by Congress.

The annual report of the Secretary of War places the present strength of the Army at 2,187 officers, 24,262 men, and 388 officers retired. Of this force a portion, however, is employed in detached or special service, and the Secretary joins "most heartily" with the General of the Army in recommending that the effective force of the line of the Army be raised to 25,000 men exclusive of these detachments. "Most if not all the disasters attending Indian hostilities are the result of inadequacy of force on our part," he says. Other recommendations of General Sherman, already published, are approved. The estimates for the year ending June 30, 1881, are $40,380,428 93. An increase in the clerical force of the civil establishment is urgently requested, and, among others, an appropriation of $50,000 is asked for the purpose of preparing maps of the unexplored areas of the country which is likely to be traversed by the troops and hostile Indians—a work eminently worth the small sum mentioned, we should say.

Mr. F. C. Morehead, President of the Mississippi Valley Cotton Planters' Association, delivered a fortnight ago an address to that body which will be given, and deserves, a very wide circulation. The main object of it was to show that the planters do not stand in need of greater capital, but have it in their power to become independent by making cotton not the only crop, as at present, but a "surplus money crop." For example, Mr. Morehead says that raising the provender for their own teams would save the planters $32,000,000, or nearly double the amount of their net profit on the cotton, which is $18,000,000. In other words, so small and inconsiderable an addition to their labor as this implies would swell the return on their invested capital from 4 per cent. to nearly 13. But he contends, with perfect justice, that wheat and corn can be raised in the cotton States as well as the feed for their stock, in quantities more than sufficient to meet their own needs, and the same is true of horses, mules, sheep, and hogs. A still further economy would result from manufacturing on the spot, and from improved machinery for gathering the crop. On this point Mr. Morehead was able to make two very important announcements—one, of a cotton-picking machine almost perfected "which, with one or two mules and a man, will pick ten acres a day," and another of the so-called "Clement attachment," which is actually engaged in spinning yarns direct from the seed-cotton, thus doing away with gins, gin-houses, and presses, and permitting bales of yarn to be shipped in place of cotton. The advantage of these improvements will be shared by the laborers, who, being lifted out of debt, will develop new wants to be supplied. Mr. Morehead urges on the Association the systematic promotion of immigration and opposition to repudiation, and there can be no doubt that in the vigorous pursuit of the objects which the planters have in view, the South has the best guaranty of moral and material restoration yet held out to it by any single instrumentality.

The trial of Mud-Scow Superintendent Isaac O. Hunt by the Police Commissioners last week furnished an interesting illustration of municipal government under a reform administration. The accusation preferred against Mr. Hunt by Commissioner MacLean was that of incompetency. His duties are to superintend the mud-scows and send them out to sea. On examination by Mr. MacLean he testified, according to the *World's* account, that his position was one of great difficulty and embarrassment; that when he took office he found no record of what had been done by his predecessor; that he could not get any information whether the scows were loaded or not; that he could not understand who were his superiors or his subordinates. On being asked what the tug *Burke* was doing last week, he said that she was doing nothing because the captain was drunk; that he had made no formal charge against him because he had repeatedly applied to Mr. MacLean for instructions as to his duties, and had never received a satisfactory answer. He stated that he had not been to the dumping-ground for a long time, thinking it useless to do so, as he was "not a navigator." He says that

he does not complain of persons who interfere with him, because "there is no telling who is boss. Things are awfully mixed." This is no doubt the reason why, as he further testified, he had not thought it necessary to find out whether the work certified by him as having been performed had actually been done. In one branch of his duties he seems to have been most efficient, however. On being asked as to his occupation on November 4 he said: "I worked and voted that day for Cornell. I worked hard for him. I did the same for Cooper a year ago, and see what we have got for it now!" According to another witness's testimony, Mr. Hunt's only absence from duty was for two days when he was "at some convention." The accused superintendent also charged Mr. MacLean with "conspiring against him before he ever saw him," and putting obstructions purposely in his way; he also casually remarked to Mr. MacLean that he had "held positions which you [MacLean] could not fill to save your soul." On a vote being taken the Republican Commissioners voted unanimously that the charges were not sustained, and Mr. Hunt will, therefore, still continue in charge of his department.

The Irish rent troubles have at last reached the "seditious" stage, and three orators have been arrested and committed for trial for language inciting people to violence and illegality. This stage in Irish agitation is always one of prodigious excitement, as it gives the leaders the martyr's aureole, and the trials will probably be the finest entertainment which Sligo, a dull western town, has seen for many a day. There is, of course, but little chance that the jury will agree; but the mere proceedings usually shake a man's nerves and those of his family, and interrupt his business so much that the prediction of the London press, that the talk of the other agitators will now become comparatively tame, is probably well founded. There is no doubt about the sufferings of the farmers. Their crops are greatly deficient, and the calamity is aggravated by a failure in the supply of peat through the same cause—the wetness of the season. Lord Beaconsfield's remedy for this last affliction is said to be a supply of coal at cost price.

The great conflict in London between Mr. Labouchere, of *Truth*, and Mr. Levy Lawson, of the *Telegraph*, has taken an unfortunate turn for the former. Labouchere is before the police court on a criminal charge of libel, and has indulged in a prolonged cross-examination of his opponent with the view of showing that he was justified in calling him "a disgrace to journalism." The magistrate after a while said he had had enough of this, but agreed to adjourn to enable Labouchere to apply for a mandamus to the Queen's Bench to compel him to hear more. This the Queen's Bench has refused, and Labouchere will probably now be committed and have to justify himself before a jury. The discussion of the question, What constitutes "a disgrace to journalism"? will be interesting if not fruitful. There are nearly as many kinds of "journalism" as there are journalists. In fact, nearly every journalist makes his own "journalism," and it would therefore be difficult to prove that any given journalist was a disgrace to anything but human nature. There are, however, great numbers of journalists who everybody feels are a disgrace to something or other, without knowing exactly what. The times are bad in England for "society papers." Rosenberg's successor in *Town Talk* has been brought up for libel and compelled to make a most humiliating apology. He hinted in his paper that a brother journalist named Townsend had passed six months in the penitentiary, but confessed in court that what suggested the insinuation was his having passed six months in that institution himself.

The war between Chili and Peru has made considerable progress since the loss of the *Huascar*. The Chilians have landed a force at Pisagua, captured the place, and then marched against the combined Peruvian and Bolivian forces who were concentrated near Iquique, and there, according to despatches received in Paris, totally defeated them. This will probably end the war, which has been marked on both sides by pluck and skill on sea and land; but, considering that it is waged between small states of the same faith and language and lineage, who are still sorely behindhand in most of the essentials of material and moral well-being, is one of the most pitiable spectacles of recent times. The women of such communities as Peru giving their jewels to buy ironclads is a sort of grim satire on civilization. The cause of the quarrel lies in the exploitation of mines of nitrate of soda and borax in the desert of Atacama, which lies between Chili, Bolivia, and Peru, and belongs in part to each and in part to none. A Chilian company worked some of the mines on Bolivian territory, under a contract with the Government as to its rights and dues, and constructed a railroad to Autofagasta for the transport of its produce to the sea. A new government established by revolution in Bolivia first broke the contract and imposed fresh taxes on the company, and then seized its mines and railroad, and refused all redress. The Chilians then interfered with armed force for the protection of their citizens, and Peru formed an alliance for resistance with Bolivia—with the result we all see. The bottom fact, as they say in Brooklyn, of the whole affair is probably the envy and disgust excited in two turbulent and ill-governed communities by the sight of Chilian success in developing resources which they themselves had equally easy access to, but could not turn to account.

Mr. Delane, for many years editor of the London *Times* during the period of its greatest influence, has just died after a long illness, superinduced by overwork, at the early age of sixty-one. He was the first of its editors to become a prominent and well-known figure in London society. Not many years before his accession Sir Robert Peel, in writing to thank Edward Sterling, the then editor, for his powerful support, confessed that the editor of the *Times* was an unknown person to him. Mr. Delane preserved the best traditions of the "Thunderer" period while giving up the editorial mystery or obscurity, and the *Times* probably never thundered so vigorously and efficiently as during the Crimean War. With Mr. Delane, however, the fierce editorial independence of the paper passed away, and it now reflects more distinctly than ever the cautious and somewhat tepid views of the chief proprietor, who is a great landowner and Conservative. The present Ministry gets a feeble support from it, and it attacks nobody with any vigor. Its propriety of utterance is very great, and is probably only approached in this country by the Boston *Advertiser*, to which the *Times* bears a striking resemblance editorially. In news-gathering, in which it was once pre-eminent, it is now beaten by more than one of its contemporaries, but its foreign correspondence, taken as a whole, is probably unequalled for solidity and trustworthiness, and it is, of course, still the favorite vehicle for distinguished persons who wish to communicate with the public. Mr. Delane's one great mistake was his position with regard to the civil war in this country, which was at one time ascribed to the West Indian connections of his family, but was more probably the result of enormous deception at the hand of its American correspondent after Dr. Russell's departure.

There is little Continental news of interest beyond continued reports of an approaching reconstruction of the French Cabinet, M. Waddington being about to retire. His position has never been a strong one. He is not a good speaker, and weighs on the Ministry in some degree in their *Culturkampf* by the fact that he is almost an Englishman, having been born of English parents and educated in England. There are statements and counter-statements as to the Ministerial policy with regard to the Ferry bill, the prevailing opinion being, however, that they will eventually abandon the seventh section. They have no other real difficulty before them except the conduct of the returned Communists, whose defiant attitude brings some discredit on the policy of clemency. It probably has killed the prospect of a general amnesty. Prince Napoleon takes on himself more and more of the air of a pretender, and has apparently secured the adhesion of Paul de Cassagnac. But there is no real revival of the Bonapartist cause, and Madame de Rémusat's book is a severe blow to the Napoleonic legend.

THE DUTY OF REPUBLICAN ORATORS TO THE SOUTH.

IT is greatly to be regretted that Mr. Blaine and Mr. Sherman have found it impossible to go down to Louisiana and take part in the State canvass as they have been earnestly urged to do by the State Republicans. Secretary Sherman has declared that the proper conduct of elections at the South was a more important matter than labor or money or credit, and Mr. Blaine has now for several years made it the chief subject of his attention and his speeches. In fact, it would not be unfair to suppose that almost any prominent Republican politician at the North would just now grasp eagerly at any excuse for going down to the South to stump on the Republican side. It is almost certain that he would not be killed or maltreated, and if he were not he would be enabled to apply his balsam to the very wound itself. Instead of talking about the wickedness of the Southern Democrats to people at the North who live fifteen hundred miles away from them, and never see one in the course of their lives, he would be able to get at the very sinners themselves, and describe and characterize the Southern enormities to the very men who commit them. More than this, he would be able to describe at Northern meetings through the winter things which he himself saw or had personal cognizance of, and thus be able to give his charges against the South that spice of specification, the absence of which does so much now to prevent their being effective.

It is the more to be regretted because an effort is being made in Louisiana to give the State good government, such as we have not seen since the war. The Republican party there is now headed by men with whom no Northern politician need be ashamed to associate. Its candidates are unimpeachable and its principles sound. The Democrats, on the other hand, can be assailed down there at this moment with a force and effectiveness to which they have not laid themselves open since the war. From the close of the war until now the charge has been brought against them that they murdered and intimidated the colored voters; but to this they have until recently been able to make answer that, being in a minority, this was the only way in which they could rid themselves of corrupt government. They now have the government in their own hands, and have had it for over two years, and although there are undoubtedly fewer crimes of violence than there used to be, the corruption, even if half what is told of it be true, is as bad as it ever was. The State credit, which rose to 92 after the Nichols government came into power, has, partly by gross jobbing with State securities and partly by threats of repudiation on the part of the dominant party, fallen to 38 as regards the consols, and to 48 as regards the premium bonds. The correspondent of the New York *Times*, who has been throwing a good deal of valuable light on the situation, though not writing in a very judicial tone, shows that the machinery of elections, as created by the party now in power, is in no respect an improvement on the old machinery devised by the carpet-baggers. The difference between them seems to lie mainly in the fact that, while the carpet-baggers doctored the returns in New Orleans, by means of a central board, the Democrats doctor them on the spot in each parish by means of local officers called police juries. Owing to the perfection of this machinery, the correspondent says, intimidation has been abandoned. He admits that, "as a rule, the Democrats have not attempted to break up Republican meetings or maltreat the negroes," and the reason he gives is that "Judge Beattie and the majority of those associated with him on the Republican ticket are not men to be trifled with," in addition to which the emigration movement has frightened the planters, who are dependent on the negroes for labor, into protecting them.

The situation is, in fact, more favorable than any which has existed since the war for injecting into Louisiana a strong expression of Northern opinion as to the way in which power is exercised by its present possessors. For bringing home election frauds to those who perpetrate them, there is no place like the spot on which they are perpetrated. Speeches delivered in Maine and New York about frauds in Louisiana cannot be delivered with half the force or point or knowledge of the facts of speeches on the same subject delivered in Louisiana. The condition of the State credit is something about which there can be no dispute. It was used powerfully by the Democrats against the carpet-baggers, both in South Carolina and Louisiana. The market price of bonds is a kind of proof which no Congressional Committee is needed to supply, and the place to use it is where the bonds are held, and where the people who hold them have been ruined by them, as has been largely the case in Louisiana. That there would be any personal danger for a Northern speaker in Louisiana no one pretends. That he would be quietly listened to, and, if a man of prominence, eagerly listened to, there is no sort of doubt. That he would, if an able speaker, produce some impression, we must believe, unless we conceive that the Southern whites are irredeemable barbarians incapable of being persuaded, and so far below even the most savage races of the world as to be insensible to oratory.

Moreover, the educating influence on Northern politicians just now of addressing Southern audiences on the Southern question would be invaluable. Everybody knows what a temptation to violence, exaggeration, and distortion lies in the habit of denouncing people who are absent and far away, and who are sure not to reply to you. There is in a Northern meeting absolutely no restraint of any kind on an orator talking about the South. No matter how extravagant his charges or how wild his distortions, they are sure to meet with toleration if not with applause. No one corrects or gainsays them; no one is offended by them. Before a Southern audience he would, in spite of himself, when discoursing on Southern questions be more careful and moderate and accurate, and absorb, as it were, some appreciation of the special difficulties with which Southern whites are contending. The time has, in fact, distinctly come when it is the solemn duty of those Northern politicians who are impressed, as most prominent Republicans seem to be, with the moral responsibility of the North for the condition of the South, and especially for the safety and welfare of the negroes, to go down to the South and reason face to face with those who in their opinion now stand in the way of a more perfect Union. Far-off and ill-informed denunciation has done all that it can do for good. It has now reached the point at which it simply breeds impotent sectional hate. There never before has been such a spectacle witnessed in political history as a body of statesmen making a specialty of the feelings and interests of a region which they never visit, and know nothing about except what they learn from partisan newspapers. If the old anti-slavery spirit animated the Republican leaders to-day, Messrs. Conkling, Sherman, Blaine, and half a dozen others would be spending most of their time at the South, going to the bottom of the question which they consider by far the most important of the day and which is the principal subject of their thoughts. Louisiana, too, has, as we have said, peculiar claims on their attention. The whites have split, and a highly respectable body of them have joined the Republican party, and are working, not simply to furnish votes for the next Republican candidate, but to furnish their own State with good government. Surely these men have, after all that has been said and done, the strongest claim on the support and encouragement of Republican leaders, not through distant "words of cheer," but through their appearance on the same platforms and before the same audiences, so as to bring home to the Southern people that they are in real moral and intellectual connection with the rest of the Union.

THE ANTI-RENT AGITATION IN IRELAND.

THE Beaconsfield Ministry no sooner get out of one trouble than they are plunged in another. The Zulu war was hardly over when Irish discontent entered on a new phase and a very much more serious one than the Home-Rule agitation, and one which is more difficult to deal with. The combination not to pay rent without heavy reductions, which showed itself a couple of months ago, has passed, or is very rapidly passing, into a combination not to pay any rent at all—in fact, to claim the proprietorship of the land for the tenantry. This is, as we pointed out not long ago, a natural

outcome of the present condition of the land question in England. The grievances of the tenants and the misfortunes they are suffering from the failure of crops are of much the same character in the one country as in the other, but the remedy proposed is, as might be expected, much more radical in Ireland than in England. In England nothing more serious is called for than a change in the law regulating the transfer and settlement of land, which will give the life-tenant more complete control over the estate, or, rather, prevent the formation of any life-tenancies or any property in it short of the fee. However, the notion that there is anything wrong with the land-tenure, that it is not, in fact, the best ever devised, is a new notion, and one which has never obtained recognition by practical politicians until the present year, and probably would not have obtained it now but for the overwhelming blows inflicted on the existing régime by American competition. In Ireland, however, the existing landlords may be said as a general rule, except in Ulster, where solid Scotch and English colonies were planted, never to have obtained from the tenantry a recognition of the moral validity of their titles. If any one wants to make himself thoroughly acquainted with the reason why, he has only to read that most careful and instructive work, Prendergast's 'History of the Cromwellian Settlement in Ireland,' which describes one of the most remarkable episodes in the history of the British Empire. Prescription would probably have long ago covered up the original defects in these titles if the new-comers had been of the same creed and race as their tenants, and if a century of ferocious religious persecution had not kept the breach between them open almost down to our own time, and if—what is, perhaps, more important than all—the native Irish had got beyond the tribal notions of property in land when the English system was imposed upon them. The old Celtic chief whom the Cromwellian Stalwarts dispossessed did not own the land in fee. He never thought of driving people off from it. He might kill a tenant whom he disliked, but he never thought of ejecting him. The English tenure and the social structure based upon it might have succeeded if the native chiefs had survived the conquest and gradually adopted it, as they did in so many cases in the Scotch Highlands; but the last persons in the world to recommend it were the Cromwellian Stalwarts, who got their estates for doing the Lord's work among the Irish heathen. Not that all the tenants who settled on these estates afterwards were of Celtic blood by any means; but the Irish view of land-tenure gradually permeated them all, and even penetrated into the Scotch plantations in Ulster, so that it may be said, without exaggeration, that the Irish people of both races have never really accepted the English legal view of real property, and never submitted to it except as a matter of physical necessity, and never ceased to protest against it after one fashion or another—more frequently by murder and outrage than any other. It is not surprising, then, that when the English themselves show signs of losing faith in it the flames of Irish hostility to it should shoot up with greater force than ever.

Nevertheless, we doubt if the agitation of which Parnell has made himself the head is likely to have any immediate result beyond producing a considerable reduction of rents and greatly lowering the value of the fee of Irish estates. Land has already fallen heavily in England, and there are a good many reasons why the fall should be still greater in Ireland than the mere diminution in the value of the yield would call for. The Tory Government is pledged on every side not to yield on a question of this kind. They may make what concessions they please as regards the suffrage and education, and they may afford considerable relief by public works, but they can hardly venture to attack landed property, or to countenance peasant proprietorship, even if they had the legislative ability to deal with any such scheme. They will probably meet the crisis, as they have begun to meet it, by troops and prosecutions for sedition; and all experience of Irish agitation supports them in believing that a steady application of force will put an end to the anti-landlord movement in its more violent form. To this all Irish agitation except the tithe agitation has hitherto succumbed rather ingloriously, and there is no reason for supposing that organized resistance to rent-paying will form an exception to the rule.

This brings us into the presence of one of the most curious phenomena of modern politics, which appears to have long had a fascination for Mr. Froude, and which he discusses with characteristic extravagance and inadequacy in the last *North American Review*—the prodigious growth and pertinacious political self-assertion of the Irish race. Mr. Froude's treatment of Irish questions furnishes, in spite of Mr. Freeman's charges in other directions, the most serious blot on his character. The apologist of "Flogging Fitzgerald" would not deserve ordinary literary civility if his coming over here to refute O'Donovan Rossa before American audiences did not show a fatal want of perception, both as to the limits of his own rôle and the true proportion of the subjects which interest him. That Mr. Froude enormously exaggerates the influence of the Irish as propagandists of Roman Catholicism there is no question, but it is none the less true that religion has been a powerful, in fact the most powerful, agency, not only in keeping alive the flame of patriotism at home, but in keeping the Irish separate in interest and feeling from the people among whom they settle in England and America. There is but little in Irish history to touch the imagination apart from religion. The story of intestine dissensions, diversified by foreign conquests, ending in crushing subjugation by an enemy who despised as well as hated them, would have nothing very enlivening about it if it were not for the fidelity with which the Irish clung to the Church through all their misfortunes. It is this which gives the "six hundred years of wrong" its touch of poetry and glory, and gives the Irish peasant in England and the United States something to be proud of in the midst of a civilization to which he knows he has contributed nothing, and in the midst of a population which dislikes him both peremptorily and for cause. It is probably, too, the agency which makes it difficult for men of any other race or faith to sympathize deeply with his passionate patriotism.

The Irish emigrants now hold the balance of power in so many of the English boroughs as to make a serious impression on the opinions of English members of both parties on Irish questions. The dalliance of both Liberal and Tory representatives of English constituencies with Home-Rulers, or any other Irish sect which happens to be uppermost, has become a very common phenomenon in English politics, though one which twenty years ago was unknown. The influence of the Irish vote in this country is something with which everybody is familiar, though few thought it as formidable as the recent result of the Kelly bolt in this State has shown it to be. The passion of the Irish, too, for the government of municipalities, and their success in getting hold of them, is one of the most notorious facts of American politics. Not long ago we heard of a small town in Canada, with a population, mostly French, of five thousand, and among them only twelve Irishmen; but these twelve had secured and divided among themselves all the local offices. Curiously enough, too, they seem remarkably impervious to the opinion of their neighbors of other races and creeds. They have a press and a code of morals and manners of their own, on which the criticisms of Protestants and persons of Teutonic origin make little or no impression, and, in spite of their reputation for humor, they manifest that want of the sense of the ridiculous in politics which has worked so much evil in France, and which makes the trade of the demagogue very easy among them. They voted almost solidly for Butler in Massachusetts, and in his canvass he apparently found it impossible to be too absurd to suit them. They have been in every age of their history a fighting people, and have produced more than their share of the great soldiers of the world, but they listened with emotion to his telling them at one of his meetings that his failure as a general, in so far as he failed, was due to his unwillingness to order an advance because it would probably lead to the death of some of his staff.

What makes the Irish influence in Anglo-Saxon politics to-day so serious a problem is, however, chiefly the difficulty, if not impossibility, of divining its precise aims or extracting from its utter-

ances its political ideal. Nobody can guess from the speeches or writings of the Irish agitators on either side of the water the kind of Ireland they would make if Ireland were independent, or the nature of the influence which is dominant in Irish councils. One result of this is that English legislation, no matter how well meant, has thus far missed its mark, and failed to allay Irish discontent. The nearest approach to a solution would seem to be the radical one suggested by the London *Daily News*, apropos of the present difficulties—the concession of a very large measure of local government, county and provincial. The county government is at present completely oligarchical, being that of grand juries made up by the sheriff from among the great landed proprietors. There is no provincial government at all. If there were local assemblies charged with considerable powers they would, at all events, be almost sure to bring out in some palpable form the Irish political and social ideal, and this would be a great gain both for Irishmen themselves and for the people who have to carry on government in conjunction with them. At present one is puzzled to know whether they would like a restoration of the ancient kings, attended by corps of harpers; or the rule of a council of Catholic bishops, or of the Pope himself; or that of a single pious Boss, advised by his confessor; or of a parliament of great orators, rich enough to pay handsome assessments to the "workers"; or whether they would like a society composed of tenants with fixed tenure, under popular landlords, or one of peasant proprietors solely. The precise position of the average Irish Catholic layman about Church establishments and popular education is veiled in like obscurity. For this reason, if for no other, the meeting of the convention of three hundred proposed by Mr. Parnell might do a great deal of good by bringing out some expression of dominant opinion on the questions which make the Irish race all over the world so restless.

MEMOIRS OF MADAME DE RÉMUSAT.

II.

PARIS, November 10, 1879.

I HAVE shown, from the 'Memoirs of Madame de Rémusat,' how Napoleon, in his relations with women, placed himself above all the common rules of propriety; the laws of society did not exist for him. He probably had but one sincere passion in his life—his passion for Josephine—and he loved her chiefly as the unconscious instrument of his first ambitions. There is an episode in the 'Memoirs' which has long been familiar to me, but which hitherto has never been told in any book: it is the history of the relations of Napoleon with the mother of Count Walewski, who became the Minister of Foreign Affairs of Napoleon III. I hesitate to translate this episode, and must refer your readers to pages 121 and 122 of the volume. Madame de Rémusat tells the whole story; she forgets only to say that the young Polish woman who is the heroine of it had been chosen by her compatriots as a sort of ambassador. She was charged to reconcile Napoleon to the idea of a resurrection of Poland. She accepted this mission as a sort of sacrifice. She was very brutally received and treated, but she made in the end a lasting impression on Napoleon, who continued to see her till 1815.

In his relations with men Napoleon was more interesting to study. He was, in one sense, a great moralist, in so far that he constantly studied human character. He took no high view of it, and constantly looked for the hidden causes of the actions of men, and tried to find these causes in the most selfish instincts. His pulse was remarkably slow, and though he often affected violent anger he never really felt it. "My anger," he once said to Madame de Rémusat, "never rises higher than this"—showing the line of his neck, and meaning that the brain, the intellectual force, constantly remained undisturbed. The contact of Napoleon and of Talleyrand, whose brain also was always undisturbed, was a remarkable phenomenon. Talleyrand had the indestructible character of what we call a "grand seigneur." His silence was disdainful; his politeness had a tinge of patronage. His whole nature was factitious; he had a light and easy way of treating the most serious matters as if they were nothing to him. He held a singular position in the court of the First Consul: he belonged to the *ancien régime* by his name, his manners, his deep-seated aristocratic instincts; he belonged to the Revolution by his offences against the Church, his renunciation of his ecclesiastical character. Napoleon saw at once that Talleyrand would be an invaluable instrument in his hand; but Talleyrand was too proud to be a mere instrument. When Bonaparte was on the point of starting for Egypt he made a visit to Talleyrand, who was then Minister of Foreign Affairs for the Directory.

"I was in my bed," said Talleyrand, in a conversation with Madame de Rémusat; "Bonaparte sat by me, and opened to me the vistas of his young imagination. . . . He spoke to me of some money embarrassments. 'Well,' said I, 'open my secretary—you will find in it a hundred thousand francs which belong to me. They are now yours; you will give them back to me on your return.' Bonaparte embraced me, and I really enjoyed his satisfaction. When he became Consul he paid me back the money I had lent him. But one day he asked me, 'What interest could you have in lending me this money? I have a hundred times tried to find out, and I have never well understood what your motive could be.' 'Well,' said I, 'I had none. I felt very ill; it was possible that I should never see you again. But you were young; you made an impression on me, and I was drawn to render you this service without the slightest afterthought.' 'In that case,' answered Bonaparte, 'if it was really without any prevision, you were acting the part of a dupe.'"

The two men show themselves completely in this conversation; only Talleyrand shows himself a shade better than he was, and Bonaparte a little worse than he was. During the negotiations which preceded the peace of Amiens, in 1802, Bonaparte was expecting the diplomatic courier with great impatience, as there had been some difficulties between the plenipotentiaries. The courier arrived, and brought to Talleyrand at the Foreign Office the long-expected signature.

"Talleyrand put it in his pocket and went to see the Consul. He appeared before him with the impassive visage which he kept on all occasions. . . . He remained a whole hour explaining to Bonaparte many important affairs, and when the work was done, 'Oh!' said he, with a smile, 'I will now give you a great pleasure: the treaty is signed. There it is!' Bonaparte was stupefied with this way of announcing it. 'And why did you not tell me this at once?' 'Ah!' answered Talleyrand, 'because you would not have listened to a word of the rest. When you are happy you are not *abordable*.' This capacity for silence struck Napoleon, but did not displease him."

One day, when Napoleon was already emperor, the conversation between them fell on Berthier, who was the chief of staff, and whose devotion to Napoleon was passionate and almost canine. "In truth," said Napoleon, "I cannot conceive how between Berthier and myself a relation which bears any semblance of friendship could have established itself. I don't amuse myself with useless sentiment, and Berthier is so mediocre that I don't know why I should amuse myself with liking him; and still, when nothing draws me away from it, I believe that I am not quite without some leaning for him." "If you like him," answered Talleyrand, "do you know why? It is because he believes in you."

There is, as everybody knows, a chapter in Napoleon's life during which his relations with Talleyrand became terribly intimate: I allude to the assassination of the Duc d'Enghien. This question is treated *in extenso*, and with a view of clearing Talleyrand's character, in the famous Memoirs of that diplomat, which unfortunately cannot yet be published. Let us see what Madame de Rémusat has to say about it. She was a personal friend of Talleyrand, and when she wrote her 'Memoirs,' it was at a time when Napoleon was fallen and when she herself had taken her place again among the Royalists. She tries, therefore, to throw most of the odium on Bonaparte himself. "The enemies of Talleyrand," says she, "and Bonaparte himself have accused him of having counselled the murder of the unfortunate prince; but Bonaparte and Talleyrand's enemies can hardly be believed on this point. The well-known character of M. de Talleyrand does not admit of such violence. He told me several times that Bonaparte had advised him, as well as the two Consuls, of the arrest of the Duc d'Enghien, and of his fixed determination; he added that all three had perceived that words would be useless, and that they had all three remained silent." This silence is perhaps significant enough.

The way to the arrest of the Duc d'Enghien was paved by an article which appeared on the 21st of March in the *Moniteur*: "The Prince of Condé," said this short article, "has prepared a circular to summon the *émigrés* and assemble them on the Rhine. A prince of the house of Bourbon is for this purpose on the frontier." Talleyrand, who was in the Foreign Office, sent to all the members of the diplomatic body copies of the secret correspondence of Drake, who was Minister of England to Bavaria. This correspondence, which had been stolen, was full of attacks on France and the Consul; these were the preparations for the great event. Napoleon wished to persuade the world that England was conspiring with the *émigrés* and the *Chouans*. Pichegru was in France, concealing himself, and it was rumored that he had secretly seen General Moreau. On the 17th of February, 1804, Madame de Rémusat arrived at the Tuileries; she found the Consul in Josephine's room; Josephine had been weeping, and Napoleon was playing with the eldest son of Madame

Louis Bonaparte (who became afterwards Queen Hortense). "Do you know," said Napoleon to Madame de Rémusat, "what I have just done?" "No." "I have given the order to arrest Moreau."

"I probably made some motion. 'Ah! you are surprised; this will make a fine noise, will it not? They will certainly say that I am jealous of Moreau, that it is an act of vengeance, and a thousand things of the sort. I jealous of Moreau! He owes me the best part of his glory; I left him a fine army and only kept in Italy raw levies. I was willing to live in harmony with him. I feared him not; I fear nobody, and Moreau least of all. . . . He is weak and proud; women have directed him, parties have pressed him.' In so speaking Bonaparte had risen, and going towards his wife, he took her by the chin, and lifting her head: 'Everybody,' said he, 'has not a good wife like myself. You cry, Josephine; why? Are you afraid?'"

On the 29th of February Pichegru was found and arrested; but the police could not find George Cadoudal, the chief of the conspiracy in which Bonaparte tried to implicate Moreau. Many Legitimists were arrested, and it became by degrees apparent that George's conspiracy had a royalist character. It was then, probably, that Bonaparte resolved to strike a great blow at the royalists; he was already meditating the suppression of the Republic, and it probably seemed necessary to him to prove that if the French wanted a monarchy they could only have his own. In striking the Bourbons, Bonaparte reassured the Jacobins; the murder of the Duc d'Enghien gave him the regicides. "This calculation," says Madame de Rémusat, "entered for much in the condemnation of the Duc d'Enghien, and I continue persuaded that what was done at that time was not done under any violent impulse, any blind feeling of vengeance, but was simply the result of a Machiavellian policy which was determined to clear the way at any price."

On the 18th of March Madame de Rémusat was beginning her week with Madame Bonaparte. After Mass she set out with her in the same carriage for the Malmaison, where Madame Bonaparte was to spend the week. "'I will tell you a great secret. This morning Bonaparte has told me that he has sent M. de Caulaincourt to the frontier to seize the Duc d'Enghien; he will be brought here.' 'My God! Madame,' said I, 'what will they do to him?' 'It seems that they will pass judgment on him.' These words gave me the greatest sentiment of fear that I have experienced in all my life." Madame de Rémusat felt instinctively that the Duc d'Enghien was lost. Madame Bonaparte herself had no illusion. "'I have done all I could to make him promise that the Prince shall not die, but I fear that his determination is taken.' 'What! you think he will put him to death?' 'I fear so.'" The two women were both attached to the old régime by many ties. Madame de Rémusat was related to one of the last ministers of Louis XVI.; some of her relations had been in the household of the Condés. It is easy to imagine in what state she arrived at the Malmaison. She found the Consul perfectly calm, and playing at chess. He affected some gaiety during the days which followed; he played with the little child of Louis Bonaparte; he would turn suddenly to Madame de Rémusat: "Why did you not rouge? You are very pale." Madame de Rémusat said she had forgotten her rouge. "Ah," said he, "a woman who forgets her rouge!" and, bursting with laughter, "this will never happen to you, Josephine." Then he added, "There are two things which suit women peculiarly well —rouge and tears." He had no measure in his gaiety; his manners with Josephine, when he felt amiable, were garrison-manners. Madame de Rémusat was obliged to play chess with him; he whispered to himself the famous "Soyons amis, Cinna," of Corneille, and at other times the words of *Gusman* in "Alzire":

> "Des Dieux que nous servons connais la différence :
> Les tiens t'ont commandé le meurtre et la vengeance ;
> Et le mien, quand ton bras vient de m'assassiner,
> M'ordonne de te plaindre et de te pardonner."

Madame de Rémusat, who watched him with a painful curiosity, was beginning to hope that it would all end in some great scene of clemency. They were still at play when a carriage was heard:

"The First Consul threw back the table vigorously, rose, and entering in the gallery near the drawing-room remained the rest of the evening with Murat, Hulin, and Savary. He never reappeared. I went to my room more tranquil. I could not persuade myself that Bonaparte should not be moved at the idea of having such a victim in his hands. . . . The night, the terrible night, passed. In the morning early I went down to the drawing-room. I found Savary alone, excessively pale, and, I must do him the justice to add, with a troubled countenance. His lips trembled as he spoke to me, though he uttered only insignificant words. I asked no question. . . . Madame Bonaparte entered; she looked sadly at me, sat down, and said to Savary: 'So, it is done?' 'Yes, Madame,' said he, 'he died this morning, and, I am forced to confess, with a fine courage.' I was thunderstruck."

If Madame Rémusat had at that very moment ordered her carriage and gone home to Paris, she would have been very different from what she was. She did not pretend to be a heroine; but, as a *femme d'esprit*, I wonder how she could ever forgive Bonaparte his "Soyons amis, Cinna," and the quotation from "Alzire," at the very moment when he knew that the work of death was being done.

MATTER FOR ART MUSEUMS.

Bassano, October 16.

How far art is to be stimulated by the formation of exemplary collections is perhaps a question to be decided by various schools of the day according to their definition of art. In the naturalistic sense, which has so marked a dominance in many of the European schools, and which furnishes all the technically good work of the time in Germany, Italy, England, Spain, and the Low Countries, with a large proportion of that of France, it is doubtful if the art of the centuries prior to this has been of material advantage, for the reason that the modern painters have, in starting from a purely naturalistic basis, been necessarily led to reject the methods and traditions of the early subjective schools, which were those in which all the great idealists (*i.e.*, the followers of a purely artistic purpose) were trained. Every great school of pure art has grown out of systematic and long-sustained pursuit of some ideal—has, in fact, been an evolution from the most childish forms of expression of that ideal through successive stages of development—and, as soon as it reached the highest attainable expression of its ideal, began to decay with a rapidity out of all comparison with that of its development. The naturalistic painter no more requires the training of the old masters than a modern stump-speaker or revivalist preacher needs to study Demosthenes and Cicero, or a modern actor requires to know the proper reading of Æschylean verse and the use of flutes and the chant. The greatest master of naturalistic painting the world knows anything of now—Velasquez—is, in his methods and ways of seeing, completely *sui generis;* as are the lesser, yet not little, masters, Rembrandt, Reynolds, and Gainsborough, and the still smaller realists of the French school, Meissonier, Gérôme, etc., who have got as far from art as anybody can go and be within the limits of its control. Properly speaking, these last are not in the true sense of the term artists, but more or less artistic naturalists, between whom and Denner, Van Os, etc., there is only difference of purely *intellectual* capacity, which must never be confounded with *artistic*. The great art schools all agree in certain points—they begin with earnest, simple, and even childish attempts to tell something of which nature is merely a vehicle of expression, and proceed in gradually and consistently increasing power and definiteness in this expression, so that whole schools move together so closely that the determination of the author of a particular work is sometimes impossible, and only chance has at times preserved the name of an artist whose work would otherwise have passed for that of his master. These schools continually tended to a more and more exact truth to nature, but the moment that direct study of superficial nature was reached the school died. Any pursuit of realistic representation, however able, has invariably marked the moribund period of a great school; while the weakest man who was capable of following the training of the great men, left behind him work technically so great that he always keeps his place in the school, and would, if he were painting to-day, be a giant in executive powers.

I never felt the truth of this so strongly as in going through the gallery of this the native place of Jacopo da Ponte, surnamed of Bassano, and seeing collected the best works of himself, his father and brothers. Few of my readers are aware that Bassano had brothers painters or that his father was a painter; yet there is in this gallery a Madonna with saints, by the old Francesco, quite worthy its place in the early Venetian school, while the best work of Jacopo is so powerful, so masterly in all that pertains to execution and manner, that I know no modern work which approaches it, though in intellectual calibre it is so weak that one wonders what led him into art by the side of men like Tintoretto, Veronese, and Titian. There is an "Assembly of Saints" which is superb in general color, rapid and masterly in execution, but which throughout betrays such a vulgarity in selection of form and want of grace that a hasty sketch for a picture by Veronese which hangs near it seems quite Raphaelesque in line in comparison. Certainly, if Jacopo came to me to-day for advice as to choice of profession, I should by all means and with all my powers urge him not to adopt painting. All there is of him worth keeping came from his training, the traditions of his school. Yet from his day to this not one of the most devoted students of the work of his master, Titian, has ever done a stroke of painting to compare with Jaco-

po's, *as painting;* and of living Frenchmen, the only one I know of who can compare with him as *wielder of the brush* is Monginot.

When we are considering the formation of a museum for the development of art, the history of Jacopo da Ponte has a peculiarly valuable moral as an example of what good training may do with mediocre individualities; and, indeed, it is all that training can do, for the sense of beauty is innate and the poetic vision incommunicable—a truism which any child comprehends, but which older people sometimes forget. And looking at Bassano's work, I was forcibly reminded of a conversation with Delacroix on the subject of art education. I asked him what was the main deficiency of our modern art. He replied, "Execution," and went on to say that, conscious of his own deficiencies in this respect, he had done what he advised all young painters to do—copy, copy, copy; and he pointed out to me on the walls bits copied from various masters, of which he had done many as training of the hand. He never succeeded in arriving at thoroughly good execution himself as judged by the Venetian standard, but a study of a few of the inferior painters of the great schools, such as Bassano, shows us exactly what he meant when he said that the modern deficiency of art education was in execution, the power of expressing vigorously, clearly, and solidly (with reference to permanent retention of the quality of color and execution) whatever pictorial idea the painter had to express.

If the painter wishes simply to give us nature, as do such men as Holman Hunt, Brett, Meissonier, etc., the ideal of execution is simply the most facile, broadest, and exact rendering of the visible qualities of the material they deal with, and all the galleries of the old masters in the world will hardly help them, for not one of the old painters painted with such an object. If they are able to attain the largeness of treatment of their theme of Velasquez, Mieris, or of Teniers, they will find nothing more congenial or useful in old art; and nature, their best guide, is still nearer to them. But for that better and higher art which does not spring, or which, at least, never has sprung, from naturalistic studies—that of which Phidias, Michael Angelo, Raphael, Titian, not to speak of Giotto, Fra Angelico, and all the line of purely religious painters are the exponents—there is something which must precede and interpret nature, and which is acquired by tradition and the study of all preceding art. Nature forms their alphabet-vocabulary, perhaps, but is never their master. What we ignorantly call their want of fidelity to nature is simply the using of that alphabet and vocabulary to express in the clearest and most direct way what they wanted to tell, but there never was any hesitation about taking any liberty with any fact of nature which made their work more forcible. To understand them and acquire their language we must not only go back to the beginnings of their schools and study their growth, but look into the details of their methods, see their drawings and sketches; and ascertain as best we can from contemporary literature and internal evidence the manner of painting. I have heard Millet, the greatest of modern purists and, with few to question his supremacy, one of the greatest of modern painters, lecture by the hour in the most enthusiastic manner on a portfolio of fac-similes of Raphael's drawings, which to him were the *ne plus ultra* of instruction in art. No one in this generation knew better the worth of a line or the rendering of a form, nor the relation of the ideal to the actual, than Millet; no man has ever gone so near to the reconciliation of the two. Take his teaching and that of Delacroix together, and you could hardly find more competent direction as to what should compose the aims of a modern school—copy to learn large, facile, and solid execution such as the Venetian school gives us the highest type of in the brush-work of even its lesser men; and draw as Raphael and his contemporaries taught their pupils to do. But the drawing must precede the painting; and if we will but study deeply enough the methods and relics of the Venetian school, especially of Titian and Veronese, we shall find not only that all the great qualities of style are contained in the preparatory drawings and sketches in chalk, but that the largeness of the brush and purity of the color were to a very large extent dependent on this previous preparation of all the material and determination of all the forms with absolute conclusiveness before painting was begun—a determination so positive that I cannot remember in any picture of Titian a *repentir*, but the forms are always laid in largely, boldly, and with the greatest evident deliberation, and that first painting is never lost through the subsequent work. It would be hopeless, then, to attempt to follow Titian's style in the finished picture without having first learned his large way of drawing his figures. It is doubtful if he himself could have attained it in any single one of his great pictures without this thorough preparation. Good painting, as execution or color, is impossible to a hesitating and undecided hand.

As material for education, therefore, while the work of secondary masters of any good school and the drawings of the great masters of it are most valuable, even the best masters of a secondary school are of very doubtful value, and an art museum, to be of use in developing a high standard of artistic purpose, is not by any means necessarily a complete historical selection or a collection to popular taste; on the contrary, the pictures which captivate most certainly the popular suffrages, and even those of the mass of mere amateurs, are certainly those which are worthless for the purposes of art education *for artists*. A picture by Bassano is worth more than one by either of the Carracci or by any Dutch painter except Rembrandt, and yet neither Bassano nor Rembrandt can be properly understood except by referring to the Bellini and Van Eyck, just as no one can properly estimate or study a picture of Titian without having studied the preliminary work which was the basis of all the greatest qualities of the finished work.

The fifteenth and sixteenth centuries furnish us with the material of the highest value for serious art education, taken, however, as models with frequent reference to preceding centuries. A collection of original drawings such as that which Mr. Jarves secured last winter in Florence is of estimable value to the beginnings of a school, just as the possession of a few original pictures by the painters of the great schools are indispensable to the perception of what execution and style should be. In the former we find how the great artist looked at his subject—what to him were the salient qualities in it and the dominant points and forms to be marked; we find how he classified and subordinated facts, and how the artistic logic selected the essentials from the chaff. For, in spite of what Ruskin or any one else may say, "Nature foists on us a great deal of rubbish," and the difference between a Denner and a Michael Angelo begins with the power of selecting the vital and essential facts from those which are merely the accidents of geology and epidermatology—the facts by which we can classify and arrange our ideas of things, from those by which we can merely recognize the things themselves. I remember hearing some one ask Emerson, "What is a genius?" "A man who can generalize from a single example," replied the sage. To learn to generalize largely and at first sight is the gift of the great artist, but a gift which, like all other great qualities, requires diligent and deliberate development, and the proof and examples of it we find in these drawings of the great masters of the great schools, as we see the result of their system of thought and work perhaps more clearly in such pictures as those of Bassano and Tiepolo, who mark the decadence of the vital powers of the school and still preserve the manner and mien of the great men on whom they formed themselves.

There is no great probability of our ever being able to draw to America the best examples of the great Italian masters, and copies of them for the purposes of study are of very little—I am disposed to go further and say absolutely no—use to students of art; but genuine drawings can be obtained and should form the basis of our art study, and then a few pictures by even secondary masters, well trained in the great schools of Venice and Tuscany, are worth to us a whole ship-load of Dutch, German, Belgian, and modern realistic pictures for all the purposes of higher education, in which I include the elementary training of whatever hopes to become high art. For purely naturalistic painting the life-schools of Antwerp and Paris are the only ones worth attending, and until we can import them we shall never develop even great realistic art or keep our best art students at home through their preliminary studies. W. J. S.

FOOD SUPPLY OF THE EASTERN UNITED STATES.

To the Editor of The Nation:

Sir: I have read with especial interest the part of your Kansas City letter on Western cattle-raising and its relation to English land questions published November 13. May not questions of supply for our own growing population modify the conclusions to be drawn from the writer's facts? I had occasion last year to look very carefully over the census returns in connection with the food supply of the United States, with the result here shown. With the exception of New York and Delaware, each State east of Indiana had fewer cattle in actual number in 1870 than in 1860, while every State except Maine had gained in population. New York, Delaware, Indiana, Illinois, Michigan, and Wisconsin are the only States east of the Mississippi in which the actual number of cattle increased, and of these Wisconsin alone shows an increase in proportion to

increase of population. Hogs increased only in Michigan, Illinois, and Wisconsin. Sheep only in Pennsylvania, Ohio, Indiana, Illinois, Michigan, and Wisconsin, east of the Mississippi. The food animals in the total States east of the Mississippi are in actual decrease. West of the Mississippi cattle diminished in number in Missouri, Oregon, California, and even in Texas. Sheep also diminished in Texas. Hogs diminished in Missouri, Arkansas, Louisiana, and Texas. Between 1860 and 1870 Illinois gained 142,200 cattle, 221,000 hogs, 201,035 sheep ; but the gain in population was 800,000, or more than the gain in food animals. New York gained 80,000 cattle and 800,000 people in the same decade.

The value of these comparisons was greatly modified by the occurrence of the war in that decade, and the census of next year will not conform to it altogether, but in a general way the country east of the Mississippi will be a large consumer of the surplus raised to the west of that river. The food grains have a similarly suggestive record. A large part of the farmers of Illinois buy flour made of wheat raised west of the Mississippi, and for use in its towns so small an item as eggs is gathered to some extent in the same region. For local markets the Eastern farmer, or the English farmer, will find his land important to provide fresh articles and articles not readily transported.—Yours truly,

JAMES H. BLODGETT.

ROCKFORD, ILL., Nov. 15, 1879.

MARYLAND BULL-DOZING.

TO THE EDITOR OF THE NATION :

SIR: I have just noticed in your issue of the 6th inst. that you say that "according to Republican newspapers" there was "Democratic slaughter of negroes" in Maryland at the recent election. I shall be obliged if you will give me space in your columns to say that this does not rest on partisan or doubtful authority in the least. Of one of the outrages—that at Elk Ridge Landing—I was myself a witness; but lest you should think any Republican authority prejudiced I can give you the name of a Democratic witness, Colonel Charles Marshall, who was on General Lee's staff, acted as his aide at the capitulation at Appomattox, and is still a strong Democrat. He saw the same affair as myself, and it was principally owing to the firm stand he took that the roughs hired by the Democratic committee to assault the negroes and carry out the rest of the programme by repeating were driven off.

You are mistaken, however, in thinking that "bull-dozing" is something new in Maryland. Anne Arundel County, which has a fair Republican majority of 400, is regularly roughed every year to give from 900 to 1,700 Democratic; and in 1875, when a reform movement had brought the Democratic nominee for governor to the brink of certain defeat, Baltimore City was roughed from one end to the other, and to that were added registration frauds, ballot-box stuffing, repeating, and an illegal count to roll up a majority of 15,000 that should overcome the counties. In the Ninth Ward even, through an excessive zeal, a majority was returned by the judges of election larger than the entire number of voters living in the ward. So far from this year being exceptional, Maryland yearly adds a long chapter to the list of Democratic opposition to a free ballot.—Yours truly,

EDWARD J. SHRINER.

62 WALL STREET, NEW YORK, Nov. 18, 1879.

THE ARMY AS IT IS.

TO THE EDITOR OF THE NATION :

SIR: In your issue of October 9 you remind your correspondent "R." that the American and English armies are filled exclusively by volunteers, and, therefore, by men who may be said to have failed or to have despaired of success in civil life. Now, sir, it is not a fact that the United States Army is filled by men who could not make a living in civil life. There is no doubt that such men do come into the Army, but they do not remain long, for they very soon either desert the service or are discharged for worthlessness. I have been nine years in the Army myself, and I speak whereof I know when I say that no man who has not energy enough to make a living in civil life can serve in this Army and be discharged honorably.

Your correspondent "R.," whom I sincerely thank for his good intentions toward the enlisted men of the Army, makes a great mistake when he thinks that the Army would not compare favorably with any corporation or institution in the country in the line of promotion. The fact is that it would compare more than favorably, and if "R." does not believe me let him look at the 'Army Register' for this year, and he can see for himself.

As regards the social difference between officers and men, it exists in a purely military sense—that is, no officer will attempt any superiority over a good and intelligent man other than that required by military etiquette, and I presume the same thing obtains in the Seventh New York, which is supposed to contain the best material.

I do not wish it to be inferred that I mean by the foregoing to say that there is no room for improvement, for I well know that there is. Of course it is plain to everybody that an act of Congress was nullified by the recent appointment of civilians, but I pass that by and come to that which I am better qualified to speak upon. The mode of selecting non-commissioned officers is the worst and rottenest that could be devised, and this in the face of the fact that the discipline of a company depends almost entirely on the character and efficiency of its non-commissioned officers. To remedy this evil the vacancies in a company should be filled by competition, and not by the order of seniority or favoritism, as they now are ; then the meritorious private would not have to suffer the humiliation of having a man appointed over him who is less competent and far more ignorant than he is himself. The non-commissioned officers at present in the Army should be compelled to qualify for their warrants, and those who failed should be compelled to step down and out.

Yours truly, PATRICK SHERIDAN,
Sergeant Co. "I," Twentieth U. S. Infantry.

FORT BROWN, TEXAS, Nov. 5, 1879.

WESTERN FLUNKEYISM TO GRANT.

TO THE EDITOR OF THE NATION :

SIR : It may appear captious and ill-natured to utter a word of criticism against a movement in Louisville to give General Grant a grand reception which is just now exciting our population and provoking no little rivalry among those who seek the foremost places on the committees, and are pushing to approach as near as possible the divinity that doth hedge the person of the distinguished guest. But it must be admitted that these demonstrations have their dark side, the darkest shade of which is not merely the disgusting exhibitions of toadyism and snobbishness which attend them: they are certainly calculated to stimulate the efforts of his friends and to feed his own ambition for a third term, though such a result would establish a dangerous precedent and destroy what has hitherto been considered a wise provision of the unwritten law. Let the promoters of these receptions declare as often and as loudly as they please that they are non-partisan and have nothing to do with General Grant's political aims; they must of necessity have a tendency to promote them. General Grant is as much a candidate for re-election now as he was on the eve of his second term, and it is impossible, under present conditions, to separate entirely Grant the soldier from Grant the candidate. His personal partisans know this, and chuckle over the simplicity of Democrats who are contributing to the "boom" of their hero. There is reason to believe that his "managers" arranged for his travels and, as far as they could, the honors paid him abroad, timed his return, and calculated on the advantages of the receptions to be tendered him in this country. They could not, however, have expected their opponents to fall into their trap more blindly and stupidly, for it has surpassed the predictions of those who expect from the Democrats nothing but blunders.

But there is yet a stronger objection to these displays. Criticism upon General Grant's military capacity need not be attempted just now. History will fix his position among the successful captains; and, so far as his conduct during the war is concerned, there seems nothing in it which should excite the prejudice or hostility even of an ex-Confederate soldier. There is nothing in his military career which would prevent a brave and conquered enemy from shaking him cordially by the hand and sincerely joining in a demonstration to his honor. But, unfortunately, his record was not closed at Appomattox. For eight years he was at the head of the most corrupt administration this country has ever known. He shielded peculation and many other forms of fraud in his official and household intimates after the most damaging proof of their guilt had been adduced, and in spite of the loudest public clamor for their removal. He upheld a brood of corrupt adventurers in the South, overturned legally-constituted State governments with soldiers, and sheltered the culprits from the consequences of their robberies and usurpations. Public meetings of protest were held in many cities, and several rousing gatherings were called in Louisville, denouncing his conduct as in violation of his oath and subversive of the Constitution of his country. He has done nothing since to atone for these wrongs, but to the end of his last term he persisted in rendering his administration disgraceful to his

country and odious to the better elements of his own party. Yet the same men who violently denounced his conduct then are now conspicuous and active in their efforts to do him honor.

It may well be asked if it is wise to deify such a man. Do not these superb receptions, at which over-dressed women smirk and men fawn and make fulsome addresses, tend to destroy the value of a pure and patriotic public life, and remove the odium which should attach to the debasement of our public service? The mayor of Chicago said that Grant would rank in history with Washington. The mayor of Louisville will, if possible, say something still more foolish. Indeed, most of the reception-speeches sound like a modern oriental "poem" addressed to some sublime majesty whose countenance is brighter than the sun and whose perfection is superior to that of deity. Western flunkeyism is fast rivalling that of the East, and any who may wish to see an exhibition of its most disgusting arts should be with us when our thane of Cawdor comes. C. E. S.

Louisville, Nov. 20, 1879.

NORTHERN PROVINCIAL CONCEIT.

To the Editor of The Nation:

Sir: In the discussion of purely political questions we are altogether accustomed to hearing the South accused of all sorts of political and moral enormities, and spoken of as a sort of conquered province or dependency which it is the duty of the Nation—meaning the North—to admonish, correct, and generally keep in order. You have frequently commented on and rebuked this tendency in Republican speakers and writers, and I do not now seek to occupy your space to add my protest to yours, but to ask attention to another manifestation of this same tendency which indicates that the view you oppose is held by others than mere politicians.

Has not this idea that the North is the Nation taken possession of the minds of many outside the ranks of the professional political agitators? I think there are numerous evidences that it has, but have seen none more complete than is offered by a letter from Kansas City which appeared in No. 750 of the *Nation*. The object of the writer is simply to show the probable effects of Southwestern cattle-herding on the land question in England, and there is not a thing in his letter going to show that the alleged preponderance of Southern influence in Kansas City in any way affects the increase of cattle on which the predictions of the article are based; yet, under cover of describing the town mentioned, the writer manages to give a marked exhibition of the idea I am commenting on. As a matter of fact, Kansas City is distinctively a Western rather than a Southern place, and its growth, which did not fairly begin till after the war, has been almost fiercely rapid, and marked by that eager absorption of all concerned in efforts for individual gain which leaves, as is the case also in mining towns, little time or care for public comfort or outward appearances. Added to these general causes, operative to like effects in many another Western town, are the natural disadvantages of the city's site, which would make its proper grading a work from which a rich and leisurely community might shrink.

But it happens that Kansas City is just inside the line of one of the former slave States, and in this fact alone your correspondent sees the sufficient explanation of whatever does not please him. To the wonderful business energy and individual enterprise in the place he pays willing tribute, and adds, "all this is Northern"; but seeing that the place has ill-graded, pig-infested, dirty streets, untidy street-cars, few public buildings, and no public squares, he declares "all this is due to the presence of the old Southern element," which he confesses constitutes a small minority of the present population. Could the warping effects of a one-idea prejudice be more thoroughly illustrated!

But the feeling that the North, and even New England, alone, is America, crops out in articles entirely free from any political allusion. A writer in the Contributor's Club of the June *Atlantic* amusingly defends the much scoffed-at spring poet, declaring that his abused verses are but the natural outburst of joy at the ending of the bleak New-England winter. "Do you see such poetry in Southern papers? Who cares about bluebirds in Florida?" he asks; and adds, "It is the maddened crowd who have buffeted five months with the fierce blasts and snows of New England, who have found the heavens brass and the earth iron, and been tossed from the scorched fury of the national stove into the deadly gripe and glare of *the national climate*, like human shuttlecocks, who 'drop into poetry' at the whistle of the first bird, or the breath of the first south wind." Here we find that it is New England that even fixes "the national climate," and the utter unconsciousness with which the idea is let out but shows how completely it holds possession of the writer's mind.

Those of us who live in the border States see this provincial conceit manifested by both Northern and Southern people, but usually it is only the more ignorant Southerners who still affect a contempt for "Yankees," while it is the educated and cultivated Northerners, having ready access to journals like yours and such magazines as the *Atlantic*, who unconsciously exhibit a narrowness akin to that which led the plantation boaster and his "poor white" allies in the ante-bellum days really to believe, to their bloody cost, that one Southerner could "lick" five "Yankees." Surely a people whose range of vision is so great that they sing they've "seen the glory of the coming of the Lord" ought to know there is a considerable America outside New England, while that breadth of culture which is denied to us of the border States as much as to the people further South should render the minds so happy as to have enjoyed it incapable of becoming imbued—even through much contact with "magnetic" orators—with the idea that the opposing poles of right and wrong can be discovered by the aid of a mariner's compass.

W. T. Croasdale.

Wilmington, Del., November 18, 1879.

SUFFRAGE AND THE HIGHER EDUCATION FOR WOMEN.

To the Editor of The Nation:

Sir: When I read what Mr. Parkman had to say in the *North American Review* on Woman Suffrage I was tempted to ask for space in the *Nation* for a woman's comments. The recent editorial of the *Nation* increased that wish, and the two letters in the last issue make it hard to keep silence longer.

My experience coincides with the opinion of the *Nation* that there is less interest and fewer believers in Woman Suffrage than formerly. Eight years ago I was one of six or more vehement supporters of the doctrine. We now believe in higher education, and especially the help that higher education ought to give to a reform, "thorough, radical, and complete," in the rearing of children and in fulfilling the proper functions of social life. We appreciate the rough and thankless work done by the older Woman Suffragists which has made these things possible to us. We realize, too, the seeming ingratitude of having to say that, by their intense radicalism and fervid enthusiasm, the very means of their success in overcoming the objections to higher education and to "wider and more varied fields of usefulness," they have made it impossible for us to be further guided by them.

Mrs. Thompson speaks of the women students in Michigan University as recent disciples to Woman Suffrage. They are unfortunate selections if it is intended to give thoughtful men and women confidence in the movement. Right here I would say, so entirely do I believe in co-education as tried at Ann Arbor, that I have helped to influence six girls to seek their education there rather than at any woman's college in the East. I think, however, it is true that the young women in the University are as yet in all matters of social science raw. In history, also, an essential study for any woman, but indispensable for the prospective Woman Suffragist, they have conspicuously failed, many of them avoiding that course as far as possible. Their ultra opinions are the natural consequence of minds well trained in language and mathematics, but in all else crude from limited knowledge, reflection, and experience, suddenly at large as pioneers in a new and immense field. They are at the mercy of a self-confidence holding itself able to dispose of important questions at once and for ever. In spite of this, I think it as probable that they may develop into the ideal woman as their more lovable but less thoroughly trained sisters. So far as I am aware, the professors, while generally in favor of co-education, regret the radical tendencies of some of the women students; but they are hopeful that as these students grow more used to higher education, they will be as earnest and as competent as they now are, but less self-assertive. In fact, I know that the conservative element is gaining ground in the literary department of the University.

For ten years I have studied as intelligently as I could women in home and social life. The result has led me to the same conclusion as "A. L. E."—that there is little calm, steady, earnest belief in the necessity for improvement. The woman who cautiously ventures a discussion on specific questions has to face the charge of "youth" or "eccentricity," and the question is quickly disposed of by some witticism upon "theory versus practice." I have had intimate personal knowledge of perhaps fifty young women of more than average ability and earnestness who had

planned in certain definite ways to improve their lives somewhat upon most of those which they had known. Only one of these has yet shown that she has the breadth of mind and the steadfastness of character to do this as a life-work. The tendencies given by Mr. Parkman as rendering women unfit to enter into political life are, I think, precisely the causes for these failures of women grown and women ungrown to make continued and intelligent progress in home and social life. It is not pleasant, but I am compelled to accept the analysis of our mental and moral tendencies as given by Mr. Herbert Spencer and Mr. Lecky; to accept Mr. Stubbs's "feminine quality of irresolute pertinacity," and Mr. Parkman's expressions in the same vein: but I am not yet willing to believe these characteristics are fixed and unchangeable. It is vexatious and discouraging to observe how many men clearly foretell the influence of women in politics, but are blind to the possibility that these very tendencies, though more hidden, may be preventing most of us from doing any but random, incomplete work in a sphere in which the consequences for good are practically limitless. I cannot see that wifehood and motherhood are in themselves more noble than the mere fact of being a minister or a school-teacher. They are high or low in the degree that we perform the duties intelligently, unselfishly, and successfully. I felt that it was no tribute to my womanhood when told by an intelligent man that a woman's place was "to rock the cradle."

Want of reasoning capability, impetuosity in forming judgments, "irresolute pertinacity," all these and more of our characteristics are as unlovely and as pernicious in our position as wives, in our training of children, in our social life, as they would be in politics. The step in progress that now seems practicable is to give our daughters the mental discipline and the breadth of outlook which young men get in a good college, that first they may somewhat realize the importance of their position in the development of the race, and that their training may be more adapted than was that given to us to overcome the difficulties which they will meet, however modest their attempt. E. L. S.

Indianapolis, Nov. 15, 1879.

To the Editor of The Nation:

Sir: May Wright Thompson writes, in a letter to the *Nation* of November 13th on the Woman's Suffrage question, that she "is informed that at Ann Arbor most of the lady students are believers in suffrage." She has been wrongly informed. Since reading her letter I have learned what fifty-three lady students think on this question, and the following is the result: Two will give no opinion whatever, five are undecided; fourteen are in favor of Woman's Suffrage, and thirty-two are more or less decidedly opposed. The figures speak for themselves. They represent the literary department only. But the lady students of the law and medical colleges, whatever their convictions, are greatly in the minority in numbers. Therefore I think the above figures indicate the temper of the University.—Respectfully yours,

Eliza Darling.

Michigan University, Ann Arbor, Nov. 21, 1879.

"A LITTLE BALM."

To the Editor of The Nation:

Sir: While Boston, in the person of "J.," threatens to repudiate your paper as intolerably hostile to Stalwartism, and Mississippi, through its Natchez "Subscriber," declares it to be almost intolerably Stalwart, it may be a crumb of comfort to you to learn that, at a great distance from both Boston and Natchez, there is an individual holding a more friendly view of the same publication. That man is the writer of the American section of the article "Zeitungen und Zeitschriften" in the just completed twelfth edition of Brockhaus's 'Conversations-Lexikon.' Speaking of the "*Nation* (seit 1865)," etc.—excuse my copying the original, which may be less offensive to some orthodox American sensibilities, both in Boston and Natchez, than a translation might be—he characterizes it as "nicht nur das beste amerikanische, sondern eins der besten kritischen und polit. Wochenblätter der Neuzeit, und bis jetzt von keinem andern Lande erreicht." Of course that writer is outvoted by the opinions of the two Americans, who ought to know better, and who so wonderfully agree in condemning your journal; yet minorities have their rights, and convicted editors deserve the charitable application of a little balm to the wounds inflicted by impartial judgments. A. B.

New York, Nov. 21, 1879.

[Such praise from so high an authority is of course very flattering, but it would be more welcome if accompanied by an explanation of that mysterious phenomenon, our "somersault" or "fall from grace," referred to by our correspondents last week. We venture to say, with all modesty, that this deserves the investigation of the best German minds.—Ed. Nation.]

Notes.

Houghton, Osgood & Co. announce 'The Army of Virginia,' by Gen. George H. Gordon, of which our readers have had a foretaste in the discussion of the Fitz John Porter case in these columns.——G. P. Putnam's Sons have nearly ready the 'Life of Gladstone,' by George Barnett Smith.——Robert Clarke & Co. have published in pamphlet form Mr. Stanley Matthews's address at the unveiling of Ward's equestrian statue of General Thomas in Washington last week. We have also received from them a supplement for 1879 to their 'Bibliotheca Americana' (Nos. 6,888–9,171 inclusive).——The Topographic, Hypsometric, and Meteorologic Report of the Princeton Scientific Expedition has just made its appearance. It is a beautifully printed pamphlet of upwards of eighty pages, and the illustrations of natural scenery (by the Artotype process) are superior to any we recall in similar publications.——Very interesting, too, are the autographic views of scenery (generally after photographs) in the important "Report of Progress for 1877-78" of the Geological Survey of Canada (Montreal: Dawson Bros.) A series of maps accompanies the full volume.——The Fine Art Publishing Company of this city have just issued in quarto form 'The Doré Bible Gallery,' which consists of reproductions of one hundred of Doré's well-known Scriptural illustrations, each of them accompanied by an explanatory and highly eulogistic page of letter-press.——Mr. J. W. Bouton sends us the first volume of *Le Musée Artistique et Littéraire*, which is *L'Art* for the corresponding period minus the etchings, the wide margins, and the fine paper, and whatever of the text the editors chose not to select; and plus a lighter and miscellaneous text also at the editor's discretion, and which completes the distinction between *L'Art* and *Le Musée*. This experiment of cheapening the parent journal (the price is but $2 50 in paper) is a bold one, and the effect, of course, on most of the illustrations is more or less disastrous, in an artistic sense; but on the whole we believe in the wisdom and the popular advantage of it.——The *American Antiquarian* is entering upon the line of conduct which we had hoped to find pursued from the first number. The recent quarterly issue, vol. ii. No. 1, is richly freighted with reviews, correspondence, proceedings, and bibliographical material. It forms a useful epitome of the work done in the field of archæology during the past three months. The performance is marked by much ability, and an organ conducted in this special line, and which leaves the issuing of so-called original articles rather to the care of the learned societies, cannot fail to gain a large subscribing public both in this country and in Europe. Mr. Bandelier's review of the "Anales del Museo Nacional de México," abounding as it does with valuable material combined with critical investigation, will no doubt attract the attention of those readers by whom the solution of the historical problem regarding ancient Mexico is considered of higher interest than that in which her modern progeny appear to be involved. ——Parts 8 and 9 of the new edition of Stieler's Hand-Atlas (B. Westermann & Co.) embrace maps of the German Empire, Plate 4; Inner Russia, Greece and the Archipelago; Spanish Peninsula, Plate 4; Scotland; and the lands adjoining the Baltic. The most striking side-map is a fine one of Berlin and vicinity. The two naval harbors, Kiel and Wilhelmshaven, are also given on an enlarged scale.——The October number of the Paris *Polybiblion* contains the beginning of a bibliographical notice of the Luxembourg idiom and literature by Eugène Beauvois. From the same number we learn that the first volume of the Deschamps-Brunet 'Supplement to the Bookseller's Manual' has appeared, and that the whole work will shortly be completed; also that a brief inventory of the MSS. of the libraries of France whose catalogues have not been printed, has begun to be issued by M. Ulysse Robert (Paris: Picard & Champion).

—Mr. Moses King, of Harvard, who has a proved aptitude for that kind of work, has prepared a 'Hand-book of Cincinnati,' of 88 pp. 16mo, which describes the most important features of the city, and will be found very useful. The author rightly gives a special paragraph to "Sunday" in Cincinnati, in respect to the observance of which day Cincinnati is somewhat European—*i.e.*, Continental. "Smoke" ought to have another paragraph, for Cincinnati is as famous for its smoke as its Sundays. Walnut Hills should also be specially described with the other suburbs,

deservedly praised for their attractions. The Unitarian Society is lost under First Congregational Society. But the work is undoubtedly accurate, although the striking apparatus connected with the chimes of the cathedral does not strike four strokes for each quarter, but one for the first, two for the second, etc. The reader is, perhaps, likely to be misled by the description of the noted painting in the dining-room of the St. Nicholas. This picture is inscribed, "Pauline Bonaparte, by Devonge, 1811." The author says it represents Madame Bonaparte, life-size, almost nude, seated on a sofa, and is said to have belonged to Joseph Bonaparte, and was sold upon his return to France, etc. Pauline Bonaparte, the favorite sister of Napoleon, celebrated for her beauty, is Princess rather than Madame, by which title the Baltimore Bonaparte is usually designated, and she should be called Princess here unless it is intended to hint some connection of Madame Bonaparte with the figure represented, for which, however, we suppose there is no authority.

—The *American Art Review* will be published by Messrs. Estes & Lauriat, of Boston, its editor being Mr. S. R. Koehler. Mr. William C. Prime, of New York, and Mr. Charles C. Perkins, of Boston, are named as assistant editors, and a long list is added of possible contributors. The first number comes to hand bearing the date of the present month, containing 48 pages of the size of our own, but printed with larger type and a wider margin, and three full-page etchings, besides woodcuts and "process" pictures in the text. The numbers will appear monthly, at the price of a dollar each. The three etchings promised for each number ought to be worth the money. Certainly there is no reason why they should not be as good as the illustrations of the *Portfolio*, which journal, although it deserves very great credit and has earned the gratitude of all of us for its energy in pushing the art of etching into popularity among English-speaking people, is not always equal to its own requirements in the matter of pictorial illustration. The present number of the *Review* contains an original etching by Mr. Robert Swain Gifford, "The Path to the Shore," a bit of New England coast scenery; an etching by Mr. Jas. D. Smillie after that very fine picture by Mr. Charles Jacque, the property of Mr. Belmont, of which we spoke when it was shown with the Decorative Art Society's Exhibition; and, thirdly, an etched head by Mr. Rajon, from Murillo's own portrait of himself. Whatever is to be said about each of these must be deferred until another occasion, when other modern work can be compared with them. Each is interesting, and deserves regard and repays study.

—The other illustrations are not so good. They are, to be sure, illustrations of the text, and answer that purpose, even as outline diagrams "illustrate" a geometry book; but in so far as they ask admiration or respect as works of art, their claim on the reader is slight. The greater number are produced by some patent process, and of these we can best receive the purely outline memoranda of works of sculpture in Mr. Davidson's article. The ornamental head-pieces and initial letters are the least satisfactory part of the decoration, the worst of all being the "Council of the Gods, from Preller's Illustrations of the 'Odyssey,'" a senseless and impertinent design if there ever was one. For the text, it would seem that we are promised a great mass of information upon many subjects connected with art. The diligent reader of the *Review* will find himself greatly advanced in knowledge. The body-articles, present and set down for the future, are upon subjects much needing elucidation; and, at the end of each number, the Chronicles, native and foreign, and the Bibliography will give to the public the monthly posting-up that it requires. As to freshness of thought and real insight into art, and the critical spirit, and such rare excellences as those, we shall see. The first number is not to be taken as final demonstration in the case of any periodical.

—It is a little disappointing to find the December *Lippincott's* less well written than it is edited, but nevertheless the number is easily the best for some months. Two descriptive papers, excellent of their class, though of the class now grown somewhat hackneyed, are, "Among the Biscayans," by George Catlin, and the sixth chapter of Dr. Oswald's "Summerland Sketches," which latter we have always found readable; both are illustrated. "The Backwoods of Carolina," by Louise Coffin Jones, "Foreign Education for Young Republicans," and "The Impressionist School of Painting," by L. Lejeune, promise rather more than they fulfil. A paper on "Poisoning and How to Treat it," by Dr. C. W. Dulles, is worth reading and even cutting out for consultation in emergencies. The most valuable article of the number, perhaps, is a description of the system of treatment for the insane pursued at Gheel, in Belgium, which is the centre of a system of villages to each of which is assigned a certain class of disease, and where the lunatics live as unrestrainedly as sane people live elsewhere. The English "Coffee-palaces," as they are called, established by the Duke of Westminster, Mr. Gladstone, and others, to take the place of "Gin-palaces," are described entertainingly by Wirt Sikes. There are two stories: "Rose," which is a tale of English life of no particular merit or interest; and the conclusion of "Aimée," by G. H. Pierce, which treats a rather difficult problem for the story-teller very easily and gracefully. "Monsieur le Charmant" is a historical sketch of the Marquis Létorières and d'Olbreuse, by M. Mather, which is brief, entertaining, and well told.

—Mr. Stedman concludes in the December *Scribner's* his two papers on Bayard Taylor, his poetry and literary career—a critical task in which he has reconciled frankness with delicacy, and friendship with a perspective which the judgment of later times will not find greatly in need of adjustment. In "Nature and the Poets" Mr. John Burroughs both agreeably and usefully calls attention to the defective epithets and false attributions in natural history of which even some of our truest and most observant American poets have been guilty. On the other hand, the general correctness and aptness of Emerson, Lowell, and Whittier, in especial, are given their meed of praise. Mr. Burroughs's examples are mainly ornithological; but the times of budding of flowers, their colors and those of autumn leafage, the sounds of the farm, the various appearances of the sky, also come within the range of this good-humored writer. At the close he briefly turns Principal Shairp's position as to the poetic interpretation of Nature. Perhaps the most amusing article in this number is Professor Boyesen's account of two visits to Victor Hugo, whose portrait, by the way, as here cut in wood by Cole, fairly rivals, if it does not surpass, the etching from the same original from a recent number of *L'Art*. A massed collection of poems by American women—a score of them—scarcely furnishes one permanent contribution to our anthology. A woman tells in a rather inadequate sort of way of the aims and organization of the Johns Hopkins University. Mr. Smith describes the coffee culture of Brazil. An elaborate and beautifully-illustrated paper, by Mr. Montgomery Schuyler, on the new capitol at Albany, condenses skilfully the long story of mismanagement and attempt to retrieve a commonplace design which makes this building so instructive to boards of public works as well as to the profession, who receive rather caustic treatment from Mr. Schuyler. His views on the completed Assembly room and Court of Appeals room, the corridors and staircase, the mural paintings of the late W. M. Hunt, seem to us intelligent and generally discriminating; but the capitol is so far from completion that one hesitates to agree altogether or disagree with some of his eulogy. Of Mr. James's "Confidence" we are to see the end in one more instalment, so that it behooves us to say less about it than heretofore. Mr. Cable's "Grandissimes" proceeds gaily, and in the ever-increasing number of its *dramatis personæ* affords a striking contrast to the slender company who figure in "Confidence."

—The suitableness of Ireland for grazing, and the consequent likelihood of its becoming a great stock-raising country, have of late often been dwelt upon, but in the *Contemporary Review* for November the reasons for a change of this kind are given with unusual force and clearness by Mr. E. S. Robertson, who describes himself as an Irishman who has returned to the country after an absence of twenty years. His opinion is "that the soil and climate of Ireland render the country utterly unfit to maintain a considerable body of peasant proprietors," and that "natural conditions mark it out as a pastoral and cattle-breeding country—the destined home of *latifundia*. It is not merely that cattle require large spaces of pasture, but the trade in cattle requires capital. An attempt to breed or deal in cattle by a class of peasant proprietors acting singly could only end in ruin. . . . Another product for which Ireland is eminently fitted is timber. This also obviously requires spaces of land and intervals of idle capital utterly incompatible with any system of small holdings." Nevertheless the writer thinks a certain quantity of peasant freeholds should be allowed and, if need be, created by the interference of the Government, and for the reason that "the peasant farmer will never cease to believe ownership a panacea for all his ills until he shall have tried it and failed. . . . If all the holdings of fifteen acres and under (there are two hundred and eighty-five thousand of them) were turned into peasant properties to-morrow, I believe they would in thirty, or at most fifty, years be recast into large cattle farms, owned probably, for the most part, by joint-stock companies. . . . But those who might be compelled to part with their lands could no longer ascribe their ruin to the tenure by which they held. It would be made clear to them

and to all concerned that it is the laws of nature and not of England which hinder Ireland from maintaining a dense agricultural population." In the same number of the *Contemporary* Professor Max Müller writes on "Freedom" (to think and teach) and Mr. Lenormant on the Deluge; and Professor Sybel reviews critically, but favorably and agreeably, Taine's 'Old Régime.' Professor Sybel does, indeed, find that Taine is "more than just in the sentence he passes on the nobles and prelates of 1789"; the truth being "that there were doubtless among the emigrants many who won respect and regard in the regions whither their flight led them. But the great majority, by their thoughtless arrogance, mutual bickerings, and shameless frivolity, left behind them a bad reputation, whereas a hundred years before, the exiled Huguenots, by their unity, earnestness, and industry, won, wherever they went, the respect and gratitude of their new countrymen." In the *Fortnightly* Mr. Hamilton Lang, once consul in Cyprus, describes Bosnia as he saw it in August last. What struck him most was the folly of still keeping an enormous body of troops in the country, the cost of which allows but very slow progress in public works and administration. The political policy of the Austrians is to favor the Mohammedan landowners as their natural support against the Slavic tendencies of the Christian population, but the customs regulating land tenure, which forbid the owners in fee to till the soil, reserving this right to the Christian peasants, prevent any increase in general prosperity. A railway (gauge two and a half feet) has been built from the boundary of the province for one hundred and twenty miles towards Serayevo, and from there on there is now an excellent carriage road.

—Last week's performances of the Italian opera introduced nothing of particular interest. "Aïda" was repeated before a crowded house with the same brilliant success; "Faust," "Trovatore," and "Marta" were reproduced with the same casts as before. The thirty-eighth season of the New York Philharmonic Society opened on Saturday last with a particularly brilliant and interesting performance. A more numerous and appreciative audience than that which crowded the Academy of Music on that evening has not been seen at these concerts for many years. Mr. Thomas's name evidently possesses an attraction with our concert public superior to that of any conductor now living in this country; for the programme, although of sterling artistic merit, did not contain any composition which has not been heard here before. Berlioz's overture to "King Lear" is one of the earliest works of the master, and one in which he may be said to have first attempted what is now known under the name of programme-music—namely, an endeavor to represent by musical effects dramatic actions and situations, which no composer before him had ventured to do, and which after him Liszt has brought to a high degree of perfection. Mr. Rummel gave a very vigorous and artistic rendering of Tchaikoffsky's pianoforte concerto, Op. 23, with which Von Bülow, to whom it is dedicated, made us familiar some years ago. The concerto does not improve on acquaintance. It is commonplace in conception and inartistic in construction. The immense technical difficulties, which were mastered by Mr. Rummel in admirable style, are no compensation for the absence of graceful melodies and artistic instrumentation and phrasing. In the two numbers from Wagner, "Ride of the Valkyries" and "Siegfried's Death," the greatest interest of the evening was concentrated. It is impossible to speak too highly of Mr. Thomas's admirable performance of this wonderful music. With an orchestra composed of seventy-two string instruments and with most of the wind instruments doubled, he produced, with his band of over one hundred musicians, effects such as have never been heard in the Academy of Music. The "Ride of the Valkyries" is familiar to everybody; it only need be said that it was rendered with all the weird passion and fire which Wagner's highest ambition could desire. The scene from the "Götterdämmerung," "Siegfried's Death," is a composition of truly colossal dimensions. The mournful funeral measure, lamenting the death of the hero, interwoven with lovely motives, recalling earlier and happier scenes of his life, is at times almost overwhelming. There exists perhaps no composition in which every effect that can be produced by instruments invented by man is brought out with such astounding impressiveness. Will it be considered blasphemy to say that Beethoven's Fifth Symphony, which concluded the concert, sounded, as regards instrumental effects, tame and domestic after the overpowering phrases of Siegfried's funeral march?

—The production of the "Octoroon" is always a theatrical event in its way, for the play has now held the stage for a generation, and is probably the best of all the serious plays of American life and manners. The only drama with which it challenges a direct comparison is "Uncle Tom's Cabin." The difference between them, however, is the difference between a clever novel clumsily dramatized, and a real work of melodramatic art. *Salem Scudder*, *Jacob McCloskey*, *Uncle Pete*, *Wah-no-tee*, and the *Octoroon* herself are all dramatic characters representing actual types—representing them in a melodramatic way no doubt, but in a dramatic way that is interesting. The situation round which the play centres has strong dramatic points. To the generation which has grown up since the war, slavery and all its consequent social complications are so utterly non-existent that it is hard to imagine the position which a girl like *Zoe* might have had in a planter's family forty or fifty years ago. But once granted that the illegitimate daughter of a white planter might have become established in his family after his death, almost as a member of it, and yet remain under the laws a slave, and everything that follows is natural, and at the same time intensely tragical. Boucicault has, with advancing years, become terribly kind-hearted, and if he were writing the "Octoroon" now would probably make it end happily in the marriage of *Zoe* and *George Peyton*, and the discovery that *Paul* was still alive and well. But, fortunately for the play, when he did write it it was perfectly clear to him, as it must be to any one who considers what the situation is, that the death of *Zoe* was the only possible ending, and that if *Wah-no-tee's* introduction as the avenger of *Paul* were to be justified at all, it must be as the avenger of a real murder. *Wah-no-tee* the avenger is, of course, a stage Indian, though *Wah-no-tee* the inebriate, as he appears in the early part of the play, is an Indian from real life. Taken altogether, the *Octoroon* is a thoroughly well-constructed play. There is no drag in the action; the plot is developed necessarily by the characters out of the situation in which they are placed; the tragedy and the humor are not thrown in pell-mell, but are closely connected throughout, so that there is no harsh incongruity between them which jars upon the feelings, and *Zoe's* story is worked out with a coherence and continuity that is masterly. It is a pity that Boucicault's passion for sensational effect should have misled him into making the identification of the murderer of *Paul* turn upon such an impossible piece of clap-trap as the accidental photographing of the murderer's face. Everybody, for his sins, is to a certain extent an expert in photography, and to attempt to persuade an ordinarily intelligent audience that a recognizable image of a man engaged in the extremely active and rapid operation of murdering a boy and rifling a mail-bag would be reproduced on the slide of a casually-exposed camera, is to rely too much on their credulity. It would be curious, by the way, to trace through the long list of Boucicault's plays the gradual growth of his reliance on sensational mechanical or scientific effects, from the time when he wrote "London Assurance" to his present electro-locomotive-drawbridge method, as shown, for instance, in such a play as "Rescued." In the "Octoroon" there is no necessity whatever for the camera business. It is injected into the play apparently for the purpose of trying the effect. The means by which the murderer is identified are of no sort of importance. The company which is now playing the "Octoroon" at Haverly's Theatre do their work fairly well. Mr. Gotthold does *Salem Scudder*, a part which used to be acted by Joseph Jefferson; Mr. L. R. Stockwell is a capital *Uncle Pete;* Mr. Losee a good villain, better at the bowie-knife, however, than dramatic dialogue; while Mr. Duffield brings out the strong points of *Wah-no-tee* very well. Miss Elmore's *Zoe* is good as far as it goes, but she has hardly tragic force enough for the part. The slaves are done by a troupe of real negroes, which we think is a mistaken sacrifice to realism; that the corked Caucasian is, for theatrical purposes, a far better negro than the African, seems to us hardly to admit of a doubt.

—The "Yorke Prize" was founded by a bequest of Edmund Yorke, a Fellow of Cambridge, and is offered annually for an essay on some subject relating to "the Law of Property, its Principles and History in various Ages and Countries." The first topic assigned was "The History of the Law of Primogeniture in England, and its Effects upon Landed Property." On this topic the prize was awarded last year to two essays, pronounced to be of equal merit, which are now published in book-form, under the title 'Two Essays on the Law of Primogeniture.' They may also be had separate. The first essay, by Mr. C. S. Kenny, contains 71 pages; the second, by Mr. Perceval M. Laurence, 156 pages. Both essays are scholarly and well written, and the subject is wide enough to admit of independent treatment from two different points of view, neither of which interferes materially with the other; yet it is surprising how little they repeat each other. Both essays are at once historical and legal, and at the same time deal with the practical question of the present day; neither of them can be fairly said to neglect either of these points of view. Nevertheless the special merit of Mr. Kenny's essay is in its

thorough treatment of the history of primogeniture; it is an almost complete history of the law of real property, especially in the Norman and early Plantagenet period. Mr. Laurence begins his historical sketch even earlier, in the primitive Aryan institutions; this is, however, the least satisfactory part of his essay, the weightiest portion of which is in the history of the law of entail and connected subjects. In regard to the present problem neither essayist takes a position so hostile to the law as Mr. Brodrick in the Cobden Club essays. Mr. Laurence, indeed, has been led by his studies to a conclusion at variance with the ideas with which he began his investigation, and does not favor any immediate change in the law; while Mr. Kenny proposes some modifications rather than its abolition outright. Mr. Kenny's essay has a full table of contents, Mr. Laurence's an index. We see announced a new treatise by Mr. Kenny—"History of the Law of England as to the Effects of Marriage on Property"—but cannot say whether it is another "Yorke Prize."

CHARLES LEVER.*

ALTHOUGH it is only a few years since Lever died, his popularity as a novelist had been at the time so long waning that his death had not the effect, as in the case of Thackeray and Dickens, of bringing to an abrupt termination a brilliant career; but rather of reviving for a brief time a reputation already almost extinct. And yet there was a time when instalments of a new novel by the author of 'Harry Lorrequer' were almost as eagerly awaited as those of the authors of 'Vanity Fair' or 'Oliver Twist,' and there was never a period during his long literary activity when Lever's ready wit and fertile imagination were not equal to the task of producing fiction far more deserving of attention than nine-tenths of the successful novels of the present time. And after he had had his day as a novel-writer he still continued to be a popular contributor to the periodical press, and as long as he lived he wrote, and wrote well. Nevertheless it must be admitted at the outset, in any consideration of Lever's literary career, that he belongs to a completely bygone period, and that his reputation, whatever may become of it in the future, is almost as completely dead for the time as if he had never written a line. The explanation of this fact is, we take it, a double one. Within the past twenty-five or thirty years English fiction has taken on itself an introspective hue, and the taste of readers of fiction is all for analysis of character and motive, while the taste of the period immediately preceding was entirely for the display of character and motive in action. It is difficult to imagine an introspective novel-reading public caring much for the earlier romantic method, or *vice versa*. It was absolutely necessary for Lever and James, and all the literary descendants, imitators, and remote kin of Sir Walter Scott, to pass away before such fiction as that of George Eliot could gain an audience; and introspection once given its way romance has become impossible. In connecting the name of Lever with that of James we do not mean to compare them, nor in tracing a literary connection between both of them and Scott do we mean that the connection is anything more than a very remote one; but there was a connection, as there is a connection between all these and even Continental novelists of the romantic school such as Dumas. They all write about life from the outside, and all tell stories in which romantic adventure plays a principal part. It is surprising to think to how late a date this was the only recognized system of novel-writing. Thackeray first made it ridiculous in his 'Prize Novelists,' and it is interesting to find that Mr. Fitzpatrick attributes the marked change of method in Lever's later novels to the effect upon his mind of Thackeray's ridicule of his earlier style. But there is another reason for the decay in Lever's popularity than a mere change of fashion. The novels by which he gained his reputation had very little thought or reflection behind them, while his later ones, which certainly had these merits, lacked the strength of narrative and the flow of animal spirits which made the earlier stories successful. Of course a writer of stories of action and adventure will put into them just as much experience and observation as he possesses; but Lever, when he began to write, knew very little about life except that it was a very pleasant thing, and when he had really found out what it was he had ceased to be able to write novels.

There is a certain amount of satisfaction to be derived from an examination of a career like Lever's from the fact that it is so easy to understand. There is no sort of mystery or secret about the style of the man. There are no "problems" of any kind connected with or suggested by him. He told stories because he was a born story-teller; his heroes were Irish, because he was himself an Irishman and intensely fond of his country; he plunged them in desperate adventure, because he liked adventure himself. If they loved wine, woman, and song, it was because Lever did so too with his whole heart. He was apt to be in straits for money because he had, as he complained of himself, no head for thrift, and to attempt to save caused him more anxiety and trouble of mind as well as expense, to judge by his own account of the matter as quoted by his biographer, than even the unpleasant results of recklessness. He was fond of society, and got as much of it as he could; of travelling, and travelled whenever he could; of whist, and played whenever he could. He was brave and generous, fond of his friends, convivial, changeable in purpose, and consequently always lived the life of to-day without much thought of the morrow. In fact, as is very apparent from Mr. Fitzpatrick's 'Life,' the character, tastes, and mind of Lever could be easily reconstructed from one or two well-known characters in his books, if all other record of him were to be totally lost.

Mr. Fitzpatrick's book is very badly put together; it is, in fact, an ill-arranged collection of all the information he could obtain as to the novelist's life, hung upon the thread of a very halting narrative of his own. Nevertheless we have found a great deal that is interesting and amusing in it, particularly the account of Lever's early education and youth. The Levers were an English family, whose first appearance in Ireland appears to date from the Cromwellian invasion. Charles Lever's father, James, however, was himself of English birth, and from Mr. Fitzpatrick's account it seems that Lever's Irish blood came from the maternal side. He was born in 1809 in Dublin, when Dublin was part of an antique social world which has long since wholly ceased to exist. The Union had only been effected a few years before, and the fierce passions which had divided the country on that question still survived; the enmity between Orangemen and Catholics was a part of the atmosphere of the place; popular feelings found vent sometimes in street ballads, such as "Lilliburlero" and "Shan Van Voght," and sometimes in riots. Quiet, order, and prosperity there was none; every young Irishman was born a soldier of fortune. Lever's lines—

> "For 'tis the capital of the finest nation,
> Wid charming peasantry upon a fruitful sod;
> Fighting like divils for conciliation,
> And hating each other for the love of God"—

are no bad description of the Dublin and Ireland of Lever's childhood. Of the social influences by which Lever was surrounded early in life we do not get a very clear idea, but his father was a well-to-do builder, or architect, who evidently made a point of giving his children advantages which he had not had himself. Lever was early sent to school, where he received his share of the instruction and flogging that was administered. It may be worth suggesting to sociologists and reformers, by the way, that one reason why the men of the early part of this century seem to have got so much more enjoyment out of life, to have had so much higher animal spirits than their descendants of the present generation, may have been that their education was such a hard one, and the repression exercised by parents so severe, that the reaction on being admitted to the full rights and privileges of men lasted for the remainder of their lives, and colored their whole existence with what Mr. Mallock would call "prismatic hues." Certainly our enjoyment of life is not so keen as our great-grandfathers' was, and we are flogged far less. A great many of the amusements of the young men of that period point in the same direction. There was no greater pleasure known among high-spirited and well-bred young men of Lever's early days in Dublin than the sport of beating a watchman; but it is difficult to understand what satisfaction this can have afforded, except that of a violent and ostentatious assertion of independence from all authority, made delicious by the remembrance of a long state of infantile servitude. Whether this explanation is sound or not, there can be no doubt of the fact that Lever arrived at man's estate with a fund of animal spirits which displayed itself first in practical jokes, and later in such rollicking tales as 'Charles O'Malley' and 'Harry Lorrequer,' and his songs, full of a true Irish humor, are just as amusing to-day as when they were written. The reader will find in Mr. Fitzpatrick's pages a very detailed account of his student-life at Göttingen, of his return to Dublin and professional practice there, and of his subsequent wanderings, and constant literary activity. We have not space to do more than call attention to one or two of the more interesting parts of Mr. Fitzpatrick's volume, which have not attracted the notice they deserve owing to the extraordinarily unattractive manner in which the book is put together.

One of the oddest things in Lever's life is the account of his visit to this country. It is difficult to make out which part of it is pure legend and which is fact. That he came here we are willing to admit, and even that he met a man who told him that he felt sure he was an Irishman,

* 'The Life of Charles Lever. By W. J. Fitzpatrick, LL D., M.R.I.A.' New York: Harper & Brothers (Franklin Square Library). 1879.

because all the Irish were "such damned ugly men"; but that he was habitually treated with such rudeness that he finally determined that life with an Indian tribe would be preferable to the barbarism of American society and accordingly joined the Red Men, this is, we confess, more than we can quite believe, as are also his subsequent Indian adventures and final escape to civilization. It is impossible to read this story without suspecting that, as he grew older, Lever's habit of story-telling got the better of his memory, and that he sometimes himself became confused between what had actually happened to him and what he imagined might, under given circumstances, have occurred. The most interesting part of the book is "Major D.'s" account of Thackeray's visit to Lever in Ireland. This is really a valuable picture of both men, and throws a curious light on Thackeray's manners and habits of thought. Mr. Fitzpatrick gives in great detail the history of the later years of Lever's life, passed almost altogether on the Continent, and most of this is worth reading for one reason or another. It is a career over which it would be easy to moralize. Why is it that the men who after all have done most to contribute to the amusement of the world—the great race of English novelists of this century—have spent, whenever we come to examine their careers closely, such anxious and care-worn lives? Some have been thrifty and some unthrifty, some have led active, some quiet lives; but the careers of nearly all the greater ones have been full of unhappiness. In Lever's case the explanation is simple enough; but what is not so simple is to see how, if he were to write the novels he did write, he could have been a man in the least different from the man he was. This is not a literary question. It is a riddle for educators and moralists which we must leave to them to solve. For ourselves, we confess a warm sympathy for Lever, whether in his gay and careless youth or in the anxious and harassed years of his later life. His child-like naturalness and simplicity, his honest love of everything noble and generous, please us in his character, just as his imagination and wit please us in his books. Throughout his long life they seem fortunately never to have failed him.

The Life and Epoch of Alexander Hamilton. A Historical Study. By the Honorable George Shea, Chief-Justice of the Marine Court. (Boston: Houghton, Osgood & Co. 1879.)—This book, as the author informs us in his introduction, "had its first step in a monograph on Hamilton as an historical study." It was "the prosperity of that first step" which induced him to undertake "an elaborate exposition" of Hamilton's "early and least known years, and of the great epoch to which he belongs." The volume, therefore, only brings the life down to 1777, the year in which Hamilton was appointed aide-de-camp to Washington. The author, however, does not despair of being able to continue his work. He says: "I purpose, but do not promise, to continue my work, so that it shall ultimately include every incident and phase of his memoirs in their private, professional, and public aspects." The volume is divided into nine chapters, of which the first three are introductory, and the remainder historical and biographical. The introductory chapters are rather designed to excite an interest in readers "who are not acquainted with the epoch and the man," and in them have been collected by the author "some of the testimonies of the most celebrated of his [Hamilton's] contemporaries, in America and in Europe, to the creative faculties of his mind and to the grandeur and permanence of his labors." We had feared, in noticing the author's judicial position, that his legal training and professional habits might have disqualified him for biography. He himself hints that the book was written in a brief period of relaxation from public duties which must be arduous. But his style shows nothing of the judicial pedant; it is as easy and fluent as if Mr. Shea had never cited an authority or charged a jury, and it is, moreover, an original style, a style which cannot be passed by without notice. It is, indeed, the most original thing in the book, and as such deserves our attention first. The chief peculiarity of Chief-Justice Shea's method of writing English is that he has a profound belief in the value of words as words. Everybody knows, of course, the value of words as representatives of ideas, but it is only now and then that a writer recognizes the inherent power of words themselves and avails himself of it. Judge Shea is master of this secret, and many of his most telling sentences and paragraphs appear to have been constructed mainly with a view to their verbal effect upon the ear. To give two or three examples: "The United States of America became and are, by natural induction, a Republic: constituted by the States in empire." "The fasces of Roman symbolism has, at last, found in statesmanship the truth of which it is the emblem" (p. 15). "As the single drop of pure dew resembles its crystallized similitude, the diamond, so did the clear intellect of Hamilton resemble that of Talleyrand. The one, full of life and lustrous; the other, fixed and brilliant" (p. 30). "Annotation also assists us to the sense of the text, as intelligible gesticulation explains the meaning and spirit of the orator" (p. ix.) We need not multiply instances of the freshness and vivacity of Mr. Shea's style; to appreciate it fully it is necessary to read several pages of it consecutively.

Apart from the style, Judge Shea's book is not a very notable addition to the biographies of Hamilton. It does not contain much that cannot be found elsewhere; indeed, it is doubtful whether the most industrious research into the early years of Hamilton's life will be repaid by any new discoveries of facts or of materials for forming a judgment of his character. Judge Shea tells the story of his boyhood and youth with great detail, and gives us the benefit of a good many reflections by the way. These are generally of a somewhat commonplace character, though they are expressed in a manner that is the reverse of commonplace. As an instance we may refer to the following passage:

"It is not always edifying to attempt an estimation of the comparative degrees of culpability: yet there are often evolved thereby significant essentials which give light and shade to the truer understanding of human character. There is certainly an obvious distinction between hypocrisy and a gross sin—it is a difference not favorable to hypocrisy and guile. There is a distinction between the insidious allurements of seduction and the indulgence of impurity; and the difference is not favorable to the first named. It is pernicious to believe that 'vice itself loses half its evil by losing all its grossness.' There is no sense in which it can be true in fact or in morals" (pp. 406, 407).

Taken apart from the context, the casual reader might say of these reflections that they were true but trite. When we find, however, that they are introduced in reference to the comparative morality of Burr and Hamilton in their relations with women, we see at a glance that they are such as few men would have thought of making. The same thing may be said of a good many other observations of the author. It is his opinion that "the social and political history of those times which preceded, and by a series of evolving events developed, the revolutionary spirit which brought about the separation of the American Colonies from the crown of England has, in its controversial literary phases, yet to be written." It is a pity that Judge Shea could not undertake this. His biographical task and his judicial duties probably make it idle to hope that he will ever do so, yet we cannot help suggesting that before he goes on with the biography proper a prefatory volume tracing the development of the evolving events here referred to ought to be written. A thoroughly judicial account of it might be even better than having it presented in its controversial literary phases.

Gleanings from the Natural History of the Ancients. By the Rev. W. Houghton, M.A., F.L.S. Illustrated. (New York: Cassell, Petter & Galpin.)—It is a pleasant thing to open a book by a Christian divine and to find it dedicated to Sir John Lubbock, and concluding with these words: "Among many great men who, at different ages, have directed their minds to zoölogical questions, especial mention may be made of Aristotle, Cuvier, and Darwin, of whom the greatest is Darwin." It is equally pleasant, on glancing over various parts of a book of two hundred and fifty very small pages, to discover that it contains as much varied and interesting information as many a learned and pretentious quarto volume; and pleasanter still to find, after perusing it, that not a single one of its pages ought to have been skipped over, and that most of them fully deserve to be read a second and third time. After saying so much, we almost hesitate to add that the little work is, perhaps, equally interesting to children and ripe naturalists, to friends of classical literature and students of Biblical, Assyrian, and Egyptian antiquities. But let the 'Gleanings' of Mr. Houghton, the aged author of the 'Country Walks of a Naturalist with his Children,' of 'The Ages of Christendom,' etc., speak for itself; one or two extracts may suffice, though it is hard to make a choice:

"The Ostrich was hunted by the Egyptians for the sake of its plumes, which were highly prized for ornamental purposes, and also because an ostrich's feather had a religious signification: it was an emblem of truth, and is occasionally represented as placed in the scales of Justice, being weighed against the actions of a departed soul in the presence of Osiris. . . . The ostrich was well known to the Jews, and is often mentioned in the Bible. The character of cruelty is attached to this bird in the Book of Job and in the Lamentations: 'The daughter of my people has become like the ostriches in the wilderness.' In Job xxxix. 13 our translation is in fault; the verse should be rendered thus: 'The wing of the ostrich moveth joyously, but has she the plume and feather of the stork?' Here the ostrich is instanced as the very opposite in character to the stork,

which was proverbially celebrated for its affection to its young. . . . Stupidity and want of affection have long been attributed to the ostrich by the Orientals. The Arabs have a proverb, 'Stupid as an ostrich,' and they give the following reasons for their belief: The ostrich will swallow iron and stones. When the bird is hunted it thrusts its head into a bush, and imagines that the hunter does not see it. It neglects its eggs. It has a small head and few brains. . . . The character of cruelty attributed to the ostrich is accounted for in this way: The ostrich is polygamous; the nest, which is a hole scratched in the sand, is filled promiscuously by several hens; the eggs are then covered over about a foot deep and left to the heat of the sun, which in the daytime acts as an incubator. . . . Figures of the ostrich occur on the Assyrian monuments, upon cylinders and utensils. There is no mistake about the bird denoted, though the drawings are grotesque; indeed, the Assyrian artists are far from happy in their delineation of bird-life generally."

"Pigeons.—The domestication of the pigeon dates from very early times. The prophet Isaiah apparently alludes to these birds when he asks: 'Who are these that fly as a cloud, and as the doves to their windows?' (lx. 8). In Egypt their domestication goes back, it is said, as far as 3000 B.C., and even before that time the pigeon appears in a bill of fare. The Egyptians used the pigeon as a carrier, as appears from a coronation scene of the time of Rameses III. . . . The Romans, in the time of Varro, bred enormous numbers of pigeons, as many as 5,000 sometimes occupying a single dove-cote, which was called by the Greek name *περιστεροτροφεῖον*, and was lofty and large. . . . Besides this tame breed, there was another, called *agreste* or *saxatile*, which was wild, or partly so. This breed dwelt in high places, and flew about at will; its color was checkered (*varius*), and there was no admixture of white. The tame kind (*clementius*) was generally of a white color, which was always preferred. These two breeds crossed. What is this wild or half-wild pigeon of which Varro speaks? He must, I think, refer to the Rock-pigeon, the *Columba livia*, the undoubted parent of all the various domesticated breeds, notwithstanding he says that it has no white (*sine albo*); . . . the Roman writer must have forgotten the small patch of white on the back. . . . At the present time letters are fastened under the wing of the carrier-pigeon, when the bird is required to act as a messenger. The Romans tied them to the feet. During the siege of Mutina (the modern Modena) Decimus Brutus, who was shut up in the town, held a communication with the consuls by means of letters fastened to pigeons' feet. . . . The pigeon was employed also as a messenger in affairs over which Cupid rather than Mars presided. We find Anacreon thus making use of the bird as early as B.C. 500."

And the author devotes no less attention to the ox than to the ostrich, to the pig than to the pigeon. The illustrations, taken from Assyrian and Egyptian monuments, are well selected and well executed. All we find to blame in the work is an occasional looseness in historical statements and in the spelling of Oriental words. This statement, for instance, "We do not read of elephants being employed in war before the time of Pyrrhus, who in B.C. 280 made use of these animals in the war with Tarentum against the Romans" (p. 180), would be correct only if limited to the use of war-elephants in Europe—which it is not; for elephants were thus employed, and in large numbers, by Porus against Alexander of Macedon, half a century before Pyrrhus's Italian campaign. Nor is it quite correct to say that the Accadians, from "their highland and wooded home of Elam, . . . migrated southwards down into the Mesopotamian plains," and there considered the horse as come "from the 'East'—that is to say, from Media and Armenia" (p. 89); for Elam was east of the Mesopotamian plains, and Media and Armenia were north-east and north of them. Of course, the Accadians may have thought only of Media, and that of its southern parts, in thinking of the east; but this explanation is wanting. "*Ôchîm*," "*akh*" as the singular of the preceding (p. 167), and "*dukîphath*" (p. 207) are badly-conflicting Hebrew words, and the second is incorrect in itself; they ought to be spelled *ô'hîm, ôa'h, dúkhîphath;* or, if the German *ch* be admissible, *ôchîm, ôach, dûchîphath.*

A Pocket Classical Dictionary, for ready reference. By Frederick G. Ireland. (New York: G. P. Putnam's Sons. 1879. 12mo, pp. 144.)—The very small size of this book is a sufficient indication that all that can be justly required of it is a judicious selection from the materials which usually go to make up a classical dictionary. Smith's 'Classical Dictionary,' published under the supervision of Dr. Anthon by the Harpers in 1851, itself an abridgment, contains 950 large, double-columned octavo pages. It is clear that we must make very moderate demands upon a little book of 144 pages, three inches by five. There is no indication of the plan upon which the author has made his selection, and hence the book must be judged upon general principles. The title, 'Classical Dictionary,' conveys to the mind of the classical scholar the notion of a book containing information as to the mythology, chronology, history, and geography of the ancient Greeks and Romans, and incidentally of the peoples with whom they had relations, arranged in alphabetical order under the names of persons, peoples, and places. The proper orthography and pronunciation of the names are also important requisites. Opening at the first page of this little book, we find, among other names, the name of a town, and the name of a river, and on page 3 the name of a promontory. These are properly spelled, the pronunciation is sufficiently indicated for those who understand the rules of Latin accentuation, and as much information is given as could reasonably be expected. The purchaser of the book would, on using it, probably be a little disappointed at finding that for other geographical names than these three he must have recourse to some other work. The names of peoples are also omitted, though the names of a few of the barbarous tribes whom Cæsar subdued are inserted, while others, apparently equally entitled to mention, are excluded.

Under the title *Musæ* the names of the nine Muses are given, but any one looking for *Calliope, Terpsichore*, and the rest in their alphabetical place will not find them. Under *Mœræ* the names of the Fates are given. *Parcæ*, their Latin name, is given in its alphabetical place with the proper cross-reference to *Mœræ*. *Lachesis*, the name of one of them, is given in its alphabetical place, but with no cross-reference; while *Clotho* and *Atropos*, who are mentioned much more frequently than *Lachesis* in classical authors, have no separate articles. The names of the Graces are given under *Charites*, but neither their individual names nor their Latin name, *Gratiæ*, which frequently occurs (*e.g.* Hor. Od. I. iv. 6), are inserted in alphabetical order. These different ways of treating titles which apparently require one uniform method seem to indicate the absence of a fixed plan. The death of Plato is placed in 434 B.C., five years before he was born. He died in 348. The death of the younger Cyrus at the battle of Cunaxa is stated to have occurred 41 B.C. It should be 401. This is, no doubt, a printer's mistake, but it is the misfortune of the authors and publishers of books the value of which depends almost entirely upon their accuracy, that such mistakes are almost unavoidable and quite inexcusable.

The book, however, as a rule is accurate, is handy to have lying on the table, and would often be consulted when the inclination or the time might be lacking to refer to a more unwieldy volume. Its convenience and cheapness constitute its chief claims to favor, and to most students these claims are not small.

The Human Species. By A. de Quatrefages, Professor of Anthropology in the Museum of Natural History, Paris. (12mo, pp. 498. The International Scientific Series, vol. xxvii. New York: D. Appleton & Co. 1879.)—The venerable author of this book has been an active worker in science for nearly half a century. He is a good representative of the elder school of *general naturalists*, whose knowledge is well-nigh encyclopædic in its kind, and who are therefore often esteemed better fitted for discussion of the broader scientific questions than are some of their younger successors, whose monographic devotion to special lines of research may sometimes limit their views to the exclusively botanical, or zoölogical, or geological standpoint. Hence it is not a little comforting for the present generation to witness the occasional radical disagreement of these scientific Nestors upon so vital a matter as the Origin of Species in general, and the Origin, Nature, and Antiquity of Man in particular.

Our author accepts as proved Darwin's propositions as to the Struggle for Existence and Natural Selection, but rejects his conclusions as to the mode of origin of organized beings. He admits the possibility that man may even have existed in Secondary times with the oldest mammals, but limits the post-glacial epoch to one hundred thousand years, and thinks modern computers "have begun to handle time with a strange laxity." He cheerfully assents to the statement that "from an anatomical point of view there is less difference between man and the superior order of apes than between the latter and the inferior orders," but ignores the extraordinary embryological resemblances which perhaps form the most potent weapon of the evolutionist. He ascribes to animals a degree of consciousness and a language—albeit interjectional—but enumerates as essentially human peculiarities, 1, the perception of moral good and evil; 2, the belief in superior beings; 3, the belief in a future life. He regards man as a single species, and favors the idea that his cradle was somewhere north of the Himalayas, but insists upon observation and experiment as the sole foundations of knowledge, and rejects all ecclesiastical tradition and authority. Indeed, like Agassiz, our author is liable to be called a sceptic by some and a bigot by others; but he seems to be not only prepared for this double condemnation, but even full of kindly consideration for his opponents. His cordial admiration for Agassiz and Darwin notwithstanding his objections to their opinions, is in pleasing contrast with the flippant abuse of the former by the author of the recently-published 'Evolution of Man.'

The language is usually clear and forcible, and there are many passages worth quoting. The author compares species to the *unit*, of which races are *fractions*. The "Yankees" are defended (p. 235) from the vague charge of physical degeneracy, and slavery is denounced (p. 86) as "an institution detestable indeed, but the results of which have been favorable to anthropology." The English will be interested by his idea that the Zulus are a mixture of negroes and Arabs, and all civilized nations may well stand abashed at his comparisons between savage morality and our own. Speaking (p. 350) of the fallacy of regarding certain features as evidences of degradation, he says: "If the Chinese and Egyptians had judged our ancestors as we too frequently judge foreign races, they would have found many signs of inferiority in them, commencing with the white skin, of which we are so proud."

On the other hand, one is almost ludicrously impressed by the repetition—on pages 368 and 369—of a very trivial statement respecting the Hottentot Venus, and any attempt to use the work with a view to the formation of an independent judgment is hindered by the total absence of exact references. The lack of an index is discreditable to both author and publishers, but the latter alone are probably to be held accountable for the non-intimation as to the date of the original work of which the present is a translation. The reader is allowed to infer that the present volume is of recent date, but had this been the case there would certainly have been references to publications such as the Reports of the Peabody Museum of Archæology by the Curator, the late Prof. Jeffries Wyman. The general appearance of the volume is good, but what sort of proof-reading can it be which passes over such words as *fossail*, Tanton (for Taunton), Witney (for Whitney), Wittlesey (for Whittlesey), Vrolick (for Vrolik), Daubenson (for Daubenton), Tiddemann (for Tiedemann), and Eskimas ?

Meditations in the Tea-Room. By M. P. (London : Pickering & Co. 1879.)—This is a little volume of some one hundred and fifty small pages, printed with the quaint attractiveness of text and marginal decoration familiar in the works of the Chiswick press. There is in this instance an entire conformity between the contents and their dress. The "meditations" quite suggest Lamb, although they are modern in both thought and statement, so as to be wholly free from the reproach of affectation, and they deal with politics in the main. They are well worth reading, and the sympathetic reader of them will probably have a comfortable sense of the fitness of their publication in such anonymous and unpretentious shape, instead of in the form of current discussion which the prominent English reviews now furnish. The "tea-room" is, of course, that of the Houses of Parliament ; and whoever "M. P." may be, he is evidently a person of mature experience, besides having the gift of humor and the art of expression. The character of his book is best explained, perhaps, by an extract or two, since it has no distinct drift, and is only a number of shrewd observations, each highly polished, strung upon the string of general satire. They are naturally of varied excellence, but we select quite at random :

"The greatest good to the greatest number imposes on the majority so severe a discipline that they are content to take less than their share.

"A civilized nation will not be respected of barbarians by reason of its civility alone.

"Honesty is disgusting to many men of fine feeling, because it is represented as a good investment.

"Respect is only an accidental liking for those whose interests are in conflict with our own.

"When we have all read and practised the theories of Mr. Mill and his followers we may, perhaps, be a very worthy people, and, like all of that class, play but a small part in the world.

"Whether the diadem of these realms fell among the gorse on the field of Bosworth, or whether we are to understand, as we look on the emblems of kingly power, that the thorns sprang up and choked it, you may—for you will—decide according to your prejudices.

"I suppose it was in the woods, where they had observed the good effects of having now a fine day and then a wet one, that our ancestors conceived the happy idea of governing by party.

"What most recommends party government is that it enables us to slander our rulers without sedition and overthrow them without treason."

We suspect the author of a lack of sympathy with what is known as liberalism in politics, and are bound to acknowledge that some of his apothegms, as well as some of his elaborate argumentation—examples of which we have no space for—are fantastic, not to say whimsical ; but for literary finish and flavor, as well as for a certain insight that only irony of the first-class can secure, we have met with nothing of the kind recently that equalled these "meditations." The book is manifestly not for him who runs, but its title gives fair warning to the impulsive and impatient who dread desultory reflections in which it is impossible to find syllogisms and credos.

Yellow Fever a Nautical Disease. By John Gamgee. (New York: D. Appleton & Co. 1879. 8vo, pp. 207.)—When the "horrid hair" of comets or the mysterious dispensation of Providence was responsible for sickness and pestilence such supernatural causes necessarily carried epidemics out of human control; but with the study of the natural history of disease hygiene is becoming a domestic art and preventive medicine is elevated into an affair of state. Just now yellow fever, a disease whose literature is overwhelming and whose occasional interest for the public is excessive, especially engages our philanthropists and sanitarians, and the latest accession to the great flood of narration and argument is an essay in popular style by Professor John Gamgee. This sets forth that the disease is essentially nautical, generated in the tropical Atlantic; that it can exist nowhere on land except as freshly imported from infected shipping; and that its suppression is certain by disinfecting the contaminated ships with very cold air specially applied, and by excluding all old and rotten vessels from the fever zone.

Common and deadly as it is in certain regions, the general interest in yellow fever follows from its causes and its limitations not being clearly understood, and the voluminousness of its record is due to the succession of observers, to most of whom it is novel and alarming. Its history is chiefly a long discussion as to origin and propagation, whose decision is yet *sub judice*, and upon it is engrafted the vexed question of quarantine. The pendulum of opinion just now is swinging towards belief in the exotic character of the disease, although a respectable minority acknowledges its possible domestic origin; the whole question being complicated and trammelled by hypothetical views of germs, and by the natural unwillingness of communities to confess that their own homes may give rise to such a pestilence. A certain interpretation of the germ theory, which has secured so firm a hold on both the scientific and popular mind, compels every case of specific disease to have a genealogical dependence upon another like it, and this requires all American epidemics of yellow fever to radiate from a foreign centre.

The author is a well-known comparative pathologist, whose investigations into the epidemic diseases of domestic cattle have been of great public service in Great Britain and the United States, and his recent studies have been upon the antiseptic property of extreme cold. Enthusiastic and confident as he is, he probably has not solved the whole problem of yellow fever; but as it is a well-known fact that the extension of the disease is incompatible with very low temperature, it follows that if, as he proposes, infected localities should be thus refrigerated the disease will cease to spread there. The possibility of effectual artificial refrigeration of infected places remains to be demonstrated. But cleanliness as a preventive is more important than cold as a destroyer, for the presence of yellow fever implies sanitary filth, without which there will be no epidemic.

Legends of the Saxon Saints. By Aubrey de Vere. (London : C. Kegan Paul & Co. 1879.)—Aubrey de Vere, the devout Catholic poet, is well known in this country to lovers of refined and graceful verse. His latest work, in which he records the touching and noble legends of the early Saxon Church, is mainly marked by fervor and elevation of religious feeling, so far as its character is indebted to the personal qualities of the poet, to whose spirit and powers, indeed, the period he has chosen to illustrate is well fitted. His subject is that seventh century in which England became Christian, and the names of her heroes and martyrs were first inscribed on the illustrious roll of English saints, a century as glorious to England, he thinks, by virtue of its aspirations and sanctities, as the thirteenth was to mediæval Europe. He has borrowed the principal motive of his poem from the old legend that Mithradates, fleeing northward from the insulting advance of Roman dominion, became that Odin in whose worship and laws were moulded the fierce races which wrecked imperial, and made way for Christian, Rome ; in their creed of mingled heroism and horror he discovers a prophecy, of which the conversion of these races is the fulfilment, so that by becoming Christians Odin's kings, earls, and thanes seem to be only carrying on to its purified conclusion the truth of Odin. Subject to this controlling idea, he takes his narrative of the fortune and reverses of the Christ in England from Bede's history, which, as he reminds us, Cardinal Manning has compared to the exquisite *Fioretti* of St. Francis as an illustration of an age. He has thus woven a versified legendary history, enlightened by his own ardent devotion and adorned by his poetic thought, fancy, and allusion, which, as poetry, it

is true, is sometimes injured by merely historical statement, but is, nevertheless, a noble portrayal of conversion, battle, and martyrdom, of saintly and heroic living. The landing of St. Augustine, the consecration of Westminster Abbey, the story of Oswald, of Oswy, and of Ceadmon, the Pentecost of St. Cuthbert, and Bede's Last May, are all pleasant reading, but they do not submit easily to extract. Here is one short passage describing how the Thames looked the morning of the consecration of Westminster :

"Old Thames that day
Brightened with banners of a thousand boats
Winnowed by winds flower-scented. Countless hands
Tossed on the brimming river chaplets wov'n
On mead or hill, or branches lopped in woods
With fruit-bloom red, or white with clustering cone,
Changing clear stream to garden. Mile on mile
Now song was heard, now bugle horn that died
Gradual 'mid sedge and reed. Alone the swan
High on the western waters kept aloof:
Remote she eyed the scene with neck thrown back,
Her ancient calm preferring, and her haunt
Crystalline still. Alone the Julian tower
Far down the eastern stream, though tap'stries waved
From every window, every roof o'erswarmed
With anthem-echoing throngs, maintained, unmoved,
Roman and stoic, her Cæsarean pride;
On Saxon feasts she fixed a cold, grey gaze;
'Mid Christian hymns heard but the old acclaim,
'Consul Romanus.'"

Such sincere and deep piety as this volume evinces is rarely found in our verse to-day; the poet, standing thus alone, seems to feel discontent and to harbor gloom with regard to the work of his fellows in the art, and speaks of "that professed poetry of a materialistic age when the poet is tempted to take refuge from the monotony of routine life, either amid the sensational accidents to be found in the byways, not the highways, of life, or in some sickly dreamland that does not dare to deal with life, and belongs neither to the real nor to the ideal." In this he only re-echoes what others far removed from him in spirit have said—George Sand, for example—and the truth in it is to be laid to heart. But, while disagreeing with his reasons, we join in his regret. This record he has transcribed of high deeds and emotions, told with grace, sympathy, and reverence, is a very welcome gift.

Götzendienst und Zauberwesen bei den alten Hebräern und den benachbarten Völkern. Von Dr. Paul Scholz, o. Professor an der Universität zu Breslau. (Ratisbon. 1877. 8vo, pp. x. and 482.)—This is a systematized collection of Biblico-archæological treatises on idolatry and sorcery among Hebrews, Phœnicians, Syrians, Babylonians, Assyrians, Egyptians, etc. In regard to everything Scriptural connected with these topics, in their widest extension, it may be said to be exhaustive ; and it is brought up to the latest level of archæological research in Eastern fields. The erudition displayed in it is such as is only attained by devoting a great many years to the study of a single subject. All the stores of information available for the purpose, classical, patristic, rabbinical, or critical, down to the last number of the *Zeitschrift der deutschen morgenländischen Gesellschaft*, have been ransacked by the author with an almost prodigious assiduity. The mass of references is perfectly overwhelming, and, we may say, distracting, since the names of authors and titles of books, abridged and unabridged, and chapters and pages mingle with Hebrew, Greek, Assyrian, Egyptian, and other ancient words of strange spelling and strange meaning, forming mazes through which only the trained eye of the specialist can find its way. And only to specialists can we recommend the book, not only on account of the difficulty of penetrating through its intricacies, but chiefly on account of its peculiar character as a critical guide. A history it hardly pretends to be, and its critical decisions are in numberless cases the *dicta* of an orthodox conservatism carried to the last extreme. This is sufficiently shown in the preface, in which the theory is established that monotheism preceded polytheism and fetishism in the history of mankind, and idolatry arose from the abandonment or corruption of pure and divinely-revealed religion. This view is, in the first chapter, proved to be the correct one by a large number of quotations, beginning with one from the Book of Wisdom, which "assures us" (*versichert*) that "from the beginning there were no idols." The other proofs are equally strong. The defection from the true God, we are told, must have preceded not only the building of the tower of Babel, but even the deluge, "since of the seven commandments established, according to Jewish tradition, for the time of Noah, the first refers to abstention from idolatry." The often-debated question, "whether Abraham, before receiving his call, was an idolater or not," is, with equal conclusiveness, decided in the negative, as far as his life in Chaldea is concerned, by a reference to the Book of Judith ("5, 7, *seq.*"—we do not doubt the correctness of the reference); while Nehemiah (9, 7, *seq.*) favors a similar decision in regard to the patriarch's life in Mesopotamia, for we read that God, after bringing him out of Ur of the Chaldees, found his heart faithful before him. About the reappearance of Samuel to Saul, before the battle of Gilboa, Dr. Scholz quotes a number of opinions, the upshot of which is that it is safest to consider the affair at Endor as having begun in a trick of the witch and ended in a divine miracle—the apparition of an angel or another image personifying the deceased prophet. Such personages, however, as Abraham, Samuel, and angels play an unimportant part in the book, which is in the main devoted to the worst abominations of Semitic and Hamitic antiquity, to idols and worships equally shocking. The accounts are given with minuteness and fidelity, and nothing monstrous is covered with a veil. Bull-worship is treated in fifteen pages ; Moloch, in sixteen ; Baal-Melkart, in twenty ; the West-Semitic Baal, in twenty-two ; Astarte, in forty-two. And the pages are both long and crammed with learning.

The Amateur Poacher. (Boston : Roberts Bros. 1879. Pp. 240.)—This adds a third to the delightful volumes of R. J., and, like the two previous ones, first appeared in instalments in the *Pall Mall Gazette*. To any lover of sport, or one interested in just and accurate descriptions of the details of natural scenery given by one fully in sympathy with them, the book will not soon grow wearisome, and it is free from that minuteness of recital which made its predecessor, 'Wild Life in a Southern Country,' somewhat disappointing. The author begins by telling of his first experience in shooting, with an old gun, an heirloom in his family, a single barrel, "long, slender, and light as a feather," with "a groove on the barrel at the breech and for some inches up, which caught the eye and guided the glance to the sight at the muzzle and thence to the bird.' With this weapon he succeeded in hitting a wood-pigeon, but further sport that day was brought to an end through the untimely breaking of the ramrod. The first victim was, however, soon followed by others, and then comes a chapter or two on fishing, principally of wiring and shooting, by both which methods he was quite successful, especially with jack. One way of killing these fish which is practised in this country he does not mention, namely, by striking a heavy blow on the clear ice directly over the spot where they lie against its lower surface in sunny winter days. The great clearness with which R. J. writes, and the graceful transitions he makes from the pursuit of a hare or stalking of a pheasant to some charming description of a path he is following, the trees and plants growing beside it, or some trait or habit of the animal or bird shortly to be slain, are delightful and frequently recurring features of the book. It is pleasing to note the author's neglect to avail himself of the chance for sentimentalism and nonsense his topics afford. There is no affectation of a pity the sportsman never feels for the game he has fairly killed, no "marvellous effects" of clouds and sunshine and "blues and yellows and greens," but a straightforward, simple way of saying what is to be said in a manner which shows a true love of sport and nature, with a keen eye and discriminating taste for what is beautiful, and a thorough knowledge of just how to describe it. It is hard to make selections from such uniform goodness, and we can only heartily commend the whole book to every one who sympathizes with the writer in his last paragraph :

"Let us get out of these indoor, narrow modern days, whose twelve hours somehow have become shortened, into the sunlight and the pure wind. A something that the ancients called divine can be found and felt there still."

Studying Art Abroad, and How to Do it Cheaply. By May Alcott Nieriker. (Boston : Roberts Brothers. 1879.)—This little book has no preface, but its intent is declared on the first page as being "to report the actual cost of living, instruction, and rent of studio abroad ; and how one in search of such can most easily and economically obtain them." To a certain extent it does all this ; but only to a certain extent, so that the reader feels that the useful hints scattered through these pages fail of being a safe guide to life abroad, because they are so few, so disconnected, and so accidental. The book is written in the most careless fashion, like the private letters of a correspondent not over-vain of her epistolary style. But on pages 47, 48, and thereafter what is said about Paris studios is good, and calculated to set an enquiring pupil in the right direction, and the information contained in the volume is summed up in a list of teachers, *pensions*, and dress-makers likely to suffice for all the needs of a new arrival. Evidently it is the woman-student that the writer has in mind, and the title ought to say so.

A slight attempt is made to call attention to useful and easy trips out of the great cities ; but that sort of guidance might be carried to any extent, and it is perhaps to be regretted that in this little volume there is

given to a mere hint at the subject space which was much needed for the positive information about student life and study which it is the avowed object of the book to convey. One difficulty in the way of absolutely free art-study by women our author alludes to more than once—apparently with astonishment that it should exist: "It was found to be an impossibility that women should paint from the living nude models of both sexes, side by side with Frenchmen. This is a sad conclusion to arrive at." Substitute *young men* for Frenchmen, and *inevitable* for "sad," and we should agree with Mrs. Nieriker. The attempt has not the excuse of necessity to justify partly its indecency.

History of France. By Charlotte M. Yonge. [Freeman's Historical Course for Schools.] (New York: Henry Holt & Co. Pp. 247.)—"Good wine needs no bush," and a history of France written by Miss Yonge and edited by Mr. Freeman has all the guarantees possible for accuracy and interest. We need only add that it is at once considerably thicker and in finer type than most of the other volumes of the series, so that we may no doubt pronounce it to be what has so long been desired—a readable short history of France. Except, however, for the necessity of making it correspond in outward appearance with its fellows, one would have wished to have it in two volumes, so as to allow larger print. The maps, twelve in number, representing France at that number of different epochs, are very valuable; but these too are on too small a scale. It is very hard to make out the boundaries, which are given in fine dots instead of colored lines; in the map of 1811, for example, one would not guess that the French Empire extended to the Baltic. The responsibility of the renewal of the war between France and England after the Peace of Brétigny must, we suppose, be divided between the two parties; and it is hardly fair to throw all the blame upon Charles V. of France, on the ground that he offered a gratuitous insult to the Black Prince "by sending him a challenge by the hands of a scullion" (p. 61). It ought to be mentioned that this was a fit response to the outrage committed by Edward some months before in seizing two envoys of the King of France and throwing them into prison. Again, it is unworthy of a modern historian to gloss over the cruelties of the Albigensian crusade by representing these people as utterly immoral (p. 33). No doubt they were so represented by their enemies, and no doubt there were bad men among them; but there is no reason to believe that their lives were worse than those of their persecutors. Wattenbach says of them that "their life was free from reproach, and exemplary"; and at any rate, however bad they may have been, it was not for their wickedness but for their heresy that they were exterminated. On what authority is Franklin called a Quaker? (p. 163).

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*
American Art Review, Vol. I., No. 1, swd.	(Estes & Lauriat) $1 00
American Continent, Parts 2-6, swd.	(C. Collins & Co.) 50
Arctic Voyages of Adolf Erik Nordenskiöld.	(Macmillan & Co.) 4 50
Baird (W. R.), American College Fraternities.	(J. B. Lippincott & Co.) 1 50
Barnard (F.), Character Sketches from Dickens.	(Cassell, Petter & Galpin) 6 00

By JESSIE FOTHERGILL, author of 'The First Violin.'

16mo (Leisure-Hour Series), $1.

HECTOR BERLIOZ: Selections from his Letters and Æsthetic, Humorous, and Satirical Writings. 12mo, $2.

THE MAGIC OF THE MIDDLE Ages. By Viktor Rydberg. 12mo, $1 50.

THE YOUNG FOLKS' CYCLOPÆdia of Common Things. 8vo, illustrated, $3.

HENRY HOLT & CO., New York.

NOW READY.

A new and cheap edition of

Snider's System of Shakespeare's Dramas.

Two vols. in one, price $2 50 net; mailed on receipt of $2 65.

No work on Shakespeare of late years has excited such diverse and vigorous criticism. The latest review is from the pen of Dr. Wm. T. Harris, the distinguished educator, who, it will be remembered, pre-eminently distinguished himself at the Concord School of Philosophy last summer. In the course of an elaborate review in the *American Journal of Education* he says: "We regard Mr. Snider's book as by far the ablest work on Shakespeare that has appeared up to date in any language. Nay, we go further and say without reservation that Mr. Snider's book is *the greatest work of scientific literary criticism* that has been written in any language. As such it marks an epoch in the history of literature."

SWINTON'S

New Word Analysis;

Or, School Etymology of English Derivative Words, with Practical Exercises in Spelling, Analyzing, Defining, Synonyms, and the Use of Words.

This is a new modelling and re-writing of the author's very popular 'Word Analysis,' first published in 1871. It has grown out of a large amount of testimony to the effect that the older book, while valuable as a manual of methods in the hands of teachers, is deficient in practice-work for pupils. The old METHODS have been retained, while an adequate amount of new MATTER has been added.

Cloth, 150 pages. By mail, for examination with a view to introduction, on receipt of 25 cents.

WELLS'S

Natural Philosophy.

NEW EDITION.

With many new Engravings. Carefully revised and re-edited in accordance with the latest results of scientific discovery and research. By WORTHINGTON C. FORD. In *two* parts and in *one* volume.

PART I. includes the discussion of matter and its general properties, the attraction of gravitation, and the elementary principles of pneumatics, hydraulics, and hydrostatics.

PART II. treats of the theory of the forces known as heat electricity, and magnetism, together with the principles of Acoustics.

By mail, for examination with a view to introduction, PART I., 45 cents; PART II., 55 cents. Complete, $1.

THE REVISED CODE
OF THE
Public General Laws
OF THE STATE OF MARYLAND.

By Lewis Mayer, Louis C. Fischer, and E. J. D. Cross, Attorneys-at-Law. Legalized by the General Assembly of 1878.

The condition of the Statute Law of the State has been such that it is only with great difficulty and research that those familiar with the course of legislation can acquire or retain a knowledge of the existing law. The Code of 1860 has been essentially modified by the legislation subsequent, and in the eighteen years since its adoption new articles have been added and many repealed.

THE REVISED CODE is the result of much labor, and, with the index, makes a volume of about 1,100 pages. It is essential to every Lawyer, every Law Officer, every Property and Real Estate Agent, all Railroad, Banking, Insurance, and other Corporations; every Merchant, Manufacturer, Farmer, and Business man should have a copy of the Laws at hand for ready reference. The attempt to reduce the legislation of the State to a rational shape, and to give reference to those decisions of the Court of Appeals which construe the law, is an undertaking of great importance, the successful execution of which affects not only the administration of justice, but will render possible a knowledge of the Statute Law of the State as a system.

RECENTLY PUBLISHED, in 1 vol. of 784 pp., price $8.

The Testamentary Law,

And the Law of Inheritance and Apprentices in Maryland.

With an Appendix of Forms, and an Index.

By Edward Otis Hinkley, of the Baltimore Bar.

Every Lawyer, every Property and Real Estate Agent, and every owner of Property, who expects to make a Will or have any business with the Orphans' Courts as Executor, Administrator, or Guardian, and Merchant, or other person, having a claim against the estate of a deceased person, ought to have a copy of this work for ready reference.

RECENTLY PUBLISHED, price $5; by mail on receipt of price.

THE LAWS OF MARYLAND,
PASSED AT JANUARY SESSION, 1878.

☞ Early orders respectfully solicited.

MURPHY & CO., PUBLISHERS,
182 Baltimore Street, Baltimore.

NEW BOOKS.

MISCELLANIES. By John Dean Caton, LL.D, author of 'The Antelope and Deer of America,' etc. With a fine Steel Portrait. 1 vol. 8vo, $2.

CONTENTS: The Close of a Judicial Career—A Lawyer's Retrospect—The Death of Lincoln—Gen. W. H. L. Wallace—The Position and Policy of the Democratic Party (1862)—The Growth of the Law—An American State and its Architecture—Old Chicago—Origin of the Prairies—The Last of the Illinois, with a Sketch of the Pottawatomies—American Cervus—The Wild Turkey and its Domestication—Some Points connected with the Vital Statistics of the Hawaiian Islands—The Volcanoes of the Hawaiian Islands—Surf-Bathing at Hilo—Letters from Low Latitudes—The Yosemite Valley and its Origin—The Petrified Forest of California.

This list indicates the large variety and interest of Judge Caton's book.

The Nation.

NEW YORK, THURSDAY, DECEMBER 4, 1879.

The Week.

THE opening proceedings in Congress fully justify what we have said below as to the unlikelihood that either party will touch the currency problem this winter beyond, perhaps, stopping the coinage of silver. In the House Mr. Price introduced a resolution declaring that in the opinion of the House no change should be made in the currency laws at the present session of Congress; Mr. Fort, a less sweeping one, declaring that any attempt to withdraw the legal-tenders or change their status at the present session of Congress would be injudicious and mischievous. Mr. Carpenter was to introduce one in the Senate on Wednesday declaring that any legislation during the present session of Congress changing the existing system of finance would be inexpedient. There appears to be a disposition on both sides to get rid of the legal-tender quality of the United States notes, but neither party is willing to take the responsibility of it, and each hopes that the Supreme Court will settle the matter by a decision in the Chittenden-Butler case. It is said, but we trust not correctly, that Attorney-General Devens will not have this pushed forward in the calendar, fearing that Chittenden's victory would injure the party. In fact, it is more and more plain that, although the Congress of the United States sits every year, it is only the two middle years of every Presidential term which are available for rational legislation. The year after the Presidential election is given up to distributing offices, and satisfying claims, and avenging wrongs; the year before to getting rid of all questions which are likely to embarrass the party in the campaign.

The President's Message takes very strong and clear ground on all the important topics of the day. He urges Congress to refrain from new legislation on the general subject of the coinage, pending the proposition for unity of action between the United States and the principal commercial nations of the world with regard to the relative value of gold and silver, but also to authorize the Secretary of the Treasury to stop coining silver in order to prevent the expulsion of gold from circulation, which he anticipates as the result of unlimited coinage of the former. He says $45,000,000 of silver have been already coined, but only $12,700,344 of this is now in circulation—in other words, about the amount of the postal currency which has been withdrawn. He also recommends with much earnestness the retirement from circulation of the United States notes as "the policy and duty of the Government, and the interest and security of the people," and expresses his "firm conviction that the issue of legal-tender paper-money based wholly on the authority and credit of the Government, except in extreme emergency, is without warrant in the Constitution and a violation of sound financial principles"; and he declares that "the circulation of these notes for any protracted period after the purpose for which they were issued [the rescue of the country from imminent peril] had been accomplished was not contemplated by the framers of the law under which they were issued." He denounces the Mormon practice of polygamy; refers to the judgment of the Supreme Court affirming the constitutionality of the Prohibitory Act of 1862, and urges its firm and effective execution, but he offers no suggestion as to the means of meeting the difficulty of procuring evidence of polygamy when both parties to the offence are willing agents, though he recommends the deprivation or refusal of the rights of citizenship as a penalty of disobedience to the law. He draws attention to the proof afforded by the late State elections, and the discussions preceding them, of the deep interest felt in the more general and "complete establishment, at whatever cost, of universal security and freedom in the exercise of the elective franchise." He appeals to good citizens of whatever party all over the country to unite in compelling obedience to existing laws aimed at the protection of the right of suffrage, and urges Congress to remedy any defects in existing laws which experience has shown and which it is within its power to remedy, and for "this great purpose he invokes the co-operation of the executive and legislative authorities of the States."

He devotes more space, however, to civil-service reform than to any other one topic, and, in reading his clear and cogent reiteration of the arguments in its favor, one cannot help regretting that he should only have returned to the subject at the opening of the last year of his term of office, when both parties are occupied above all things with the election of his successor, and that there should have been so many things in his own practice which the opponents of the reform can cite in order to bring his exposition into ridicule and contempt. He announces the early production of a report by the Chairman of the Civil-Service Commission, giving the results of British experience in dealing with this problem; repeats his old objections to "the partisan-spoils system" of appointment to office and of office tenure; points out the distinction between the participation in party agitation of Cabinet officers, who must go out of office with the party to which they belong, and that of subordinate officers who ought not to do so; defends and explains the system of competitive examinations, and gives a sketch of the history of its working, and also of the history of the "Civil-Service Commission," for which body he again requests an appropriation. He makes remarks on the devotion to electioneering work by officers of the Government of time for which they are paid for devoting to the public service, which the illustrious Dutcher must read either with amusement or surprise, and about which probably no human power would induce Secretary Sherman to express his opinion, and, in passing from the subject, fires a parting shot at the odious and disgraceful income-tax levied on the unfortunate office-holders under the name of an "assessment" or "voluntary contribution." The remainder of the Message describes briefly the state of our relations with foreign countries, and gives the salient points of the reports of the heads of Departments.

The report of the Secretary of the Treasury has nothing in it that will attract much attention beyond his recommendation that greenbacks be deprived of their legal-tender quality, and then that $300,000,000 of them, redeemable in coin on demand, be kept constantly afloat. This is really a proposal that the United States should go into the banking business permanently under the superintendence of the majority in Congress for the time being. What this means, or would mean, we hardly need to point out after the experience of the past fifteen years. Every session would witness attempts to increase the issue in order to "meet the wants of trade," or to supplant the national banks; or proposals to suspend redemption in specie as unnecessary, or to suspend it practically by appropriating the gold in the Treasury for some other purpose. In fact, we should, were Mr. Sherman's suggestion adopted, enter on an indefinite period of wild-cat finance. We cannot help believing that so shrewd a man as Mr. Sherman sees all this very well, and that his scheme is simply a tub thrown to the whale. He knows that nothing will be done about the greenbacks this winter at all, and he therefore throws out this suggestion as something which will keep him on a good footing both with those who wish to see the greenbacks all destroyed, and those who wish to keep them all afloat. It is a kind of *via media*, in fact, in the construction of which he is a master. All speculation as to what Congress will do about the currency this winter is, we need hardly say, idle. Both parties are manœuvring for position in the Presidential canvass, and neither will commit itself to any affirmative policy or do anything beyond trying to get its opponent "on record" in some

damaging or disgraceful way. If the mode of counting the electoral vote is properly prepared we may be thankful. Neither party will attempt anything that looks like contraction, and the Democrats are quite capable of pretending to desire inflation, but without doing anything to bring it about.

The specie imports were again large during the week, and the total since the resumption of specie payments is now nearly $78,000,000, of which nearly $72,000,000 have arrived within the last four months. The market for exchange on London still rules in favor of gold imports, although the rate for sixty-day bills was advanced one-half during the week. The New York money market continues easy, and the banks have advanced their surplus reserve to about $7,250,000. The event of the week, so far as the Stock Exchange is concerned, was the sale by private negotiation of 250,000 shares (par value, $25,000,000) of New York Central and Hudson Stock. The seller was Mr. Wm. H. Vanderbilt, and the buyers were a syndicate of bankers represented by Messrs. J. S. Morgan & Co., of London, and Messrs. Drexel, Morgan & Co., of New York. The members of the syndicate include a half-dozen of the leading foreign bankers, and the managers and chief owners of the Wabash system of railroads, to wit: Cyrus W. Field, Jay Gould, ex-Governor E. D. Morgan and his partner, Solon Humphreys, Russell Sage, and Sidney Dillon. The price paid for the stock was 120 per cent., and the payments are to be made in monthly instalments, the first of $5,000,000 having been made on Friday, the 29th of October. The members of the syndicate have entrusted the right to sell the stock to a joint committee in London and New York for one year, so that no individual member of the syndicate can control his share of the total holdings of the syndicate for that time, at least. The first effect of the authorized announcement of the transaction was a rapid advance in the price of the stocks of all the companies represented in the transaction. This was of short duration, and was followed by a decline as great as the advance. The President's Message and the Secretary of the Treasury's Report had considerable effect on the Stock Exchange markets on account of their recommendations respecting the legal-tender notes. Silver declined in London to 53*d.* per ounce, presumably because Congress has been urged by the Executive to discontinue the coinage of 412½-grain silver dollars. The bullion value of this dollar at the close was 88¾ cents.

The New York Central sale has been widely and variously commented upon, and Mr. Vanderbilt has been "interviewed" with great assiduity. For once Mr. Vanderbilt has shown a disposition to take the public into his confidence, telling the Froudes and Macaulays of the press that he was moved by the double purpose of dividing with others the brunt of legislative attacks upon the Central Railway, and of giving to the public everything they could justly demand. The former is an intelligible reason; but it is difficult to see how the public are benefited by the fact that Mr. Vanderbilt owns fewer shares of Central than he did last week, and Mr. Field, Mr. Sage, and Mr. Morgan own more. The rational explanation of the matter is that the parties to the contract believed there was money to be made out of it. The "Street" refuses to take any other view of it, and the "Street" is undoubtedly right. Whether the money is to be made by turning the traffic of the Wabash system of roads into the New York Central's channel, or by selling the syndicate's stock at an advance in London, or otherwise, is of interest to speculators and to the shareholders of rival railroads, but is immaterial to others.

The Organ is very angry because the *Nation* said that he "produced the story of the sale of the New York Central stock in a very positive form on the very day of the panic, and after the panic acknowledged it to be untrue." Unhappily, what the *Nation* said was strictly correct. On the 21st of November, the very morning of the panic, the Organ announced that "the most sensational stock transaction of the season *is the sale* of twenty millions of New York Central by William H. Vanderbilt, at 120, to a syndicate composed," etc. On the 22d, the day after the panic, when "the lambs" had been shorn, he declared "that it is now understood that there is an obstacle in the way of the completion of the arrangements for the sale of twenty millions of New York Central stock by Mr. Vanderbilt." In other words, he acknowledged that the sale had not taken place. We believe both statements were honestly made, and that their discrepancy was easily explicable, but, when first made, appearances were against him, as his enemies were not slow to point out. We invited him to make a little explanation of the facts, like a gentleman, before we knew that the sale had positively taken place. Instead of doing this, he fell into a senile fury (against which his doctors must have often warned him), and began to curse and call names. It is probable, however, that he forgot on the 22d what he had said on the 21st, and now forgets what he said on both days, through a not uncommon infirmity of old age. We therefore do not blame him, but we think he ought to have his proofs revised by a younger man, and try to get more sleep. His increasing irritability since the Scratchers attacked him in his "bark" and wet him with his own "reform" spray, is not surprising, but it is a bad symp om. If he cannot control himself, the State Committee will have to give him a Coadjutor, as the church does the aged and infirm bishops.

Secretary Schurz's report takes a cheering view of the Indian question. Of the 252,000 Indians in the United States there has never, at any time since the pacification of the Sioux, been any but an insignificant fraction engaged in hostilities. Less than a thousand are now making trouble—some 800 Utes in Colorado and 150 marauders in New Mexico. As a rule, we have peaceable conduct, and that, in a very large majority of Indian reservations, without the restraint of any coercing force. Mr. Schurz also remarks that of the four disturbances which have occurred during the past two years three broke out in the immediate presence of the military. He declares the policy of his department to be to set the uncivilized Indians to work as farmers or herders, and render them self-supporting; to educate the young in civilized notions; to allot parcels of land to Indians in severalty, making the fee inalienable for a term of years; afterwards to dispose, with their consent, of the unsettled portion of their reservations, using the proceeds as a fund to relieve the Government of the burden of annual appropriations; and finally to merge the Indian in the common citizen. He makes a very interesting showing of the numerous employments in which the Indians already show industrial and mechanical aptitude, dwelling with special satisfaction on the complete success of the experiment of letting them carry the supplies to the Sioux agencies of Southern Dakota: the service was never so well and faithfully performed. Nearly a thousand more children of the uncivilized Indians are at school this year than last—7,193 in all; and not only are some being educated at Hampton, Va., but the disused barracks at Carlisle, Pa., have, by permission of the Secretary of War, been converted into a school, which begins with an attendance of 158. Mr. Schurz points out the necessity of making the law more stringent in regard to the sale of arms and ammunition to the tribes. He thinks the Utes had no ground for their outbreak. The Poncas, from personal inspection during the recess, he knows to be better located and housed than they were in their old home on the Missouri, and he regards as mischievous the attempt to obtain a judicial decision as to their rights.

General Woodford, greatly to his honor, has gone down to Louisiana, and has been making the best Stalwart speeches we have yet read to crowds of Democrats in New Orleans. He has been neither mobbed, insulted, nor interrupted, but has been cordially received and listened to with attention, and he has given them what even Mr. Conkling would admit to be the pure milk of the word. That he should have gone alone, reflects great discredit on the old "bloody-shirt" men of the party, and gives an air of plausibility to the story that they have discouraged each other from going to the South, lest their being peaceably received should destroy some of

the oratorical material they are keeping in store for the next canvass at the North.

The Atlanta (Ga.) *Constitution* has a shameless story purporting to give the returns from the Controller-General's Office in that State, showing the amount of property now held by negroes. The valuation of all taxable property has fallen off $1,000,000, but the returns, this lying rebel sheet says, show that the property of negroes has gone up to $5,182,398 this year, from $5,124,875 last year, which means, it says, that, taking the depreciation into account, it has increased about $100,000. They have added, too, 39,309 acres of land to their holdings within the year, making a total of 341,199 acres owned by negroes in the State. In order to give a plausible air to this audacious invention, the editor adds that, as there are only four negroes in the State worth more than $10,000, his figures show a considerable distribution of property among the colored race. As we have the authority of the Secretary of the Treasury and of more than one Senator for the statement that the negroes pass a large part of their time "hiding in the swamps," and otherwise eluding white murderers and robbers, there is something almost disgusting in these attempts to persuade us that they are acquiring farms and saving money. What gives a darker hue to the tale is, that it is evidently intended to be spread through the winter for political effect, when the writer well knows that what the country needs for real peace and prosperity is circumstantial accounts of the murders which he and his friends are daily committing.

The *Herald* improved the opportunity of Thanksgiving Day to publish some graphic statistics, compiled as a chart by Mr. Edward Atkinson, showing the comparative areas of the several States and Territories, and of the European states, Russia excepted; showing also the relative areas occupied by the nine crops, cotton, corn, wheat, rye, oats, barley, buckwheat, potatoes, and hay. The obvious lesson of these lines and figures is that we ought to be thankful for Texas, which not only reckons more square miles than the Austrian Empire, or the German, France, Spain, etc., but could grow, at the rate of a bale to an acre, the world's supply of cotton on less than a tenth of its cultivable soil, which is equal in extent to the total area under cultivation for the crops above enumerated. Less than three thousand square miles (2,825) were in 1878–9 devoted by Texas to the growth of cotton, and produced nearly a million of bales (950,000) of 480 pounds each. Mr. Atkinson was led to gather these facts, which are much more striking to the eye than when simply related, and to group them about a single State, by the erroneous idea which some Englishmen have formed of the condition of our territory on learning that the Government has parted with almost the entire public domain. This was taken to be equivalent to settlement and cultivation up to the ordinary capacity of the land, and an exhibit of the resources of Texas in particular seemed a ready and striking way of proving the contrary.

There was a report in the early part of last week, which excited some sensation, that the priests in New England had been directed by the bishops to refuse the sacraments to the parents of children attending the common schools, and that this action of the bishops was taken under instructions from Rome. It now appears that no directions have been given to the priests, and that no such instructions have been received from Rome. It seemed very unlikely in view of the fact that the Pope had disapproved of the violent proceedings of the Belgian bishops in this matter. The policy of the Church in this country will probably continue to be what it has been both here and in France—to fight hard for money from the state for the support of sectarian schools; to take what it can get in default of getting what it wants; to put the public schools under ecclesiastical control wherever this is possible; to set up parochial schools wherever the money can be raised for the purpose; and where none of these things can be done to make the best of the schools as they are, all the while warning parents of their danger to faith and morals. But it is quite certain that no severe strain on ecclesiastical authority will be attempted as a general policy, though zealots like Father Scully may here and there be guilty of excesses.

The Genevans, in their first attempts to deal with Ultramontane aggression after the Council of the Vatican, undertook, like the Germans, to encourage or take under protection of the state, as it were, the Old-Catholics. In fact, they went further than Bismarck a good deal, for they made the Old-Catholic Church a state church. The excitement of the conflict has since then greatly diminished, and it has become plainer every day that Old-Catholicism was not worth state patronage. In 1878 the Radicals, who founded the connection, lost their majority in the Grand Council, though they retained it in the Council of State. In the elections which have just taken place the Democrats, or Liberals, as they are called, have carried the Council of State also, and their policy is embodied in the formula that the state must be "neutral and lay, as it is, for example, in the United States." Hereafter, therefore, the government of the Canton will take no part whatever in ecclesiastical quarrels, but confine itself to seeing that neither party encroaches on the rights of the state.

The rumors of an approaching ministerial crisis in France continue to grow stronger. The Government has been compelled to offend the Extreme Left by the measures of repression adopted against the returned Communists who resumed their old trade of agitation, and by its refusal to remove judges suspected of royalist or reactionary sympathies and opinions. The result is that the Left has drawn up a programme, which it intends to submit to the Ministry for adoption, which includes, according to the cable, liberty of meeting and association and of the press, and gratuitous and compulsory education. This programme the Ministry, of course, cannot adopt without giving free rein to the Communists and rousing the country against them. The matter will probably have been debated before this reaches our readers. If the Ministry fails to receive a vote of confidence the succession falls inevitably to Gambetta.

The relations between England and Turkey are reported to be easier—that is, the Turks have made a concession by appointing Baker Pasha commander of the 60,000 gendarmerie who are to begin the reform in Asia Minor. The selection of Baker, on the demand of the British Minister, for such a mission is, considering the circumstances under which he was dismissed from the British service, one of the oddest incidents of the Beaconsfield policy in the East. The Government at Constantinople seems to be steadily falling to pieces, and it is not at all unlikely that before long the British Minister may find the actual administration of Asia Minor on his hands, through Baker's corps. The world is still wondering over the reticence of the Premier at the Lord Mayor's dinner, and the latest explanation of it is that he did not wish to furnish ammunition to Mr. Gladstone, who is now stumping vigorously in Midlothian, in what promises to be the fiercest electoral conflict which has been witnessed in Great Britain for many a day. He is attacking a great Tory magnate, the Duke of Buccleuch, in his stronghold.

There is a story from Russia that the Czar is about to announce the formation of an advisory council, partly elected and partly nominated by the Crown, but without any legislative power. This move is said to be due to the Tzesarevitch, who has hitherto been set down as a violent Old Russian and Conservative. If the report be true of another attempt on the Czar's life, it is questionable whether his nerves will not be too much shaken to carry out any scheme of reform even as mild as this one. The *Golos*, the ablest and most prominent of the Russian newspapers, has been suspended for five months, but the nature of its offence is not stated. The rumors of trouble with Germany are dying out, owing, probably, to the determination of the two Emperors—especially the Kaiser, who, on this point, is well known to be divided from his Chancellor—to keep up the *entente cordiale*.

THE NEW YORK PRIMARY AS DESCRIBED BY A "WORKER."

IT has been for many years a constant subject of reproach against the more respectable and intelligent voters of this city, and especially those of the Republican party, that they would not attend primary meetings, and by their presence and influence bring about the choice of pure and upright delegates to the conventions. The respectable and intelligent defended themselves for a while by saying that it was no use, that when they reached "the primary" they invariably found it "fixed" or "controlled" by persons who made attendance on primaries and preparation for primaries the principal work of their lives, and who treated them as non-professional intruders—very much as the doctors would treat laymen who tried to take part in the discussions of the Medical Association, though of course with much less courtesy. Of late years they have ceased to defend themselves at all. When you ask one of the respectable and intelligent, nowadays, why he does not attend primaries in this city, he feels at once that you are joking, and answers you with a smile.

One of the severest critics of those who refused to avail themselves of the primaries was Mr. George Bliss, the late United States District Attorney, and always an active and skilful politician. Writing in the *Nation* of Sept. 7, 1876, in reply to some enquiries of ours on this subject, he was very emphatic in expressing his sense of the value and purity of primaries, and gave us to understand in caustic terms that attendance on them would cure us and others of the habit of "grumbling" about politics. Said he:

"Since I have had any influence in such matters, I have attended no primary at which there was even an accusation of unfair dealing. In the district in which I reside, which is the only one in which I ever attended a primary, I have procured the adoption of a practice which does away with all secret or close caucuses. Every member of the association is invited to every caucus, and can make himself heard.

"No Republican has, to my knowledge, ever been refused admission to the association. From the indefiniteness of your word 'fixing,' I can only meet it by repeating that neither in primary, caucus, nor convention have I ever been concerned in anything which prevented, or was intended to prevent, the fair expression of the views and wishes of all. I have usually had my own candidates and my own opinions, and have urged the one and expressed the other freely. Sometimes I have succeeded and sometimes I have been beaten. When overruled I have concluded I was wrong, for, not being the editor of a weekly reform newspaper, I have never claimed omniscience. I may add I do not believe that Republican caucuses or primaries or conventions in this city are often 'fixed,' if by that you mean the prevention of the fair expression of opinion."

In the number of Sept. 14, 1876, he further testified that there had up to that time been few, if any, cases of abuse in the working of the primaries. The associations were not "close corporations," he said, but formed as large a proportion of the total Republican voters of the city as those who take part in the organization in any other part of the State. No persons desirous of joining the organizations were excluded; and, finally, the associations were not controlled by office-holders.

We were much surprised, though much edified, after this by a long letter from Mr. Bliss, dated November 12, 1879, addressed to General Arthur, the chairman of the Republican State Committee, and published in all the city newspapers, giving the writer's experience as to the present working of the New York primary. He says that the present plan of Republican organization in the city was adopted (some time in 1871) on the report of Mr. Jackson S. Schultz and Mr. William Orton, and the prediction was made in Mr. Orton's presence, and concurred in by him, that "the usefulness of the organization therein established would last not more than ten years, for the reason that everything degenerates in New York, and nothing so fast as a political organization"; so that Mr. Bliss's attention was called at the very outset to the weakness of man's nature in this particular field of activity. The theory of the organization is very simple. Twenty-four district associations, composed of enrolled Republicans living in the district, meet at the proper times and elect delegates to the nominating conventions, after the kind of deliberation described by Mr. Bliss in the passage we have quoted above from his letter in the *Nation*. The actual situation is depicted by Mr. Bliss in his recent letter to General Arthur. The rolls of the associations contain 13,335 names, representing the 50,000 Republican voters of the city. This would be a small representation even if honest. But, alas! it is not honest. Mr. Bliss says that of the 13,335 names nearly half are those of dead men, of men who have removed, and of men who have turned Democrats. "Not 6,000," he says, "should be there." The rolls, too, are full of the names of "avowed Democrats—names or men used by the managers to perpetuate their control of the associations." "Desirable members, good Republicans, are excluded." "Sometimes this is done by direct rejection, but oftener by a refusal to act upon names presented by hanging them up in a committee which never reports." Against these proceedings there lies an appeal, it is true, to the Central Committee; but this Committee, Mr. Bliss says, "is sure *not* to act against the 'henchmen.'" He gives other details, equally flagrant, of the tricks resorted to to keep the respectable and intelligent away from the meetings. One is to refuse to show the roll of members; another is to "drop" persons whom the "henchmen" do not like; another is to expel them on frivolous charges; another is to send them notice of the meeting by postal card about two hours before the hour named, and then admit no one who cannot show the card. A constant remark of the "henchmen," when any one opposes them at an election, is: "What's the use of his fighting? We've got the inspectors." It seems, too, that these hardened villains "know full well that they commit all sorts of frauds."

Mr. Bliss confesses that "this is a dark picture of the Republican organization of this city, and that it goes far to sustain those who assert that we have a machine, and not an organization." Indeed, it is hard to see how it could be darker. What is a body containing 6,000 names—mostly or largely those of rascals, "committing all sorts of frauds" and managed by "henchmen"—and professing to represent or control 50,000 votes, if not a machine?

But the saddest part of Mr. Bliss's letter is that in which he says "that he has tried in vain, in his weak way, to bring about that 'reform from within' which he believes to be essential to the usefulness or long continuance of the organization," but that "he has accomplished little except to receive the sneers and slurs of those who glory in fraud because they profit by it, and whose approval is a disgrace to any honorable man." We confess that Mr. Bliss is much dearer to us in this character of a soured, disappointed, and grumbling reformer, sneered at and slurred by the shrewd and wicked, than he was in the halcyon days of 1876, when, according to his own account, the primaries were the seats of purity and integrity, when "every member was invited to every caucus, and could make himself heard"; when "no Republican was refused admission to an association," and when "nothing occurred to prevent, and nothing was intended to prevent, the fair expression of the views and wishes of all." There is only one thing needed in his present miserable situation to secure him the undivided sympathy of all good men, and that is an explanation of the circumstance that the predicted degeneration of the organization did not show itself at all between 1871 and 1876, and has advanced with such terrible rapidity in the last three years. By what process was the serpent kept out of the Eden in the former period, and by what lapse of vigilance has he been allowed to enter in and set "the henchmen" to work in the latter period? Moreover, though Mr. Bliss uses the word "henchmen" freely, he forgets apparently that it is a relative term, and that a henchman must have a chief. Now, whose "henchmen" are they whom he has been manfully fighting on our behalf? They can hardly be Senator Conkling's; for in his caustic letter in the *Nation*, heretofore referred to, he expressed much admiration for that statesman, and intimated that he needed no henchmen, and stood high above all his critics, present and to come.

Mr. Bliss's fate has a moral which we earnestly commend to the

attention of Independent Republicans. He does not himself draw it, and apparently knows of no remedy for the state of things he describes but an appeal to General Arthur, who, it appears, is "the Strong Man" of the occasion. "A word" from this potent personage would, according to Mr. Bliss, purify all the associations and "consign to deserved retirement some men who have brought disgrace on the Republican party." This means of redress may suit persons like Mr. Bliss, whose nature retains the childlike simplicity of their earlier years. Most men in this city who are really interested in good government, and think it means something more than a frequent distribution of offices, are more hardened and sceptical than he, and cannot be persuaded when they are cheated at a primary to go, like him, and weep in General Arthur's bosom over the depravity of "the henchmen." They have discovered a better, manlier, and far more efficacious remedy. The time which would be wasted at the primaries in doing the work of a detective—that is, discovering and circumventing the tricks of a gang of scoundrels—can be far better spent in creating and maintaining an organization which will watch what the conventions do, and give the men whom the primaries send up fair warning that they must not carry their little games to the polls, and that the election of "henchmen" to public offices will not be permitted. In no way can the primaries be reformed so effectively as this, as far as the mere action of the voters is concerned. To put a complete stop to the abuses which Mr. Bliss exposes one thing more is necessary, and the mere mention of it makes Mr. Bliss's plan of an appeal to General Arthur seem a little ludicrous: we mean the exclusion of officeholders from active political management, and the release of officeholders, either as regards getting or retaining places in the public service, from dependence on party tests or party activity. Most of the six thousand tricksters who evolve "the people's will" for the Republican party in this city would probably no more devote themselves "to fixing primaries" than to carrying on the Society for Improving the Condition of the Poor, if they did not expect thereby either to earn office for themselves or their friends, or to make sure of keeping offices they already hold. Do away with this expectation and fear, and they would be governed by the same motives as other men of their class and choose the same kind of pursuits. If they were out of the way—that is, if political work did not involve associating with them and making a study of their criminal practices—there would be no difficulty whatever in finding thousands of business men of good standing and character to give the necessary labor to enrolling Republican voters and obtaining a full and fair expression of their wishes at the meeting of the associations. The recent work of the Independent Republican Committee proves this. There is no deep mystery about the matter, as professional politicians try to persuade people, any more than about the charitable work which is done on so large a scale by volunteers of the highest respectability. What it needs most of all is industry and honesty, the two things in which the class who now make a business of it are lamentably and notoriously deficient. But few respectable citizens will undertake the task of watching and foiling such a class merely as a piece of preparation for a nominating convention, for this is essentially a policeman's task and not that of a politician.

SIMPLIFICATION OF THE TARIFF.

NOT long since the daily newspapers gave an account of a search extraordinary on the White Star steamship dock. Mrs. G., a resident of New York, arrived at this port with her child and maid. Her husband and sister were at the landing waiting to meet her. Mrs. G. was suspected by the customs officers of having dutiable articles concealed upon her person. She was accordingly taken into a private room and searched. No such articles being found upon her, the husband and the sister (who were not passengers at all) and the maid and child were successively taken into private rooms and searched, with like results, no dutiable articles being found upon any of them. So convinced, however, were the officers that they were on the right track that they took a high-spirited Englishwoman, who had been seen conversing with Mrs. G. in the steamer's companion-way, and searched her—with no other result, however, than to leave her speechless with indignation, Mrs. G. meanwhile being bathed in tears and Mr. G. "swearing mad." No dutiable goods being found, there was a reaction in Custom-house circles, and for a month or more a feeling of lassitude verging upon despondency was observed in their ranks at all the steamship docks. The event was duly commented upon by the organs of the effete monarchies of the Old World, one of which remarked jeeringly that it was dangerous for an American citizen to approach within a mile of an incoming steamer lest he be seized by the customs authorities and searched.

Much indignation was vented upon the luckless officers who in this instance executed a bad law. They had the right—that is, the lawful power and authority—to send every man, woman, and child coming from the steamer's deck into the searching-rooms, and cause them to be divested of all their clothing, before allowing them to proceed upon their several journeys. By neglecting to do so in all but half a dozen cases, in this particular instance, it is not improbable that several yards of lace, and perhaps sundry diamonds and watches, were smuggled on shore, and that the United States revenue suffered the loss of a few dollars. The whole amount of revenue collected from passengers' baggage is only $100,000 per annum (average) at all the ports, and the expense of collecting it is probably greater than that sum; but, of course, the value and importance of the searching must be measured, not by the amount of money collected, but by the amount of smuggling prevented. It is generally perceived and acknowledged that there has been a marked improvement in the moral tone of the customs service as regards passengers' baggage since Gen. Merritt came into the office of Collector of this port. Mistakes like the one described are calculated to call forth public animadversion, while the acceptance of a bribe by the inspector in lieu of any search at all is unnoticed by anybody except the briber, who generally keeps the transaction a close secret. It is pretty safe to say that there is now little bribing on the docks or after leaving the docks, and that the errors in dealing with passengers are rather on the side of too great severity in executing a law which leaves much to the discretion of the officer and much more to the conscience of the passenger. Secretary Sherman in his current annual report says that "the law does not define any limit of quantity or value in regard to either household or personal effects which may be admitted free of duty." In the absence of any such law the inspectors make a mental calculation as to how much a passenger ought reasonably to travel with, varying according to the time he or she has been abroad, and according to wealth, occupation, and social position, so far as these can be ascertained in a series of hasty "interviews" on the dock. Anybody travelling with more than this "reasonable" amount, although strictly within the letter of the law, is liable to have his baggage detained, and all are liable to be searched—even persons who are not passengers, if they have been on board the steamer before she has discharged her cargo.

The United States tariff embraces some two thousand articles, from which varying amounts of revenue are raised. The article of imported tripe has yielded in one year as much as 40 cents, and sugar as much as $40,000,000. Between these extremes we find that water from Lourdes (we suppose it may properly be classed as "holy water") yielded 90 cents to the Treasury in the year 1876 on an importation of $9 worth; that palm-leaf produced 87 cents, acetate of magnesia $1, putty $2 40, prepared insects $6 80, bladders upwards of $9, locust-tree seeds $12 80, and plum-pudding the magnificent sum of $50 60. Turning to articles likely to be concealed on the person of a traveller of smuggling propensities we find that laces, cords, braids, gimps, galloons, insertings, and lace trimmings yielded altogether $950,795 60 in an average year; that diamonds, cameos, mosaics, gems, pearls, rubies, and all other precious stones yielded $240,962 83, and that watches yielded $330,800 28. When passengers are sent into the searching-rooms and asked to take off their clothes it is expected that something embraced in the three foregoing items of revenue will be discovered

Although the duties on gloves, silks, and velvets are needlessly and viciously high, these articles are too bulky in proportion to their value to be concealed to any great extent on the person. Any measure or policy which should effectually prevent the smuggling of laces, jewels, and watches would make an end of personal searching, which is always an indignity and often an atrocity upon the traveller. The examination of trunks is a different matter, and is unobjectionable when conducted under a definite set of rules and with clear ideas on the part of the examining officers.

The surplus revenue for the fiscal year 1880–81, after applying $39,000,000 to the sinking fund, is estimated by the Secretary of the Treasury at nearly $10,000,000. That amount, and probably more, can be spared from the national tax-bills. It would seem to be the dictate of wisdom, first, to abolish the duties on tripe, holy water, prepared insects, and all other articles the proceeds of which are ridiculously small, being less than the cost of collection; and, second, to repeal those levied upon articles so small in bulk that they are easily concealed in people's pockets and smuggled. Both these propositions are among the commonplaces of political economy, and are recognized and acted upon in other countries. Tariff reform, which cannot be long postponed, should begin with tariff simplification. The monstrous jungle of two thousand or more articles should be first cleared of the parts which are merely nonsensical in order to reach those which are debatable. Let bladders, glauber-salts, children's dolls, and their mothers' enamel be stricken out as summarily as quinine was expunged last summer. And let all the microscopic things, which must needs be searched for as one searches for a flea in the seams of his clothing, be stricken out at the same time; or, as an alternative, let it be ordained by law that all persons arriving on our shores shall be impartially stripped naked without regard to age, sex, or previous condition, and let notices to that effect be posted in all our consular offices abroad, so that the perils of navigation may be fully understood before the passenger takes ship for this land of freedom.

Simplification of the tariff is needed in other directions. Duties ad valorem, duties specific, and duties both ad valorem and specific, market value and invoice value, appraisements and reappraisements, importers' affidavits and consuls' certificates, have fallen into dire and exasperating confusion, which is but feebly commented on in Secretary Sherman's report. The remedy he proposes, that in cases of dispute between importers and customs officers the Government shall take the goods at the invoice value plus ten per cent. allowed for expenses and profit, is not adapted to our political system, since it proposes that the Government shall go into the dry-goods and grocery trade on a large scale. Civil-service reform has not reached the acme of perfection among us that would warrant such a venture. Nevertheless something must be done to lift us above the level of Turkey in our customs department, and we commend the problem to the Committee of Ways and Means, whose efforts hitherto to bring about any change whatever in the tariff, although Congress was evidently favorable to a change, have been as unfortunate as the late Henry C. Carey or any of his disciples could have wished.

IS ÆSTHETICS A SCIENCE?

BERLIN, Nov. 10.

WHAT is the origin, nature, and highest form of æsthetic pleasure? For many artists this now unfortunately seems a purely metaphysical question, the discussion of which is as irrelevant as for a mason to fall to discussing the *rem per se* of his brick and mortar. For many connoisseurs of art it is a purely individual question, because we are reminded there is no disputing about taste. For many philosophic writers the question is sufficiently answered by the formulæ of Hegel. Art, they tell us, is the absolute idea immediately presented to sense. In symbolic art, typified, *e.g.*, in Egypt, matter preponderates and the ideal struggles through it, and attains only an imperfect expression; in classic art matter and ideal are mutually expressive, adequate and befitting; and in romantic art the ideal preponderates and the material is able to serve only as a hint or allegory of what to it is inexpressible. Thus, the first and lowest forms of art are gardening and architecture; then follow sculpture, painting, music, and lastly poetry, which merges by insensible gradations into religion, the doctrines and institutions of which, though in very different senses, were made the supreme form of æsthetic expression by Schleiermacher and Strauss. Others still find a ray of light in Schopenhauer, who said that when we contemplate a work of true art we not merely find the only possible surcease from the universal anguish, but lose ourselves, not in the particular object contemplated, but, through it, in the platonic ideal, or purest objective form of will, which it illustrates. Vague and intangible as are such answers, they have at least given us glimpses of the vastness of the problem and the depth of our ignorance about it.

The philosophy of Evolution next attempted to explain pleasure as a sense of usefulness, and pain as a feeling of the diminution of vital functions. The sweet taste of sugar-of-lead really augments the vitality of the organs of taste, though it happens to be poison in the stomach. A pleasant sound favors the nutrition of the auditory nerve, a beautiful picture that of the visual organs, etc. This, again, seems to me ingenious, and as such provisionally credible enough, but almost purely hypothetical and unproven. Are the terms convertible, and is nutrition æsthetic? If so, sleep is higher than art.

In Germany the subject has been approached in two other directions with at least very hopeful results. Zeising, and later and more fully Fechner,* starting with the simplest forms of geometric figures, have enquired, first, how must a horizontal, and, secondly, how must a vertical line be divided in order to give most pleasure to the eye, and, thirdly, what is the most symmetrical way of uniting both in the form of a cross or a right-angled quadrilateral. The opinions of scores of people of different nations, degrees of culture, etc., were collected and averaged, and the result, given with much unanimity, was that when the whole of a straight line was to its longer as the latter to its shorter section the most pleasing impression was produced. This "golden section" determines the position of the horizontal on the vertical arm of a cross, the long to the short sides of a parallelogram, etc.; this, it was said, corresponds nearly to the side or ground forms of the most pleasing architectural structures, a number of which have since been built on that pattern, and it has been developed with great ingenuity into real or fancied coincidences with the relations between ground tones and harmonies in music. Here again we cannot forget that the average opinions only approximate without exactly giving this relation, nor can we believe the subtle influences of association are escaped, as is asserted, by dealing with such simple visual forms. These at least, as well as the almost infinite complication involved, would come in to prevent the extension of this method to more compound forms, colors, sounds, etc., as is suggested.

The other direction is best illustrated by the psycho-physical analysis of the sensations of sound, which has shown that the accepted intervals between notes in an octave are not mathematical, and that the purest harmony is only relatively perfect, certain natural overtones belonging to each ground tone being discordant with those of the other series, and suggesting to speculative minds the question whether the music of the future will not be written on a reconstructed scale. Hence three varieties of harmonium have been constructed, in which the octave is divided into notes with equal intervals—Bosanquet's has fifty-three—or in which vibrations give only the ground tones, and the accordant overtones may be played and the rest omitted. The sound produced by these instruments is certainly a new and exquisite sensation. There was a strange purity and ringing clearness about the tones and chords, which I heard for the first time in another room without knowing the instrument, and thus without expectancy or association. The immense number of keys increases greatly the manual labor of playing, and makes quick music impossible, while the labor of composing, writing, and reading must be immensely increased.

The question whether such instruments foreshadow a new sort of music of the future, or belong simply to the curious demonstrative apparatus of the scientific lecture-room (like Castel's *clavecin oculaire*, or visual harpsichord, by which a symphony of colors, divided on the color scale by the same mathematical relations of wave-lengths as notes in the scale, was flashed over the field of vision soon after the laws of complementary colors were developed, and which threatened at one time a new chromatic dispensation), is the question of practical interest. It is a generic question—viz., Is practice still so far ahead of theory in the domain of æsthetics, or does æsthetics embrace so many other than the purely rational elements that we can never be told with any scientific authority what we ought to like or dislike? Ought artists to credit it as an additional proof of the accu-

* See 'Vorschule der Aesthetik.' 1878.

racy of the Greek eye, that if the horizontal lines of the Parthenon slightly incline to the right and left it is to compensate the slight distortion of every horizontal line to the normal eye, or that some attitudes of a galloping horse, instantaneously photographed by a new method, correspond to equine postures found upon the Elgin marbles, if at the same time other details, no less observable and perhaps more serviceable, like perpendicular visual directions in the columns of ancient temples, and the second phase of the horse's spring, etc., are, so far as known, ignored in Greek art? Should German poets listen to Brücke, *e.g.*, when he writes on a revolving drum the mathematical time-relations of anapests, spondees, cæsuras, accents, etc., and thus demonstrates that the laws of metre for the German tongue make certain verse-forms, borrowed from the classics, logically unusable, or others, hitherto unknown, possible, or shows the natural sub-rhythms of the muscles of the chest, larynx, etc.? Should painters listen to Helmholtz on the laws of saturation, intensity, and contrast of colors, even if he points out errors in the great masters? Should architects trouble themselves about such average impressions respecting proportion as Fechner has collected?

Any answer to these questions, especially an unqualified affirmative, seems to me premature, but I think any discussion of it would be likely to be rather more meaty than the inane speculations about the nature of the Beautiful and Sublime which fill so many pages of text-books on æsthetics. Certainly, science has not yet disclosed the foundations for a radically new synthesis of any art. The moral sense has long been accustomed to all sorts of theoretic explanation and dictation. Of this the æsthetic sense has been less tolerant, though it admits the need not only of culture but of instruction. For my part I am unable to believe that fashions will ever be set or child's playthings chosen by a quadrennial Congress of professors of æsthetics, or that the scale in which Beethoven wrote will ever be regarded as a rude hieroglyphic alphabet of sound, or that Titian will be called a poor colorist because he did not know whether his strongest contrasts were mathematically complementary. At the same time I fancy it may behoove the artist of the future to be more instructed in the scientific aspects of his department, and perhaps a trifle less fearful of impairing creative faculty by the cultivation of critical acumen. Perhaps the understanding has a sort of satisfaction peculiar to itself which may justly be called æsthetic.

MEMOIRS OF MADAME DE RÉMUSAT.

III.

PARIS, November 14, 1879.

THE 'Memoirs of Madame de Rémusat' show very conclusively that the transition from the Republic to the Empire was very gradual: this political change had nothing of the character of a revolution or of a *coup d'état*. The *coup d'état* was made on the famous 18th Brumaire, and though it was not apparently directed against the Republic, it really gave the death-blow to it, and established the rule of one man. When Madame de Rémusat entered the service of Madame Bonaparte the Consul still preserved a certain republican simplicity; but it is difficult to live with much simplicity in a palace like the Tuileries, and by degrees the old manners exuded, so to speak, from the old walls. The First Consul took possession of the Tuileries on the 19th of February, 1800; Madame de Rémusat first entered into the palace in 1802. She says that when Josephine slept there for the first time Napoleon said to her: "Come, come, little Creole, and sleep in the bed of your masters." There was hardly a person belonging to the old society in the salon of the Consul; ministers, generals, ladies of the Bonaparte and Murat family, all dressed in the antique style which David had invented, seemed like strangers in the old palace of the monarchy. M. de Rémusat was very useful to Bonaparte, as he knew the traditions of the old etiquette. Napoleon was himself very simple in his dress, but he desired his generals to have the most gorgeous uniforms, and he encouraged dress in women; he thought the French could be seduced by ostentation and pomp. He had at once placed a great distance between himself and the two other consuls: the official documents of the Government, though beginning with the formula "Par arrêté des Consuls," only bore his signature. He kept his court all alone, either at the Tuileries or at Saint-Cloud; he received the ambassadors with the ceremonies used in all the courts; he never appeared in public except with a numerous guard, and he only allowed his colleagues two grenadiers before their carriage. These small details show that the First Consul really assumed the position of the governor, the ruler of the country; and he assumed it with the consent of all, or almost all. Madame de Rémusat describes well the general feeling of the country:

"I did not," says she, "reason on the rights of Bonaparte, but I heard everybody say that he made a good use of his power. M. de Rémusat, confiding in him as did the rest of France, abandoned himself to the hopes which it was then permitted to conceive. All were indignant and disgusted with the horrors of the Revolution, and looked upon the Consular government, which preserved them from the Jacobins, as a new era for the country. The trials of liberty which had been made at various times inspired against it a sort of natural aversion, which was not much reasoned out; because, in truth, liberty had always vanished when its name was used, and there had been only changes in the form of tyranny. Generally there was no desire at that time in France except for rest; people wanted to use their minds freely, to cultivate a few private virtues, and to repair the losses of fortune common to all. I can only think with a true *serrement de cœur* of the illusions I then entertained. I regret them as one regrets the pleasant thoughts of youth, of that time of life when, to use a familiar comparison of Bonaparte himself, all things are seen through a gilded veil which makes them brilliant and light. 'By and by,' he would say, 'this veil thickens till it becomes quite dark!'"

At the end of 1803 the Consul wore, on common days, the uniform of his guard; but on all great ceremonies he and his colleagues had a red coat embroidered with gold, velvet in winter and silk in summer. The two Consuls, Cambacérès and Lebrun, powdered and neat, wore this shining dress with lace and a sword, as people used to wear the *habit habillé*. Napoleon, whom this luxury annoyed, tried to have as little of it as possible. His hair was cut short, flat, and ill-kept. With his red-and-gold dress he retained a black cravat, a lace *jabot* (frill), but no *manchettes* (ruffles); sometimes a white satin waistcoat embroidered in silver, sometimes the vest of his uniform; the sword also. When he became emperor he had a court dress with a little mantle and a hat with feathers, which suited him very well. He also had a magnificent collar of the Legion of Honor, all diamonds. Commonly he only wore the silver cross. Seeing once, before the coronation ceremony, all his new marshals arriving in magnificent dresses, he turned round to Madame de Rémusat and said to her with a smile: "The right of dressing simply does not belong to everybody." When Bonaparte was Consul he allowed his wife to receive visits in the morning by herself; she received a great number of persons who belonged to the old régime, who would have no relations, or seem to have any, with the First Consul; but who asked his wife for many erasures (from the list of the émigrés) or restitutions of confiscated property. Madame Bonaparte was very affable and kind, and she was never tired of asking favors for everybody.

The First Consul received all the foreigners of distinction, and he drew round him the academicians, the painters, the musicians; his salon had become a real court. Talleyrand and Fontanes had the manners of the old times, and constantly urged the First Consul to abolish the last vestiges of the Republican period. The Chambers had become servile, and the Tribunes (for the Tribunate was still in existence) rivalled the Senators in their expressions of admiration and adulation. Napoleon directed and inspired the press through Maret, afterwards Duc de Bassano, and his secretaries Bourrienne and Méneval. He liked to dictate articles while he walked at a great pace in his room. He himself answered the violent attacks of the English papers, the *Courier* or the *Sun*.

After Cadoudal's conspiracy and the murder of the Duc d'Enghien it became evident that the First Consul was determined to sit on the throne of France. As he had no children by Josephine, the question of his divorce was already discussed. For two years before the establishment of the Empire, says Madame de Rémusat, there were incessant quarrels in the Bonaparte family about the possible successor of Bonaparte on the throne. He was himself inclined to adopt as his heir the young Napoleon, the son of Louis Bonaparte, who was at the same time his nephew and grandson (as Louis Bonaparte had married Hortense, the daughter of Josephine). Joseph Bonaparte, as the eldest, maintained that Napoleon had no right to deprive him of his rights to the succession; Louis Bonaparte objected to having his son preferred to himself. The Bonapartes and the Beauharnais were constantly quarrelling, and Louis Bonaparte showed himself very angry with his own wife because she was the confidante of the projects of the First Consul. Napoleon was much annoyed by these family quarrels; it was ridiculous to see so many people disputing for a crown which France had not yet formally given. Napoleon, therefore, put an end to this noise by renouncing for the present the choice of an heir; he merely inserted the power of adoption in the imperial constitution which he was preparing. He had many conferences on the subject with Talleyrand. Talleyrand was essentially monarchical, and he simply wanted to create a new royal dynasty. "He confessed to me," says Madame de Rémusat, "that the title of emperor frightened him at first; he saw in it a vagueness and a grandeur which were precisely what pleased the imagination of Bonaparte."

"But," said M. de Talleyrand, "there was in that name a combina-

tion of Roman Republic and of Charlemagne which turned his head. One day I wished to have the pleasure of mystifying Berthier; I took him apart and said to him: 'You know what great design we are pursuing; go and tell the First Consul to take the title of king; you will please him.' Berthier at once, delighted to have an occasion to speak to Bonaparte on an agreeable subject, joined him at the end of the room where we all were; I went a little off, as I saw the storm coming. Berthier began his little compliment; but when he pronounced the word king the eyes of Bonaparte became fiery, he put his fist under Berthier's chin and pushed him to the wall. 'Imbecile!' said he, 'who told you to come and rouse my anger? Don't you ever run such errands.'"

On the 30th of April, 1804, one of the Tribunes of the People, Curée, made the motion at the Tribunate that the government of the Republic should be confided to an emperor, and that the Empire should be hereditary in the family of Bonaparte. Carnot alone voted against the motion. The Senate followed, and unanimously voted for the Empire. Addresses came from all the great cities, from the army. On the 10th of May, 1804, the Second Consul, Cambacérès, came to Saint-Cloud in great state, with all the Senate, and addressed Bonaparte for the first time as Majesty. "Napoleon behaved as if he had had a right to that name all his life." The new Charlemagne created a number of high dignitaries, a great elector, a constable, a chancellor, a treasurer, sixteen marshals. The republican principle was nominally respected, as the new constitution was submitted to a popular vote. On that same 18th of May Napoleon renounced for the first time the word "citizen"; he addressed everybody as "Monsieur"; he had scrupulously said "citizen" till that very day. Madame de Rémusat says that the proclamation of the Empire satisfied the great majority of the nation. The Jacobins were delighted with it in their hearts; the lions of 1793 became the lambs of 1804. Bonaparte, who was a "Jacobin à cheval," embalmed all the Terrorists in high dignities and in new names; they became his most servile adherents. The Royalists had hoped for a while that the Consul would play the part of Monk, but the assassination of the Duc d'Enghien had dispelled their last hope; they were completely disheartened, and many of them transferred by degrees their loyalty from the king to the usurper. There was a fraction of liberals who were proselytes to American institutions, but this fraction was small and insignificant; their discontent was ignored; they had admired the Consular constitution, but Madame de Rémusat justly says that the Consulate was only the Empire in disguise:

"Déjà Napoléon perçait dans Bonaparte."

Victor Hugo shows in his verses the face of the Emperor under the mask of the Consul; and Madame de Rémusat says: "What was his Consular authority if not a dictatorial power under another name? Had he not, without consulting the national wishes, pronounced upon peace and war? Had he not the right of conscription? Did he allow public affairs to be freely discussed? Could the newspapers publish a single article which he did not approve of? Did he not clearly show that he drew his power from the right of his victorious arms, and how could severe Republicans be deceived?"

The name of Republic could no longer be pronounced under the Consulate, as it was identified with the crimes of the Terror; the Directory had fallen under the universal contempt of the nation; there was a general opinion current that the Revolution had exhausted its force, as well as the force of the nation, and that a period of rest had become necessary. France longed for a despotism—"ruunt in servitudinem." Even the sovereigns of Europe looked upon Bonaparte as a protection against the Revolutionary doctrines. Fatigued with perpetual troubles, afraid of this liberty which had made so many victims, all men looked upon Napoleon as an instrument of Providence. He was a personification of imperial order, of victory, of peace. Alas! he soon showed the world that he was not peace. The fatality of his mission could not yet be understood in its full extent: he gave a little rest to France, but it was the rest given to the soldier during the night which precedes a long and bloody battle. He thought that if France no longer had liberty she must have glory. His reign was a long struggle for glory. He knew no rest. He never made a real peace; he merely made a *halte*, to use Talleyrand's expression. The succeeding volumes of Madame de Rémusat's 'Memoirs' will show us Napoleon in this second period.

Correspondence.

WHY THE DEMOCRATIC PARTY IS NOT BAD.

To the Editor of The Nation:

Sir: The letter of your correspondent "J.," and your note upon it, are somewhat exasperating as well as amusing. The quiet assumption that "the Democratic party is the party of ignorance" is a sweeping, and to some of us life-long Democrats a startling, proposition.

That the party has within it a majority of the laboring classes at the North is true, and the fact is founded on a perfectly comprehensible and philosophical basis. That party in its essential principles and political policy has always represented what may be called the *force* of the country as distinguished from its wealth and mechanical investments. Until the war the Whig party and its successors were acting in principle and policy *in rem*. It advocated tariffs, navigation laws, banks, and all those material elements which tended to the enrichment of the few and the concentration of political power; while, on the other hand, the tendency of the Democratic party was, so to speak, *in personam*. It discussed and fostered and found its coherence in the theories and formulas that related to individual freedom and the disseverance of personal enfranchisement from the elements and operation of material influences.

That distinction prevails to a certain extent now, and the laborer knows it. Nothing is more ill-founded or in the end more to be deplored than the almost universal belief among the educated classes in the absolute ignorance of workingmen. It is true as to many things cultivated men, so-called, esteem; but it is not true as to those ideal truths relating to man as an individual and his relations to existing social organizations. On those questions the majority of literary men, of active business men, of mere theorists of all sorts, would do well to give very many who are ill-dressed, coarse-looking, and unrefined—Democrats, if you will—a wide berth; for all the practical politics of the day meet their first impact and attrition in and upon the workingman. He knows as by a supreme instinct what principles tend to his welfare or his injury, and he knows what the Massachusetts school of thinkers never can see, that in practical good works and right-dealing the mass of workingmen, in their daily life, rival almost Boston itself. It is easy to see, therefore, why a party so actuated should be permanently conservative and slow to adopt new notions. Reforms spring not from organized and formulated belief; they are the result uniformly of practical and material disabilities or evils.

So much as to one reason for the fact complained of. What are its results? Is New York worse governed than Massachusetts? Is the law worse administered? Neither question can be answered in the affirmative. Is its body of laws worse enunciated in the Reports? Is its bar of a lower intellectual or moral grade? Are its moral influences less? In the features which social administrations impress on a people are the results they accomplish less manifest in the city of New York than in Boston? No man out of Boston will say so.

It is true we have had our Tweed and our Barnard and Cardozo, and they were Democrats. But they were not what they may have been by reason of Democracy, and they never received any sensible check from Republicans. Among those who aided them, who enriched themselves by them, who cringed for the crumbs from their tables, a due proportion of the loyal and respectable Republican party were to be found, and the malefactors received their deserts chiefly from Democrats. Those evil men came from the times and the opportunity; the temptation fell on them rather than on Republicans, with like tendencies, and they yielded. The 1,500,000 of people in the city of New York and its environs, because condensed into a municipality, are held to a higher and more immediate responsibility than an equal number scattered through the State of Massachusetts. It will be found that in the more degraded crimes the State exceeds the city.

But suppose we reverse the picture for a moment. The evil complained of came from the ignorance of the Democracy. Let us see what the higher planes of Republicanism have done, simply as to the judiciary. That pure and sagacious organization, when the highest tribunal in the land was acting in its most august capacity—an impeachment of the President—entered unrebuked into the most scandalous and shameful system of lobbying those who were to act as judges sworn to decide upon the evidence, and menaced them into partisan decisions. The same party appointed two judges to make a majority of a court to overrule and reverse a judgment on a momentous question of public policy; the judgment being then, as now, believed by every honest man, even in Boston, to be righteous and necessary, and its reversal to have had an extra-judicial motive. The same party appointed Busteed and Underwood and the like to be judges. The same party, in selecting men to become judges *de facto* on the Electoral Commission, took the most avowed and unscrupulous of their adherents, who were notoriously committed in advance on the question to be decided, and so mocked and degraded the judicial function. Of the judicial decisions of Republican judges rendered for political reasons throughout the whole country time and space fail us to speak.

As to "reform" (except in the single instance above mentioned, which constituted its sole impeachment), the Democratic party has uniformly, when in power, maintained such practical reforms as economy of administration, maintenance of law, purity of the judiciary, and regard for private rights. To select New York City, in those days of shame, as an illustration or result of Democratic rule is a manifest injustice; both parties at that time were "tarred with the same stick." That evil, and the many we now complain of, were the results of false systems and public apathy. We shall be happy to compare the action of the leaders of both parties in seeking a cure for the public maladies. W.

[If "W." had given us some explanation of the means by which the Democratic party has, since 1860, sought to embody in legislation "the theories and formulas that relate to individual freedom," and to promote "the disseverance of personal enfranchisement from the elements and operation of material influences," his letter would be more valuable. As it stands, it seems to us an illustration of the tendency of both Democrats and Republicans at the present crisis, when asked to describe the policy of their party, or to say what it proposes to do for the country, to fall into vigorous denunciation of the other side. The result is that campaign documents and speeches are rapidly becoming mere lists of rascalities, and read very like the Newgate Calendar.—Ed. Nation].

ABOUT THAT "SOMERSAULT" OF OURS.

To the Editor of The Nation:

Sir: That "somersault" and "fall from grace" of yours, referred to in the two last issues of the *Nation*, would doubtless afford an interesting subject of enquiry, were it not for the far more interesting subject afforded by the mental exhibition made of themselves by your two correspondents, "J." from Boston and "Subscriber" from Natchez. I would like to make a suggestion which may afford you matter for a useful editorial. The present is a time of general legislation, and we hear a great deal about the duty of Government in the matter of educating the people. Wouldn't a law compelling every one to subscribe to some paper advocating views opposed to his own, work pretty good educational results? The stupid intolerance with which the average man expels from his range of vision any presentation of leading subjects under discussion in which he does not concur, is very depressing. In the case of your Natchez subscriber this is in no way surprising. The Southern mind has always refused to hear but one side of the question, and this constitutional intolerance has there had its reward. With "J." it ought to be different. Here is a man, Northern-born and educated, who, judging by his letter to you of November 10, is not in all respects unintelligent, actually announcing in public that he is resolved to see but one side of an important matter of public concernment. Isn't a little reconstruction needed here? Most of us know our own sides of the questions of the day well enough; isn't it "the other side" which an intelligent man, who wants to understand himself, ought to see? I wish all the Free-traders would read the Boston *Advertiser*, for instance. I'm a Free-trader, and I do; and the consequence is that I now live in the hope that some day I shall join in burning a custom-house. As a "Scratcher" I take the *Tribune*, and it has irrevocably confirmed me in a determination never again, on any account, to vote a "clean ticket." "J." may rest assured that for any one not a bigot there's nothing so healthy as seeing all sides. If you're wrong, it sets you right; and if you're right, it acts as an exhilarating irritant.

I think I see difficulties in the way of an early enactment of a law compelling intolerant men to take papers representing the other side, and we sha'n't just yet be able to break down party lines in that way. In our individual capacity, however, we are all bound to do something for the advance of general enlightenment. I recognize the obligation in my own case; nor have I lately met better subjects for missionary labor than "J." and "Subscriber." If, therefore, as I presume is the case, they have stopped their subscriptions to the *Nation*—or whenever they may do so—please have them renewed at once, and send the papers to them and the bills to me. I will deduct the amount from my annual subscription to the Foreign Missionary Society; for enlightenment, like charity, ought to begin at home.

X. Y. Z.

Boston, Dec. 1, 1879.

[We think a much better plan would be to have the Government furnish gratis to every person taking one paper another representing different views. This would remove the objection of oppression which might attach to a scheme compelling a man to pay for a paper he did not like. We agree with our correspondent, that one of the greatest obstacles to healthy politics in our day is the practice of confining one's reading to one's own party organ, and the effect of it is far worse in the country districts than in the city, because in the latter it is somewhat counteracted by social intercourse. Nothing does so much to destroy the responsibility of party leaders and make the influence of popular opinion on the Government so slow in its operation, and the perpetuation of party humbug and delusion so easy. In fact, the popular notion that the people *discuss* public questions through the newspapers is a curious hallucination. Not one man in a hundred takes any part in discussion whatever, or listens to any discussion except when he goes to hear stump-speakers of opposite parties during a canvass. The average Democrat or Republican derives his political opinions from a writer in the nearest city, whom he hires at so much a month or a year to dress up one view of every public topic with as much artifice, sophistry, evasion, and concealment as he can bring to bear. After a year or two of this, of course any presentation of the other side has the air of an impudent breach of contract, calling not only for complaint but punishment. There is nothing more ludicrous in an editor's experience than the air of offended dignity with which a subscriber of the old school now and then announces that he does not agree with him on some topic of the day, and that the holding of opinions about it so unlike his own must indicate some moral obliquity or evil design. There has probably no question come up in the politics of Christendom within two centuries which has so distinctly two sides and is so full of complications as this Southern question as it presents itself to the people of the North today, and yet we venture to say that not five per cent. of the newspaper readers of either party ever have more than one side offered for their inspection. Many men have worked themselves about it into a mental condition which in private business would be considered unsound, as when they lose temper if you refuse to believe all the newspaper stories of "outrages," or doubt whether the Brigadiers mean shortly to rise in arms once more against the Government. One party newspaper announced at the opening of the extra session last year the approaching outbreak of a civil war that would rage in "every school district in the country," but the subscribers seemed to like it, and probably would have refused to look at a paper which treated this anticipation as insane. The evil is a growing one, and has more danger in it to republican institutions than appears on the surface. It is, in fact, the application to politics of the discipline of the Catholic Church, which protects faith and morals by the expurgation of literature.—Ed. Nation.]

THE PROPOSED EVACUATION OF FORT SUMTER.

To the Editor of The Nation:

Sir: The "Diary of a Public Man," as recently published by the *North American Review*, contains, amid much apocryphal gossip relating to the outbreak of our civil war, certain specific statements based on the assumption that the Administration of President Lincoln was brought, in the early days of its existence, to contemplate and accept the evacuation of Fort Sumter as a military necessity. This purpose was unofficially announced a few days after the inauguration of Mr. Lincoln, but as the subsequent conduct of the Administration indicated a change of policy—if any such purpose had been formed—it has been common to resolve the public doubts under this head by questioning the existence of any such intention. It may be proper, therefore, to say that, as one of the editors of the *National Intelligencer* in 1861, I was authentically informed of this purpose by Mr. Secretary Seward, not only for my guidance as a public journalist, but with the request that I should communicate the fact to the Hon. George W. Summers, the recognized leader of the Union majority in the Virginia Convention then sitting at Richmond. Mr. Seward believed that intelligence of the fact would strengthen the hands of the Unionists in that body, and, concurring with him in this opinion, I hastened to write to Mr. Summers in the sense and to the purport of the Secretary's statements.

I have recently made application to the son of the late Judge Summers in the hope of being able to recover the letter I wrote, but regret to learn from him that, being, as he supposed, in failing health in the years 1869 and 1870, and not knowing into whose hands his father's papers might fall in the event of his own death, he felt it his duty at that time "to destroy all not pertaining strictly to business." But as I still have the reply of Judge Summers, from which the purport of my communication can be sufficiently gathered, as well as the effect it produced on the minds of the Virginia Unionists in the Convention, I subjoin it to this note as a slight contribution to the political literature of that troublous period.

The *North American* diarist says, under date of March 6, 1861, that Mr. Seward communicated the meditated purpose of the Administration to the Richmond Unionists through "a messenger enjoying the direct personal confidence" of the Secretary. This *may* be true, but as the fact that I had written to Mr. Summers was an open secret both in Washington and Richmond at that time, it may be that the statement of the diarist is but an echo of the communication I was authorized to make.

As the statements made by Mr. Seward in the early days of March, 1861, with regard to the projected evacuation of Fort Sumter, when viewed in the light of subsequent events, have subjected him to the charge of duplicity in the premises, I beg leave to say that the charge, according to my knowledge of the facts, is entirely unfounded. He honestly believed in the truth of his statements when he made them, and he had a right to believe in their truth, for they were made with the full knowledge and consent of Mr. Lincoln, and were supported by the military representations of General Scott—representations supposed at the time to be decisive of the question. And when, at a later day, Mr. Lincoln determined to send supplies of food to the famished garrison of Fort Sumter, "peaceably if he could, forcibly if he must," I have good reasons for believing that the resolution was concerted without the privity of Mr. Seward, though after the resolution *had been taken*, a sense of loyalty to his official chief combined with convictions of public duty to prevent him from replying to the suspicions brought upon him by his ill-fated efforts to "keep the peace."

In order to appreciate the motives and conduct of Mr. Seward in this crisis, it is important to remember that his statements were made not at all in subservience to the wishes and claims of the Confederate politicians, but in deference to the wishes and sensibilities of the Union men in the Border States—men who were fighting a gallant political battle for the Union under circumstances which gave them a claim to his best consideration. He believed, moreover, that if these States could be retained within their normal orbits the Secession movement initiated by the Cotton States would either "die a natural death" or could be restricted within limits so comparatively narrow as to make it otherwise manageable by the power of the Federal Government. If the view was a mistaken one he should at least have the benefit of the candor and earnestness with which he held it.

When the truth of history in this matter shall be fully brought to light I incline to think that the facts in the case will prove to be substantially as follows: that the evacuation of Fort Sumter was entertained by President Lincoln and his Cabinet as an inevitable military necessity during the earlier weeks of March, 1861; that this evacuation was never *formally* or finally resolved on by the President, although for a time he had no alternative plan in his mind; that during this time the statements in question were made by Mr. Seward not only in perfect good faith but by authority of the President; that when the announcement of the proposed evacuation excited, as we know it did, a profound feeling of disgust and indignation in the breasts of the "Stalwarts" of that day, the President was finally moved to accept the alternative proposition which was submitted to him, with the view of protecting himself from political odium, and at the same time maintaining the prestige of the National Government at the only two points where it was then possible to make a stand in the seceded States—Fort Sumter and Fort Pickens.

As the Hon. Montgomery Blair, a member of Mr. Lincoln's Cabinet, was understood at the time to be opposed to the meditated evacuation of Fort Sumter, and as the expedition to Charleston was placed under the command of his brother-in-law, Capt. G. V. Fox, an ex-officer of the United States Navy, and subsequently Assistant-Secretary of the Navy Department, it is reasonable to suppose that either or both of these distinguished gentlemen could shed valuable light on the motives and considerations which, beyond and besides those adduced in Mr. Lincoln's Message of July 4, 1861, may have led to the President's final decision in this matter.—Yours most respectfully,

JAMES C. WELLING.

WASHINGTON, November 21, 1879.

Letter of Judge Summers.

RICHMOND, March 19, 1861.

DEAR SIR: I owe you an apology for not having promptly acknowledged the reception of your letter, with its most gratifying intelligence. I was unusually engaged for some days afterwards, and have been quite unwell. I entertain a most kindly recollection of our brief acquaintance, and shall be most happy to extend and enlarge it.

We have in our Convention various shades of Union sentiment, but there is a reliable majority opposed to any act of secession. We shall most probably adopt the amendments proposed by the late "Peace Conference," with some slight verbal modifications to remove cavil. These have been reported from our Committee on Federal Relations, and are now before us. Our plan is to call a conference of the remaining slave States at Frankfort or Nashville, and submit this plan of guaranties to the consideration of that body, as one approved by us, subject to such modifications as shall be agreed upon there. The conference will put forth its propositions in such form as may be devised and deemed best. In the meantime, we shall adjourn over until fall and wait events. We shall not go into matters connected with the State constitution until after we have disposed of Federal and State relations, probably not until after our reassemblage in the fall.

We shall have no difficulty in doing all this if not disturbed from abroad. But it is of the essence of our plan that a pacific course be continued. It there should be a collision anywhere, or troops brought to Fort Monroe or Old Point, we can't answer for the result. If left unaffected by extraneous events we can and will, after our adjournment, enter upon the spring canvass both in the Congressional and Legislative elections, and bury Secession and Secessionists in Virginia.

Do use your utmost exertions to preserve a pacific policy; everything depends upon it. The removal from Sumter acted like a charm—it gave us great strength. A reaction is now going on in the State. The outside pressure here has greatly subsided. We are masters of our position here, and can maintain it if left alone.

Please write me; keep me advised of occurrences and intentions. It would be well for Mr. Seaton to see Mr. S[eward] and Gen. Scott, and impress them with the necessities of our posture. Tell the General, for God's sake, not to bring any troops to Monroe or Old Point. They are not needed. We will answer for their safety if let alone.

Yours truly, GEO. W. SUMMERS.

P.S.—What delays the removal of Major Anderson? Is there any truth in the suggestion that the thing is not to be done after all? This would ruin us.

[N. B. The reader will understand that when Judge Summers wrote "The removal from Sumter acted like a charm" on the Unionists in the Virginia Convention and gave them "great strength," he referred to Major Anderson's removal from that fort as understood, on the authority of Mr. Seward, to have been virtually decided on by the Lincoln Administration. Hence his anxiety, at the date when he wrote, about the delay which had attended the promised "removal," and hence, too, his prediction that if the thing were not "done after all" it would "ruin" the status of the Union party in Virginia.—J. C. WELLING.]

Notes.

WHETHER as a curiosity for its text, or as a work of art for its manufacture, the new edition, abridged, of the Comte Roselly de Lorgues's 'Christophe Colomb' (New York: F. W. Christern) will attract holiday purchasers. As is well known, the providential and saintly character of Columbus is here insisted on, of set purpose; and the pious author may yet have the gratification of having made two saints grow where only one grew before. Gorgeous volumes for the centre-table are seldom meant to be read, and none but Catholics familiar with French will read the Comte de Lorgues's in the spirit in which he has written. So we need only commend for its great variety of ornamental borders (which no page lacks), its beautiful typography, and other marks of care, this elegant volume of 580 pp. 8vo.——'American College Fraternities,' by Wm. Raimond Baird (J. B. Lippincott & Co.), is a "descriptive analysis" of the different Greek-letter college societies by a member of one of them who has preserved a

fine enthusiasm for "the old wigwam." He has performed what we should be inclined to call a rather thankless task very faithfully in the main. Minor statistical errors are, of course, almost inevitable, but an error of taste, such as saying of a prominent Yale society, "Its members are generally looked down upon," is difficult to account for.——Dr. Friedrich Kapp, who is now revisiting this country, is about to publish a third revised edition of his 'Soldatenhandel,' or 'Sale of Soldiers to America by German Princes,' and to issue in Leipzig next spring a new work, 'Letters and Memoirs of Justus Erich Bollmann,' the liberator of Lafayette from the dungeons of Olmütz. He desires to make arrangements for the publication here of English translations of these works, and to that end may be addressed in care of Mr. E. Steiger, 25 Park Place, New York.——In No. 490 of the *Nation* we gave our estimate of the late John Camden Hotten's patriotic compilation, called, to choose the briefest title, 'Lists of Emigrants to America, 1600–1700.' Mr. J. W. Bouton has now brought out a second edition, which does not profess to be revised, and probably is in answer to a real demand. Some warrant for this exists in the book, but rather in virtue of its old (*i.e.*, previously published) data than of its new. The volume is luxuriously manufactured.——A 'History of the United States under the Constitution,' by James Schouler, of the Boston Bar, is announced by W. H. & O. H. Morrison, Washington.——In the latest *Verhandlungen* of the Berlin Geographical Society (vol. vi. No. 7) is a brief account of the climate, geological formation, vegetation, and capacity for settlement of the Galapagos Islands, by Dr. Theodor Wolf. This observer's visit was made in August–November, 1875, and he condemns the archipelago as worthless for colonizing. But too much should not be exacted of islands which, through the medium of Mr. Darwin, have already contributed in full measure to the welfare of mankind. The same Society's *Zeitschrift*, No. 82, contains Dr. Hirschfeld's report of his archæological journey through southwestern Asia Minor, which is accompanied by a useful map showing also the lines of Eggert's and Kiepert's travels in the same territory. ——The important 'History of the States of Europe,' edited by Heeren, Ukert, and Von Giesebrecht, is, according to the report of a conference of the *collaborateurs* at Munich in October, making satisfactory progress. Hertzberg's 'Greece' is completed with an index volume; Hillebrand's 'France' will shortly be extended to a third and fourth volume; Wenzelburger's 'Netherlands' (revised) has appeared in a first volume; a new volume of 'Spain,' by Prof. F. Schirrmacher, is promised for next year, etc., etc. The beginning of the revised 'Germany' will also be made in 1880, and the work completed in 1883. Prof. Huber has undertaken to revise 'Austria,' in six volumes; and 'Hungary' and 'Bohemia' will follow.

—Colonel T. T. S. Laidley, U.S.A., has issued in a small pamphlet a 'Reply to the Charge of Infringement of Colonel Wingate's Copyright for his 'Manual of Rifle-Practice,'' which charge we have heretofore noticed in the *Nation* (No. 742). The reply is in brief that nothing peculiar to Wingate's book was imitated, and that such portions as were copied from it had already been copied by Wingate from other works, which Colonel Laidley shows with a copiousness of citation that must have cost considerable research. Colonel Wingate's point, as we understand it, was not that his work was original, but that his great labor in collecting the material for it had been taken advantage of by Colonel Laidley, and no credit given him. If Colonel Laidley's 'Reply' could be bound up with his book we should say this objection would be removed, since it would show that, either before or after his attention was called to the matter, he had consulted the same original authorities as Colonel Wingate himself. This labor, however, he might have saved himself, possibly, if he had in the first instance acknowledged that Colonel Wingate had already performed it. It would not have been an ungraceful thing to do, and would have saved us the not particularly pleasant spectacle of the present controversy.

—A few persons in this country, a very large number in Brazil, will hear with deep regret of the suspension of *O Novo Mundo* after the number for the present month has been issued. This monthly illustrated journal, founded in this city in 1870 by Mr. J. C. Rodrigues, and conducted by him ever since, quickly attained an enviable rank among all periodicals circulating in Brazil. It was not a mere lady's journal or fashion print, but it combined with its engravings, its *feuilletons*, its literary notes and correspondence, an earnest political department marked by liberal sentiments, great independence, perfect candor, and religious feeling, which made it very attractive to those who are capable of being impressed by such characteristics. We have more than once had occasion to refer to this admirable journal, whose influence in the mother country could not fail to be beneficial in a high degree. The cause of its sudden abandonment is curious enough, being attributed to a desire to protect "home industry," whereas the immediate effect is to destroy a Brazilian industry which happens to be established outside the Empire, though wholly in the interest of the natives at home. The Portuguese classics, well and cheaply printed in Portugal, are the special objects aimed at in the prohibitory tariff, which, on January 1, will raise the duty on printed matter from 7½ cents per kilogram (35.27 oz.) to $1 50, thus levying on the innocent *O Novo Mundo* a tax greater than its actual receipts from the sale per copy in Brazil. Mr. Rodrigues has promptly faced the necessity imposed upon him, and will have the sympathy of men of letters everywhere.

—The first three numbers of the *Etcher* are sent us by Mr. Bouton, who adds the agency of this periodical to his other undertakings. It is a monthly, with a page slightly larger than the *Portfolio*, each part containing three etchings and three leaves of printed description, and nothing else, and the price is twelve dollars a year; so that the subscriber for one year gets thirty-six etchings, at a uniform price of 33⅓ cents each, and the only question that arises is whether the etchings are sufficiently attractive to persuade him into buying them at that low price. Of the nine prints before us eight are by English artists—Messrs. Chattock, Montefiore, Macbeth, Heseltine, Crooke, Urwick, Slocombe, and Wm. B. Scott. The ninth is by M. Gravesande, who is to most of us an etcher of the French school, and known simply as Charles de Gravesande, but who appears here, with his name in full, as a citizen of Holland. During the same three months the *Portfolio* gave eight original etchings, besides reproductions, and we find those eight prints more varied, and, on the whole, more interesting than those of the *Etcher*. But about all of them together the consideration is forced upon us that the demand for etchings has outgrown the supply of what is excellent, even of what is spirited and brilliant. M. Chauvel's etching of "Cellardyke Harbor," in the July *Portfolio*, and Heseltine's "Ramsgate Harbor," in the July *Etcher*—whatever those two etchings were made for, it was not for pure artistic delight. Such work is of the nature of padding; and, as the existence of padding is not a crying abuse, nor its manufacture a sin, we must even allow that these prints have a right to exist.

—It must also be remembered that these periodicals afford to English and American buyers the readiest opportunity to get etchings at a fitting price. And here we must recall what we said last week about the *American Art Review*. Etchings ought to be sold at not more than half a dollar apiece for prints, and a dollar for proofs; with perhaps two dollars as the price of the first few carefully printed impressions. The coolness with which painters of some reputation as painters, but new in the field of etching, ask a guinea apiece for small prints and two and three guineas each for larger ones, is irritating. Mr. Haden is not meant; whatever rank his art may ultimately retain, he has now a great and long-established reputation as an etcher, and may justifiably take the benefit of it. That is true of Mr. Whistler. To perhaps an equal degree it is true of MM. Lalanne, Appian, Jules Jacquemart, and, in his larger etchings, Charles Jacque; if any of those artists choose to ask twenty-five francs apiece for prints of their more carefully made and elaborate etchings we have only to accept or refuse the proposal, and that civilly, although, in fact, the Frenchmen have not dreamed of such prices. But why Mr. Herkomer, strong and able as he is, or Mr. Macbeth, successful as he has been, should ask for their first published etchings from two to ten guineas, is what we cannot understand. We open the folios of the old Society of *Aquafortistes*, and compare those prints at less than two francs apiece (the proofs before letters) with the modern work at five-and-twenty times the price. There is a plenty of rubbish; the half might well be burned up; but in the first volume we open, among the sixty prints there are twelve of real value, which are sure to hold their own, which no twelve living etchers can surpass, by such men as Corot, Edouard Frère, Lalanne, Yongkind, and Haden; and these twelve, together with the forty-eight less important prints, cost one hundred francs for Holland-paper proofs, or half as much for prints. These considerations are of weight to us Americans now that artists among us are beginning to etch, and expect five dollars apiece for their often crude performances.

—At the same time perfect fairness requires allusion to the manner of printing etchings. Mr. Haden, who is known to take peculiar personal care of the printing of his plates, and to leave nothing undone that forethought, personal supervision, and liberal outlay can do to secure their perfectness, has introduced the ideal state of things. The making of paper and the importing of "sepia from the Mediterranean" especially

for his "Calais Pier" may or may not have been necessary precautions; the result is fine, and worthy of Turner's design matched with Haden's execution; but it is not of that plate that we speak more than of others. It is understood now, when any London publisher announces a new plate by Mr. Haden, that every single impression will be examined and approved by the artist, that the number of impressions will be no more than seem to him to be perfect, the printing being arrested as soon as there are signs of wear, and that, as a result, every copy is as good as every other copy so far as practical worth is concerned. Thus, to return to the "Calais Pier," in the case of which plate it was announced that fifty copies of the first state, with the dark sky, and fifty of the second state, would be made, the writer having applied directly to Mr. Haden for a copy of the first state was offered one, but was advised to be content with the second state, of which he already had a copy, on the ground that Mr. Haden himself preferred it as a design, the impressions being assumed equally good. Mr. Haden's etchings of the last ten years have all been printed with astonishing perfection, and in this he has set a good example to other etchers. The Americans especially need to copy him in this. High-priced proofs are brought to us for sale which are as badly printed as it is possible for etchings to be.

—"An Arabian Night," produced last week at Daly's Theatre, is an adaptation of a German comedy by Von Moser, the adapting being done by Mr. Daly himself. To judge by the manner in which it was received by the audience, it is destined to have a considerable success. The plot of the play is founded on the theme which is so shocking to English and American moralists when it makes its appearance in French plays—marital inconstancy; but by some means, which are too subtle for our comprehension, Mr. Daly and Von Moser between them have managed it in such a way as to deprive it of most of its terrors. As moralists we cannot ourselves see much difference between such a play as "Contempt of Court" and "An Arabian Night," except that the latter is the broader of the two. But broad humor and vulgar fun will probably hold their own on the English stage for many a long day, and of these there is plenty in Mr. Daly's new play. Most of the characters in it are part of every playwright's stock-in-trade. There is the young husband, who has got himself into a scrape by his attentions to an unknown woman; there is his cynical and good-humored uncle, who is only too willing to believe the worst of him (a part capitally acted by Mr. Davidge); there is young *Moodle*, the fop; there is the young wife who believes everything she is told by her husband; the niece from abroad; the artist; the mother-in-law, who acts as detective upon the husband, and sows dissension between him and his wife; the faded landlady with young airs, the pert chambermaid, the knowing butler. All these are old friends. The character of the play is *Rosa Maybloom*, the unknown young woman, who turns out to be a bareback rider in a circus, and whose untimely intrusion into *Mr. Sprinkle's* happy home brings misery to him, and leads to all the subterfuge, misunderstanding, evasion, and intrigue which make up the play. The part of a circus-rider, who passes herself off upon a suspicious woman as the niece of her son-in-law, letting her real character be all the time quite evident to the audience, is not an easy one, and Miss Lewis certainly overdoes it, making the difference between her real and her assumed character grotesquely glaring. Mr. Charles Leclerq, who is too good an actor to be given such work to do, also overdid in rather a comical way the "cannon-ball tosser." The real niece, by Miss Lanner; the husband, by Mr. John Drew; the fop, by Mr. Parkes, were all well taken. The play drags, however, in the second and third acts and needs shortening. The "Arabian Night" is to be followed by an adaptation of the "Seecadet," which is described in the bills as the "reigning Continental sensation," and which is also being played at one of the German theatres in this city. The modern German stage ought to prove a valuable addition to the resources of American dramatists. There are a host of comedies and plays of the sort known in German as "Posse mit Gesang," abounding in comical situations and lively dialogue, which might easily be Americanized. German plays are not so cleverly constructed nor so witty as French dramas, but there is a healthy vulgarity about them which an intelligent audience will never fail to discriminate from French indecency, as long as they are made acquainted in advance with the fact that the play is not of French origin.

—The first concert of the New York Oratorio Society took place on Saturday last in Steinway Hall. Mendelssohn's "Elijah," the oratorio selected for the occasion, has since its first performance in this country, now many years ago, been a great favorite with the general public. This and the oratorio of "St. Paul" show the genius of the composer in the most favorable light. They are full of lovely melodies, brilliant instrumentation, and dramatic effects, and have always enjoyed an amount of popularity which is perhaps only equalled by one composition of a sacred character—namely, Handel's "Messiah." A large and appreciative audience crowded Steinway Hall on Saturday night, and Dr. Damrosch has every reason to be satisfied with the success of the opening concert. The performance was, indeed, a very good one. The chorus, which appeared to be more numerous than on former occasions, was evidently thoroughly familiar with its work, and some of the numbers—as, for instance, the first chorus of the priests, "Baal, we cry to thee!"—were sung with great spirit. The celebrated final chorus of the first part, "Thanks be to God," was lacking in vigor and devotional fire, which are the characteristics of this beautiful composition. This, however, was the fault of the conductor, who dragged the *tempo* and did not insist upon a sufficiently marked accentuation of the rhythm. Mrs. Mary Louise Swift, who sang the soprano solo parts, is not an oratorio singer of the highest rank; her voice wants the necessary fulness, her style the classical composure, for such a place. But if she is unqualified to sing in an oratorio of Bach or Handel, her sweet voice, her modest and unassuming manner, are particularly appropriate for the gentle *andante* movements of Mendelssohn's sacred music. Miss Drasdil is the oratorio singer *par excellence;* the low and plaintive tones of her voice are heard to the greatest advantage in the solemn strains of church music. Her rendering of the well-known "O rest in the Lord" was admirable in every respect. Mr. Fritsch is a great favorite with lovers of light music as an excellent singer of German ballads, particularly of a hilarious character, and Italian operatic airs. He is altogether out of place in oratorio music, so much so that his rendering of some numbers in Saturday's concert bordered on the ridiculous. Mr. Whitney was not in very good voice, but his rendering of the long and difficult part of "Elijah" was in every respect artistic and noble.

—Mr. W. H. Sherwood gave a series of three pianoforte recitals which deserve more than a passing notice. This young artist was heard here towards the end of last season and produced a very favorable impression. Since then he has made great progress, and is undoubtedly entitled to a very high rank among pianoforte players, of whom there is just now an *embarras de richesses* in this country. The chief characteristics of Mr. Sherwood's playing are an absolutely faultless technique and a very even and highly-finished touch. For this reason he is best in works of the most modern school, in Schumann, Chopin, Liszt, Rubinstein, etc. He is decidedly wanting in the breadth and power needed to play Bach, and in the depth of conception and passion which Beethoven requires. This was strikingly evident in the first two numbers of the first concert, Bach's great Organ Fantasia and Fugue in G minor arranged for piano by Liszt, and Beethoven's last pianoforte Sonata, Op. 111. The transcendent technical difficulties of this last-named composition were admirably mastered by Mr. Sherwood, but he has no idea what Beethoven means by an *Allegro con brio ed appassionato*. His rendering of Schumann is very clear and intelligent, but sometimes wanting in that inner warmth which the most poetic of all composers requires. Mr. Sherwood is most successful with Liszt and Chopin; the étude, "Waldesrauschen," by the former composer, and almost every number by the last named, were rendered by the young artist in a truly admirable manner. Mr. Sherwood is an excellent octave-player; his performance of Kullak's octave étude was a wonderful exhibition of the strength and flexibility of his wrist.

—The London newspapers have of late made such a stereotyped phrase of the statement that the English have become a musical nation that foreigners have almost felt obliged to believe it unconditionally, even though the names of English composers are now as conspicuously absent from concert-programmes as heretofore. Our only means of judging the truth of the boast is the musical literature and criticism published in London, and this certainly is not inconsistent with the claims advanced. There is hardly a paper in Germany which publishes such instructive and interesting criticism as constantly appears in the *Times*, and there is in Grove's 'Dictionary of Music and Musicians' an amount of well-digested and discriminative writing such as can be found in no similar work in any other language, including German. This proves the existence in England of a body of musicians who in erudition are hardly the inferiors of their German colleagues, while they have an advantage over the latter in their inherited national literary skill and taste. But what of the nation at large? Has that become musical? According to the London correspondent of the *Vossische Zeitung* it has not. This writer, a pupil of Spohr, insists that of all the arts which Puritan asceti-

cism put under ban, music has so far failed to recover its lost ground. A piano is, indeed, to be found in every parlor, but is regarded by Englishmen of the old school either as one of the necessary evils of life or else as an elegant piece of furniture, and as such procured of the furniture dealer, the chief consideration being that it shall match with the chairs and tables, its musical qualities being of secondary importance. The writer appears to have suffered a good deal from ambitious young ladies whose chief desire is to execute the latest operatic melody with the left hand alone, or at the hands of ambitious young men who practise that semi-musical instrument, the cornet, which has become the fashionable instrument in the "higher circles"; and these sufferings seem to have led him to take a perhaps too pessimistic view of affairs. Most of his reflections, however, come near enough to the truth, as when he says that the directors of the larger orchestras, Costa, Benedict, Manns, are foreigners; the members of the orchestras are mostly Germans; the composers are either Scotch, like Bishop and Macfarren, or Irish, like Balfe and Thomas Moore; and the only prominent English composer, Sterndale Bennett, was educated in Germany, and is, in his works, chiefly an imitator of Mendelssohn, without any marked originality. The most that can be said of the English as a "musical people" is, therefore, that they have tried very hard to assimilate the musical tastes and habits of foreigners, while their resources have enabled them to make of London the principal resort of all the great living artists.

—Music, as is evident from all accounts, is now "the thing" in London, and every person with a claim to æsthetic respectability must make his appearance at the Philharmonic concerts, the Handel oratorios, and the Italian opera. Whenever there is a classical concert the newspapers, with comic gravity, call attention to the fact that the audience listened with evident attention and remained to the very end. What heroes! Perhaps the most suspicious thing about the vaunted musical culture in England is the tendency to make a certain composer fashionable for a time, and then drop him, to make room for some one else. On this topic there are some suggestive remarks by Mr. Statham in the June number of the *Fortnightly*. For a time there was a Rossini *furore*, then Mendelssohn for a long time became the lion of the day until he was superseded by Schumann, who, too, has "had his day, and is now making way for Wagner." Mr. Statham endeavors to point a moral from this state of affairs, and cautions Mr. Grove not to let Mr. Dannreuther write the articles on Liszt and Wagner for his dictionary; because Wagner too, like Mendelssohn and Schumann, may soon cease to be the fashion in England, and then Mr. Dannreuther's articles would be "a permanent blot on the dictionary by committing it to ill-regulated enthusiasms, which can only be of temporary acceptance." As if the value to be assigned to a musician in a dictionary were to be gauged by the probability of his remaining a fashionable article with the London public! It is psychologically interesting to observe what sinuous methods some critics resort to in their desire to disparage modern composers. All things considered, Mr. Statham is doubtless right in saying that, notwithstanding a considerable amount of hypocrisy, there is a real advance in the appreciation of music of the highest class in England. But until she abates somewhat her ecstatic admiration for sentimental ballads and showy arias; her one-sided prima-donna worship connected therewith; her ranking Handel above Bach, and Mendelssohn above Schumann; her calling the "Flying Dutchman" Wagner's masterwork; her excluding Biblical subjects from the stage, and thus rendering the performance of such beautiful works as Rubinstein's "Maccabees" impossible; and until she is able to employ orchestral conductors and performers of her own nationality, and has given to the world at least one symphony, oratorio, or opera of the first order of merit, England can hardly pretend to have really become a musical nation.

—The November number of *Blackwood's Magazine*—which since its foundation has numbered among its contributors every Tory writer of ability in England—unmasks a very disreputable piece of business, the true nature of which, it is safe to say, would not have been discovered if it had not been for the penetration of a *Blackwood* contributor. From an article entitled "Whig Reviewers, as Painted by Themselves," we learn that in publishing the selections from his father's correspondence, so widely and favorably noticed by a superficial, not to say a suborned, press, Mr. Macvey Napier was guilty of "uncovering his father's literary nakedness," which can only be compared to the similarly unfilial performance of "Noah's second son." It would, however, be well for him if his flagitiousness had only injured the memory of his father. The *Edinburgh Review* itself, "in its present respected position," must have been as shocked by it as we all are "when brought unexpectedly face to face with any forgotten fruit of our early excesses." The "surviving friends and families" of Mr. Napier's contributors are also injured, as many of these, it is neatly remarked, "have themselves told their own stories still more advantageously." They appear to have been about the most quarrelsome, unprincipled, and meanest happy family that were ever associated even by the common bond of Whiggery, and the only thing that palliates Mr. Napier's offence against public decency in exposing them is the circumstance that they had sufficiently exposed themselves before. Each of them "arrogated to himself the claim [*sic*] of having founded the *Review*," and consequently all but one of them must have been liars. There was from the very first "a furious rivalry between the contributors themselves as individuals, and between the contributors as a body and the editor." When Jeffrey resigned the editorship "for the certain prospect of political preferment" he was so hard bestead to find in Edinburgh a successor of any literary standing who was also a Whig that he was forced to get a stool-pigeon in Mr. Napier—in itself a nefarious procedure. At this juncture "there was a general disposition to show restiveness," and "the best thing we can say of Mr. Macvey Napier" is that he saved "both his party and his publisher from the scandal of an outbreak." The quarrels between Brougham and Macaulay form "the backbone of interest" of the Correspondence, though the writer in *Blackwood* seems to be interested in a number of other quarrels also. The sense as well as the spirit of the Reviewers he apparently esteems lightly. He says: "We find Carlyle's reputation as a thinker increasing in a fixed ratio with the incomprehensibility of his utterances"; affirms "that for Holland House they all had a nervous and superstitious regard"; intimates that they were the next thing to traitors to their country, as well as hypocritical in their party relations; and reaches a climax of contempt in asking, *apropos* of Bulwer's association with them: "Mais que diable allait-il faire dans cette galère?" The only relief to all this blackness is a letter from Wilson, "the most genial and kindly in the whole volume," which is natural, as Wilson was a Tory. What is it in the air of Caledonia that forbids us to suppose this grave paper the excellent "skit" it might be taken for if published in a milder climate?

—A warning voice has finally been raised in Germany itself—the land which writes so many odes to its native tongue and then neglects and abuses it so shamefully—against the mania for translating French and English books. What makes this warning still more significant is its appearance in a newspaper especially devoted to foreign literature, the Leipzig *Magazin für die Literatur des Auslandes*. Two leading articles are given up to the development of this theme. Foreign wares are cheaper than domestic, sometimes cost very likely nothing but the mere pittance doled out to the poor hack who tortures them into translators' German, and so they are naturally given the preference by newspaper editors in their feuilletons and by book publishers equally eager for a favorable balance-sheet. The condition of translators by profession has become so miserable in Germany that one of the guild recently issued a touching appeal to the public for sympathy with "this class of our fellow-citizens," and proposed the formation of a sort of trades-union as a measure of common defence against the publishers. The harm which cheap and hasty versions do is much more serious in German than in English or French, for in German the *Sprachgefühl*, or instinctive sense of right and wrong in expression, is extremely weak. Of course there *are* now and then, in German, ways of saying a thing which the genius of the language strictly forbids; nevertheless in general half a dozen clumsy ways have the same civil rights with the one accurate and deft way. Further, the class tempted by poverty to do this harm, and equipped with a reading knowledge of English or French, is very large.

—In our own language many more translations appear nowadays than formerly. Of course a still larger number are made but never published. One prominent New York publisher keeps ready a printed circular which he sends to amateur translators along with their rejected manuscripts. In this circular it is stated that not one tithe of the translations offered him are accepted, and that not one tithe of those he accepts succeed with the public. Even those which succeed are often written in a sort of broken English. They are read, perhaps, for the sake of the ideas that struggle to the surface, but they are read with ever-increasing nervous irritation. The final revision of a translation for the press should certainly not begin until the words of the original have entirely faded from the mind of the translator, and then the revision should be finished without once recurring to that original. We leave out of account in our censures such poetical translations as Taylor's 'Faust,' and, perhaps, Longfellow's 'Dante,' for translating poetry is, after all, contending with impossibilities. These versions are no doubt praised by Germans and

Italians respectively, nevertheless it seems as if an Englishman could enjoy them more thoroughly if he were acquainted with German or Italian, and could keep the original by him constantly to explain and justify the translation. Then, again, we are not inclined to be too severe towards occasional actual mistranslations, whether arising from ignorance or momentary carelessness. Mrs. Bunnètt mistakes *childish* for *childlike* in Grimm's 'Michael Angelo,' and greatly mystifies the reader. Hayward, if we are not mistaken, turns *fideler*, "jolly good" (from the Latin *fidelis*), into *fiddler*, in his excellent prose 'Faust.' Finally, Carlyle, as cited but not corrected by Bayard Taylor in his 'German Studies,' makes Jean Paul's brothers and sisters trot along by their father's side in the twilight *under his nightgown*, whereas the original says *among* [the folds of ?] *his dressing-gown*. All this may pass, but the one crying evil, which no mere commercial motives should ever induce a publisher to tolerate, is bad English. What we mean by bad English two passages to which we opened in recent translations will clearly show. The first is from Rydberg's 'Roman Days' (Putnams): "Cautiously, the war was waged, it is true; for circumspection, he said to himself, is a commander's pre-eminent virtue; but to the decision of his aim, the bold blows testify that he struck, when mildness was not enough. Can it be thought possible that the secret foe of a free condition of the people," etc., etc. The second is from Jacquemart's 'Ceramic Art' (Scribner): "The Este family . . . have a claim to our interest upon more than one title. . . . It is then by the assistance of the learned Modenese, and in supporting ourselves upon the works preserved in the most important collections, that we are going to rebuild the history of the products of Ferrara." Thackeray—see the conversations of his Frenchmen in the 'Newcomes'—was the great master in this kind of English.

—Michel Chevalier, Professor of Political Economy in the College of France, Member of the Institute, Senator under the Empire of Napoleon III., Grand Officer of the Legion of Honor, and author of numerous works on political economy and cognate subjects, died at Paris last week, in the seventy-third year of his age. In his youth he accepted the doctrines of Saint-Simon, and advocated them with so much vigor that he fell under the ban of the Government and was condemned to a year's imprisonment, six months of which effectually cured him. He was then released and sent to the United States (1834–5) on a public employment to report upon the system of roads and canals in this country. The result of this journey was a painstaking and meritorious work in two volumes, one of which consisted entirely of maps, drawings, and mathematical illustrations. M. Chevalier had been educated as a civil engineer, and his selection for this work was attributable mainly to that fact; but a series of letters which he wrote at the same time to the *Journal des Débats* on the social and industrial aspects of the United States proved that he possessed the capacity of observation in a high degree. These letters attracted much attention, and were collected and published in a volume in 1836, and subsequently translated into English and republished in this country. In 1840 he was made professor of political economy in the College of France, where he laid the foundation of his fame as writer and teacher of the principles of the science. Three large volumes—the third entitled 'La Monnaie,' published in 1866—constitute his 'Cours d'Économie Politique.' They are well adapted to the end the author had in view, being a series of lectures addressed to college students, but are not remarkable. The volume on Money traces with great perspicuity the history and development of monetary ideas and monetary science in Europe, and is fairly entitled to a place among standard economical works. M. Chevalier's treatise on "the probable fall in the value of gold" is important for its wide range of statistical information, but events since its publication have proved that its scientific standpoint was erroneous—as the author acknowledged by becoming a stout adherent of the gold standard. As the negotiator with Cobden of the commercial treaty with England he conferred a great and probably lasting benefit upon his country, since whatever lodgment the principles of free-trade have acquired in France, outside the circle of thinkers and scholars, dates from that event. Without great originality of thought M. Chevalier became known to the world as the most considerable name among contemporary French economists, and one of the most useful public men of his time.

—An examination of candidates for the post of librarian at the universities and other public institutions in France has just been held in Paris, there being four or more vacancies to be filled. According to the instructions issued a year ago by the Minister of Public Instruction, the requirements were an essay on some subject relating to bibliography, and "the classification of fifteen works treating of different subjects, and belonging to different epochs of printing." Included in this classification were all the various operations performed in cataloguing. "Close and perfectly clear handwriting is an indispensable condition." This action of the French Government will doubtless lead to the establishment of librarians' schools, or the endowment of professorships of library economy in the universities, and a corps of highly-trained men will in the not very distant future serve the various libraries to the great advantage of the science of bibliography. Still, it should never be forgotten that the head of a great public library has need of other and far higher attainments than a knowledge of bibliography and the rules of cataloguing.

THE LETTERS OF DICKENS.*

SCARCE a decade has elapsed since the death of Dickens, and ten years make far too brief a period in which to determine by induction the relation between such amazing contemporary vogue as his was and permanent fame. Nevertheless, few of us have any doubt, we suppose, that, on however different grounds, many of his creations will be as much admired and found to be as admirable in the next century as they have been in this; they contain, even if they do not consistently and completely embody, a union of truth and freshness, of originality and nature, upon which the lasting fame of literary creations has always built securely. But ten years are nearly enough to show that in Dickens himself the future admirers of his works will take almost no interest at all. In reading through these letters one's irresistible feeling is that it is at least well that their publication was not delayed longer, if, indeed, it has not been delayed too long already. They present the man very adequately, we imagine, and, in presenting him, inevitably betray how slight was the real foundation for the quick personal interest taken in him during the last thirty or forty years. Every one must remember this: how the family circle, the lyceum platform, and even the pulpit used to discuss with excited warmth the essential difference between real Christianity and ecclesiasticism, between true philanthropy and hypocrisy, between snivelling cant and hearty, frank humanity, as illustrated in his character as well as in his writings; how it used to be debated whether or no he drank too much brandy, whether he went to church, whether he sympathized with the North or South in our civil war, whether he meant to deride the clerical calling in his "gross caricatures," Stiggins and Chadband, whether he or his wife was to blame for their domestic trouble, and so on; how seriously the 'American Notes' were taken in this country, and how anxious we were—even the tobacco-chewers—to evince our magnanimity when their author revisited us; what an unprecedented *furore* he then created; how widespread and intimate was the grief manifested when he died; and, finally, after his death what countless magazine articles and lectures were written, not only about his books but about his personality. From the elaborate 'Life' by Mr. Forster to the 'Whispering Gallery' recollections of Mr. James T. Fields, the supply of personal information concerning him has been all that the thirstiest public could crave. It is, of course, not difficult to account for this. The works of Dickens were not only universally popular, which of itself would suffice to create an interest in their author; they were intrinsically remarkable, and argued that such an interest was deserved. To discover to the many the great discrepancy between the worth of his works and of him, despite the mass of inadvertent testimony constantly witnessing this to the discerning few, the lapse of time was essential. But, though the lapse of time is slow it is also certain, and, unless we are mistaken about the fact, popular interest in the man has already appreciably declined, if it has not subsided. There are probably few who will read these two volumes from cover to cover.

Nevertheless, no small portion of them is worth reading. They will not materially modify the discerning reader's notion of Dickens, but they will emphasize, point, and explain it; and we are tempted to add, out of their emptiness. They throw, too, some light on what is after all a curious problem, how such a man, namely, could have written such books; they show how loose are our stock ideas of such matters, and how entirely possible it is for a writer of remarkable genius, high spirits, and humor to be at the same time a rather coarse-fibred and conventional kind of man, from acute interest in whom all but his friends may be dispensed. As 'Letters' they are not entertaining. The chief charm of ana is, perhaps, the circumstance that it ought not to be written. "How happy it comparatively is," says the biographer of John Sterling, "for a man of any earnestness of life to have no biography written of him"; and one feels what Will Waterproof means in lamenting the time when the Poet

* 'The Letters of Charles Dickens. Edited by his Sister-in-law and his Eldest Daughter.' 2 vols. New York: Charles Scribner's Sons. 1879.

"flash'd his random speeches,"
Ere days that deal in ana swarm'd
His literary leeches.

But this is what is called taking high ground, and, though we are far from saying Dickens was not "a man of any earnestness of life," it is objection enough to Dickens ana to feel persuaded that there is no objection of this kind to make to it. No man lived less in "the fear of little books," or needed them less to make him "talk for show." The charm which consists in the mere fact of getting behind the scenes of a quiet man's life these 'Letters' afford. A large number of them are private letters, and fulfil the purpose of the editors "of showing him in his homely, domestic life." But this charm becomes very slight when it is seen that there is nothing in a "homely, domestic life" that distinguishes it from the life one lives in public. And there was nothing in Dickens's, so far as we here learn. Except the cause of his separation from his wife, there seems to have been nothing the disclosure of which could be considered a violation of delicacy—nothing intimate and private, to divulge which he would himself have hesitated. We do not, of course, mean moral errors and omissions, of which every man's life is full and the disclosure of which is scandal, but the thousand things, morally colorless, that in a man of subtle refinement make the difference between his private and public life, and before which he and his draw a screen whose removal is always the most interesting as it is the most difficult and delicate part of his biographer's duty. In the second place, the 'Letters' are not entertaining for the collateral contemporary gossip we should have said they would contain, and as so many "letters" and "memoirs" are. There are letters to Jerrold, Macready, Thackeray, Mark Lemon, Shirley Brooks, and others of the brilliant company in which Dickens moved, but they are of almost no objective interest.

The volumes, however, succeed in giving "the public another book from Charles Dickens's own hands—as it were, a portrait of himself by himself," as the preface announces, and if they furnish little of the entertainment one looks for in ana, this portrait is, as we say, worth examination. It is not painted in very vivid colors, and it is not a very sensitive and subtle countenance; but the very circumstance that this is so, and that at the same time it is an indisputably authentic sketch of the author of Dickens's works, makes it a curious study. We can give but a random hint or two of its lineaments, premising that for a total impression the reader will have to consult the sketch itself. He writes to "my dearest Macready" that in "my little Christmas book" ('The Chimes') "I have endeavored to plant an indignant right-hander on the eye of a certain wicked Cant that makes my blood boil, which I hope will not only cloud that eye with black and blue, but many a gentle one with crystal of the finest sort. God forgive me, but I think there are good things in the little story!" To Mr. Monckton Milnes (Lord Houghton) he writes: "That Nellicide was the act of Heaven, as you may see any of these fine mornings when you look about you. If you knew the pain it gave me—but what am I talking of? If you don't know, nobody does." To Cattermole, also referring to the "Nellicide," "I am for the time being nearly dead with work and grief for the loss of my child." These sentences illustrate, it seems to us, how sincere his attitude towards his own pathos was, and, considering the character of his pathos, quite as aptly the character of his sincerity. After a railway accident in which he was comparatively unhurt, but exhausted himself by helping the wounded among his fellow-passengers, he had the following circular-note prepared "in answer to innumerable letters of enquiry":

"Many thanks for your kind words of remembrance. This is not all in my own hand, because I am too much shaken to write many notes. Not by the beating and dragging of the carriage in which I was—it did not go over, but was caught on the turn among the ruins of the bridge—but by the work afterwards to get out the dying and the dead, which was terrible."

To Miss Mary Boyle: "Pray read 'Great Expectations.' I think it is very droll. It is a very great success, and seems universally liked. I suppose because it opens funnily, and with an interest too." To Miss Dickens, relating an accident and incipient panic at one of his crowded readings, during which a lady screamed and "ran out wildly towards" him: "I addressed that lady laughing (for I knew she was in sight of everybody then) and called out, as if it happened every night, 'There's nothing the matter I assure you; don't be alarmed; pray sit down'; and she sat down directly, and there was a thunder of applause. It took some minutes to mend" (the gas-batten had fallen), "and I looked on with my hands in my pockets; for I think if I had turned my back for a moment there might still have been a move." To the same, concerning his readings at Edinburgh: "The talk about 'Copperfield' rings through the whole place"; at Glasgow: "The whole Blackwood family were borne in on the top of a wave, and landed with their faces against the front of the platform"; at Torquay: "I read 'Copperfield' and positively enthralled the people"; and in a similar strain during his tour in this country, summing up the character of the late Mr. Staunton (*sic*), by the way, in a letter from Washington, thus: "He is a man of a very remarkable memory, and famous for his acquaintance with the minutest details of my books."

The reader who sees conceit in this sort of thing overshoots the mark, we fancy. One gives no evidence of conceit in being beautifully frank with one's sister-in-law. It simply illustrates how seriously Dickens took himself. He was always a part of his own audience, and reported what he did and what happened to him with conspicuous fidelity. It would be hard to find a more striking example of the conscious man; all that he seems to have been unconscious of was his own self-consciousness, and the esteem in which a betrayal of self-consciousness is held by certain fastidious people. There was nothing unwarrantable in his self-concentration, moreover. Everybody about him all his life encouraged his serious view of himself, talked much of the "reforms" he had worked with Dotheboys Hall, and Jarndyce *vs.* Jarndyce, and his little Nells and Joes and Pauls and Tiny Tims. And it was not only excusable but inevitable, since to avoid it in such circumstances requires either ingrained fineness of fibre or subtlety of perception, and Dickens was not fine-fibred or subtle of perception. But it is not the less unfortunate for being unavoidable, and with Dickens it operated curiously to narrow his range. We doubt if as many letters of any of the men worthy to be ranked as his compeers could be collected which would show such a limited concern for the world in which he personally played no part. December 3, 1861, he writes from Glasgow: "I fear the North to be utterly mad, and war to be unavoidable"; in May, '63: "A very intelligent German friend of mine, just home from America, maintains that the conscription will succeed in the North, and that the war will be indefinitely prolonged. *I* say 'No,' and that however mad and villanous the North is, the war will finish by reason of its not supplying soldiers. We shall see. The more they brag the more I don't believe in them." Greater sages than Dickens shared these views at the time, but his expression of them has something unique and characteristic about it; and we shall make room for the following extract, not because time has shown its foolishness but because it displays a tone and temper he invariably employed in speaking of most subjects outside the realm of private theatricals and the works of Dickens—the tone and temper of incurable superficiality in serious matters:

"If the Americans don't embroil us in a war before long it will not be their fault. What with their swagger and bombast, what with their claims for indemnification, what with Ireland and Fenianism, and what with Canada, I have strong apprehensions. With a settled animosity towards the French usurper, I believe him to have always been sound in his desire to divide the States against themselves, and that we were unsound and wrong in 'letting I dare not wait upon I would.' The Jamaica insurrection is another hopeful piece of business. That platform-sympathy with the black—or the native, or the devil—afar off, and that platform-indifference to our own countrymen at enormous odds, in the midst of bloodshed and savagery, makes me stark wild. Only the other day here was a meeting of jawbones of asses at Manchester to censure the Jamaica governor for his manner of putting down the insurrection! So we are badgered about New-Zealanders and Hottentots, as if they were identical with men in clean shirts at Camberwell, and were to be bound by pen and ink accordingly. So Exeter Hall holds us in mortal submission to missionaries, who (Livingstone always excepted) are perfect nuisances, and leave every place worse than they find it. . . . I seem to be grumbling, but I am in the best of humors. All goes well with me and mine, thank God."

In the best of humors, happily, Dickens almost invariably found himself, we judge; cast down only occasionally by grief at an enforced "Nellicide,' and then able to recover speedily after having enjoyed the contrast of light and shade in his sensibility, and having communicated his sensation. High spirits are as constantly attested in these letters as the other qualities we have mentioned. They do not seem to desert him even when he is writing to his presumably anxious sister-in-law and daughter details of his bad health: "My cold sticks to me, and I can scarcely exaggerate what I sometimes undergo from sleeplessness," he writes from New York to Miss Hogarth. "The day before yesterday I could get no rest until morning, and could not get up before twelve. This morning the same"; and so on with what would be querulousness in a less scrupulous reporter, but is manifestly here only an exact diagnosis, interesting in itself. Of humor we get but little, and that less entertaining than the same quality in his books, for the sufficient reason that as a character-background

their creator compares unfavorably with Mr. Richard Swiveler, "Prooshan Blue," and their companions. Upon the whole, it is perhaps possible from this portrait of Dickens by himself to account for the excellences and defects of his books, and for his authorship of them, but only by reading between the lines of the volumes. They are remarkably well edited, and evidently justify the acknowledgment of the preface to Mr. Wilkie Collins for help in the technical part of what is—we ought to add—a pious task faithfully performed.

RECENT BIOGRAPHIES OF LESSING.*

NOT till within the last decade or two would anything like a detailed account of Lessing and his literary achievements have been so widely welcome among the English-speaking nations as to remunerate the trouble of presentation. Known chiefly, and yet scarcely save to curious readers, through review articles, two or three of his dramas, and particularly 'Nathan the Wise,' Lessing was long generally regarded as one of those unassimilable foreigners a very slight acquaintance with whom is deemed justly proportionate to their deservings. Of the obligations due to him by modern thought, and in lines of study the most disparate, few were at all aware, his own countrymen excepted. They, however, have never, at least since his death, been blind to his eminent merits; and, as time has worn on, they have recognized those merits with constantly increasing distinctness and gratitude. That, after their wont, they have in many cases imaginatively exalted and transformed him into something against which, with his profound sense of equity, he would have vehemently reclaimed, was only to be looked for. Yet, when contemplated with all dispassionateness, he stands before us as a most imposing figure. Taken for all in all, he is, indeed, such that to be pronounced comparable with him is no disparagement even to the foremost of the celebrities who have shed a lustre on the literature of Germany.

Lessing was born in 1729 and died in 1781. His father was a Lutheran clergyman, and he himself was intended for the church. In his eighteenth year he entered the University of Leipzig. After a while he became, but only in name, first a student of theology and then a medical student. But while still at school he had written a play, the first-fruits of a vocation for which, at the outset, he thought himself peculiarly fitted, and which he pursued, intermittently, almost to the close of his career. From an early age his diligence, alike as an investigator and as a writer, was indefatigable. At the same time he was far from being by option a recluse. Barring what he observed during a hurried tour through Italy, his experience of men and manners was confined, after boyhood, to Leipzig, Berlin, Wittenberg, Breslau, Hamburg, and the solitudes of Wolfenbüttel, where he spent the eleven last years of his life. In the autumn of 1776 he married a lady every way worthy of him, Eva König, a widow, who died in January, 1778, as did the son to whom she was then giving birth. He felt her loss most keenly. Rallying from it, he produced, in the course of the three years that still remained to him, three of his most original works, which are also certainly the maturest of all his writings. We refer to his 'Nathan the Wise,' 'Education of the Human Race,' and 'Ernst and Falk.' While still at the zenith of his intellectual vigor he was assaulted by that strange malady, ossification of the arteries; a phenomenon which rarely exhibits itself but in extreme old age. A stroke of apoplexy supervened, and then came the end. So poor was he at his death that the Duke of Brunswick, his patron, had to defray the charges of his interment. Long subsequently, it was not without persevering quest that the humble stone was discovered which marks his last resting-place.

Whatever the subject-matter handled by Lessing, we are at once struck, on scanning his treatment of it, by the amplitude of his erudition, by his firmness of grasp, and by the sincerity of his convictions. Nor are his mental and moral characteristics denoted exhaustively by this beadroll of merits. To those from whom he differed, with their arguments and deliverances, he was all but absolutely just: a fact which is the more remarkable in that nearly all which he wrote is, directly or indirectly, polemic. From prejudice of every description he was also well-nigh entirely free. Notwithstanding that he worked his way eventually to views about as far removed as possible from the rigid Lutheranism which was instilled into him in his youth, his attitude, as towards creeds, was that of a mind through and through judicial. While his juvenile associations and reminiscences nowise illogically colored, in their favor, the conclusions at which he finally arrived, neither, as is so frequently observable in recalcitrants against traditionalism, did they operate, by provoking a recoil, to recommend to him their dogmatic antipodes. A scrutinous survey of facts, and a calm and fearless use of reason, were with him indispensable antecedents to any decision touching what he accepted or rejected. Considering the grossly slanderous personalities with which he was assailed by some of his antagonists, it is noteworthy that, being a Teuton and a master of every variety of vocabulary, he should not, in reprisals, have gone further in invective than he is seen to have gone in his regrettable 'Vade-mecum für Herrn S. G. Lange' and in certain of his letters to Klotz. And here a word must be said of his epigrams. As a whole they cannot be commended as chaste compositions, any more than as felicitous; not a few of them, besides that they lack miserably both salt and point, being uncleanly to the full degree which entitles them to the designation of classical.

We have noted that Lessing died in poverty; and in poverty, or something near it, he passed all his days. Yet, even when most hardly bestead to make good his own immediate wants, he ever lent a willing ear to the suit of his importunate kinsmen. Nor was this all. His sympathies were genuinely cosmopolitan; his very friendship for Moses Mendelssohn is a pregnant proof that they were so. Like Dr. Johnson—whom he resembled in several points, such as penury of the poetic faculty, deficiency in ear for rhythm, insensibility to the beauties of nature, and dislike of Gothic architecture—he was a friend of castaways. In his fellow-men, politically considered, he yet seems to have taken but a tepid interest. Voluminous and varied as is his correspondence, it is never with the citizen as such that he therein concerns himself. There are, however, in the very latest of his writings passages which can bear no interpretation but such as comports with a distinctly democratic tendency. For all this, in the same composition, which appeared the year before our national autonomy was acknowledged by Great Britain, he has only to say with reference to the struggle of our forefathers that "what costs blood is surely not worth blood." This in passing. Lessing, indifferent as he may have been to humankind in its relation to the state, was a true friend of freedom; averse to domineering, and as averse to the arts of the flatterer or the sycophant. A lifelong laborer for hire as he was, and constantly a critic of popular or influential authors, he never once stooped even to assentation; and, dreaded as he was by those who crossed argumentative weapons with him, he never once took unfair advantage of the weakness of an adversary.

Here, indeed, we have tokens of most of the elements of character which warrant us in calling their possessor magnanimous. Yet we miss in Lessing what we miss so conspicuously in his contemporary, Voltaire—the virtue of masculine equanimity. In other words, so far forth, he was at bottom a typical German; for a German, whether a savage, or a sentimentalist, or whatever else, is very seldom indeed a placid and substantial philosopher, an Epicurean of choice and a Stoic at need. Most that was inevitable to Lessing was of his own inducing; and he might have averted it by conciliation which would have cost him no sacrifice but abstention from wholesale belligerency, and from writing with bitterness where urbanity would have proved equally if not more serviceable. Very far from agreeable is the impression left on us by his letters, where we find him perpetually railing and wincing at some one whose abuse he had incurred by his irritating onslaughts, or else moaning over his straitened circumstances, or fretting and sulking about his loneliness. In brief, he lacked, in a rather pronounced degree, that serene, reserved, and self-reliant manliness and fortitude which characterize him who is cast in the true heroic mould.

Few are the departments of thought for which Lessing did not evidence an aptitude; and there are few about which, at some time or other, he did not manifest warm curiosity. That he might have excelled even in a pursuit so alien as mathematics to the multitudinous subjects over which he ranged, indications are not wanting. It was his preference, and no doubt wisely, above all things to cultivate his critical faculty. No man was ever less a passive recipient of opinion; and he praises quite as rarely as he acquiesces. Untiring student as he was, his judgment was never for a moment in a state of suspended animation. Step by step, as he fared forward, he collated, weighed, and measured, and registered the results to which the best ascertained facts and straightforward logic necessitated him. He subverts, it must be granted, more than he establishes; and yet, even where he is most thoroughgoingly destructive, he has, as a rule, something weighty to offer in suggestion, constructively. Especially as a theologian his services cannot easily be overrated. He is, in truth, the originator of that phase of modern enlightenment which

* 'Lessing. By James Sime.' In two volumes. With portraits. London: Trübner & Co. 1877. Boston: Houghton, Osgood & Co.
'Gotthold Ephraim Lessing, his Life and his Works. By Helen Zimmern, author of 'Arthur Schopenhauer, his Life and his Philosophy.'' London: Longmans, Green & Co. 1878.

has refused to rest satisfied with despoiling Satan of his hoofs and tail. Almost, too, if not without qualification, he is to be accounted the first effective pioneer of reasoned æsthetics. As to literary taste, it is mainly to him that his countrymen are indebted for their emancipation from the shackles of French influence, which Gottsched threatened to rivet on them in permanence. Following the lead of Opitz, he also largely contributed, practically as well as by precept, towards prevailing on his compatriots to discard superfluous foreign vocables, and to reinstate, with such modifications as were requisite, the homely but vigorous speech of Luther. And it was by no means simply in the avoidance of useless Gallicisms that he set a praiseworthy example as a stylist. For lucidity, directness and conciseness of expression, and some slight approach to grace, he stands, to this hour, prominent, and all but paramount, in German literature. Would that his mantle had fallen on more of his successors! But we must have done, conscious as we are that what we have said is, though of necessity, most inadequate. Only to hint very briefly and imperfectly what he was and what he did, is practicable within the restricted space which we have at our disposal.

Of Mr. Sime's excellent biography we shall not attempt a circumstantial examination. It richly deserves a place in every well-appointed library. The author is intimately conversant with everything pertaining to Lessing, and has depicted him, both as man and as author, with remarkable thoroughness and ability. His work has already been honored with translation into Lessing's own language; a circumstance significant of its sterling value. Whether narrating, commenting, or analyzing, Mr. Sime approves himself an adept in book-craft.

As a Scotchman, he has naturally devoted more pages to Lessing's metaphysics than the mass of readers will care for; but this is a trifle. Less trifling, in these days of so much careful writing, are his rather abundant solecisms. Sentences such as "Give me a room . . . and I *shall* here complete my book," "I *should* gladly be a physician upon earth," and "At a distance I *would* lose the privilege of being able to visit you in the library," he shocks us with at every turn. Equally indicative of his habitat beyond the limits of England proper are his "*With* every step the arrows rattle upon the shoulders of the enraged god," "Here I cannot live *for* 800 thalers a year," and "*On* the year of his death, Schiller published his first drama." "Thereafter" for "after that," "pitiful" for "pitiable" or "miserable," "*quite* better," "*ambrosian* hair," "a *tingling* of rhymes," and "has *acquired* great attainments," are further samples of his violations of idiom. There is, too, his affected "goes without saying." And why "dramaturgie," as if "dramaturgy" were not the form, now that we have "liturgy," "metallurgy," "theurgy," and "thaumaturgy"?

To look for translators of German like Bishop Thirlwall and Mrs. Sarah Austin, among the dead, and like Miss Mathilde Blind, among the living, is to look for prodigies. Mr. Sime does not, to be sure, remind us of these incomparable artists; nor, on the other hand, does he evince the ignorance and heedlessness of Mr. Thomas Carlyle. He translates, though far from perfectly, better than fairly. A few of his slips we must notice. "I am very much mistaken, if far greater harm is not done by [*zu besorgen von*] jokes which our fine wits are accustomed [*belieben*] to call roguish," vol. i. p. 84. Read, to render the words interpolated, "to be apprehended from" and "pleased." "I hope you do not trust to me as if [*Sie mir zutrauen werden, als*] I had hung my studies on the nail," etc., vol. i. p. 220. Put "will not believe of me that I have," etc.; besides which "given up" is preferable to the literal Germanism just after. "We abstract ourselves from it" [read "we turn away from it," *Wir abstrahiren von ihr*], vol. ii. p. 31. "It is, indeed, true that we have abstracted [correctly, "inferred," *abstrahirt*] their character from their actual deeds," vol. ii. p. 36. "If you say it without believing a word of it, merely to stand well with me [*um mich zum Besten zu haben*], you are a dishonest man," vol. ii. p. 71. The very common locution here misrendered signifies "to ridicule," "to make game of." *Mit Ehren* is not "with learning" (vol. ii. p. 104), but "creditably." "Let an honest cobbler, who has leisure enough in his calling [rightly, "in spite of his last," *bei seinem Leisten*] to have many a good thought," etc., vol. ii. p. 292. Elsewhere we have, in all cases wrongly, "also" for *also*, "coy" for *artig*, "once more" for *auf einmal*, "slanderer" for *Cabalenmacher*, "at once" for *gleichsam*, "equally" for *gleichwohl*, "rascal" for *Ruschelkopf*, "perhaps" for *zuverlässig*, etc., etc. In vol. i. p. 286, we find "two" shoulders, instead of "broad," from mistaking *breiten* for *beiden*. And who would imagine that, in "the learned principles which make up his system" (vol. i. p. 94), "learned" could be meant as the equivalent of *auswendig gelernten*, "learned by rote"? Or that "The patriot *cries down* the poet" (vol. i. p. 167) was to be interpreted "outvoices," *überschreiet*? In vol. ii. p. 110, Adam Neuser is erroneously called "Adam Neusern." Some of the typographical corruptions are very distracting. Such are "Protagoras" for "Protogenes," vol. i. p. 248; "movements" for "moments," vol. i. p. 278; "place" for "plan," vol. i. p. 325; "dialectic" for "didactics," vol. ii. p. 267.

Miss Zimmern's performance, but for Mr. Sime's, would call for attention which it cannot now claim. Of the two works it is much the slighter. On the whole, it is, however, highly creditable. As might be expected, very rarely does the authoress supplement her predecessor in any way. At times, it is noticeable, she is far more positive than she has any good grounds for being. For instance, she will have it that the hero of 'Nathan the Wise' is "Lessing himself." She is censurably sparing of references, and almost never marks omissions when abridging passages of German which she Englishes. Her style is a curious medley, every here and there, of the ambitious and the slovenly. Her "steely brevity," "in arrears," and "genuses" intimate her possibilities. Further, she tells us that, on one occasion, "a void had entered into Lessing's life," and that, on another occasion, "he had been suffering from a veritable hydrophobia of all that concerned writing." Except when in the mood which prompts the invention of curiosities of this sort, she expresses herself with no little force and propriety.

CHILDREN'S BOOKS.

MRS. CORBIN'S 'Belle and the Boys' (Chicago: Jansen, McClurg & Co.) is the story of a maiden of sixteen who relieves her mother of the care of her household—which includes two boys, aged twelve and eight respectively, and a baby about a year old—in order that the latter may recover her health by a visit to Europe. The task is beautifully accomplished, and the two boys are delivered to their mother at the end of the book with many faults corrected and with a profound affection for the "little mamma," as they call their sister. The "little mamma," it is pleasant to mention, feels a wonderful sense of relief that she can roll from her shoulders the heavy burden she has borne for six months, though nothing is said of her delight at having an opportunity to cease to be an unendurable little prig, which it is to be hoped she will take advantage of.

'Mildred at Roseland's' (Dodd, Mead & Co.) is a sequel to 'Mildred Keith' and, as a short preface tells, the precursor of another volume; it is also connected with a finished series called 'The Elsie Books.' It is of the kind that abounds in Sunday-school libraries. The heroine has been brought up in a Christian family, and during a visit at her uncle's in the South she shows the effect of this training by a well-sustained and apparently successful attempt to live a worthy Christian life when removed from her parents' influence. They, however, would doubtless have been pained to find her taking quite so conspicuous a stand as the teacher of her elders, and would probably have disapproved of her asking any person "modestly" but firmly, "But don't you think it a duty to try to please your husband and make his home attractive?"

Mrs. Hays's 'The Princess Idleways' (Harper & Bros.) is a prosaic fairy-tale of a little princess who becomes weary of life because her every wish is gratified; so she is sent into the woods to an old fairy Motherkin, who kindly corrects her faults, and teaches her to be useful and to share her gifts with the poor and unfortunate. We may mention one incident that is likely to be a source of unpleasant dreams to an imaginative child: the dwarf Grim, Motherkin's attendant, is told to carry the little princess up to her room; she attempts to run from him, but his arms lengthen out so that she is unable to escape. To offset this ugly image there are many pretty pictures in the book, which is on the whole, perhaps, above the average of its kind.

Mr. Edward Eggleston's 'Pocahontas,' in the series called "Famous American Indians" (Dodd, Mead & Co.), is a graphic and accurate story of the adventures of Capt. John Smith and Pocahontas. It is meant, the preface says, "to attract young people to the early history of our own country"; and we can heartily recommend it to parents and teachers to supplement the work of the school-room. It is pleasantly written, and contains many extracts from Smith's writings, in the quaint English of the time, illustrated by a number of the original cuts. On the vexed question of the rescue of Capt. John Smith by Pocahontas, the writer takes what is probably the best course for a child's book. He tells the story as it is usually told, adding: "The story of her rescue of Smith may be doubted, but there can be no doubt that she saved the colony from starvation." Then an appendix discusses the question briefly, ending

with the statement that "there are some reasons for believing it [the story] to be true."

In his 'Magellan; or, the First Voyage round the World' (Lee & Shepard) Mr. George M. Towle has given us another of his capital series of books for boys. "Heroes of History" he entitles it, but so far he has chosen only discoverers; and this is very well, for a man is likely to work with more interest and success in a field which he has made his own. His next selection, 'Marco Polo,' is on every account an admirable one; and we hope that he will go on in this work, and bring all the great discoverers before his readers in the same vivid and instructive manner. They are just the books that are needed; when boys can have true stories as full of interest and adventure as these, we do not see why the wretched books of sensational fiction which they are now devouring should not disappear. Of this particular volume nothing especial need be said, except that it comes in very well as a sequel to the life of Vasco da Gama; for it was the acquaintance and conversation of Vasco da Gama that incited Magellan to his enterprise.

That boy will be lucky who gets Mr. Sidney Lanier's 'Boys' Froissart' (Chas. Scribner's Sons) for a Christmas present this year. There is no better and healthier reading for boys than "fine Sir John," and this volume is so handsome, so well printed, and so well illustrated that it is a pleasure to look it over. The selections here given comprise about one-ninth of the entire work, the editor tells us. They appear to us to have been made with good judgment, and will give the reader a tolerably complete view of the fourteenth century, beginning in the reign of Edward II. and ending with the death of Richard II. We have here the battles of Sluys, Crécy, and Poitiers, the siege of Calais, the career of Philip van Artevelde, and the insurrection of Wat Tyler, as well as some incidents in the revolt of the Jacquerie and the sedition of Étienne Marcel. The translation, so far as we have compared, is Johnes's; the editor gives as a reason for not using the "stronger, brighter, and more picturesque" translation of Lord Berners, that it would have been more difficult for his readers. In this he is probably right, although it seems a pity. He has, however, done a very good thing in appending to the account of the Battle of Crécy the same in Berners' translation, and also in the original French. The introduction is excellent, and yet we fancy part of it is as much above the level of the readers as Lord Berners' diction would have been. That is to say, after a brief sketch of Froissart's life, and some sensible words to boys upon true chivalry and what it means in the nineteenth century, Mr. Lanier goes on to speak of Sir Thomas Malory's 'Morte d'Arthur,' its origin in the chronicle of Geoffrey of Monmouth, and a comparison between the chivalry depicted by him and by Froissart. The comparison is instructive, but its tone and its scholarship are rather above the average of boys. There are twelve good, full-page illustrations; modern, but on the whole true to the period depicted. In the picture of "the blind king of Bohemia dead on the battle-field of Crécy" the king is represented as an old, gray-bearded man; he was, in truth, in full vigor, and only fifty years old—blind by disease, not by age. His name, moreover, was John, not Charles (p. 154).

The Rev. Edward E. Hale's 'Stories of War, told by Soldiers' (Boston: Roberts Bros.) purports to be a collection of descriptions of battles in the War of Secession, extracted from old newspapers and reports by some boys on a visit to a country house and kept indoors by a north-east storm. It is a pretty good book, nothing more. In the first place, many of the stories are not told by soldiers, but by newspaper correspondents; others are told by men who have written much but not well on military subjects; others, again, by self-praising soldiers, and by soldiers whose writings display a bad spirit and a disregard of truth. On the other hand, there are many interesting extracts from the reports of the able and successful soldiers of the war. In the second place, the compiler has admitted into his book much veritable stuff and nonsense. It is aggravating, at this time of day, to read of rebel entrenchments and the derring-do of the Black Horse Cavalry at the first Bull Run, and worse than aggravating to find Burnside represented as contributing to such success as we gained at the battle of the Antietam. If boys are to begin early to read stories of our war the stories should be told them truly, and the falsities of 1861 and the errors of later dates should not be reproduced for them. Allowance made for these defects, it is to be said that this book is readable, and many boys will probably find it very interesting.

The 'Bodley Family' has the more or less welcome flattery of imitation paid it by Mr. Richard Markham in his 'Around the Yule Log' (Dodd, Mead & Co.), which, even to the pseudo-Japanese cover, is patterned directly after its illustrious predecessor. Here it is the Longwood family whose holiday seaside frolic with some young friends in midwinter at the east end of Long Island is commemorated. Outdoor sports are mingled with fireside stories, more or less predetermined by the publishers' available supply of woodcuts, and we must do Mr. Markham the justice to say that there is rather more unity and verisimilitude in his book than in the chronicle of the Bodleys. The neighboring Shinnecocks lead up to King Philip's war and the Pilgrim Fathers; and besides there are tales of the Stamp Tax, the burning of the *Gaspé*, the capture of Gen. Prescott, the adventures of Captain John Smith, Hendrik Hudson's fate, the curiosities of natural history, etc.—a good assortment. If we have any criticism to make of so well-bred a narrative it is that we think the traditional merciless Indian and oppressive Britisher ought now to be withdrawn from juvenile literature, or, if retained, to be tempered by such other pictures of these American bogies as will nip prejudice in the bud, and inspire broader and more humane views of our fellow-creatures, for the welfare of the dusky portion of whom the younger generation will presently be responsible.

Of Olive Thorne Miller's 'Little Folks in Feathers and Fur, and Others in Neither' (E. P. Dutton & Co.) we can speak almost unreservedly in praise. It is a very unconventional talk, on the childish level, about penguins and turtles, and earwigs, and armadillos, and devil's darning-needles, and crabs, and codfish, and much else. The illustrations are excellent, being partly taken, as in 'Around the Yule Log,' from Louis Figuier's 'Ocean World.' The writer is perhaps open to slight criticism for her fantastic titles—*e.g.*, "a fellow who wears his ribs outside," "a little dark nursery under the ground," "your little servants." It is often some time before the name or even the species is reached in the description, and the infant curiosity seems needlessly piqued by this enigmatical method of avoiding scientific formality.

'Letters from a Cat' (Roberts Bros.) appears to be a reproduction of genuine letters written by a mother to her little girl away from home, as if by the forsaken pet. They are very clever and any child will enjoy the humor of them, but the book has a less permanent value than some others on our list of which the literary merit is inferior. "H. H.'s" preface might be thought unfortunately vindictive, seeing that it contains the only moral between the two covers.

Mr. Thomas W. Knox's 'Boy Travellers in the Far East; or, Adventures of Two Youths on a Journey to Japan and China' (Harper & Bros.) is a notable addition to the stock of good and elegant books for children. It is crammed with pictorial and other information; the writer speaks mostly from an unusual personal experience in foreign parts; and his "two youths" are properly put in charge of an older person, so that there is nothing sensational or unreal in their doings. Something might be desired occasionally on the score of refinement. "Doctor Bronson" is apt to be reminded of a little story of the kind found in the funny column of country newspapers; he has the national habit of "taking a toothpick from his pocket and settling back in his chair in the parlor of the hotel"; and he permits the boys to propound shocking conundrums. Herein lies most of his individuality. The author, on his side, indulges too freely in the "reportorial style," as when, instead of declaring a boatman naked, he states that he "was not encumbered with a large amount of superfluous clothing." But these lapses are unimportant, and can readily be forgiven in view of the general wholesomeness and instructiveness of the narrative. Here and there older readers will put an interrogation-mark which may be worth Mr. Knox's attention in another edition; for example (p. 57), against the statement that a whale's spouting is caused by the ejection from his lungs of a certain amount of water taken into them along with the air; and (p. 395), against the derivation of the word "coolie," said to be properly the name of a tribe of natives on the northern coast of Africa—where a hill-tribe of India should be read. The best of the illustrations are from photographs or from original Japanese drawings. Some we should have preferred omitted for their imperfect rendering of the Eastern type of countenance; others for their repulsive subjects, like torture among the American Indians and the Chinese. Finally, the publishers should have provided maps and an index; in all other respects their share of the work is irreproachable.

Any parent who values poetry as a means of discipline for the young will welcome a book of 'Moral Songs,' at least for its intention. The volume bearing this title from the pen of Mrs. C. F. Alexander (London: Masters & Co.) is externally attractive, and is adorned with vignettes and larger woodcuts after designs in not a few cases by women. The songs are nearly forty in number, and for the most part convey the "lesson" of the sunshine, the stream, the lark, the violet, the thorn-tree, etc., or embody a "thought." More to our liking are the unobtrusively moral pieces, like "The Little Sister Left in Charge," "The Boy and the Bee,"

and "The Swallow." A distinctly pious tone pervades the book, and its English origin appears in its consoling comparison of poor and rich, its lessons of contentment with one's lot, its note of charity. Mrs. Alexander's verse is not rare and seldom escapes being commonplace, but mothers will find much of it helpful and all of it intelligible to children.

A Portfolio of Proof Impressions selected from *Scribner's Monthly* and *St. Nicholas*. (New York: Scribner & Co.)—One hundred and two woodcuts have been selected from out the large number accumulated by the publishers of *Scribner*, and one thousand copies have been printed with care, though not with any peculiar precautions. The size of the page is about eleven by fourteen inches, one print only is put upon each page, and the whole surface of the page is covered with a grey tint printed on it, except that the space occupied by the cut itself and a small margin is left white. The paper is smooth and good, and not too glossy, which is a rare merit. On the other hand, it is a little too translucent, and the ghost of Cut xxi. worries you as you study Cut xx. The printed tint, we think, is in bad taste; it gives a cheap look to the cuts, and makes the book, which comes very near being a thing for even an amateur or a collector to buy and keep, seem too much like a gift-book. There is a full table or list of the engravings, giving the names of designers and engravers, and a very tolerable cover, with leather back and corners and cloth sides, printed with a design of which the lettering is unwisely fantastic and unsubdued, but the big medallion very good. This medallion is from a design by Mr. Francis Lathrop, and has the three heads of the printer, the engraver, and the designer—Gutenberg, Bewick, and Holbein.

Just now, with the mid-winter pressure upon our critical columns, we cannot take up the question as to how good, relatively, is the style of wood engraving affected by *Scribner's Monthly*, or at least introduced and developed by that magazine to a very great extent. Everybody knows what sort of work it is, and will know about what to expect in these proof copies of familiar pictures. We recognize some of our favorites, and some we have not liked as well, among the prints. Messrs. Cole, Marsh, Linton, and other strong engravers are represented.

Their Majesties' Servants: Annals of the English Stage from Thomas Betterton to Edmund Kean. By Dr. Doran, F.S.A. With a Memoir of Dr. Doran and an Introduction and Conclusion by R. H. Stoddard. Two volumes 8vo, pp. xxii. 424, 432. (New York: A. C. Armstrong & Son.)—Dr. Doran's 'Their Majesties' Servants' is one of the very best books ever written about the stage, and one of the half-dozen volumes which the wise critic would recommend to any enquiring student who sought to gain a knowledge of the history of the English stage, and to improve at the same time his theatrical taste. With Colley Cibber's 'Apology' and Lewes's little book 'On Actors and Acting' it ought to form the nucleus of every well-chosen dramatic library. Dr. Doran was a born gossip, with a great relish for the *minutiæ* and the *facetiæ* of literary history. He had a wide acquaintance with things not generally known—and not known, perhaps, because they were for the most part of little worth; but in Dr. Doran's hands they were fitted together with surprising skill. He was a compiler who might have been something better, a bookmaker all of whose books are readable; and these 'Annals of the Stage' form perhaps his strongest title to remembrance. He is here seen at his best; his liking for gossip and his love for the stage united to help him on his task. With untiring industry he waded through nearly all the many books about the stage, however shallow and however muddy. He was master not only of these facts and fables, but over and above his theatrical erudition he had sound dramatic taste.

The volumes before us are a reprint of the original American edition, always, if we mistake not, better than the English, and in greater favor among illustrators. The reissue is augmented by a memoir of Dr. Doran (whose life was very uneventful), beginning as far off from the subject as possible and working slowly down to it through the ages. It is written by Mr. R. H. Stoddard, who also contributes an unnecessary Introduction and a more welcome additional chapter carrying on the story to the retirement of Macready. Mr. Stoddard evidently has no special knowledge of the subject. On p. xi. in the memoir a list is given of Dr. Doran's books, omitting his 'Memoirs of British Towns.' On p. xv. we are told that we know "little or nothing of the first actors of the Elizabethan drama except their names and the parts they filled." The new edition of Mr. Collier's history is now accessible. The slur on Dr. Allibone (p. xvii.), who, in spite of his lapses, has deserved well of all who make literature a profession, is in the worst possible taste. On p. xix. occurs this passage:

"Dr. Doran enumerates above a hundred post-Shakespearian dramatists, none of whose productions (and they are very voluminous) can now be called stock-pieces. The most eminent were Dryden, Lee, and Otway, who represented the poetic side of the English drama—at any rate, they wrote in verse—and Congreve, Etherege, and Vanbrugh, who laid the foundation upon which Sheridan, Goldsmith, the Colmans, Cumberland, and others raised the structure of prose comedy. It is possible, I suppose, to read them, but the object in view must be imperative, and one's amount of unoccupied leisure endless."

The second sentence here implies, if it means anything, that in his plays Dryden was not a poet. The same sentence contains the name of Etherege and omits those of Wycherley and Farquhar. In like manner Cumberland is mentioned, no one of whose plays holds the stage, while no mention is made of Garrick, whose "Clandestine Marriage" and "High Life Below Stairs" are seen not infrequently and always with pleasure. In the chapter added to the second volume like errors are to be detected. Master Betty, the Infant Roscius, is again and again called Master Beatty; on p. 424 it is said that Sheil's "Damon and Pythias," brought out in 1821, has not been a success, although it keeps the stage to this day; and on p. 426 we find the phrase "his Majesties' servants." We remark also that the old index is reprinted, and that none of the new matter is incorporated in it; it contains, for instance, no mention of Macready, to whose career the last chapter is devoted.

A Practical Treatise on the Law of Ground Rents in Pennsylvania. By Richard M. Cadwalader. (Philadelphia: Kay & Brother. 1879.)—Mr. Cadwalader's book is a valuable contribution to a branch of law little studied and yet of much practical importance. As he says in his preface, with the exception of a lecture by Judge Sharswood on Tenure, and some magazine articles by Mr. Husbands, very little has been written about it. In Pennsylvania, ground rents, or perpetual leases, are very common; the whole city of Philadelphia may be said to have been built up by means of them; a fact alone sufficient to make the matter deserving of attention, on account of the close connection between the prosperity of densely-packed city populations and the system of tenure by which land is held in them. The difference between a system of improvement by the landlord and leases for short periods, and a sale of lands for improvement by the tenant with a reservation of an annual rent amounting to a fixed rate of interest on the purchase money, is practically the difference, so far as the working population of a city is concerned, between having a stake in the land and being a mere nomadic proletariat. The comparative comfort in which the poorer classes in Philadelphia live may be chiefly attributed to the system of ground rents. In a valuable note (p. 101) Mr. Cadwalader has collected a great deal of information as to the system of tenancy prevailing in other parts of the world; and it is curious to notice that the Pennsylvania system has been called to the attention of the British Government by the English Consul at Philadelphia, as offering a solution of the land question in Ireland in the case of unimproved lands. As a legal treatise Mr. Cadwalader's book will be found of great value to the practising lawyer, and also to the student of tenure both in Pennsylvania and elsewhere. His collection of authorities is full, and his work is evidently the result of much labor carefully and judiciously applied.

The Exploration of the World. By Jules Verne. Famous Travels and Travellers. Translated by Dora Leigh. With Illustrations by L. Benett and P. Philippoteaux, and Fac-similes of Ancient Drawings. (New York: Charles Scribner's Sons. 1879. 432 pp 8vo.)—The admirers of Jules Verne's brilliant geographical novels will find little to enjoy in 'The Exploration of the World.' In a sober record of voyages one should not, of course, look for the exciting incidents of a romance, but it is not too much to expect to find in it some traces of the author's undoubted genius. We have failed, however, to detect any such in the work before us, and were it fresh from M. Verne's pen we should feel that it gave fatal evidence of decaying powers But the first part of it was published some ten years ago, and it is not yet completed, though nothing upon the title-page indicates this fact. The preface asserts that it "will demonstrate what manner of men the great travellers have been from the time of Hanno and Herodotus down to that of Livingstone and Stanley," but this English version ends with the death of La Salle in 1687. The work has not even the merit of originality, being in great part hardly more than an abridgement of M. Édouard Charton's 'Voyageurs anciens et modernes.' If it is intended to serve as a kind of manual of geography, the lack of an index is almost fatal to its usefulness in this

respect. Nor is there a single modern map to enable the reader to follow the voyages narrated, the old maps, of which fac-similes are given, having an historical interest, but being well-nigh valueless as guides. In addition, the work shows such a lack of care either in the preparation or in the revision as to affect seriously its general trustworthiness. The following are instances of this carelessness taken almost at random: After describing the voyage of Nearchus along the coast of the Indian Ocean it is said that he "finally anchored near the village of Degela, at the *source* of the Euphrates" (p. 13). This is not a mistake of the translator, but the word in the original is "source," though M. Charton has it correctly "embouchure." On p. 311, the "skeleton in armor" is said to have been discovered "in the Gulf of Boston," an unpardonable blunder in a book bearing an American imprint. The date of William Dampier's birth is given as 1612, and he is left in the middle of a voyage in 1701 with a promise that the remainder of his adventures will be narrated in a succeeding volume. The fact is that it is uncertain when Dampier was born, though 1652 is ordinarily given as the approximate date. Marco Polo is said to have touched at the Andaman Islands, "whose inhabitants are still cannibals" (p. 69), an assertion which is certainly false. A grave fault in a work of this description, intended for instruction rather than entertainment, is the failure to distinguish clearly between what is fable and what is truth in the narratives quoted from the old voyagers. It should not be inferred, however, from what we have said that the book is without value. The accounts of the voyages of Columbus and Magellan especially, and the conquests of Cortes and Pizarro, are very interesting, though they lack the brightness and vivacity of style which characterize M. Verne's popular fictions.

The translator has done her part fairly well, although we occasionally meet with such extraordinary sentences as the following: "The colonies first founded in the neighborhood of Cape Farewell had not been slow in stretching along the western coast, which at this period was infinitely less desolate than it is at the present day, as far as northern latitudes, which were not again reached until our own day" (p. 313). The illustrations are in the main good, and have far more of a Jules Verne flavor about them than the text, though we must protest, in the interest of the youthful reader, against the picture facing p. 337, which represents lofty palms, tropical ferns, and large cactus plants as giving a true idea of a "Canadian landscape," according to the legend which it bears.

*** *Publishers will confer a favor by always marking the price of their books on the wrapper.*

"For a CHRISTMAS PRESENT it is the thing exactly."—*Cincinnati Times.*

The Young Folks' Cyclopædia OF Common Things.

Illustrated, 8vo, $3.

HENRY HOLT & CO., NEW YORK.

O'Meara's and Las Casas' Napoleon.

NOW READY.

NAPOLEON IN EXILE; or, A Voice from St. Helena. Being the Opinions and Reflections of Napoleon on the most important events in his Life and Government, in his own words. By Barry E. O'Meara, his late Surgeon. With a Portrait of Napoleon, after the celebrated picture of Delaroche, and a View of St. Helena, both finely engraved on steel. 2 vols. 12mo, cloth, $2 50; half-calf, $5.

ALSO,

LAS CASAS' NAPOLEON. Memoirs of the Life, Exile, and Conversations of the Emperor Napoleon. By the Count De Las Casas. 4 vols. 12mo, 400 pages each, with eight steel portraits, maps and illustrations, cloth, $5; half-calf, $10.

"The earlier American editions of these fascinating memoirs have been long out of print, though of all the works relating to Napoleon, by his personal associates, they still hold their place as the best and most important."

☞ For sale by all booksellers, or by mail on receipt of price by

W. J. WIDDLETON, Publisher,

714 Broadway, N. Y.

A NEW BOOK.

THE FIRST TWO BOOKS OF

Milton's Paradise Lost.

With Introduction, Explanatory Notes, and Six Diagrams. By Homer B. Sprague, Ph.D., Principal of Girls' High-School, Boston.

These books, the sublimest of Milton's poetry, are here prepared for class use, as well as for private reading.

The edition differs, it is believed, from all other school editions—

1. In containing the results of the most recent studies and criticisms.

2. In being illustrated by diagrams needful for the proper understanding of the poem.

3. In omitting fifteen or twenty objectionable lines that need not be read in school, and that have often and properly caused the exclusion of the book from the class-room.

4. In having more convenient and suggestive notes, with better type and arrangement.

The author's edition of MILTON'S 'LYCIDAS' will be bound with above.

MAILING PRICE, 65 CENTS.

GINN & HEATH, Publishers,

BOSTON, NEW YORK, and CHICAGO.

White's Latin Lexicon.

ABRIDGED FROM THE LARGER WORK OF WHITE AND RIDDLE.

Based on Dr. Freund's Dictionary, but so thoroughly rewritten as to entitle it to the character of a new work. Full enough to cover the reading of the College course.

The New York *Nation* says of it: "The boy has constantly before him the historical side of the study of the language. This is absolutely essential, and is to be found in no other book. . . . The student will recognize many new meanings which he has had to look for in other sources than his dictionary. . . . There is nothing so good elsewhere."

N.B.—We have reduced the price of this book to $1 60 for introduction.

☞ We will send a sample copy to any teacher of Latin for $1 and postage (15 cents).

GINN & HEATH, Publishers,

Boston, New York, and Chicago.

CHARMING.

"'IRENE, THE MISSIONARY,' a Novel of Syrian life, appears without the acknowledgment of the author. It is generally understood to be from the pen of Mr. J. W. De Forest. We know not why he should hesitate to put his name to it. It is one of the best of recent American novels, and would do credit to any of our native authors. As a picture of the scenery of the East and the life of the missionary there it is admirable; as a story it is interesting; and as a series of sketches of character it would be difficult to overpraise the work. He who fails to read 'Irene, the Missionary' misses a very clever story indeed"—says the SATURDAY GAZETTE.

PRICE $1 25.

EASTLAKE DESIGN. PRICES REDUCED.

These cases, made of various woods, with leather fringe to match other furniture, are of exceptional value, and give the greatest satisfaction to all who use them. Send for descriptive circular and price-list to

LOCKWOOD, BROOKS & CO., 381 Washington Street, Boston.

The Nation.

NEW YORK, THURSDAY, DECEMBER 11, 1879.

The Week.

SOME excitement was caused in the early part of the week by the report that the President was so much disturbed by the reception accorded by Congress to his financial recommendations that he had sought in an interview with Mr. Fort to explain them away, by saying in substance that his Message, like his civil-service order, contained his ideal, but not what he desired to see put into execution at the expense of "harmony in the party." This has, however, since been contradicted, and he has reiterated his adherence to his policy in a conversation with the correspondent of the Boston *Herald*, besides offering a still further exposition of his views on the currency in a letter to a friend apparently written *ad hoc*. The state of mind of the Republicans on this subject, for reasons which we have set forth elsewhere, seems to be deplorable; but here, at least, the argument, "Are the Democrats any better?" which has done so much good service, seems to have much weight. Petitions signed by bankers, merchants, and other "money kings" are being forwarded to Congress in support of Mr. Bayard's resolution depriving greenbacks of the legal-tender quality, but the danger is that this will only stimulate the hostility of the Western inflationists, who firmly believe that whatever bankers want must be bad for "the poor man." The passage of the Bayard resolution is not all that is needed to put the currency on a sound footing, but it would be a great step in advance.

The Committee of the caucus of Republican Senators, having under consideration financial measures and particularly the legal-tender question, have decided by a majority of 7 to 1—the latter, Mr. Morrill, of Vermont—to recommend that no action whatever be taken upon the currency during the present session. Mr. Morrill, it is stated, will recommend that the greenbacks be divested of their legal-tender character, and that measures be taken for their retirement. The attitude of Mr. Morrill at this juncture is important, inasmuch as he is a member of the Finance Committee, which has Senator Bayard's resolution (referred to in another article) under consideration. It has not been announced whether the action of the caucus is to be considered binding upon Senators, and if so considered by the majority, whether individual members will allow it to bind them. If Mr. Morrill follows his convictions, as no doubt he will, it will be possible to get Mr. Bayard's resolution reported back with the favorable recommendation of the Committee and a bill to carry it into effect, in which case a debate upon it cannot be staved off. Nothing could be more wholesome than such a discussion. One of the most striking signs of the disturbed condition of the party as regards legal tender is the repeated attempt on the part of Congressmen to "interview" the President and extract something from him in contradiction of his Message, which can be peddled to the newspapers. Representatives Fort and Price appear to be the Froudes and Macaulays of the press for this purpose. All that they have obtained so far is the assurance that the President adheres to his opinions, but that he is not such a fool as to quarrel with those who differ from him.

The discussion on the bill which Mr. Bicknell, of Indiana, has reported from his committee, for regulating the mode of counting the Presidential vote in Congress, is likely to furnish the student of human nature with much interesting if not entertaining reading. The Bicknell plan, in substance, makes the two Houses concurring supreme in the whole matter. If there is a dispute over the returns in any State, it is to be referred to the supreme judicial tribunal of the State. The decision of this tribunal may, however, be overruled by both Houses concurring, and if the court has not decided at all, the returns cannot be counted if either House objects. This has developed on the part of the New York *Times*, and probably will on the part of other Republican journals, an extraordinary respect for the State courts, which has a very odd appearance to those who remember the contempt it heaped on the Supreme Court of South Carolina in 1876, and the applause which greeted General Grant's remarkable speech to Mr. Wade Hampton in that year, that he cared nothing about the State Supreme Court, when Hampton informed him that the Court had confirmed his title to the governorship. The Republicans are also likely to be awkwardly placed in this controversy by their late strenuous assertion of Federal authority with regard to Congressional elections, and their very extravagant denial of the ability or willingness of the State governments to conduct Federal elections, all of which, of course, can be cited in support of the Bicknell plan. In fact, one passage in Bicknell's report reads very like Mr. George Hoar or Mr. Blaine on the Federal supervision of Congressional elections. It says:

". . . Every State has the highest interest and a right to demand that the electoral votes of every other State shall be lawful votes; and that result cannot be fully secured unless the right of ultimate determination be retained in both Houses of Congress."

We do not see how a real Stalwart can answer this.

On the other hand, the Democrats, having a Congressional majority, and wishing to get the next Presidency for themselves by hook or by crook, will now be deeply impressed with the importance of having the State returns rigidly scrutinized and rectified by Federal authority; and their experience in their contest with "Zack" Chandler in 1876 has probably destroyed whatever vestiges of the scruple about means they had up to that time retained. In fact, there is, we fear, little doubt that the Republican victory of that year was dearly bought. But nothing has occurred to change the opinion we then held, that, however rascally the performances of the State canvassers, the path of safety lies in making the State itself sift them through its own machinery, and in leaving Congress little to do but to ascertain the regularity of the certificate. Otherwise it will be difficult, if not impossible, to prevent the Congressional majority for the time being from practically electing every President. The importance of settling the procedure now, beyond dispute or cavil, cannot be overrated, especially if the Stalwarts nominate "a strong man" pledged to do his own counting in case of any dispute.

The old Silver prophets of the West are plunged in perplexity by the failure of the people to draw the dollar of their fathers out of the Treasury. The Cincinnati *Commercial* has increased their embarrassment by calling for a suspension of the silver coinage in order that the Mint may have time to coin a little gold, which, it says, is now the great need of the hour, though where this need is felt outside the editor's head he refrains from mentioning. Many of the disciples, however, are amused or disgusted by this, and repudiate him as an apostate, and he replies to their railings by declaring that all he ever contended for was the right and opportunity of the people to pay their debts in silver, which they now enjoy. He is very cold and distant towards "the nations of the earth," and would not ask them any more to join him in making an eternal and unchangeable bi-metallic standard, and says proudly that "when France and England want to confer they can cable us, if they are in a hurry." We wish we had space to compare some of his present utterances with his silver gospel of 1877–8 in parallel columns. If some of his Western contemporaries will take the trouble to do it, we think we can promise them some fun.

The Chicago *Tribune* is also excited by the Silver crisis, but would not stop the coinage of silver for one moment. He says "the

balance of trade may change at any time," and then the gold would flow out; and "What," he asks sternly, "would be the condition of the country if there were no silver to take its place?" He evidently, unlike his Cincinnati contemporary, cares nothing about having a little gold in the pockets of the people, and is, in fact, a finer prophet by far, and commands more respect. The gold he is willing to surrender to the Europeans, the poor devils! on proper proof that the balance of trade is against him, and when it is gone he will draw the silver out of the Treasury and distribute it among a grateful community. So he would keep the Mint coining away at silver. When there is this fatal diversity of view between the two greatest Silver-men on earth, it is easily seen that we are as yet by no means out of the woods. The situation is the more alarming because we believe it was Mr. Halsted's fire which first set Mr. Medill in a blaze; and if the latter now refuses to follow his master, the whole school of currency which they founded may go to pieces, and then where shall we be?

The arrivals of specie from Europe during the week sufficed to raise the total receipts since the resumption of specie payments to a little more than $80,000,000, of which about $71,000,000 consisted of gold and the balance silver. Foreign exchange has, however, so ruled for the last week that gold could not be freshly ordered from Europe and imported at a profit; and this firmness of sterling exchange is attributable to the domestic speculation in cotton, breadstuffs, and provisions, which has carried the prices in New York above those in Liverpool. The New York loan market has remained easy for borrowers at 5 to 7 per cent., and the banks have increased their surplus reserve to about $7,700,000. Trade in all departments continues active, and there is no slackening in manufactures. The earnings of the railroads are still very large, the receipts for November (estimating the business of such lines as do not report their traffic by those which do) being fully 25 per cent. in excess of the corresponding time in 1878. At the Stock Exchange it was a dull and, so far as speculation is concerned, indecisive week. The expression of conservative sentiment in Congress on the currency question makes speculation cautious, although the best informed doubt whether at this session there will be legislation which will materially change the present status of the currency.

The Treasury attempted to buy $1,000,000 United States 6 per cent. bonds (which are due next year) for the Sinking Fund, fixing its price at 106.35, accrued interest included. At this price it obtained on the first day only $205,000, and has since got less than one-third of the amount advertised for. There are two propositions before Congress to renew the business of refunding: one, which comes from the Secretary of the Treasury, proposes to continue to refund into 4 per cent. bonds; the other, which comes from Mr. Fernando Wood, proposes to refund into bonds bearing 3½ per cent. interest. Adopting the last-named rate would be equivalent to stopping refunding certainly for the present and probably for all time. If authority were given to refund the 1880-81's in advance of their maturity into 4 per cents, it is likely that the year 1880 would open with another grand speculative "boom," for nothing did more to encourage the speculation that began early in the present year than the refunding operations of the Treasury, which unloosed and set adrift hundreds of millions of money which otherwise would have remained dormant in the old bonds. Silver in London ruled at 52⅛*d.* per oz.; and the New York price also was unchanged. The "buzzard dollar" at the close of the week had a bullion value of $0.8836.

The report of the Superintendent of Education in South Carolina for the year 1878–9 shows a total average increase of attendance, black and white, of upwards of 6,000; an increase of 50 colored teachers; and a slight increase in the length of the session, but in nearly one-half of the State the poll-tax in whole or in part is diverted to the payment of past-due school claims. The Superintendent, Major Thompson, whose title we suppose was earned in the Confederate service, praises the negroes for their desire to be educated, and says they receive their full share of the school fund from the disbursing officers. He is especially proud of two Charleston schools for colored children, embracing 3,568 scholars and having 39 teachers, the principal of one being a prominent graduate of the South Carolina Military Academy, and all the other teachers native whites, mostly Normal School graduates. Under the carpet-bag régime these schools never had more than 900 pupils, and in 1871, when a Democratic School-board was elected, the buildings and treasury were alike empty. Finally, the statement is made that the Claflin University for colored young men and women is the only institution for the higher education receiving State aid, which amounts to $7,500 annually. The *News and Courier*, commenting on the fact that under the present State administration (1876–79) the attendance of colored pupils has increased more than 45 per cent. over that of 1869–76, says that no other demonstration is needed that "the pledges of the Democratic party to the colored race in the matter of education have been fulfilled." This might be allowed, we should think, to be an equivalent for "gratitude to Mr. Hayes," which the Stalwarts so much insist upon; to say nothing of the recent nomination of two colored aldermen by the Charleston Democrats.

The Assembly to which this report is addressed is entertaining not only Major Thompson's recommendations for the improvement of the school system, but a proposition to establish an educational qualification for voters. The two things go logically hand in hand, and the South Carolinians might justify the restriction of the suffrage as a premium on intelligence. In fact, however, the measure is advocated on the ground of the necessity, in some unobjectionable way, of temporarily disfranchising a great part of the colored population. That the law, if faithfully applied, will also diminish the white vote and ultimately cut down the State's representation in Congress, is well understood, but the prevention of a political reaction at home seems worth the price. We hope they will make the attempt, though we warn them that they will be denounced by the very politicians and editors who charge the South with conspiring to get control of Congress. The voluntary relinquishing of national influence on the part of even one State would take the wind out of the "Solid South" and "State-rights" apparatus of Republican stump-oratory.

The long and perilous investigation conducted at the Los Pinos Agency by Secretary Schurz's Commission has ended in a revelation of the names of the Utes who took part in the White River massacre, and a demand for their surrender for trial. Chief Ouray, whose influence alone has made this possible, has agreed to deliver them on condition that they be tried elsewhere than in Colorado or New Mexico—a natural and perfectly fair precaution, which Secretary Schurz has conceded, though the trial will of course take place before a military commission. Ouray himself, with a delegation of Utes from each of the three divisions of the tribe, is permitted to visit Washington for a conference with the Department. By the time he arrives, Congress may already have decided upon some one of the measures already submitted to it for removing the Utes altogether from Colorado, and this it is useless to expect can be averted. The Government has wisely forborne to punish the participants in the fight with Thornburgh, which now turns out to have been an accidental collision, due to that officer's having abandoned the direct route to the White River Agency.

The Committee appointed by the National Board of Health to make a sanitary survey of Memphis has made a report to the president of the "taxing-district," which reveals a shocking state of filthiness sufficient to account for yellow fever epidemics past and future. The pollution of the ground and of the water-courses, the entire absence of sanitary regulations, the sale of the effects of yellow-fever victims and their storing in junk-shops, combine to invite a perpetual residence of the disease within the city. The measures proposed by the Committee, of whom Dr. Billings, Col. Waring, and

Dr. Folsom are the best-known members, embrace the absolute destruction by fire of "a large number" of buildings, not only cabins and foul shanties, but "some large buildings in the heart of the city"; the ventilation in detail and freezing out of every house, occupied or unoccupied; the destruction of infected or suspicious bedding and junk; a sewerage system estimated to cost only $225,000; making a park of the sides of the Bayou Gayoso, now a perfect sink of uncleanness; a better water-supply; solid paving of the streets; stringent building licenses and inspection, and the common sanitary policing of every well-regulated city. The Committee say there is no reason why Memphis should not soon become one of the healthiest cities in the Mississippi Valley, and certainly the cost of the improvements indicated bears no proportion to the advantages to be derived from them, and ought not to be beyond the resources of the district itself. Help from without in case of a revival of the fever next summer will be grudgingly given if the intervening period does not witness the most determined efforts on the part of the people of Memphis to remove every source of danger and every cause of reproach.

There was a despatch on Friday in the *Times* announcing the hanging of three negroes, one of them a late postmaster and justice of the peace, and another an ex-sheriff, in Madison Parish, Louisiana. On Saturday there was a despatch in the *Herald* announcing that the postmaster, R. H. Brown, was alive and well at his home, and the story about the other two was equally false. On Tuesday the *Times* had another despatch acknowledging that Brown was well, and that the third man had only been "outraged," but alleging that Armstrong, the sheriff, had really been hanged, and that in consequence of this intimidation very few negroes in the parish voted, and those at only one poll. We hope the real truth of this matter will eventually come out in spite of the character of Louisiana witnesses, but the account of this one case shows with what caution "stories" from that quarter should be received.

The Irish question and Mr. Gladstone's canvass in Midlothian continue to occupy the attention of the British public. Mr. Gladstone's appearance on the scene has produced an outburst of popular admiration of which the London correspondent of the *Tribune* has given a very graphic description, for which even his warmest friends seem to have been unprepared, and which has filled the Tories with consternation, Lord Beaconsfield's expressed opinion being that all that was needed to keep the Conservatives in office was that Mr. Gladstone should continue to write and speak on politics. The fact is that Mr. Gladstone never lost his popularity except in London and "in society." In the provinces, and especially the North, his hold on the popular heart has never been weakened, and during the last two years the contrast of his simplicity of character and moral enthusiasm with the theatrical posturing and ill-disguised cynicism of his rival have strengthened it every day. The revelation of the undiminished strength of his position, however, is likely to place the Liberals in some embarrassment, because it makes him too great a man to serve anywhere but at the head of the Cabinet. This is a place, however, to which Lord Hartington has now some sort of title, and which Mr. Gladstone has repeatedly declared he will never fill again.

The Irish agitation goes on somewhat in the old way, but the opposition to rent-paying is breaking down, the well-to-do-farmers, who find they must pay, being unwilling to face litigation and martyrdom. There is still talk of Mr. Parnell's coming to America with other "Nationalists," there being a strong desire to get at the savings-bank accounts of the servant girls, who since the Fenian excitement have been piling up money in a way that makes the teeth of the agitators, both here and at home, water. What the money would be used for is, of course, not yet clearly visible, as it is not now proposed to raise an army—though there is talk of buying out the fee simple of Ireland—but that much of it would go in the travelling expenses of orators there is no doubt. The men arrested for "sedition" are to be tried in Dublin, and they are behaving in the usual way. They have to be dragged out of court, and repeat from balconies, after being bailed, the burning words which produced their arrest, and hurl defiance at the British Government in all its branches. The meetings are attended by large bodies of men who march with an appearance of military drill which is intended to frighten the Saxon tyrants, but somehow the Saxons are not frightened, and all rational Irishmen are made much ashamed. Sir George Bowyer, the well-known civilian, who has represented an Irish constituency for many years, has expressed his opinion of the whole affair in terms which are likely to lose him his seat.

The debate in the French Assembly on the vote of confidence, or more properly on "the interpellation," came off on Thursday last in due course. We explained in our last issue to what the dissatisfaction of the Extreme Left was due, the principal grievance being the failure of the Government to purge the judicial bench of royalist or imperialist members, and to allow unlimited liberty of public meeting. M. Waddington took the chief part of the defence, which the cable despatches describe as somewhat apologetic and feeble. But the Chamber is clearly not prepared for any change, and, after expressing a sort of doubtful confidence in the Ministry, "passed to the order of the day" by a majority of 136, the Extreme Left not voting. It appears to be now acknowledged that this majority is not a real parliamentary majority on which the Cabinet can rely for the support of a policy, but is composed of those, of all shades of opinion, who, whatever their feelings may be about the present Ministry, are not prepared for what every one sees must follow their retirement —Gambetta's accession to power.

The conflict of the Belgian Government with the Catholic clergy about the schools has had some interesting light thrown on it by a recent speech of M. Frère-Orban, the Minister of Foreign Affairs. He traced the history of the quarrel for some time back, showing that the attacks of the clergy and the Ultramontane press on Belgian institutions resulted in giving the Liberals a majority at the polls in 1878. Then came the new School law, which we have already described, and the attempt of the bishops to nullify it by threatening the parents and teachers with ecclesiastical penalties. The Ministry appealed to the Pope to restrain the bishops, and M. Frère-Orban has produced the correspondence, which shows that Leo XIII. and Cardinal Nina, the Secretary of State, deplored their conduct and saw no valid objection to the School law, but desired this expression of their opinions to be kept secret, and denied that the Pope could do anything in the matter beyond giving good advice. His advice the bishops have, however, disregarded, and the clerical papers having maintained that the Pope approved of their course, the ministers have retaliated by publishing the correspondence. M. Frère-Orban reports that out of 4,376 district schools the bishops have only succeeded in breaking up 68, and that out of 1,335 students of normal schools specially managed by the clergy 578 have left and gone to the Government schools. It would be difficult, without making extracts for which we have no space, to give an idea of the violence of the language used, not only against the Ministry but against the institutions of the country, by the clergy and their supporters in the press. It enables one, however, to form an idea of the powerful restraints they put on themselves in a country like this or England, where they are in a minority, and have to submit to a strong and hostile public opinion. M. Frère-Orban tells of their excommunicating a female teacher for refusing to agree to abstain from teaching the catechism to the children. The result was she could not be married to a young man, also a Catholic, to whom she was engaged. The Minister appealed to the Papal Nuncio about it, and finally she was married, after the Pope had written expressing his desire that it should be done, but after great delay and with much apparent reluctance on the part of the local clergy.

THE DEMOCRATS AND THE PRESS.

THE complaint of a correspondent, "W.," in our last issue, of the way in which the Democrats are calumniated or misrepresented had an element of truth in it which he did not sufficiently set forth, and, in fact, did not set forth at all. The Democratic party does contain most of the popular ignorance of the country, or did before the Southern negroes were added to the Republican party, but it has, nevertheless, a theory of politics of its own, which has come down to it from Jefferson's day, much as it has been obscured of late years by the slavery conflict and more recently by the paper-money hallucination. "W." described this theory correctly enough by saying that the party sought to concern itself more about persons than about interests; to treat the individual man, as a man, with his wishes, hopes, and tastes, as of more importance than any social combinations for the production of wealth, and as more entitled to influence in the Government than the lawyer, or merchant, or banker. It has sought, as he expresses it, "to represent the *force* of the country, as distinguished from its wealth or mechanical investments." This lay at the foundation of its hostility to paper money as something by which the poor and ignorant may be readily deceived or defrauded, and its attachment to coin as something which the poor and ignorant can readily understand, and which by mere hoarding protects them against loss. The same theory naturally made the party a State-rights party, inasmuch as the growth of Federal power meant a strong centralized government at Washington, and such a government must inevitably be controlled in the long run by the capital of the country, as distinguished from its numbers, and end in belittling and weakening all local government, or, in other words, that part of governmental machinery in which the poor and ignorant can participate directly.

We do not propose here to show how this theory has been bemuddled and overlaid by the alliance of the party with the Southern slaveholders, and by the great breach in the party traditions effected by the Civil War, or by the efforts the leaders have made since the war to recover power by pandering to all the passing popular crazes which the great changes that have occurred in the composition of the laboring class during the last twenty years have caused to spring up. What we wish to point out is that the present apparently creedless condition of the party, and the contempt for it felt by the Republicans, and the absence of all moral and intellectual weight on the part of its leaders, is largely due to the fact that it has retained almost no hold on the press. It contains fully one-half the voting population of the country. The Republicans defeat it, where they defeat it at all, by very small majorities. If it were really hostile or dangerous to the Government the Union would be but a rope of sand, and Government bonds would not be worth five cents on the dollar, and the country would not attract capital much more than Mexico. Nevertheless, we do not think we exaggerate when we say that the great body of Republicans habitually think of it, and talk of it, as a band of criminals who constitute a standing menace to order and property, and to defeat whom almost any means are excusable. The "Strong Man" cry is undoubtedly an expression of this feeling. This extraordinary state of things is due in a large degree to the fact that the newspaper press of the country, as the railroad and telegraph have made it, has come into existence since 1850, when the Democrats dropped "the poor man" for the slaveholder, and the Republicans laid hold of it and used it to build up their own power. As a party in opposition, and therefore with nothing to defend or cover up, and as the exponent of the philanthropic ideas which began to sweep over the civilized world with prodigious force after 1848, they naturally attracted most of the rising and youthful talent among the writers of twenty-five or thirty years ago, and got a secure hold of most of the newly-established and ablest journals. Before the war was over, or even before it broke out, the Republican writers had acquired an influence over the more reflective, intelligent, and well-to-do portion of the community—the portion that produces its literature, science, and art, and manages its industrial enterprises, and represents it to the rest of the world—which the custom of reading only one paper of course made stronger every day, and which the Democrats have never made any serious effort to shake. The very nature of its composition has always made the Democratic party more of an army than the Republican—that is, put it more completely in the hands of a few leaders, and made them prone to rely on secret management and on discipline rather than on any process of persuasion. The result has been that they have either despised the press, or, where they have used it, have attached no value to it, unless as "an organ"—that is, as an unscrupulous partisan whose opinions on every subject could be foretold, and whose reports were always colored. The Republicans, of course, have organs too, but they have never approached those of the Democrats in servility and effrontery, and have never so openly revealed the personal indifference of the writers to the subjects they discussed. There are, of course, Democratic papers which cannot be put in this category, but, as a rule, the press of the party has for a generation given but little sign of having a theory of government behind it, and of being conducted by men who were preaching what they believed. An organ, it is true, may be edited and made effective by men who do not care, but such organship requires extraordinary skill and tact. In nothing is it more true that "art consists in concealing art." The really powerful organ is always one which does not reveal its organship, and which gives advocacy an air of statesmanship. The Democrats have nothing of the kind, and to this hour the idea of their chiefs, if called on to strengthen themselves in the press, is to put up a large sum of money, and get a corps of what are called "slang-whangers" to revile the Republicans editorially, and spread "stories" about them in the reports and correspondence. Tilden's "Literary Bureau" was one of these efforts in a peculiarly crude and barbarous form.

Against such efforts the Republican press, as at present constituted, has no difficulty in protecting itself and its clients. It overwhelms the Democrats in every field of journalistic activity. It supplies better and fuller news from all parts of the world; comments on it with greater knowledge and greater literary skill; invents or spreads more plausible or probable "stories"; has tenfold greater power of ridicule; and has now a very large capital invested in journalism by men who are simply journalists. The Democratic press, too, commits in a far greater degree than the Republican press the mistake of trying to strengthen itself by working down to the ignorance of the most ignorant and the folly of the most foolish. A newspaper often makes a great commercial success by this process, but it never helps to build up a party or restore it to power. The rising and growing forces of the world are, after all, knowledge and good sense. A constituency of ignorant men is always an unsteady one, because some of them are always learning, and the rest are daily substituting one foolishness for another, so that anybody who undertakes to gratify them by printing their nonsense can never acquire the weight which wins for a party the confidence of a nation.

The Democrats, too, make the mistake of not recognizing the change which has come over the world within fifty years in the matter of the relations of persons to property. When Jefferson began to preach the dignity and worth of the naked, penniless man, and Franklin told the story of the man who lost his vote by the death of his ass, there was but little property in the world, and that little was attainable by only a small number. Within the present century its forms have been wonderfully diversified, its transfer has been immensely simplified, and a share in it has been made accessible to almost everybody in sound health and of good character. Savings-banks, joint-stock companies, and co-operative stores have come into existence since then. Steam has thrown open vast continents to small farmers, without subjecting them to the old pains and hardships of exile. Although a great deal of poverty still exists, hopeless poverty is being greatly and steadily diminished in every country. So that it may be said that the laboring man is gradually ceasing to be in this country a force separate and distinct from its wealth and investments. Tariffs, and banks, and navigation laws,

and currency have become of as much interest to him as to the great capitalists, because he too is a capitalist and is as anxious about his hundred dollars as the "money king" about his million, and knows that its safety rests on the same conditions. He needs the same kind of money as the banker, no better and no worse. Any party, therefore, which attempts to concoct or advocate a political economy for his special benefit or use, or pretends that his interests are hostile to those of his fellows who are more prudent or frugal or have a quicker eye for investments, or in any way treats his poverty as a permanent condition, is sure to go to the wall, for it has all the forces of civilization fighting against it.

LEGAL-TENDER AND THE "BLOODY SHIRT."

THE recommendation of the President and the Secretary of the Treasury, that the legal-tender law be repealed as to future contracts, has thrown the Republican politicians into a state of agitation which has been considerably heightened by Senator Bayard's resolution, now under consideration by the Committee on Finance, to carry the recommendation into effect. Representative Fort, of Illinois, and Senator Ingalls, of Kansas, promptly "antagonized" the President; and Senator Carpenter, of Wisconsin, was only restrained from like absurdity by the calling of a party caucus to consider the subject. The assembling of the caucus to consider a matter not in any sense a party question is an unmistakable signal of distress. The Republicans derived a powerful advantage in the last campaign from their soundness on the currency question as compared with the attitude of the Democrats. No caucus was needed to put the Democrats in the wrong, or to give to the Republican platforms and public speeches a more wholesome tone than that of the opposite party. Nor is it needed now for any valuable or avowable purpose. The Stalwarts would like to enjoy the credit of being the guardians and upholders of sound principles of finance without doing anything more than they have already done to vindicate their title. They want to go into the next campaign waving the "bloody shirt." They are alarmed at the introduction of any disturbing issue, and annoyed at the idea of anybody professing to be sounder than themselves on the money question. The President has vexed them on more than one occasion, but he has done nothing so well calculated to upset their plans for waging war against the South to the exclusion of every other policy, next summer, as when he invited them to seize the present favorable occasion to make the currency permanently good and to return to the legal tender of the Constitution. Of course Mr. Hayes had no intention to distract the party; certainly, Mr. Sherman, who concurred with him, had none. Nor is there any reason why the party should be distracted at all, unless statesmanship and honorable dealing are causes of distraction. The recommendation is merely that as to future contracts the public shall be just where they were before the war—free to make their contracts in such money or property as they choose, but that contracts made in "dollars," without other definition, shall mean the dollars of the Constitution, gold or silver. General Grant made a similar recommendation to Congress during his second term. It is a curious fact that whatever Hayes does tends to split the party, while everything that Grant did, from San Domingo to the Whiskey trials, tended powerfully to consolidation and harmony.

Every step taken toward the settlement of questions not related to slavery or the status of the colored man proves that the Republican party has no common ground of action, but is thrown at once into disorder by the starting of such discussions. It was so when the silver question came up, the party dividing on a line of cleavage roughly represented by the Alleghany Mountains. It will prove to be so now, whatever the decision of the caucus may happen to be on the legal-tender question and the Bayard resolution. Nor are the Democrats more fortunate or more capable of uniting upon a financial policy. Having abandoned the policy of Jackson, Benton, and Wright—a policy which had become traditional with them until superseded by the slavery question—they are now the prey of all manner of demagogues, Greenbackers, Labor-Reformers, Republican renegades, and what not. They muster tolerably well when State-rights are in question, but when anything else is talked about they scatter even more confusedly than the Republicans, and reach more mischievous conclusions. They are unable, apparently, to see the political advantage of driving the legal-tender wedge into the ranks of their antagonists. They do not seem to be aware that the responsibility for finance rests with the Republicans while the latter hold the executive offices of the Government, and that it cannot be made to rest with the Democrats unless they refuse to the Administration the power to carry out its policy. Whatever is creditable in finance enures necessarily to the advantage of the Republicans, and whatever is not creditable goes to the damage and disrepute of the Democrats while they constitute a majority of the two houses of Congress, and prevent the taking of such steps as the President and Secretary of the Treasury deem needful.

It has been suggested in Republican circles that Senator Bayard's resolution be smothered in the Finance Committee by the votes of all the Republican members (including Mr. Morrill, of Vermont), aided by that of Mr. Beck, of Kentucky. Such a procedure would be the crowning act of folly—akin to that of the ostrich with his head in the sand and his bulk exposed to the arrows of his pursuer. The smothering of Mr. Bayard's resolution does not smother the question of legal tender. This question is irrepressibly alive, active, and rampant. It exists not by virtue of anything Mr. Bayard has proposed or the President recommended. It arises from a prolonged infraction of correct principles of finance, and of the Constitution as well. It might be got rid of or postponed by a speedy decision of the Supreme Court in the Butler-Chittenden case now pending—a decision pronouncing the issue of legal-tender paper by the Government in time of peace unwarranted by the fundamental law. The gap left in the last decision of the Court upon this class of cases might be filled in this way. Such a decision would be extremely awkward for the Court to make, since it involves the question where the discretion resides to prescribe the exigency which authorizes the making of Government paper legal tender—in other words, to decide what is a state of peace and what is a state of war. Congress has the power to declare war and, inferentially, to make peace; but it neither declared war nor made peace with the South in the exigency which led to the Legal-tender Act. This discretion must reside either in Congress or in the Court itself. If it resides in Congress, the Court cannot go behind that discretion in order to ascertain whether a state of war really exists. In view of this dilemma the Court will be in no haste to decide the pending case if there is any likelihood that Congress may itself decide it by repealing the Legal-tender Act. The spectacle of Congress waiting for the Court and the Court waiting for Congress is not an edifying one, and does not have the least tendency to smother the question at issue.

Whatever disposition of it may be arrived at, it should be well understood that after the legal-tender feature is settled the question of the continued circulation of Government notes will follow closely upon its heels. The President recommended logically that the notes be paid off and cancelled. Secretary Sherman did not go so far; but he must have seen that such a question could not long be kept in the background after the legal-tender property of the note should be withdrawn. Probably the belief that Senator Bayard's resolution, if passed, is not a "finality," but only the beginning of another and even longer debate, is one of the reasons why the Stalwarts are so perplexed and incensed by it. If the transgressions of the South are intended to be the chief capital of the next campaign, the door must be firmly closed upon a measure which has so long a train behind it. A great deal of mischief has already been done. The country has, even now, taken legal tender under discussion, and has dismissed *pro tanto* the contemplation of "outrages." It is doubtful whether public attention can be diverted from the greenback and recalled to its proper point of view upon the bulldozers by any action of the Republicans. The Democrats may, however, help them out of the difficulty by joining them in the effort to suppress Bayard, and this, at the present moment, is the thing most likely to happen.

Correspondence.

IMPERIUM ET LIBERTAS.

To the Editor of The Nation:

Sir: Lord Beaconsfield says, in his Guildhall speech: "One of the greatest of Romans, when asked what were his politics, replied, *Imperium et Libertas*. That would not make a bad programme for a British ministry. It is one from which her Majesty's advisers do not shrink." His Lordship appears to have adopted a misquotation which he found in Clarendon, and to have added a misconstruction of his own. Clarendon says of the government of Charles I.: "In a word, many wise men thought it a time wherein those two miserable adjuncts, which Nerva was deified for uniting, *imperium et libertas*, were as well reconciled as is possible." Tacitus (Agric. 3) says: "Quamquam, primo statim beatissimi seculi ortu, Nerva Cæsar res olim dissociabiles miscuerit, *principatum* ac libertatem." It is needless to say that neither *principatus* in Tacitus nor *imperium* in Clarendon means Jingoism. Tacitus is praising Nerva and Trajan for making the system of government less personal and more liberal; precisely the reverse of that which Lord Beaconsfield has done.

His Lordship is certainly fond of displaying his accurate erudition. He once gave the world a theological dissertation in which he placed the conversion of St. Paul a hundred years after Christ, and the Crucifixion in the reign of Augustus. The latter deviation from the received chronology having been pointed out, he adroitly altered *Augustus Cæsar* into *Tiberius Augustus Cæsar*, giving us to understand that he had meant *Tiberius* when he wrote *Augustus*. In his life of Lord George Bentinck he has also indulged in a Greek quotation which, as a proof of classical learning, may rank with the Latin quotation of Lord Kenyon, who told a jury that if they would do their duty by finding a just verdict "they would be able to go to their homes saying, *Aut Cæsar aut nullus*."

I take this opportunity of noticing what I believe to be a current error with regard to a circumstance in Lord Beaconsfield's career. Your excellent contemporary, *Harper*, has just repeated the statement, which I have often seen in American journals, that during the civil war Lord Beaconsfield showed himself a friend of the Union. I fail to recollect anything which can substantiate this impression. That Lord Beaconsfield himself waited to see how the cat would jump is very likely, though it is inconceivable that he should have sympathized with the Republic then, any more than he does now, when his policy on this Continent is as Jingo and as anti-American as possible. But the men about him, and those immediately under his influence, took part strongly with the South: Lord Cairns, his second self, was one of the most prominent champions of the *Alabamas*.—Yours truly, Goldwin Smith.

Toronto, Dec. 1.

THE VENUS OF MILO.

To the Editor of The Nation:

Sir: My attention has just been called to an article in the October number of the *Atlantic Monthly*, on the so-called Venus of Milo, to which my name as authority for some unimportant statement is appended, yet ignoring entirely the facts published by me, making against the Venus theory of this statue. The article in question is so teeming with the most glaring absurdities of theory and incomprehensible misstatements of fact that to controvert it, as a whole, would require another as long, and it is not worth the pains; and I make no attempt to set the author right, not knowing, moreover, whether the errors are those of the compiler or his quoted authority, "M. Grasset d'Orcet"; and if the latter, I fail to comprehend why he should be styled "archæologist and critic."

There are, however, two or three statements as of fact which I cannot allow to pass without contradiction, from regard to archæological history. "It has not been mentioned," says the *Atlantic* article, "that the underground receptacle in which the Venus of Milo was discovered was closed in with vaulted masonry. The walls, of a quadrilateral (!) construction, were then still remaining, and terminated in a hemicycle. *This construction was simply the crypt of a Christian church of the seventh century of our era*" (!!!). This is stated as a "significant fact."

As I went with M. Brest, son and successor of the man who found the statue, over the ground, saw the niche in which it was hidden, and heard the whole story from him, I have not the slightest hesitation in declaring the whole of the above quotation absolutely without foundation in fact, other than that the statue was enclosed by masonry in a niche of the ordinary form. This niche was not underground, but on the steep hill-side overlooking the port of Melos, so that the bottom of the niche was level with the ground in front of it. It had been hastily constructed, evidently merely to hold the statue, and, M. Brest told me, was walled up in front. In this niche, distinctly and evidently merely a place of concealment, was no other statue, or room for any other, and the arms of this were placed by the side of it, detached. There were no traces of walls or ruins of any kind near it, much less a "hemicycle," nor was there any antique structure visible nearer than the ruins of the unfinished late-Roman theatre, some half a mile (as nearly as I can remember distance) from the niche. The assumption of a Christian church is the wildest romancing I ever heard of in connection with archæology.

The "cave peopled with white phantoms," and the eighteen boxes of such fragments and sculptures here collected, are equally creations of a vivid imagination; but as M. Brest was upwards of seventy when (if ever) he made such statements, he had evidently ceased to be responsible for his memory, but my impression is that the well-known vividness of coloring of the Greek islander (M. Brest was, if I remember correctly, like most of the European consuls in the unimportant ports of the Levant, a resident of the island, either Greek or Levantine by descent, appointed consul *hors de carrière*, and without salary, for protection from the Turks), continually repeating the story, accounts for the exaggeration. Any one who has had my experience in the "growth of the legend" in those parts of the world will not wonder at a whole Olympus being found in the poor little niche, or at the two miraculous arms multiplying into eighteen boxes full; but as the son, who was old enough to have remembered all the incidents, was still in full possession of his faculties when he took me down to the place of concealment and told me the details with the greatest minuteness, without mentioning any of these, I am inclined to think that the "conflict" of this story "with the received official reports given out by French naval officers and others who inspected the ground almost simultaneously with himself, and who were concerned in the transportation of the statue," is perfectly explicable, and that the official reports were entitled to be treated with more respect than this rehash of Aladdin's cave, uttered by an old man whose memory had evidently failed him, of incidents which had occurred a quarter of a century before, and of which the remains, perhaps still to be seen, are a positive contradiction.

May I be permitted to repeat here the conclusion of my former letter to the *Nation* on this subject—that there is not a particle of justification for calling this statue a Venus, or anything but a Victory?

Yours truly, W. J. Stillman.

Florence, Nov. 19.

THE *NATION*, THE SOUTH, AND THE DEMOCRATIC PARTY.

To the Editor of The Nation:

Sir: In your issue of November 20 you publish two letters—one from Boston and one from Natchez—one from a Republican and the other from a Democrat. It was quite amusing to see how both took the *Nation* to task for its want of "impartiality." Now, if you had simply published both without comment, or have shrugged your editorial shoulders and said: "*Voilà!* how we do catch it from both sides!" it would have put you, in the eyes of all just men, in the position of a really *independent* journal. But when, in order to mollify the Republican, you tell him that you "agree with him in thinking the Democratic party essentially the party of ignorance and likely to remain so," you take up too much the position of a "Stalwart" and cease to hold your balance fairly. No candid Democrat will deny that there are ignorant members of his party, but surely no candid Republican will contend that Democratic voters monopolize all the ignorance of the country. We hear much from Republicans about "the ignorant Irish"; but what of "the ignorant Germans," many of whom are just as unfit to help shape the legislation of the country as the rawest and roughest Paddy. And, *en passant*, one may well question whether the German, with his atheistic and communistic tendencies very often, is a less dangerous and disturbing element in the body politic than the Irishman with his strong religious sentiment (however much mingled with superstition) and freedom from any tincture of the pseudo-social philosophy, becoming more and more rampant in Europe, which would ignore the old-fashioned distinction between *meum* and *tuum*.

But, bless my soul! why compare the Irish (mostly Democrats) and the Germans (mostly Republicans) when we at the South, with a negro population (in some States outnumbering the white) almost *entirely Re-*

publican, feel what it is to be governed by "a party of ignorance"? But it really seems as if our Northern brethren, to quote the language of one of your contributors in your last issue (November 27), entertain the "idea that the North is the Nation," and that the South is "a sort of conquered province or dependency which it is the duty of the Nation (meaning the North) to admonish, correct, and generally keep in order." This the writer I quote well terms "a provincial conceit," and it is one that crops out, in season and out of season, on all occasions. Your Boston correspondent says: "Democracy means Tweed and Judge Barnard. It means Jim Fisk and Judge Cardozo." With more justice we at the South can say, "Republicanism means Moses and Judge Whipper. It means Kellogg and Judge Durell." It is refreshing to hear a Republican like "J." (while confessing that he cares "precious little" about Southern neighbors murdering one another) exclaim: "But *honest counting of votes*"—that's the thing we Northern Republicans desire to see secured. I wonder if he ever heard of the celebrated "returning boards"?

But, Mr. Editor, in all frankness, where in the whole history of the *Democratic* administrations of the country do you find a tithe of the corruption which we have seen of late years under *Republican* rule? Why, therefore, should one, as you say, "expect little or nothing from it [the Democratic party] in the way of reform"?—Respectfully yours,

A Virginia Democrat.

[The answer to this question would involve a good deal of repetition for our regular readers, who have by this time learned the reason why the *Nation* has, from the beginning, deemed it a greater public service to hold the Republican party rigidly to its standards and expose its shortcomings than to join it in denouncing the sins of the Democracy. Some considerations, however, which have a bearing on the matter at issue we give in another place.

As regards the tendency to think only of the Northern wings of both parties when contrasting them morally, it may be excused in two ways: first, the Republican party South is a mere name, and is no longer relied on by the parent organization, which was wholly of Northern origin; and secondly, the alliance of the negroes with the Republicans, and of the Southern whites with the Democrats, is purely artificial, accidental, temporary—a defensive measure on both sides, which will be abandoned just as soon as the two races establish their just relations on the spot where they were born and must live. Finally, if the ignorance of the negroes offsets that of the Irish, what accession have the Southern whites brought to the reform spirit among the Democrats?—Ed. Nation.]

To the Editor of The Nation:

Sir: Noting the communications of "J." (Boston) and "Subscriber" (Natchez), in No. 751, Nov. 20, the writer has, with slight exceptions, been a steady reader of the *Nation* since 1866, and can bear testimony to the spirit of justice and the absence of sham which have, in the main, characterized its columns. The number of papers entitled to such credit is unfortunately very few, but the Springfield *Republican* is one, and when the tone of fairness and moderation which has distinguished it and the *Nation* is departed from, even temporarily, the departure is the more noticeable. "J." appears to be exercised about honest counts and intimidation, but the Republicans did some able-bodied counting-in in 1876 which should not be overlooked, and as for intimidation, the campaign in this State against the new constitution could have shown "J." a thing or two in "Stalwart" proficiency in that line. Upon these subjects, however, the Republican "organs" have maintained a discreet silence, and patriotically devoted themselves to showing up the wickedness of Democrats in general and the South in particular, and with a zeal which betokens a labor of love. In candor and fairness, have not Republican vituperation and detraction of the South reached the last degree of phariseeism? The Springfield *Republican* even (Nov. 7), "The Winning Causes," said: "*Political* assassinations, like those of Dixon and Brice, in view of the disappearance of the colored vote, produce a keen disappointment and make a deep impression upon Northern opinion through all classes of voters. . . . There are excuses to be made for the South, growing out of the slowness *with which an ignorant, slaveholding people* are converted into a tolerant, equality-observing people, but the Northern voter is disposed to withhold his confidence until the transition is more nearly completed." The *Nation*, No. 749, Nov. 6, "Some Post-Election Reflections," said: " . . . and two murders collected over an area as wide as the South, and from a perturbed and *semi-barbarous community*, will not be enough." As for the shooting of Dixon by Barksdale, was it so much worse, or the personal provocation less, than Kalloch by De Young, Schwartz by Haskell, Welton by Cadwallader, etc.?—all recent cases in this State, and not one of the parties Southerners, nor even Democrats. The daily papers of this city of November 30 contained reports of fifteen cases of violence—murders, homicides, suicides, deadly assaults, robberies, etc., yet but one was in a Southern State—Texas. In view of such facts, which may be further fortified by reference to the daily press reports of the whole country, may not the application to the South of such terms as "an ignorant, slaveholding people" and "a semi-barbarous community" be left to the Stalwarts? In any event, is not the use of such terms toward the South, or a Southern State, or any State, harsh and offensive and useless? Observer.

San Francisco, Cal., Dec. 1, 1879.

[We think not, as long as they correctly describe a state of facts, as we think they do, because the Stalwart theory is that the South is a community as civilized as Massachusetts, but animated with a rebellious spirit, and committing or tolerating murders simply to show hatred of the United States Government, and that this can all be stopped by giving Republican candidates rousing majorities and showing that it is useless for the South to try to get possession of the Government. We say that these murders have a social and not a political origin, and are due to causes which long antedate the war, and, therefore, that it is charlatanry to pretend that by putting Smith into the White House instead of Jones they will at once cease, and that, in order to secure this end, we should lay aside all business and all subjects of legislation except Southern murders, and make all our elections turn on them exclusively. We do not mean to say that the South is more barbarous than some other parts of the country. The tests of civilization we have in mind are readiness to submit private differences to the decision of the law, and respect for human life. A community which is very deficient in these qualities *is* semi-barbarous, no matter how rich, or well clad, or well fed, whether on the Mississippi or at the Golden Gate.—Ed. Nation.]

THE WINGATE-LAIDLEY CONTROVERSY

To the Editor of The Nation:

Sir: Will you kindly allow me to say to your readers, who know of the controversy between Col. Wingate and myself only through the medium of your paper, that I feel sure they would modify the opinion formed in reference thereto if they should examine into the question further; and that those who are interested to see my "Reply to the Charge of Infringement of Col. Wingate's Copyright" can obtain a copy of it by sending their address either to me or to Messrs. J. B. Lippincott & Co., Philadelphia.

The reason assigned by Col. Wingate why he proposes to suppress the publication of my book is that "at least two-thirds of it I [Col. W.] have been found by comparison to have been taken bodily from mine"; and "the portions which he (Col. L.) has taken the most literally from it (such as the chapter on organization and management of teams) are those which have been the fruit of the experience of its author as an officer of the National Guard and of the National Rifle Association, and *every word of which is original.*" The references given in my reply show that others had expressed the same ideas several years before Col. Wingate's book was written.

Evidence is adduced showing conclusively that portions of my book said to have been copied from Col. Wingate's were not so taken.

T. T. S. Laidley, Colonel of Ordnance.

Watertown Arsenal, Mass., December 8, 1879.

Notes.

A NEW edition of Jeremy Belknap's 'Biographies of the Early Discovers' of America has been published in large form by C. Collins & Co., of this city. The sterling merit of this work, long since a rarity in the original edition, warranted a reprint; yet, in spite of its general accuracy, it is not absolutely free from errors avoidable by the author, and from defects which time alone could remedy. An attempt, not altogether successful, to correct these in notes was made in Mr. Hubbard's

edition published by the Harpers in 1842. There has been no editing of the book before us.——The appearance of Mme. de Rémusat's 'Memoirs' has, perhaps, suggested to Mr. Widdleton a fresh edition of O'Meara's 'Napoleon in Exile,' in two volumes. Half a century has detracted nothing from the readableness of this much-discussed work.——We recently noticed the appearance of an elaborate treatise on the 'Differential Calculus.' The publication of another, by Professor Byerly, of Harvard University, indicates an increasing attention to this branch of mathematics. The title of the latter work, 'Elements of the Differential Calculus,' hardly does justice to its contents. The Integral Calculus, at least so far as the nature and processes of direct integration are concerned, is treated in chaps. iii. and v. with a fulness which would have fairly entitled the author to give some indication of the fact upon the title-page. The notation employed by Professor Peirce in his treatise on Analytical Mechanics, with some modifications introduced by Professor Byerly himself, is used throughout the work.——Little, Brown & Co. have published, in duodecimo form, two elementary legal treatises, one, entitled 'Elements of Equity for the Use of Students,' by Melville M. Bigelow; the other, 'The Principles of Criminal Pleading,' by Franklin Fiske Heard. In Mr. Bigelow's manual "an attempt has been made to present the subject of equity jurisprudence in the concrete—to show to the student the actual working of the system of equity in the administration of justice." Mr. Heard's attempt has been "to state those doctrines and rules of the law of criminal pleading which are common to all the United States; omitting what is purely local law, and citing only such cases as seem necessary to illustrate and support the text." Both books are in a novel form for legal treatises, a form so very attractive to the eye, as well as convenient, that we may hope to see it before long in general use for elementary professional manuals.——A new edition of Hickok's 'System of Moral Science,' revised with the co-operation of President Seelye, of Amherst, is announced by Ginn & Heath, Boston.——Daudet's 'Kings in Exile,' Zola's 'Nana,' O. Feuillet's 'Little Countess,' will be published in English by T. B. Peterson & Bros., Philadelphia, who also announce 'Hyde Park Sketches,' by a Westerner.——The *American Socialist*, like the system of complex marriage, is to be suspended at the Oneida Community after January 1. It has never been self-supporting, and has had, perhaps, the effect of drawing too much attention to the Community. But it has been generally a very readable paper.——S. C. Griggs & Co., Chicago, have nearly ready an edition of the 'Younger Edda,' which Prof. R. B. Anderson has furnished with an introduction, notes, a full glossary, and an index.——Charles Scribner's Sons, having acquired of the former publishers Prof. H. H. Boyesen's 'Gunnar' and 'Tales from Two Hemispheres,' will bring out new editions of them. The latter work has lately been translated into German by the novelist Spielhagen, and 'Gunnar' is announced for publication by Schottländer in Breslau.——Lieut. F. V. Greene's work on 'The Russian Army and its Campaigns in Turkey' is being translated into French and German. It has met with warm approval from the Russian press.——Macmillan & Co. promise a new edition of Flückiger and Hanbury's 'Pharmacographia,' and a new edition, greatly reduced in price, of Foster's 'Text-book of Physiology.'——Mr. L. Belknap, of Hartford, Conn., will send to any address, for one dollar, portraits of Mendelssohn the composer, his father, mother, wife, and sister Fanny, after the originals by Hensel. The form of these reproductions is tasteful, and the family group very pleasing.——The London *Athenæum* spreads the startling intelligence that "some of the best American scholars have addressed to the Governor of Rhode Island and other authorities of that State an urgent remonstrance against the transportation of the obelisk presented by the Viceroy." The appeal seems to have been misdirected.——In the same paper for Nov. 15 comparison is made of the late George Smith's and Prof. Jules Oppert's readings of the famous Creation tablets. The difference is marked. Generally, for example, where Smith renders "plant" Oppert would read "name."——An 'Australian Dictionary of Dates and Men of the Time,' by J. H. Heaton, has been published by Silver & Co., London. Blackie & Son have in press 'Old Glasgow: the Place and the People,' well illustrated after old prints and early drawings. Prof. Palmer's translation of the Koran is to appear about Easter. The Chiswick Press has privately printed, in four volumes 8vo, the Catalogue of the Chiswick Library, limited to 250 copies on large paper, and 50 on small. It was prepared and seen through the press by Sir James P. Lacaita, the distinguished Italian scholar. The richness of this library in first editions of the earliest printed books, nearly all in the finest possible condition, is equalled only by the Spencer library among private collections.——The second part of vol. iv. of the third edition of Barbier's 'Dictionnaire des Anonymes' has been published.——An interesting catalogue of the Elzevir collection of the Comte de Lagondie has been issued in Paris by Labitte.——With the first of January the fortnightly journal *Unsere Zeit*, hitherto devoted to biography, and contemporary history and literature, will become a monthly magazine, with due allowance of fiction and poetry.——In Part 9 of Oncken's 'Allgemeine Geschichte' (B. Westermann & Co.) Prof. Hertzberg begins the history of Rome; and in Part 10 Prof. Philippson takes up the Age of Louis XIV. Both numbers abound in well-chosen and well-executed woodcuts illustrative of Roman antiquities on the one hand, and on the other giving numerous portraits—of Louis XIII. and XIV., of Richelieu, Colbert, Louvois, the great Condé, Mlle. de la Vallière, Charles II. of England, etc.—views of Paris and Versailles, fac-similes of autographs, etc. The collective value of this historical series becomes more striking with every fresh issue.

—An English magazine editor is exposed to a peculiar danger—the offer of stories already published elsewhere slightly disguised or sometimes not altered at all. Unless the editor has all literature in his memory he is likely to be taken in, and to pay a good price for a second-hand article. And the worst is that the better the story and price the more likely is it that when it is in print some long-memoried reader will detect the cheat. The last imposture of this kind has not yet, we think, been pointed out. In *Temple Bar* for November is a pretty sad story, "The Sealed Letter," to all appearance original with some English contributor, which is nothing but a translation from Alfred de Vigny's 'Laurette, ou le Cachet rouge.' But this is not all. A closer translation had already appeared in our *Democratic Review*, vol. xiii., in 1843, when the source was honestly acknowledged. It is doubtful whether the English plagiarist was acquainted with this version. At any rate he has cleverly Anglicized his story, and by a considerable mixture of modern semi-slang has fitted it to the magazine and the town and the country in which it now appears.

—In our Notes last April (*Nation*, vol. xxviii. p. 285) mention was made of 'The Classics of Painting,' a German publication with English text, issued in New York by L. W. Schmidt. Of the thirty-four parts composing the whole work, as announced, twenty-two have now been published. It is a large book, the size of the page being about 13 by 19 inches, and the photo-prints as large as the page allows, and of good character. We commented last spring on a certain inaccuracy in the title; for that which is offered us here is rather classical engraving than painting—namely, rather Volpato's "Incendio del Borgo," Raphael Morghen's "Transfiguration," Bartolozzi's "Cupid," and Zuliani's "Peter Martyr," than the works of Raphael, Parmigiano, and Titian which commonly bear those titles. Classical engravings of the last century and the first forty years of the present one make but a small pretence at accuracy of reproduction. To find on the cover the name Cima da Conegliano sends the student to exploring rather eagerly the number in question in search of a lovely Renaissance design, but when it is only Folkema's stiff engraving of which he finds a photograph there is disappointment. We insist upon this point, because this taking of engravings for adequate renderings of great pictures has been a serious hindrance to the right understanding of the great schools of painting. The text of this work is in better English than one would have anticipated, and would not seem to have been translated from the German except for such slight solecisms as the title of "General" given to the stout soldier of fortune Bartolommeo Colleone. We are inclined to think well of the brief biographies of artists and the accounts of their work; and the descriptions given of the pictures are generally less wordy and sentimental than we are accustomed to in such publications. On the whole, if people would look upon these photo-engravings as memoranda only—as descriptions rather fuller and more detailed than can be given in words of the masterpieces of painting—the book might then be recommended for family use, as a book of ready reference. It appears from enclosed prospectuses that, in German at least, there are to appear additional volumes and works, going to complete an encyclopædia of painting. A second series of 'Die Klassiker der Malerei,' in thirty-three parts, will deal with the Spanish and Dutch masters of the seventeenth century, while another book, already begun, and to consist of thirty parts, treats of the French painters of the eighteenth century, Boucher, Fragonard, Watteau, and their *confrères*.

—In April last, Dr. Hagen, the Harvard Professor of Entomology, published the result of his study of the observations of Dr. Bail, of Prussia, on the nature of the yeast fungus, which that scientist had shown to be identical (in different stages of development) with the fungus of the common house-fly, with common vegetable mould, and with a

small water plant only known to botanists. He had also shown that healthy insects brought in contact with mash which has been sown with the spores are directly infested by them, with fatal consequences. Dr. Hagen concluded that insect pests might be exterminated in this manner, and proposed that beer-mash or diluted yeast should be applied with a sprinkler, naming greenhouse insects, currant-worms, potato-bugs, and even the Colorado grasshopper when newly hatched. He anticipated failure at first, but invited experiment. In a pamphlet reprint of the above paper, Dr. Hagen is now able to give an account of several trials made with caterpillars, cotton-worms, and potato-bugs, and of as many failures, except in the case of the bugs. Here the result, if not unequivocal, was so encouraging as to warrant further trial on an extended scale, the problem apparently being how to dilute the yeast and make it palatable to our insect foes. There ought to be no lack of experimenters, and it should be easy to compare tracts treated with yeast and, say, with Paris green. Happily this fungus has no effect on the human system or that of domestic animals, while the infected insect communicates it to his fellows. Investigation in this direction may shed light on the nature of contagious diseases in man.

—Last week, on Saturday, "Estelle" was brought out at Wallack's. This is a play, by Mr. Albert Lancaster, "partially founded" on Victor Cherbuliez's novel 'Samuel Brohl & Cie.' The novel is one of Cherbuliez's best, and Mr. Lancaster has done what he could to make a good play from it. The inherent difficulty is that the character of the Jew adventurer who is the central figure in the story is not a dramatic character. In the novel he is real, but it requires an immense amount of literary *finesse* to make him so, and when he has to exhibit his own character on the stage, instead of becoming, as was Mr. Lancaster's apparent intention, melodramatic, he becomes tame. Again, we miss very much in the play what it seems to us ought to have been made some use of—the strong background furnished by the veritable Polish count whose papers, name, and identity *Stephen Bartroi* steals. The dramatization of novels has become such a business of late years that it is a constant surprise to us how little the art is understood; for, like any other kind of literary composition, it has its laws. One elementary principle certainly is that the development of the plot in the story must not be slavishly followed, for the simple reason that literary narration and dramatic action seldom move on parallel lines. Consequently, those parts of a story which are most effective in a novel will probably be the least so in a play, and *vice versâ*. Those things which can be imagined in the one must be presented to the eye in the other. In 'Samuel Brohl & Cie.' the interest is almost wholly moral: it is a study of a character. While in other respects Mr. Lancaster has parted company with the novelist altogether, he has here attempted to follow in his steps by making this study of character a central subject of interest in the play. But the result is not a success. When the curtain goes down we do not understand *Stephen Bartroi* at all. As to the rest of the *dramatis personæ* there is fortunately no room for difference of opinion. Mr. Lancaster, in order to make a play adapted to the modern stage, has been forced to add a number of characters not to be found in the novel, and to modify considerably one of the original personages, the Russian Princess. The relations between this lady and the Jew are in the novel very important; but it would not have done to incorporate them in an American play. Mr. Lancaster has wholly changed the character of the Princess, and made her a good but impulsive young woman, who has been simply unfortunate enough to write a couple of foolish letters, which *Bartroi* has in his possession. Of course these are secured in the end by *Darkwood Beech* (Mr. Beckett) and returned to her. Several comic characters are introduced into the play, of whom *Darkwood Beech* is the best. *Mr.* and *Mrs. Blair* (Mr. E. M. Holland and Miss Effie Germon) are purely farcical but thoroughly well-acted parts. Indeed, we have seldom seen a play, even at Wallack's, better acted throughout. Mr. Gerald Eyre as the false count made as much of his part as could be made by anybody; Miss Dyas's *Estelle* was very pleasing and natural; and *Arthur Morton* (an American cousin and lover, introduced to make it all turn out happily) was well played by Mr. Robinson. It seems to have entirely escaped Mr. Lancaster's attention that Samuel Brohl & Cie. is necessarily a tragedy.

—The event of last week's Italian opera was the début of Mlle. Marie Marimon, who made her first appearance on the New York stage in Bellini's "Sonnambula." The same opera was selected last year by Mme. Gerster to introduce herself to an American audience, and it was almost impossible not to draw a comparison between the two *prime donne*. Mlle. Marimon is not one of the great singers of the world; she cannot be ranked with Patti, Nilsson, or Mme. Gerster. She does not possess that delightful richness and evenness of voice which are the chief characteristics of these three great artists, and which speak directly to the heart of the hearer. Mlle. Marimon's voice is not very sympathetic; her lower notes are full and telling, but her middle tones are uneven and somewhat veiled; her upper tones are remarkable for brilliancy and clearness, but they are not of the kind which warm and thrill. Nevertheless, Mlle. Marimon is a lyric artist of a very high order of merit, and among living singers of Italian music second only to the three distinguished ladies named above. Her intonation is perfect, her execution marvellous, and the compass and flexibility of her voice equally astonishing On several occasions she rang out the upper D, and even E flat, with admirable facility and precision. Mlle. Marimon, a Belgian by birth, studied her art principally in France, and has acquired the charming grace and ease in her stage manner which seem to be innate in Frenchwomen. Nothing could be more coquettish and naïvely graceful than her acting in the farewell scene at the close of the first act. Also in the celebrated finale of the second act she produced some very fine dramatic effects; but she had evidently reserved her best forces for the last act. She sang the well-known "Ah! non giunge" with a burst of passionate joy that electrified her audience, and, in response to storms of applause, repeated the popular air with some surprising variations of her own that exhibited her powers to the fullest extent. Col. Mapleson must be congratulated upon this accession to his company. Without it the season could not have been called a success.

—The second concert of the New York Symphony Society introduced a programme which, with the exception of one number only, was of a decidedly conservative character. The performance opened with a very effective orchestral arrangement, by H. Esser, of one of Bach's organ Toccatas, to which Dr. Damrosch lent additional interest by adding in some places, where it would produce the greatest effect, the original organ part. Mozart's Symphony in C—the "Jupiter"—and Beethoven's overture, "Leonore" (No. 3), were performed in the conscientious and highly-finished manner to which Dr. Damrosch has trained his orchestra. The novelty of the evening was an overture, or rather symphonic poem (for it is most essentially programme-music), by Carl Goldmark, "Penthesilea." This interesting work by the highly-gifted Hungarian composer is, like his other orchestral compositions with which we are acquainted, chiefly remarkable for brilliant and effective instrumentation. Goldmark has selected four scenes from an entirely forgotten drama by the German poet Kleist, which he depicts in his overture in striking and vivid outlines. The queen of the Amazons, Penthesilea, leads her army of virgin warriors against the Greeks, encamped under the walls of Troy, to capture the Greek youths for the celebration of the Feast of Roses. She conceives a passionate love for Achilles, but, distrusting his vows, blinded by jealousy and pride, she slays her lover and expires mourning over the hero's corpse. The leading motives—battle; the mysterious rites of the feast of roses; love; death—are treated by the composer in a truly poetic spirit. Miss Thursby sang an old Italian air by Jomelli (1750) and the well-known cavatina from "Der Freischütz" in a cold and conventional way. She failed to make an impression on a kindly disposed audience. Cold and conventional were, indeed, the characteristics of the whole performance. It was lacking in the warmth and strength to which Dr. Damrosch has accustomed us on former occasions.

—The second concert of chamber-music by the Philharmonic Club introduced a programme of sterling merit and interest. Schumann's string quartet in A, Op. 41, No. 1, perhaps the most beautiful of the three which we possess by this master, received a very praiseworthy rendering. Mr. Richard Arnold, the first violin of the Society, played with Mr. Rummel a sonata, by Raff, for violin and piano, which we do not remember to have heard here before. The second movement, a charming little air with variations, is particularly graceful and interesting. The scherzo and finale are very brilliant, but the effect was greatly marred by Mr. Rummel's *forte* playing, which drowned the violin part by Mr. Arnold, who at no time is remarkable for strength of tone. The concluding number was a pianoforte quintet, by Goldmark, which was given here for the first time. This characteristic composition was exceedingly well rendered by Mr. Rummel and the string quartet of the Philharmonic Club.

—By the death of James Clerk Maxwell England has lost not only one of her leading physicists, but a man of that highly imaginative turn of mind which, when restrained within scientific limits, is one of the most striking marks of genius. He was born in 1831, of gentle but not em-

nent family and lineage, and graduated at Trinity College, Cambridge, in 1854. Although the author of several mathematical papers before graduating, his tastes lay rather in the direction of experimental physics than of mathematics, and he does not seem to have been recognized as a youth of remarkable promise. His rank in graduating was that of second wrangler. The first evidence of his remarkable powers which was fully recognized was his essay on the constitution of the rings of Saturn, which gained for him the Adams prize at the Cambridge University in 1857. He here propounded the now generally accepted theory that the apparently solid rings are really a swarm of minute satellites which are individually entirely invisible, but so numerous as to appear like a solid mass when viewed at the immense distance which separates us from them. This theory was discussed with a completeness of detail and a profoundness of mathematical investigation which have made it a classic treatise on the subject. The next subject of his researches was the "dynamical" theory of gases, a theory which at first sight would seem to afford the most fanciful explanation of the elasticity of gases which a dreamer could conceive of, but which is now the only accepted one. It maintains that a gas is simply a swarm of disconnected molecules, each in rapid motion, which are constantly striking each other and rebounding again. The apparent elasticity of the gas, by which it presses against the sides of the containing vessel, is due only to the impact of the molecules. The velocity of motion is not far from that of a cannon-ball, and each molecule strikes another millions of times in a second. He next turned his attention to optics, electricity, and molecular physics in general, adding new and striking views to each subject he encountered. His treatise on electricity and magnetism is now the standard work in the English language. Among his curious plays of imagination may be mentioned the conception of molecular demons possessing the power of intelligently managing the motions of the ultimate atoms of matter and producing results having some of the qualities of the perpetual motion. Although purely imaginative, the idea has a philosophic and scientific value from illustrating the foundations on which the theories of thermo-dynamics and of the steam-engine rest, and the limits of their validity. Such beings as these demons could make an engine work perpetually without themselves expending any power of their own; which is more than is true of any real animal. Since 1871 Clerk Maxwell has been Professor of Experimental Physics in Cambridge University. His life was almost purely that of a *savant*, varied by the literary diversions into which he was led by his poetic and imaginative taste.

—The Berlin *Gegenwart* of November 15 contains a report of some interesting experiments made by Dunstmaier to test the accuracy of Jäger's theory that the soul of every man and animal is to be sought for in the characteristic odor exhaled in each case. Dunstmaier, who unites in his own person the physiologist and metaphysician, was, until these experiments convinced him of his error, an outspoken opponent of Jäger's views. He is now, however, an enthusiastic convert. Dunstmaier's method was no doubt suggested to him by his familiarity with experimental science. He considered that light and the soul—if the soul is an odor—are both radiated, and that light can be, as it were, collected and fixed by a photographic plate coated with iodide of silver. What body, now, is as sensitive to odors as iodide of silver is to light? Evidently the nerves of smell in a dog. In the centre of the laboratory a cage containing twenty hares was placed, and a dog was admitted to the room. He at once made violent efforts to get at the hares, which, of course, in their terror rushed to and fro in the cage. After two hours of this torture the dog was killed, the nerves of smell and the mucous membrane of the nose removed, and rubbed up in a mortar with glycerine and water. The twenty hares had been exhaling their souls for two hours, and the dog, during all his panting and snuffing, inhaling them for the same length of time. The glycerine might be expected, then, to contain a certain quantity of the soul of the hare, the main characteristic of which is, of course, timidity. That this was the fact the following experiments seemed to prove: A few drops of the extract were administered to a cat; she ran away from some mice instead of pouncing upon them. By the subcutaneous injection of only two cubic centimetres a large mastiff was rendered so cowardly that he slunk away from the cat. By a similar experiment, in which, however, a young lion in a menagerie played the part of the hares, Duntsmaier succeeded in isolating the soul-substance of courage, and in transmitting it to other animals. Still more interesting experiments showed clearly that these "psychotypic" glycerine extracts had a decided effect on the human species. Thus, after swallowing a small dose of psychotypic timidity, Dunstmaier had not the courage to believe in his own great discovery! This effect soon passed off, however. On the other hand, Jäger found a large dose of psychotypic courage of the greatest use while writing his last work on the Jews. Dunstmaier has published his investigations in the first volume of the Transactions of the German Ozological Society, where our readers can find also the details of some experiments in which a timid, blushing girl was the original radiating body. He promises further developments in this interesting line of research.

—Seldom has romance been so real and reality become so romantic as in the life and death of Alexander Petöfi, whose memory the passionate admiration of his countrymen has surrounded with a legendary halo securing to the Hungarian bard a double immortality. For it is the popular belief in Hungary that Petöfi, who was last seen alive on the battlefield of Schässburg, in Transylvania, on the 31st of July, 1849, escaped the lances of the Cossacks, which the sober judgment of the participants in that battle has assigned as the cause of his disappearance. The number of false Petöfis has been considerable, and the credulousness of the peasantry boundless; as late as 1877 the story that an escaped prisoner from Siberia had there seen Petöfi as a captive in one of the silver-mines ran like wildfire through the country, causing an excitement which was not allayed until the authorities established the untruth of the report. On the thirtieth anniversary of the battle of Schässburg the Hungarian novelist, Jókai, published some recollections of the poet under the title of "Petöfi and his Enemies," treating, in his usual lively way, of the quarrels in which the vicissitudes of Petöfi's early life as a strolling actor and his impetuous temper so often involved him. One of the causes of his quarrels while on the stage was his refusal to sing in the chorus, and he always retained a strong aversion to song and the opera. Jókai's story and an authentic description of the battle of Schässburg, by Dr. Joseph Lengyel, who was at Petöfi's side up to the time of the last attack of the Russians, together with other relevant and irrelevant matter, are now republished in pamphlet form by K. M. Kertbeny ('Petöfi's Tod vor dreissig Jahren'; Leipzig: Wilhelm Friedrich). Kertbeny is a writer who for more than thirty years, in season and out of season, has flooded the world with books and pamphlets and articles about Petöfi, Hungary, and—himself. He is, however, unquestionably sincere in his enthusiasm for Petöfi, and his translations are probably more faithful to the original, and hence more valuable, than any that have thus far been attempted. Sir John Bowring's English version is notoriously inadequate. In French no fewer than ten translations—mostly after German renderings—have been published, and there are more or less complete translations of Petöfi's songs in Spanish, Italian, Russian, Polish, Czech, Servian, Danish, Swedish, and Finnish. Only the peculiar charm of these songs can account for the many attempts to enrich other languages with the beauties of them. No one can make the acquaintance of his poetry without becoming more or less of a Petöfi enthusiast. He unites in himself the charms of many poets, yet is unlike any of them. He has Heine's sensuous softness, and yet is full of soul-kindling fire; his muse is as gay and careless as Béranger's, and yet as despondent as Byron's. His images are singularly striking, but he is sparing in their use. His short songs are often variations on one and the same theme, reminding us of the characteristic motive of Hungarian melodies.

—The St. Petersburg correspondence of German papers has a good deal to say about a diplomatic light of whom the Western world knows little—Mr. Andrei Hamburger, the newly-appointed envoy at Bern. This gentleman is a converted Jew, whence he was generally known by the nickname of the Russian Disraeli. It is now said that he has for many years been even more than a "right-hand man" to Prince Gortchakoff—that, in fact, the various state papers of which the minister has the credit were really only inspired by him; and in documents of this kind the form is often as important as the idea. When any writing was to be done the minister was helpless without his assistant, and his value to his master was proved by his being retained in service in spite of strong doubts, frequently expressed, of his being a trustworthy depositary of state secrets. It is even asserted that the Russian Chancellor will yet find a Moritz Busch in his late assistant; but his departure from the capital was caused by an indiscreet marriage which made his position in St. Petersburg uncomfortable, and not by any official indiscretion.

—Young ladies who aspire to the rank of dramatic authors should be careful to produce their first efforts before a more gallant public than that which frequents the Royal Theatre at Berlin. A certain Fräulein Hackenthal, daughter of a well-to-do merchant, having lately handed in to the director of that theatre a drama called "Eine Ehe von heut" (A Marriage of To-day), it had the unusual good fortune to be accepted for per-

formance. Public curiosity had been raised to a high pitch by various newspaper puffs and mysterious rumors, the name Hackenthal being at first described as a pseudonym, then attributed to a clever young lawyer, and finally to a blooming young maiden of distinguished family. The fact that the play had passed the rigid examination of the royal director, that it was put forward at the best period of the season, and that prominent actors were to take part in it, all helped to raise expectation to a point which is dangerous except to works of sterling merit. The first act was received with marks of encouragement mixed with signs of disapproval; but as the piece progressed the audience seem to have suddenly made up their mind that since it didn't amount to much they must at least get their fun out of it, which they did by indulging in all sorts of noises and by greeting the most serious words of the actors with sarcastic laughter. The piece is, in fact, very weak, the last act having, according to Paul Lindau, no more dramatic unity than a page of advertisements in a daily paper, while the tone of it is such that it is almost incredible that a young lady should have written it. A father who is in financial difficulties compels his daughter to marry a notorious swindler whom she detests, by threatening to shoot himself in case of her refusal. The mother does not object to the marriage, because her only thought is of the milliner, whose bills must be met. The son is a Bohemian of the worst sort, who disgraces the whole family, and even goes so far as to pawn his sister's jewelry in order to pay his debts. The accepted son-in-law, after successfully deceiving the parents and the daughter, turns out a bankrupt villain, who, not content with having won his dishonest game, endeavors to commit a forgery, but being caught, eludes punishment by blowing out his brains. And so on. Some of the critics next morning insisted that it was not so much the crude author as the director who had a *fiasco* to record, for he ought to have known better than to accept such a piece. This provoked the ire of the august personage in question, Herr von Hülsen, who immediately issued a manifesto, not denying the public's right to show disapproval of a play placed before them, but insisting in his own behalf that this disapproval should be shown in a manner becoming the traditions and the dignity of a royal theatre. Not to be intimidated by any such proceedings, the performance would be repeated in spite of them. It was repeated we find, and better received the second time, but has since then disappeared from the repertory. Meanwhile the comic papers got hold of the subject, and to them we may leave it.

—The French theatrical annuals are never very punctual, and have been no more so this year than heretofore. But though not prompt they lose little interest on that account. The 'Almanach des Spectacles,' now in its fifth number, is the same admirable little volume as ever, in paper, type, and etchings. Nothing could better mark the different positions held by the stage in France and in England than a comparison of this dainty little book, fit record of an art, with the English theatrical annual, the '*Era* Almanack,' a business-like pamphlet, as well stuffed with advertisements as any other trade year-book. Or set the English annual with its scant record of dramatic doings beside the stout duodecimo of over six hundred pages which comes out as the fourth volume of the 'Annales du Théâtre et de la Musique.' The 'Annales' for 1878 is more carelessly edited than any previous issue, and its bulk is unduly generous; not even the theatres of Paris call for six hundred solid pages a year. A falling off is also to be noticed in the quality of the always amusing 'Soirées Parisiennes (de 1878)' which M. Mortier every year gathers together from the pages of *Figaro*. But these gossiping, semi-satirical sketches are not without value to the future historian of the French stage, or to the student of French life in our day, as is amusingly pointed out in the preface, written with much wit by M. Édouard Pailleron. The 'Annales du Théâtre et de la Musique' has also its preface, as is its custom. The first volume was introduced by M. Sarcey; to the second and third were prefixed essays by M. Got, of the Comédie-Française, and M. Victorien Sardou, on travelling companies and on the effect of a late hour of dining on the theatre. This year the essayist is M. Zola, and his subject is "Naturalism on the Stage."

—M. Zola opens his essay with a discussion of the meaning he attaches to the word "naturalism": it is "the return to nature, it is what scientific men did when they first thought of beginning with the study of bodies and phenomena, of basing themselves on experience, of working by analysis. Naturalism in literature is also the return to nature and to man, direct observation, exact anatomy; the frank acceptance and depicting of the thing as it is." M. Zola admits that Homer was a naturalist, so there can be nothing very new in the theory; the typical naturalist would be Dickens minus humor. M. Zola seems to jump from Homer to Diderot, who begat Balzac; and Balzac and Stendhal bring him down to M. Gustave Flaubert and MM. de Goncourt. The naturalistic novel is "simply an inquest on nature, beings and things." The interest is "no longer in the ingenuity of a fable, well invented and developed according to certain rules. Imagination is no longer needed, plot is of little consequence." What is wanted is facts, documents on humanity. "Instead of imagining an adventure, of complicating it, preparing stage surprises, which from scene to scene will bring it to a final conclusion, one simply takes from life the history of a being or of a group of beings whose acts one faithfully registers." The work has no other merit than "exact observation, the penetration more or less profound of the analysis, the logical linking of events." Above everything else "poetic justice" is abominable. M. Sardou is, he thinks, a prestidigitator who plays with marionettes, and his human documents are worn out and commonplace. M. Dumas is almost a naturalist at times, and his human documents are better; but he is too witty and too clever, and he "uses truth as a springboard to jump into space." M. Augier is nearly always a naturalist, but some of his characters are too good to live, and his pieces are too well made. In conclusion, M. Zola sets up face to face "the two formulas: the naturalistic, which makes the theatre the study and painting of life, and the conventional, which makes it a mere amusement of the intellect, an art of balance and symmetry, ruled according to a certain code." He ends by expressing his belief in the great future of the theatre so soon as it shall have adopted and adapted itself to the naturalistic formula. Here, by the way, he is in direct contradiction with his fellow "naturalist," M. Edmond de Goncourt, who recently declared that he did not believe in realism on the stage, and that the novel would kill the theatre in fifty years.

BENJAMIN ROBBINS CURTIS.*

THE biographical part of this memoir, contained in the first volume, is the work of Mr. George Ticknor Curtis, the brother of Judge Curtis. The second volume consists altogether of professional and miscellaneous writings, of which the most important are an article on "Debts of the States," republished from the *North American Review* for January, 1844; the Report of the Commissioners on the Reform of Procedure in Massachusetts; the dissenting opinion in the Dred Scott case; and the Argument in Defence of President Johnson, delivered before the Senate in 1868. The biography is well written, and as much is made as was possible out of the uneventful life of its subject. It would be easy to find fault with its length; it might, too, have been made less dry and professional; but there was no one so well qualified on the whole for the task as the person who undertook it, and of great American lawyers of recent times we know none more deserving of an elaborate biographical memorial than Judge Curtis.

He was born in 1809, and, we may almost say, was born a lawyer. In other words, he developed very early in life those strong moral and intellectual qualities which afterwards made his success at the bar so marked. As in the case of so many distinguished men, his mother was a woman of great force of character, who devoted herself to the education of her children. The family faith was Unitarian, and the Unitarians of that day in New England were, as a class, noted for the possession of high principle and vigorous intellects. As Mr. Curtis points out, this early New England Unitarianism was no exotic, transplanted from abroad, but sprang from the soil, and was a revolt and protest against the old rigid Calvinism handed down from generation to generation of orthodox believers. There was still in Massachusetts a close connection between church and state; the old Puritan habits and traditions gave an air of severity and rigidity to New England life which has long since passed away, leaving no trace behind. In 1809, in Watertown, heretics were probably not unfrequently prayed for by name in the village meeting-house. The minister wielded a power and authority, both spiritual and temporal, utterly impossible a generation later. There was still profound thinking and discussion about fate, fore-knowledge, and free-will—not among professors of metaphysics, but among plain, honest New England people like the Curtises—when the week's work was done, and the Puritan Sabbath, with Saturday's sunset, had settled down upon the quiet, God-fearing community in which they lived. In 1809 almost every New-Englander believed not only in the God of justice and retribution that he found in the Scriptures, but also in a personal devil, and in a hell, with torments such as had been graphically described by Jonathan Edwards. We may mention here as a curious fact illustrating the difference between the New England of our

* 'A Memoir of Benjamin Robbins Curtis, LL.D. With some of his Professional and Miscellaneous Writings. Edited by his Son, Benjamin R. Curtis.' 2 vols. Boston: Little, Brown & Co. 1879.

day and the New England of two generations ago, that in the village in which Edwards once wrote his treatise on the Will, on a proposal being made to erect a monument to his memory within a few years, we have known degenerate opponents of the project to go to the length of circulating extracts from the divine's description of the torments of hell as an argument against it. In that early New England atmosphere Unitarians who protested against the orthodox faith were themselves imbued with its peculiar tone; and while they entertained liberal sentiments, and by intellectual processes reached conclusions at war with the established articles, they were, in disposition and character, filled with the serious and sombre view of life of the old Calvinism. It was an essentially religious community, and it is not surprising to find that Mr. Curtis had from his childhood up a strongly-marked religious character. In 1825, at the age of fifteen, we find him writing an essay on the Origin of Evil, and his treatment of the subject strongly shows the seriousness of his mind, while the method of argument as remarkably illustrates his logical bent. In the conclusion at which he arrived at this early age—that "the origin of evil is to be attributed neither to the agency of an evil spirit nor the natural depravity of man, but to some pleasure or advantage which outweighs a man's abhorrence of sin"—he was probably not shaken by his maturer experience of life.

It is unnecessary to pursue his career at school or at Harvard, where he was graduated as second scholar of the class of 1829, distinguished in Massachusetts for the number of men which it contained who afterwards became eminent in connection with art, science, letters, and the liberal professions. He took to the law without any hesitation, because, as his brother says, nature had made him a lawyer, and a great one. It is a proof of his natural inclination to the law that his studies in Coke and the Reports were begun while he was still in college and only seventeen years of age. In the same year in which he left college he entered the Law School of the University, where Judge Story was just beginning to lecture. In 1831 he left the Law School and began the practice of the law in the small country town of Northfield. After an active practice there for three years he moved, in 1834, to Cambridge, for the purpose of practising in Boston, and a year or two later to Boston, which became his home until his death, except during the period when he was one of the judges of the Supreme Court at Washington. The Boston bar, led as it then was by Choate and Webster, formed perhaps the most distinguished body of lawyers in the country, and for a man as young as Curtis to establish himself rapidly among the foremost of these was no ordinary proof of capacity. To those who never had the pleasure of hearing Judge Curtis argue a case it is difficult to convey an idea of the peculiar qualities which made him the great lawyer he was. The description given by his brother of his professional characteristics is the best which we have met with anywhere:

"His means of producing conviction, whether with a court or a jury, were plainness, conciseness, and accuracy. He was persuasive, because of his rejection of all superfluous and irrelevant matter, and because it was known that he disclaimed all the mere devices of speech. Mr. Webster said of him that 'his great mental characteristic is clearness, and the power of clear statement is the great power at the bar.' His power of lucid and exact statement, observed by all his contemporaries, was united with the power of close, logical, and sustained reasoning. There have been very prominent advocates who, when they have stated their case, have done all they can for it; and when this gift has risen to a high accomplishment it has been of great value. But in Mr. Curtis it was accompanied by another power of equal importance—the power of argument—which should come into play after the groundwork for reasoning has been laid. When he had stated his case he had *not* done with it, unless the statement was all that was needful to lead the tribunal to the desired decision. . . . Those who took pleasure in listening to him at the bar derived their enjoyment from the lucid and unimpassioned character of his discourse. . . . This enjoyment was felt in listening to Mr. Curtis by the unlettered as well as the lettered of his hearers, by jurors as well as by judges. Yet although he always had his feelings under control, he had very deep feelings; and he sometimes, with great simplicity and with an imagery that was all the more effective because it was never forced, and was but a momentary deviation from the steady march of his mind, touched the feelings of others while he was addressing their reason. But on such occasions he used no art. . . . To the passions or prejudices of men he never appealed. His mind was too honest, his strength was too real, to allow him to employ a weakness in others which he knew should not be allowed to govern them" (vol. i. pp. 82–84).

Perhaps it should be added to this—since nothing human is perfect—that a hostile critic might have found fault with Judge Curtis's manner as being slightly too *judicial* in tone for forensic argument.

After a practice of seventeen years in Boston Mr. Curtis was, at the age of forty-two, appointed a justice of the Supreme Court at Washington to fill the place made vacant by the death of Judge Woodbury. This period was one of intense political excitement in Massachusetts, and was marked by the rapid rise of the Free-soil party in power and numbers, culminating in the "coalition" of 1851. Mr. Curtis, like so many eminent lawyers all over the country, was conservative by instinct and training. He had no sympathy with the extremists on either side, though, like all true conservatives of that or any period, he had less sympathy with those who were endeavoring to effect a change in the established order of things than with those who stood by what they regarded as the traditions and customs of the past. But Mr. Curtis was genuinely independent, and, as his subsequent career upon the bench showed, cared nothing for the bearing of his opinions on party politics, provided he was satisfied that they were right. From his brother's account, it appears that one cause which led to his retirement from the bench was the feeling created among the judges by the Dred Scott decision. We must refer the reader to the very interesting account of this case given in the 'Life.' His biographer goes very minutely into all the details of the process by which the decision was finally reached. To the professional reader it is a melancholy story. Another cause for his retirement from the bench was the insufficiency of the salary, and on this subject some interesting facts are given. In the seventeen years from 1857 to 1874, Judge Curtis's professional receipts amounted to $650,000, or nearly $40,000 a year. A comparison between this sum and the salary paid a Supreme Court judge will enable any one to judge of the strength of the pecuniary inducements which the Government of this country holds out to eminent lawyers to adopt a judicial career. Of the part which Judge Curtis took in the impeachment trial of Mr. Johnson his brother gives a detailed account, and incidentally tells an anecdote, recalling in an amusing way the excitement of the trial, of a Republican who expressed to a Senator great regret at having read Judge Curtis's argument in the newspapers, on the ground that it had shaken his faith in the guilt of the accused.

We have no space to notice at the length they deserve the professional and miscellaneous writings collected in the second volume. To the student of law and of the constitutional history of the country they will be found of considerable value. In the article on "Debts of the States" is suggested an idea which, in a different form, has been discussed in many quarters since the repudiation of the carpet-bag debts of the Southern States. It is, that a foreign government might acquire the claims of its citizens against a defaulting State, and sue the State in the Supreme Court of the United States. Whether the same thing could not be done by one of the United States themselves was not considered by Judge Curtis; but a great part of his argument covers one case as well as the other. His report on the reform of legal proceedings in Massachusetts is also a valuable paper. The abuses of the old common-law system of practice and pleadings attracted the attention of reformers and the public at about the same time in Massachusetts and New York. The result in New York was the adoption of the Code of Procedure; in Massachusetts a simplification of the old system, without the destruction of any of its essential features. Any enquiry into the comparative merits of the two systems would involve technical considerations, but it may be said that there is no doubt that if the New York system has stood the test of time in the great commercial community of the country, and has given evidence of inherent fitness for our times by establishing itself in many of the newer States, the Massachusetts system has steadily gained favor with a bar which is certainly as competent as any in the country to judge about such matters. It is a pity that at the time when law reform obtained full swing in New York the degradation of the judiciary through the elective system also began. It is impossible to say how good the New York system might have proved with a really good bench to administer it, or how much confusion and uncertainty might have been introduced into the Massachusetts system by bad judges.

All eminent lawyers belong to one or both of two classes—great advocates and great judges. We leave out of consideration what it is the fashion now to call "jurists," who generally belong to neither. Advocates, again, may be either effective with juries or in argument before a court. Judge Curtis was a great judge, and he was also a great advocate, but, as may be inferred from his brother's description of him which we have quoted above, his strength in argument lay in addressing a court. He addressed himself to the intelligence and reason of his audience, and he consequently needed an intelligent and reasoning audience. It was, indeed, fortunate for the country that, at the critical moment of the Johnson impeachment, when it depended on two or three wavering votes to decide what was to be the fate of the Government, such a man should have been at hand to warn unthinking partisans upon what sort of a path

they were entering. It is hardly too much to say that it was owing to Judge Curtis's argument that Mr. Johnson was acquitted. One of the Republican minority is quoted as having tersely said after the trial was over: "Judge Curtis gave us the law, and we followed it."

CONFUCIANISM AND TAOUISM.*

THIS work forms one volume in a series of original treatises, issued under the auspices of the well-known Society for Promoting Christian Knowledge, which are intended to describe all non-Christian religious systems. Judging by the four already issued, and the names of their authors, it promises to be a valuable aid to an accurate knowledge of many obscure phases of human faith and practice, and of the lives and times of their teachers. Whatever rank the others may take, this treatise of Mr. Douglass's will bear comparison with any previous one on the subjects he has treated; and we can recommend it as a careful and trustworthy account of Confucius and Lao-kiun, their times, their tenets, and their disciples. The author is professor of Chinese at King's College, and has here given a convenient summary for the information of those who have no inclination or time to pursue these topics into their deeper recesses and minutiæ. We think that we shall do a good service to such enquirers by a sketch of its contents.

It is a source of constant error to Western people to call the teachings of Confucius a system of religion; and the title, "Non-Christian Religious Systems," given to this series, upholds this idea. Mr. Douglass lends it no countenance, but he seems to have overlooked the desirableness of saying a word or two against it. One result of this misconception is that people are looking in the writings of the Chinese sage for an outline of the systems of religious belief which are now seen in China, and which they naturally infer came from him. But if the moral writings of Seneca, Cicero, Plato, and many modern philosophers are not regarded as systems of religion, those of Confucius have even less claim to such a name; for he never even discussed the nature, powers, or origin of the gods, he laid down no rules for worship and instituted no ritual or sect. The very word Confucianism to denote a system of belief is unknown among his countrymen, and has been adopted by foreigners as a convenient rendering of the term *Yu Kiao—i.e.*, Instructions or Tenets of the Literati—because he is regarded as their highest authority. If we carefully remember this distinction we shall not look for what never entered his mind as being his great vocation, and shall be in a better position ourselves for estimating what he accomplished.

Mr. Douglass divides each of his topics into eight chapters, and devotes about two-thirds of the volume to the first and most interesting. A brief notice of the early history of the Middle Kingdom, aided by a skeleton map, shows the position of the leading feudal states north of the Yangtse River before and during the era of Confucius, and prepares the reader for the sketch of his life and actions. It is such an account as ought to supersede many current notices, for it has been digested from the most authentic sources available in Chinese history, and is divested of the legendary and supernatural incidents with which native writers have surrounded his name. If this sketch be compared with that of M. Pauthier in his 'Chine' (pp. 120–160), 1839; or an earlier 'Vie de Confucius en 24 Estampes,' Paris, 1783; or the still earlier accounts contained in the 'Mémoires sur les Chinois,' its superiority will be seen. One or two extracts, summarizing the leading traits of Confucius' life and character, may be introduced to show Mr. Douglass's style, and his opinion of the sage:

"He was now sixty-nine years of age, and if a man is to be considered successful only when he succeeds in realizing the dream of his life he must be deemed to have been unfortunate. Endowed by nature with a large share of reverence, a cold rather than a fervid disposition, and a studious mind, and reared in the traditions of the ancient kings, whose virtuous achievements obtained an undue prominence by the obliteration of all their faults and failures, he believed himself capable of effecting far more than it was possible for him or any other man to accomplish. In the earlier part of his career he had in Lu an opportunity given him for carrying his theories of government into practice; and we have seen how they failed to do more than produce a temporary improvement in the condition of the people under his immediate rule. But he had a lofty and steady confidence in himself, and in the principles which he professed, which prevented his accepting the only legitimate inference which could be drawn from his want of success. The lessons of his own experience were entirely lost on him, and he went down to his grave at the age of seventy-two, firmly convinced, as of yore, that if he were placed in a position of authority, in three years the government would be perfected" (page 57).

"Probably no man has been so contemned during his lifetime, and so worshipped by posterity, as Confucius. In both extremes there has been some exaggeration. His standard of morality was high, and his doctrines were pure. Had he, therefore, had an opportunity of exercising authority, it can but have resulted in good to an age when the notions of right and wrong were strangely confused, and when both public and private morality were at their lowest ebb. On the other hand, it is difficult to understand the secret of the extraordinary influence he has gained over posterity, and the more the problem is studied the more incomprehensible does it become. His system of philosophy is by no means complete; and it lacks life, if we may venture to say so, in face of the fact that it has supplied the guiding principles which have actuated the performance of all that is great and noble in the life of China for more than twenty centuries" (page 66).

In chapters iv. and v. Mr. Douglass gives a good synopsis of the two leading features of the teachings of Confucius, and readers will gather from their perusal a very just idea of his position among the intellectual leaders of mankind. One shows the "Training necessary to become a Superior Man"; the other, the proper "Government of the State." Confucius divided mankind into four classes, viz., those who are born with the possession of knowledge; those who get knowledge by learning; those who are dull and stupid, but can get knowledge by great effort; and those who are innately dull and stupid, and learn nothing. Besides these, he set before his disciples and countrymen, as a desirable object to strive for, the *kiun-tsze*—princely scholar, superior man, or perfect man, as it has been translated—a worthy character, whom every one of them could "imitate and equal." The sage was beyond common reach, being incapable of wrong-doing, but the "*kiun-tsze* was subject to faults and failings, which, though they were as transient as eclipses of the sun and moon, were yet equally observable by all men. He was endowed with no special grace by nature, but by carefully perfecting the good originally implanted in him his way became identical with that of heaven and earth and of all things, and he arrived at the dignity of a superior man."

Mr. Douglass then epitomizes the nine things which such a man seeks after, and the three things which he shuns, by extracts from the Classics under such heads as virtue, filial piety, friendship, benevolence, reverence, government of the person, family, and state, etc., etc. The high standard which the Pattern of Ten Thousand Ages has set here before the black-haired race for their moral guidance is well delineated. We think our author fails to appreciate the influence of Confucius in his ideal *princely scholar*, and fully set forth what a power for good over his race it has been ever since. It might be compared to the glorious work of Phidias on the Acropolis of Athens, that matchless statue seventy feet high, whose casque and spear of burnished brass glittered above all the towers and walls of the city in the eyes of the mariner coming from Sunium across the Ægean Sea, and engaged his constant gaze; guiding his onward course, it was still ever beyond his reach. Like the Minerva Promachus to the old Athenian voyager, so stands the *kiun-tsze* of Confucius among the ideal good men of pagan moralists. The immeasurable influence in after ages of the character thus portrayed proves how high his own standard was, and the national conscience has ever since assented to the justice of the portrait.

Mr. Douglass stops short of this; but he does ample justice to the unsullied character of the sage, and the high objects he set out to reach. He might have found a partial explanation of the devotion exhibited by his personal followers, and the lasting influence his name has carried with it ever since, in this purity, singleness, and practical wisdom. We must be careful, however, in estimating him and his great disciple Mencius, not to take them out of their proper surroundings and place them in our own, and this our author has in general tried to do, though not so fully as we should have wished. We disagree with him, however, in his translation of *ti* and *Shangti*, by God; though we will not dispute his assertion when he says: "Shangti approached nearer to the idea of the Hebrew God than any of their divinities." We might stop to ask him whether he himself regards the "Hebrew God" as one of a pantheon, for such a phrase seems to be rather a slip of the pen than anything else; but the conclusion is far more likely that Confucius reached as high an idea of Shangti as any of his countrymen, and never departed from the higher faith of his ancestors, which was akin to the deification of the visible heavens, mixed with that of apotheosized ancestors. His influence would have been greatly weakened if Confucius had left the enforcement of the practical duties of life, as given in the Analects and Great Learning, to go off into deep speculations on unseen things and beings, and multiply words without knowledge as his contemporary, Lao-kiun, did.

* 'Confucianism and Taouism. By Robert K. Douglass, of the British Museum.' With a Map. Published under the direction of the Committee appointed by the Society for Promoting Christian Knowledge. New York: Pott, Young & Co. 1879. Fcap. 8vo, pp. 287.

The enquiry which Mr. Douglass has raised in the extract already quoted, regarding the secret of the extraordinary influence Confucius has gained over his countrymen, he has partially answered at the close of the essay. Herein, too, as in his estimate of the *kiun-tsze*, our author seems to us to have been ready for a fuller exposition than his limits allowed. His words are:

"But it will naturally be asked, Wherein lay the secret of the vast influence which has been exercised by Confucius? And to this we answer, first, that being a Chinaman of Chinamen, his teachings were specially suited to the nature of those he taught. The Mongolian mind, being eminently phlegmatic and unspeculative, naturally rebels against the idea of investigating matters which are beyond its experiences, and its calm, placid habit forbids its being the instigator of fiery tempers and hot-headed crimes. With the idea of a future life still unawakened, a plain, matter-of-fact system of morality, such as that enunciated by Confucius, was sufficient for all the wants of the Chinese. Secondly, it was to the interest of both the rulers and the ruled to support his doctrines. The *de facto* ruler found in him a tower of strength; for if the throne was the reward vouchsafed by heaven for eminent virtue, then he who occupied it in peace must necessarily have an unassailable right to it; and the constant exhortations to loyalty to be found on every page of the Confucian writings cannot but have been grateful to the ears of sovereigns.

"The ruled, on the other hand, felt that they were supreme in the estimation of the sage. The promotion of their interests and material well-being was the first duty of the sovereign; and the extent of their loyalty was to be measured by his success in this direction. He recognized no ranks or titles but those won by merit, and thus every office in the state was open to every one alike. The people were to be well cared for, and in case of oppression or neglect they had the right of rebellion. The sovereign was the vicegerent of Heaven; but only as he walked in the heavenly way were the unswerving loyalty and devotion of his subjects due to him.

"And thirdly, the possession of so highly-prized a literature at so early a date having suggested its adoption as the curriculum in schools and the test of scholarship at all examinations, the people, ignorant of all else, have learned to look upon it as containing the quintessence of wisdom, and its author as the wisest of mankind. It might be considered impossible to calculate the concentration of a nation's mind, century after century, on the study of any given text-book; but in China we have the result worked out before us, and we find that it has amounted to the absolute subjection of upwards of forty generations of Chinamen to the dicta of one man" (pp. 169, 170).

This is good as far as it goes, even if it contains something like reasoning in a circle. Space does not permit an analysis pointing out the omission of some powerful influences and circumstances tending to the result now before us. Among these are the geographical isolation of the Chinese, which has prevented their mixing with other nations, and the still more complete intellectual isolation arising from their language, which has, as Mr. Douglass says, "left them ignorant of all else." When, therefore, they took the nine Classics as the curriculum of their competitive examination for office and honor, they did the best they could. They set the children to learn by heart the purest and best treatises on morals, ethics, and personal conduct in the language, and based the national standard of equity on the teachings of the highest moralist they knew.

Only one paragraph can be devoted to Taouism, though it presents many remarkable contrasts to Confucianism, in its founder, his teachings, and their outcome, which tempt one to enlarge. The first chapter is devoted to an historical notice of Lao-tsze, who will always remain one of the mysterious characters of antiquity, but who has left enough to assure us of his personality, his intellectual grandeur, and his remarkable originality, all fitting him to sit on the same seat with Pythagoras or Lucretius. His only work, the Tao-Tih King, or Canon of the Method of Virtue, is analyzed in the next two chapters, followed by a reference to some of his most eminent disciples, as Lih-tsze and Chwang-tsze, and the manner in which they departed from his instructions. In the course of ages the sect became imbued with and imitated the idolatry and hierarchy of the Buddhists, deifying Lao-tsze himself as the *San Tsing*, the Three Purenesses, or Pure Ones, and setting up a vast pantheon of gods and goddesses for the worship of their countrymen. Chapters vi. and vii. form two of the most interesting portions of this part, containing a translation of the Kan-ying Pien, or Book of Rewards and Punishments, and a brief synopsis of the Yin-chih Wăn, or Book of Secret Blessings. These two books contain all that is considered by the people of the present day essential in Taouism. They will reward perusal, but their effects in purifying and elevating society are very trifling. Modern Taouism is described, too, and Mr. Douglass shows how it has become little better than a system of alchemy, fortune-telling, and priestcraft, dividing the worship of the people with the Buddhists, and both of them disfavored by the literati.

CHILDREN'S BOOKS.

EVERY holiday season brings a fresh assortment of stories for the young which, as being new, recommend themselves as gifts and do their share in the cultivation of juvenile ethics. The books are few, of this class, to which exception cannot be taken either on the score of literary merit, or of adaptation of means to ends, or, finally, of good breeding; and as a rule they justly drop out of sight before the holidays recur. Of the better and rarer sort is Mrs. Mary Thacher Higginson's 'Room for One More' (Lee & Shepard), which has an enigmatic and almost misleading title. A motherless boy, it is true, is taken into a family already overburdened with children, but he is not the hero of the story, and the fate of the experiment is not the *motif* of the story. Mrs. Higginson rather gives a simple picture of family life for two or three years as it is apt to be passed, not without incident but without plot, and scarcely more worthy of record at one time than at another. Her narrative seems very real, and some of her readers can doubtless unmask the Rand family and locate Clifton and Riverbank on the map. The moral of it is the reward of duty and the efficacy of the law of love in the training of children. In actual experience, as we all know, these facts are often obscured except to the inner sight and in the long run, and there is a certain illusiveness in smooth and summary accounts of their realization. Anything else, however, would not be comprehensible to children, or impressive, and the compensation is that the illusions are humanizing. So we commend this book for all its examples of the formation of character from day to day under wise and gentle teaching and with the help of conscience, though we do not think it contains the whole gospel of birds'-nesting. There is a pleasant sense of restraint on the part of the writer, both in avoiding extravagant talk in her characters and in repressing fine writing about nature, and the tone of the book is irreproachable.

Mr. Ascott R. Hope's 'Spindle Stories,' "or new yarns spun from old wool," as the sub-title reads (Geo. Routledge & Sons), is an attempt to expand Mother Goose in prose, with a result anything but successful. The stories possess a degree of ingenuity, but compare sadly in humor and imagination with the corresponding portions of 'Alice in Wonderland,' etc.—the episode of Humpty Dumpty, for example. Rhyming head-lines for the pages are an innovation which will hardly become a fashion.

The repulsiveness of "Rashycoat," the first of the 'Tales of Old Thulê,' collected and illustrated by Mr. J. Moyr Smith (J. B. Lippincott & Co.), would quickly be seen if the incidents narrated should appear on the stage or in a police court. It seems to us, for all its likeness to 'Cinderella,' thoroughly unwholesome reading for children. This objection does not apply to the remaining fairy tales in the volume, but another may be raised to the intercalated Scotch popular stories, "The Brownie in the Pantry" and the "Trial of the Suitors," which have a vulgar tinge. Nor can we praise Mr. Smith's illustrations, in which there is too much india-rubber posturing.

The right and wrong of shutting up caterpillars to watch their transformations is not discussed in Mrs. Higginson's 'Room for One More,' but Mrs. Julia P. Ballard assumes the right and the instructiveness of it in her 'Insect Lives; or, Born in Prison' (Cincinnati: Robert Clarke & Co.) The introduction gives the necessary information to the beginner in the business, and then in a very charming and easy way shows from her own experience the delights of watching the spinning of the cocoon and the shedding of it, and the emergence of the known moth from the unknown shell; how the entomologist's curiosity is piqued and gratified; how fastidious in their diet worms are found to be, and the rest. The young naturalist cannot fail to be stimulated by this book, and will be rightly directed by it. The cuts are borrowed from a variety of sources, and some of the best.

For very little folks, praise must also be accorded to 'Tiny's Natural History,' in words of four letters, with plenty of illustrations (Routledge). Not only is the limited vocabulary used with great skill and fluency, but the instruction itself is admirably condensed and packed. The reindeer, fox, gold-fish, ass, dog, seal, hawk, wolf, and bear are some of the animals treated within the compass of eighty pages.

A cheap edition of 'Hans Brinker' (Charles Scribner's Sons), made from the old plates and the new illustrations, should not be overlooked. There is no better sign in juvenile literature than the survival of what deserves to endure—the genesis of a new classic.

Breton Folk: an Artistic Tour in Brittany. By Henry Blackburn. With one hundred and seventy illustrations by Randolph Caldecott.

(New York: Scribner & Welford. 8vo, pp. 200.)—"'Breton Folk' is not a description of the antiquities of Brittany, nor even a book of folk-lore. It is a series of sketches of a 'black-and-white-country' under its summer aspect; of a sombre land shrouded with white clouds, peopled with peasants in dark costumes, wide white collars and caps, black and white cattle and magpies. The illustrations have been drawn by the artist from sketches made on the spot, and, apart from their artistic qualities, have the curious merit of truth. They have been engraved with the utmost care by Mr. J. D. Cooper." Thus does Mr. Blackburn review his own and Mr. Caldecott's book. There is scarcely more preface than we have quoted above. A headpiece shows the artist lifting hard to open a large gate, while two girls in high steeple-shaped white caps await his success: a tail-piece shows him sketching, seated on the coping of a dwarf wall and leaning against high iron railings, while children swarm around him, one of whom he holds encircled with his left arm, and an old peasant cranes his neck from beyond the bars to see. The title-page vignette gives a *menhir* with a very large magpie on its top and a *dolmen* behind; a peasant, with broad hat, buttons, *sabots*, and shirt-collar, leaning against the upright stone on one side, and a peasant girl half-hidden by it, cattle beyond, a desolate landscape, and the distant sea. The gateway-towers and one angle of a fourteenth-century castle make up the headpiece to the list of illustrations; sheep, crouching behind a bank for shelter from the wind, with well-suggested thin bushes and hedgerow, are the subject of the *cul-de-lampe*. And in this way throughout the book the strange and interesting people, dress, and roadside scenes of Brittany are sketched and preserved in all the nooks and corners of the text. There are larger, and even full-page illustrations as well. Especially good are those which show each the whole of some little old village, or at least its principal square, at a glance: Pontaven and Le Faouet are two of these. "Potato-getting at St.-Pol-de-Léon" gives a charming hint of the not very distant town and its two considerable churches which tower above the near hedges and farther houses. Indeed, all these designs are of interest and some of peculiar value. They are just such studies as the attentive traveller would like to make for himself, and to one who had loved Brittany without knowing how to make memoranda of it this book would answer all the purposes of a private sketch-book, except that he would wish it doubled or trebled in extent. The reader must be prepared, however, for woodcuts of very different appearance from the elaborate works of art produced by our two rival magazines when they do their best. These seem to be fac-similes of the artist's swiftly-made drawings, and are quite regardless of refinements of light and shade.

The text is a pleasant and easy-going account of the country and people, with a good deal of advice for travellers. In both text and pictures the antiquities and the important mediæval architecture of Brittany are almost wholly neglected, and indeed little else than the ways and fashions of the people has received attention. The book may be the more pleasing to most persons on that account.

A Series of Character Sketches from Dickens. Being Fac-similes of Original Drawings by Fred. Barnard. (New York: Cassell, Petter, Galpin & Co.)—This Christmas publication is of a very unusual character. It consists of six lithographs on very large paper (20x27 inches), each accompanied by a fly-leaf on which is printed some brief extract from one of Dickens's novels having to do with the subject of the plate. The whole is contained in a portfolio. Each picture is a simple portrait of one of Mr. Dickens's immortalities—of Mr. Pickwick or Alfred Jingle, Bill Sykes or Sairy Gamp, Little Dorrit or Sidney Carton—a full-length portrait with appropriate surroundings and attributes. Mr. Pickwick is perhaps the most successful of all; he is represented as seated on the grass and caressing affectionately that famous jar of cold punch, on the occasion of the shooting-party which ended, for him, in the pound. The portraits of Little Dorrit and Mrs. Gamp are the less satisfactory because the personages are not seen at any eventful moment of their existence. It is possible that very great success in character-painting would make Mrs. Gamp, for instance, complete in herself, without the aid of her immediate occupation, but this picture, which suggests only a recent and surreptitious appeal to the "bottle on the chimley-piece," makes an insufficient impression, and we should like to have her seen shaking up old Chuffey, or denouncing Mrs. Prig. Nor do we speak without book, for in the 'Martin Chuzzlewit' which belongs to the Household Edition of Dickens those very scenes are capitally given, and in each Mrs. Gamp is prodigious. Moreover, the two designs, with all the rest, are, we take it, by this same Mr. Barnard. On the title-page, indeed, the illustrator is called J. Barnard, while on the title-pages of 'David Copperfield,' 'Bleak House,' and half a dozen volumes more it is F. Barnard; but the style is the same, and the cipher in the corner of each picture is the same, and, lacking positive information to the contrary, we conclude that our "Fred. Barnard" of the large lithographs is the illustrator of all those books. It is necessary only to add that the lithographs, without being of the highest refinement of workmanship, are good, and may be trusted to render the original drawings with fidelity.

Illustrations of the History of Art. (Boston: L. Prang & Co. Oblong folio. Part I., 39 plates; Part II., 57 plates.)—This is a gathering together of woodcut pictures from a number of different works on the fine arts. The first number is devoted to the nations of classical antiquity, and the second to the epoch of Christian art, commonly so called. The third is announced to contain forty-eight plates devoted to the architecture and sculpture of the Renaissance and of modern times, the fourth to give the history of industrial art (by which we suppose decorative art is meant) in all ages and nations, and the fifth to the history of painting. There is also to come a volume of text, of which the size and price are not announced. The books of plates, in their paper covers, are to cost ten dollars, and also will be sold separately at different prices. Such books may be made useful by students who have not access to better ones. This possible usefulness is to a certain extent counterbalanced by the possibility of their doing harm. It is the old question, never to be answered categorically: Are a few general impressions, certainly vague and therefore often erroneous, better than none? Is it better to know nothing about Greek, Roman, Persepolitan, Assyrian, or Egyptian art, or to look at these four hundred or five hundred woodcuts, all different in size, in subjects, in scale, and in style, and in doing so to pick up a lot of partial information? Nor is our question quite satisfactorily answered when we are told that such books are good for schools to have and for school-teachers to refer to. Unfortunately, the teachers of this land are not fitted to make any proper use of them.

Public Addresses of John Bright, M.P. Edited by James E. Thorold Rogers. (London and New York: Macmillan & Co. 1879. 8vo, pp. 542.)—The speeches contained in this volume are thirty-three in number, and extend from 1863 to 1879, all except one being arranged in chronological order. They may be said as a whole to present a vigorous running commentary upon the course of politics in Great Britain, both when the speaker was in sympathy with the Government and when he was in opposition. The speeches delivered during the present administration will be found to contain a keen criticism of the successive measures of the Government, from the purchase of the shares in the Suez Canal to the Afghan war. The single speech delivered in the present year is upon the Eastern policy of the Government. There is rarely in any of them any appeal to the emotions, except through the clear and forcible statement of facts, and they are almost wholly devoid of "flights of eloquence" such as second-rate orators delight in. Mr. Bright quotes (p. 107) Milton's definition of eloquence, as "the serious and hearty love of truth," and seems to have taken it as his own standard; for all his eloquence consists in the earnest conviction of a strong nature, so serious and so hearty as to possess him for the time being and inspire his utterances with genuine power.

Perhaps the nearest approach to impassioned oratory which this volume contains is the close of the speech at Bradford on unveiling the statue of Cobden (July 25, 1877); it is a noble example of sober, manly eloquence (p. 366):

"But let me add that this which you have erected to-day, or which is erected in your midst, is by no means the greatest monument that has been built up to him. There is one far grander and of wider significance. There is not a homestead in the country in which there is not added comfort from his labors, not a cottage the dwellers in which have not steadier employment, higher wages, and a more solid independence. This is his enduring monument. He worked for these ends and for these great purposes, and he worked even almost to the very day when the lamp of life went out. He is gone; but his character, his deeds, his life remain a possession to us, his countrymen. And let this be said of him for generations to come, as long as the great men of England are spoken of in the English language—let it be said of him that Richard Cobden gave the labors of a life that he might confer upon his countrymen perfect freedom of industry, and with it not that blessing only, but its attendant blessings of plenty and of peace."

A good specimen of Mr. Bright's style is found in this vigorous description of the Government of India before the Mutiny (p. 110):

"It was called a double Government. It consisted of a number of directors of an extinct trading company—a company that was always

bankrupt. The directors, who were bred in corruption, and who practised it during their tenure of office, and who, in point of fact, may be said to have lived upon it, neglected everything they ought to have done except the collection and expenditure of taxes. And to that curious Government was added a Minister of State, who was appointed to control the said directors. He allowed them to do nearly everything evil that they liked to do, and he added to their evil-doings some other evil-doings of his own. To a system like this there were numbers of persons in this country—thousands, perhaps millions—who assented. They imagined that it was possible to go on governing a country containing 150,000,000 of people, composed of more than twenty different languages, of different religions and different ways in every particular, under such a system."

Mr. Bright sees no merit in schemes for improving the machinery of government, like personal representation. His object is to carry measures, not to attain an equitable representation. "Let us have no new-fangled ideas," he says (page 104); and adds that this measure might have come "from Bedlam, or a region like that." The sixth address (at Birmingham) is especially devoted to this subject; and he insists that Birmingham, being a Liberal constituency, is entitled to a unanimous Liberal representation—not seeing any merit in having the Liberal minority in Conservative constituencies represented, to balance the representation of the Conservative minority in his own town.

There is an excellent index—an invaluable feature of a book like this. We have found it correct and complete so far as we have consulted it, except that "Irrigation" (in India) is placed out of its alphabetical order.

The Relations of Mind and Brain. By Henry Calderwood, LL.D. (London and New York: Macmillan & Co. 1879.)—Professor Calderwood tried the prolix style in his first work; in the second he attempted compression; in this he has reverted to prolixity, not, we think, altogether to the reader's advantage. This octavo of 450 pages, however distended it may be, is, nevertheless, one more pleasant sign of the *rapprochement* which is going on with ever-increasing energy between those who approach mental science from the introspective and physiological sides respectively. There is hardly a physiologist now whose duties do not call him to give some account of sensation, perception, and thought. It is amusing to see how easily they do it in Germany, referring mainly to each other's writings, adopting or refuting each other's opinions and experiments, and acting on the whole as if such creatures as purely metaphysical psychologists had never been seen on earth. It does not surprise us in the least nowadays, when the last *Lieferung* of Stricker's 'Lectures on Experimental Pathology' reaches us, to find that that excellent medical investigator has thought it incumbent upon him to present us with a complete little treatise on mental science, in which all the cardinal questions are settled after his own fashion.

Crude as a great deal of this laboratory psychology is, and ignorant as are some of its cultivators of what has been done by the philosophers who have preceded them in the study of the same problems, the whole movement must be admitted, even by those whose studies least qualify them for taking part in it, to be full of the richest promise. The facts which the trained cunning and keen rivalry of the physiologists are constantly bringing to light could never be known but for them, and whatever lack of analytic acuteness may lie in their reasonings is sure to disappear as they discuss matters more and more minutely, and have forced upon their attention the difficulties and paradoxes which philosophers have always found in personal identity, cognition, and the relation of mind, brain, and thing known. Then also their respect and sympathy will rise for their introspective rivals.

That these latter at least respect the experimentalists, is evident from the great pains which an orthodox Scotch metaphysician like Professor Calderwood has taken to master their results. The first two hundred pages of his book are occupied by an account of the anatomy and physiology of the nervous centres which would not discredit a professed naturalist, and which may be recommended to all who wish a comprehensive view of these subjects. In the latter half of the book the author tries to show at great length that none of the facts yet discovered enable us to dispense with the notion of a personal soul to which the brain stands only in the light of an organ. The excessive diffuseness of the arguments in this part makes it difficult to summarize them. The strongest is that derived from the form of consciousness. Separate nerve processes, as well as the separate feelings which accompany them, may awaken each other and coexist to all eternity, without either being aware of the other. In consciousness they not only exist distinct from each other, but are compared and distinguished. This coming together and at the same time remaining separate is a thing to which we can imagine no physical analogue. To combine several nerve processes in one "would end in confusion, not in discrimination."

In other chapters we think Dr. Calderwood decidedly less happy Notwithstanding his conscientious efforts he has failed to place himself at the proper point of view for seizing the full strength of the physiologist's position. He seems not to understand even the way in which introspective psychology has tried to build up the full working mind out of elementary motor and sensory images. The nowadays much-talked-of localization of functions on the surface of the brain is but an attempt to schematize mechanically the laws of association of these images. Professor Calderwood is grossly mistaken in supposing, as he does on page 353, that the brain theory of volition rests on the fact that the frontal lobes do not respond to electricity, and that a certain monkey of Ferrier's seemed to lose his power of attention when they were destroyed. And what a strange objection is it to the physiological account of memory to admit that a brain tract may produce the thought of a past occurrence when made to vibrate by a present sensation; but to ask triumphantly, how is spontaneous memory ever possible? for in the absence of a sensory impression "*what starts the vibration?*" Has it never occurred to the doctor that the tracts may start each other?

Altogether the critical part of the work is mediocre in the extreme, and, beyond one or two anecdotes, contributes hardly a sentence to the real elucidation of the subject. Its main merit is its temper, and that may make it do some service to ultra-orthodox readers.

A Popular History of the United States, from the first discovery of the Western hemisphere by the Northmen to the end of the first century of the Union of the States. Preceded by a sketch of the pre-historic period, and the age of the Mound-builders. By William Cullen Bryant and Sydney Howard Gay. Vol. iii. Fully illustrated. (New York: Charles Scribner's Sons. 1879.)—The third volume of Bryant's 'History of the United States' extends from the accession of William and Mary to the close of the campaign of 1778 in the Revolutionary War, ending with the victory of John Paul Jones. In space it is divided equally between the Colonial and Revolutionary periods; there are twenty-four chapters, and chap. xiii. is headed "Alienation from England"—narrating, therefore, the series of events which led to the revolt. The period embraced by this volume is, more than any other part of American history, a period of wars; and we regret that the chapters are not so arranged as to make clear the succession and connection of these wars—the earlier wars of the period being narrated incidentally in the course of the chapters upon the several colonies, while the "French War" (or, as we used to call it, the "French and Indian War") has three chapters devoted to it. Perhaps this method has the advantage of making plain the fact that war with the Indians (and consequently with the French) was almost the normal condition of things all this time; it has its advantage also in making more prominent the peaceful side of events. But it certainly makes it less easy for the reader to find what he wants. As a history of military operations, which is the most important feature of this volume, it will rank high. These operations are described clearly and with animation, and we can only wonder that the narration is so seldom accompanied by charts and plans, without which the most careful and accurate descriptions are inadequate. There is an abundance of plans of Boston and vicinity, and a good map of Manhattan Island; a good map, too, of Lake George, for the French War, and one or two other small ones; but the battles of Long Island and White Plains, the retreat through the Jerseys, Burgoyne's battles, and other important engagements are left wholly without illustration.

As in the former volumes, good use has been made of the latest monographs and researches: in the battle of Bunker Hill the chief command is attributed to Colonel Prescott, which we think hardly correct—he commanded at the redoubt, it is true, but cannot fairly be said to have had the chief command of the whole movement. This has been proved, we think, by Mr. Tarbox (see the *Nation*, No. 588).

Études accadiennes. Par François Lenormant. Tome troisième, première livraison. 4to, pp. 200. (Paris: Maissonneuve et Cie. 1879.)—The bulk and the number of the tasks which the versatile M. Fr. Lenormant sets for himself compel the purchaser sometimes to wait long before he can send to the binder the completed volumes. The last *partie* of his still incomplete 'Essaie sur la propagation de l'Alphabet Phénicien' appeared four years ago; and only now, after five years' interval, is he attempting to complete his 'Études accadiennes,' which was interrupted,

after the appearance of the first half of the second volume, by his reply to M. Halévy's denial of the existence of any Accadian language, and then by the studies necessary to write his important work, 'La Monnaie dans l'Antiquité.' The first portions of his 'Études accadiennes' were reproduced by photo-lithography from the author's autograph, though by no means with such mechanical beauty as the second edition of Delitzsch's 'Assyrische Lesestücke.' They included a tentative grammar of Accadian; a table of 548 characters, with their variants and values; and an interlineary translation of over forty Accadian texts. During the past five years, thanks largely to the spur of Halévy's destructive criticism, Accadian studies have received much attention from cuneiform scholars, and M. Lenormant could not take up his task where he laid it down in 1874. Leaving the second volume permanently incomplete, he now begins the third volume with a chrestomathy of the same bilingual texts as were contained in the second volume, with improved translations, and with some important texts added. The knowledge thus far acquired of Accadian, the Turanian language spoken by the earliest civilized people of southern Mesopotamia, is still so imperfect that it would be difficult for the best scholars to translate a long text if found by itself. Fortunately, the texts are chiefly bilingual, and most of them are known from their Assyrian translations, as the Assyrians adopted the science and religious lore, as well as the graphic system, of the more learned Turanians whom they had conquered. Our author's translations from the original Accadian of these primitive magical formulas and hymns to the gods are constantly checked by the Assyrian, which he gives in a parallel column. This forms the fullest collection of translations of these remains yet made, although nearly all of them, translated from the Assyrian version, have appeared in the 'Records of the Past,' or in Lenormant's 'Chaldean Magic,' or in the Proceedings of learned societies. When it is remembered that the Accadian ceased to be spoken as a living language about seventeen centuries before Christ—that is, from one to three centuries before the exodus from Egypt, according to what chronology we adopt—the importance to the student of comparative religion of these texts found in Assyrian libraries can be readily imagined. Not one of them is more important than the penitential psalm (p. 146), also translated by Mr. Sayce in vol vii. of 'Records of the Past.' In this psalm, which is so much like the Hebrew psalms in its parallelisms and in its humble confessions of sin, we notice that Lenormant has made some important improvements over the translation of Sayce. The rubrical directions that certain stanzas be repeated from five to sixty-five times are all otherwise translated. This volume will be completed in three more *livraisons*, which will include an Accadian glossary as complete as can be made, a new table of characters, and new paradigms of grammatical forms. It is printed from ordinary type, although the glossary will have to be reproduced in autograph, as it is almost impossible to set in type the complicated cuneiform characters.

Cebetis Tabula, with Introduction and Notes by C. S. Jerram, M.A. (London and New York: Macmillan & Co. 1878. 12mo, pp. xxxix. 51.) —The 'Tablet' of Cebes was once a very popular school-book for beginners in Greek. For nearly a century it has fallen into comparative neglect, the last preceding English edition having appeared in 1804. The present edition contains an elaborate introduction, discussing the character and genuineness of the work, the relative value of the MSS., and the various editions. The Greek text, as given by Mr. Jerram, appears to be, on the whole, very satisfactory, and a sufficient apparatus of various readings is given to enable the critical scholar to make his choice. The commentary is more than ordinarily well adapted to the use of both teachers and learners. The classical scholar will hardly find a neater, more convenient, or more useful edition of this pretty little fragment of Greek literature.

Fine Arts.

MR. RUSKIN'S DRAWINGS.

THE exhibition of drawings by Mr. Ruskin, which was opened at the Twenty-third Street "American Art Gallery," on Monday, is in many ways unusual. Indeed it is unique, in that it is a show of things never made to be shown, of drawings made not as an end but as means to a different end, the property of the artist and yet not for sale. Mr. Ruskin and his books are now undergoing trial, and in these drawings is testimony in his behalf. They are exhibited, it appears, for that reason. They show the best side of the mind and work of their author. They should be studied by those (and they are many) who, having been swayed powerfully by Mr. Ruskin's books of twenty years ago, now review their old enthusiasm and that which called it forth in the light of greater experience and the recent startling and hardly reasonable utterances of their teacher, and are not unapt to conclude that they have been fools, and their guide a fanatic.

In the spring of 1878 an exhibition was opened in London of drawings by Turner, a hundred and twenty in number, belonging some to Mr. Ruskin and some to that Oxford collection which was his own gift to the University. While this was still on view a few admirers contributed to buy and present to Mr. Ruskin a certain important Turner water-color, of his best late time, the "Pass of the Splügen," which had been bought in 1842 for eighty pounds, and was now worth a thousand, more or less, as competitors might be minded. Mr. Ruskin, it appeared, had coveted the possession of this drawing, and now, as he lay ill at Brantwood, considered how to acknowledge his sense of the preciousness of the gift. It seems an odd thing to do, but he made up a collection of drawings of his own, "in illustration of Turner," as he said, "to show the importance of this Splügen drawing, and others." What he meant was not very evident. His own work illustrates Turner only by representing topographically what Turner had drawn artistically, and that only in a few instances. The exhibition of his own drawings could be of avail in only one way, by attracting public attention to the great extent, variety, and long-continued energy of his own studies, in at least one subject—namely, the external aspects of things. This was his own especial domain, the field he was born to cultivate, but which he had almost wholly quitted for vague excursions in regions only half comprehended, only half seen by their too-confident explorer. For the illustration of his own labors as a student of external nature this exhibition was very important, and, indeed, came none too soon; for, of course, he had never sent work of his own to any public exhibition, nor sold any, and few persons could have known it except through the engravings from it contained in his books.

The present exhibition in New York is better fitted for this purpose than the London one. The writer has spent many hours in the study of each of these collections, and, while missing the important Oxford drawings which could not be brought to America, prefers on the whole the collection which makes no pretence at "illustrating Turner" or anything except Mr. Ruskin's thirty years of study from external nature. The drawings are 106 in number, and are arranged in four groups, but, in the main, chronologically. There are a few drawings of childhood, of which nothing need be said more than this—that they are rather precocious. Then come some rather slight pencil drawings of Gothic buildings, Peterborough, Roslyn, a view of the Swiss Bâle—work done between the ages of eighteen and twenty, very much under the influence of Samuel Prout, very mannered, unusually good for a boy of that age, but not remarkable if their author had been four years or so older, and promising nothing as to future advance. It is perhaps a pity that these drawings are here. A mention of them in the Catalogue would have answered all purposes, and they do harm in confusing people and creating false general impressions. One overhears gentlemen expounding to their lady friends the weakness of the work, seemingly unaware that it is schoolboy work. At all events, there should be in some way a marked division between this and the independent, strong, purposeful work from nature which begins in 1842. If this paper is read by any person who means to go to the Exhibition, let him begin his examination with Nos. 17 and 18. If, then, the visitor has any curiosity to see what kind of boy's work the boy John Ruskin did, he may look at Nos. 1 to 16 before he leaves, remembering that these drawings, which would not be remarkable for a young man who had already begun the regular and practical study of art, were the result of his own in the main undirected thought and labor.

Beginning, then, with Nos. 17 and 18, it is to be observed, as the Lon-

don "Notes" pointed out, apropos of a drawing which is not here, that this was the point the student had reached "when the first volume of 'Modern Painters' was taken in hand." This book was begun as a protest against popular and shallow views of Turner's pictures of the time, hung in every successive Royal Academy exhibition, and rather sneeringly treated by newspaper critics, to the wrath of his young admirer and personal friend. And it appears that Mr. Ruskin could draw neatly, delicately, and prettily, if the word may be used, but with no especial vigor, at the time when his first volume appeared, and people began to talk about the "graduate of Oxford." He was then twenty-three years old, and more mature in mind than these drawings would imply; by which is meant that that first volume, amid all its errors and defects, represents more thoughtfulness and power of using knowledge, and far more patience in a task of magnitude, than is possible at that age to more than one or two men out of a thousand; while, as for the drawings, they do not show anything like an extraordinary precocity of power. If ever sensible drawing from nature gets to be fashionable among us—or, better, gets to be understood by sensible parents as good training for their children—one hundred out of every thousand "educated" persons will make equally good drawings at the age of twenty-three. What Mr. Ruskin had in him of eagerness and devotion, the same gift that spurred him on to write and print that first volume, and kept him up to his work as a draughtsman—it is *that*, and not any exceptional artistical gift, that shows in these early drawings.

It is pretty well known how—his first volume published and more discussed and even more praised than he had expected—Mr. Ruskin awoke to the fact that he had undertaken a huge task, and how he set himself to work to perform it. For ten years after 1842 he published nothing very important except the hastily-written essays called 'The Seven Lamps of Architecture.' During those years he was at work studying, first and most important, External Nature, the real look of plants and rocks and distant mountain-sides; second, the work of man in painting, in associated sculpture, and in building. Perhaps the most important part of this exhibition is the series of drawings which show his rapid gain in knowledge and in dexterity during the years from 1843 to 1848, or thereabout. No. 20 is a dark little drawing, in which a serious effort is made to get the near tree-boughs and the distance into harmony—an effort which has only in part succeeded. Nos. 21 and 22 are studies of parts of Venice boats, showing strong sense of subtlety in curvature, but harsh and disagreeable in color. No. 59 (put out of chronological order, to go with other Venice drawings) is a study of two of the capitals of St. Mark's at Venice, far from being as adequate in representation of them as some of many years later. These drawings all date before 1846. At this point we have to look at the large, slight studies in pencil and thin washes of gray of pieces of northern Gothic architecture, Nos. 78, 79, and 80. The character of these sketches can be understood, very nearly, by examination of the etchings in the first edition of the 'Seven Lamps of Architecture' (London, 1849). No. 79, indeed, was partly copied for Plate II. of that book—copied by himself, that is; for all the plates of the first edition were his own handiwork, while those of the second edition were all re-engraved by professional engravers. The American editions, of course, give no idea of what we are discussing. These drawings are certainly inadequate as representations of the architecture from which they are taken. They are most faithful in intention: nothing before them had been so true to Gothic detail. But their incompleteness is against them—the hand stopping when the desired memorandum was made; the architecture is not solid, the stones are not heavy, the sculpture is not so represented that one thanks the drawing for having demonstrated to him its value. They are interesting, because they call attention to the picturesqueness of the architecture; the way of regarding the buildings is the right one, and one feels sympathy with the sincere and modest draughtsman; but the drawings are not thoroughly good. There is better architectural drawing a few years later.

No. 27 shows landscape work of about 1847. No. 73, though marked in the Boston catalogue as of Vienna, and in the New York as of Verona, says of itself "Vicenza," a not very important drawing of 1849. No. 28, "Falls of Schaffhausen" (1850 ?), is full of bounding spray, gleaming white, and blue water seen through the whiteness. * This drawing, showing an immense advance in power over the work of three or four years previous, is as good an example as we could take to illustrate the especial peculiarity of all this collection—viz., the absence from it of what most persons expect to see in a collection of framed drawings. No one of these is a finished picture. Not only is no one of them intended to be a picture—that is, a composition meant to give pleasure to the beholder, and in the strict sense a "work of art"—but not one of them is finished into the corners, or fills up its frame. Each is a drawing *begun*, dropped at some moment usually far short of completion. This No. 28 looks to be the most finished one in the room, because nearly all the opening of the frame is filled, but it is on the rush of the cataract alone that the draughtsman's eye has been fixed; it is with this, its color and sense of movement, that the workman has been concerned, and this once expressed the rocks are left only suggested—soft and feeble rocks enough—and crowned with merely suggested vegetation.

Nos. 60 to 67 inclusive should now be looked at. Those who know the large folio, 'Examples of the Architecture of Venice,' of which three parts, or fifteen plates, were published in 1851, will have the means of judging of these drawings. No. 85 takes us back to wild Nature, and is that large drawing of a Block of Gneiss which has been exhibited before in America. The great bowlder has been finished with elaborate care; its exact portrait is taken with great minuteness; the draughtsman's concern has been for its laminations, its cleavages, the newly-broken faces, the soft rounded surfaces, the scarlet and orange stains of iron, the translucent shadows upon its face. That duty done, and all that the stone had to teach once learned, an hour is spent in dashing in the near rocks and the background, that the stone may not look too flat on a white sheet of paper. Birch saplings near, pines farther away, are seen against a dark-blue sky barred with white, and distant purple *aiguilles*. The sky is nothing in itself; it is ugly, an impossible and undesirable blue; the foreground rocks and the far peaks show knowledge, indeed, but are nothing; they are merely to set off the great block.

It is impracticable to follow up the catalogue for the years that follow. The qualities of the drawing steadily improve, and especially in the evidences it gives of power of swift intuitive decision, and a way of setting down the chief lines of a landscape. Persons judging too hastily, from the engraved work in 'Modern Painters' and elsewhere, are apt to conclude that Mr. Ruskin can work only in a minute, almost microscopic, way. The late drawings here rather show him as a swift and vigorous draughtsman, doing a great deal with a few touches. We repeat that this exhibition reveals Mr. Ruskin to us in the best light. Whatever deficiency there has been in judgment and critical sense, and however serious a loss to his influence for good this deficiency has been, we see here only his singular insight and perception and the conscientious preparation for his accepted task.

* We cannot find room for statements which are printed in the catalogue, but advise all readers to write to Mr. R. E. Moore, at No. 6 East Twenty-third Street, and to send twenty-five cents for a copy. There is a great deal of Mr. Ruskin in it.

"For a CHRISTMAS PRESENT it is the thing exactly."—*Cincinnati Times.*

SENT ON RECEIPT OF SIX CENTS.

DORCHESTER

Polytechnic Academy,

DR. NEVERASOLE, Principal.

By the late Warden of Racine College,

The Rev. JAMES DeKOVEN, D.D.

This intensely interesting and amusing story will be greatly enjoyed by the friends of the beloved De Koven, while those who knew him only as a great preacher and theologian will read it with interest, as showing another phase of the character of this wonderfully gifted man. It is a book for old and young; and its cutting sarcasm will add to the interest of its perusal.

Paper cover, price 75 cents; cloth, $1 25.

The Nation.

NEW YORK, THURSDAY, DECEMBER 18, 1879.

The Week.

CONGRESS adjourns to-morrow for the holidays, having accomplished little. On Friday last the House passed the Fortifications and the Pensions Appropriation Bills, the latter calling for $32,404,000. During the week Mr. Warner has asked for information as to what came of the bi-metallic mission to the governments of Europe, for which $20,000 was appropriated; and Mr. Morrill for the effect on the revenue of the repeal of the duties on tea and coffee. Resolutions have been introduced expressing sympathy with the Irish Nationalists in their effort for equal laws and self-government, and the hope that they may soon become owners of the soil they cultivate; and equally buncombe speeches have been made over petitions for enriching the soldiers and sailors of the civil war by the difference between the gold value of the greenbacks in which they were paid and their nominal value. This impudent proposition of course comes from the demagogues who denounced as ruinous the measure which was to remove the discount on greenbacks.

General Grant has made a sort of progress through Cincinnati, Pittsburgh, and Philadelphia, but refused to come to New York for the present, probably because it is considered by his managers too early for the grand "boom" which is to terminate in his nomination. During the past week or two his friends have thrown off all disguise and openly brought him forward as their candidate for the Presidency. This is owing to the meeting of the National Committee at Washington, which, as we write, is deciding upon the place where the next Republican Convention is to be held. It is very important to the Grant managers that the meeting should be at Chicago on account of the local strength of the Grant movement, and every wire is now being pulled for that purpose. It seems to be definitely settled that William H. Kemble is to retire from the Committee, and that Don Cameron is to take his place. The Grant party will then try to make him chairman, and any one who knows of what materials party conventions are made, knows that even to have the temporary organization in the hands of a man who can be counted upon is of importance. It is said that this plan in its general features will be supported by the friends of Mr. Sherman, which looks as if a formidable "combination" had been effected between the Grant party and the most influential wing of the Ohio Republicans.

As things stand now, the nomination of Grant seems to all regular politicians such a foregone conclusion that the most important consideration for his nearest rivals, such as Blaine and Sherman, must be what terms they can make with the new Administration. Considering their long and faithful services the terms ought to be very good. Meantime, with regard to the popular enthusiasm over General Grant, accounts differ. In Cincinnati it would be strange if all the dissatisfaction of the past ten years with the extreme wing of the party had been completely swept away by joy at the General's return; and it is said that the Germans in Cincinnati have by no means forgotten that only four years ago General Grant represented to them all the most dangerous tendencies in the government of their adopted country. General Grant continues to make brief speeches wherever he appears, which are always well received. He seems to understand perfectly that what his audiences wish is to see him, and that it makes no difference what he says. There is in one respect a curious similarity between these "efforts" of the General and those which the crowned heads with whom he has been recently associating regale their subjects with on public occasions, and that is, they are thoroughly commonplace. General Grant's apologies for his want of eloquence are often infantile in their simplicity. It is not, he says, his "habit to talk much," and he expressed his belief at Pittsburgh that he could do better "with a pen." This we should be inclined to doubt.

The efforts of rival cities to secure the holding of the next Republican Convention by influencing the choice of the National Republican Committee are very instructive. Cincinnati's chances are ruined, we are told, by "the unfairness and indecency with which the *Gazette* and *Commercial* of that city treated Mr. Blaine in 1876," for which it will be "well punished." An Eastern city, like Saratoga, will be opposed by those who desire a locality more favorable to Grant. Chicago is unexceptionable on this score, and has besides the great attraction of a hall—the Exposition building—having seats for eight thousand persons. Here are at least all the conditions for a spectacle and, in the choice of a candidate, for a *coup de théâtre*, but nothing could better illustrate the purpose of these great and unwieldy gatherings—to dispense with deliberation, and rely on outside pressure and "spontaneous" enthusiasm to bear down opposition to the slate prepared by the managers. The vicinage, always of some consequence as regards the platform, was never, perhaps, more important to the nomination than it will be in 1880. Chicago gave us Grant in the first instance, and would enjoy the distinction of proposing him also for the third term. The choice of that city would therefore have a decided significance.

In spite of the season a movement northward has begun among the negroes of North Carolina, and a considerable body, having exhausted their means on the way to Indiana, were obliged to go into camp at Washington until their needs could be met. They appear to have been grossly deceived as to the aid they would receive from some imaginary organization with a sounding national title. In North Carolina this disturbance of the labor market is attributed to designing Republican politicians bent on carrying Indiana for the party at the Presidential election next year. The notion receives some color from the fact that less than a year's residence in Indiana is sufficient to qualify a voter; and in the same way the winter exodus would be partly accounted for. Their new fellow-citizens of the Democratic persuasion are naturally not pleased by this influx of negroes, since they too look upon it as a purely political colonization. Nevertheless, the authorities of Shelbyville have humanely contributed to the temporary support of the two dozen who invaded the city last week, and have endeavored to find employment for them, while the commissioners of Shelby County have notified the township trustees against allowing the refugees to become a charge upon the county in contravention of the statutes, of which chapter and verse are given. The Boston *Herald's* Washington correspondent says the Government clerks have been called on to help along the North Carolina migration to Indiana, not on the score of humanity, but for party ends, and hints that there is a Stalwart scheme to buy up great tracts of land in West Virginia and plant it with colored voters drawn from other States, to affect the representation in Congress. All this recalls the days when Secretary Stanton threatened to set up a Government saddlery in the lower counties of Delaware to overcome the disloyal supremacy.

The State Board of Canvassers, composed of the Secretary of State, Comptroller, Treasurer, Attorney-General, and State Engineer (all Democrats), officially announced the result of the recent election in this State at their session in Albany last Friday. They simply acted upon the returns sent them by the local supervisors,

deciding that they had no authority to "go behind" them. The figures differ slightly from the unofficial list heretofore published, and as a matter of record we here give the principal ones. The total vote for governor is 901.535, Cornell's vote being 418,567, Robinson's 375,790, and Kelly's 77,566. Cornell's plurality is thus 42,777, his minority under the combined vote of Robinson and Kelly being 34,789, and his minority under all 64,401. The pluralities of the other candidates are as follows: Hoskins, 290; Carr, 1,875; Wadsworth, 5,928; Wendell, 2,815; Ward, 4,144; Seymour, 12,441.

The New York *Times* has apparently joined the Grant movement, which looks as if it had private information that he had broken with the Stalwarts or the Stalwarts had broken with him. The news about the condition of his "boom" at the South is still very conflicting, but there seems to be nothing wildly improbable in the prospect of Southern adhesion to him. His progress through that region on his way to Florida will shed a good deal of light on the matter. That he is not naturally a Stalwart, there is no doubt; and the disorders and illegalities of his Administration at the South, as at the North, were largely due, doubtless, to the necessity he felt of letting "the boys" enjoy themselves with the offices. Should he now abandon the Stalwarts, the incident will be one of the oddest in recent political history, and will lead to some extraordinary posturing and grimacing.

It is reported, on Democratic authority, that the next Maine Legislature will stand as follows: House, 77 Fusion to 62 Republicans; Senate, 19 Fusion to 12 Republicans. This means, of course, a reversal of the expressed will of the people of the State, as it has been understood since the election, and (since, in order to accomplish it, the returns from seven cities have been thrown out) a disfranchisement of a large number of inhabitants—about one-seventh of the entire population of the State. The excuse for this outrage is that the returns thrown out and changed were so treated because of technical irregularities, such as the lack of a city clerk's signature, the posting of the notice of election one day too few, and so on. Though there has been a good deal of fraud charged by the Democratic contestants before the Council, it does not appear that anything but these technical irregularities was needed to accomplish the desired result, and apparently the Maine Returning Board has less excuse for its action, and alleges less, than its malodorous Southern prototypes.

The result will probably make it impossible for the Democrats to talk as volubly about the transactions of 1876 as they have done for the past three years, at least with the same solid comfort. Their position up to this time has been that the Republicans were making themselves ridiculous by their absurd suspicions of Governor Garcelon and his associates; that the assembling at the Capitol of Messrs. Blaine, Hamlin, Dingley, Chamberlain, and their cohorts, and the petitions of leading citizens headed by the names of various "ministers of the Gospel," were insolent and indecent exhibitions of a bull-dozing spirit; that arguing an application for a writ of mandamus to compel the Secretary of State to exhibit the returns, at the same time that the returns were being freely exhibited to all applicants, was an absurd spectacle; that the Governor and Council had at first refused to show the returns only from a Falstaffian objection to compulsion, and because they were not "good and ready," and that the entire tea-pot tempest would be quieted by the result, which would show that nothing like fraud had ever been contemplated. All that was needed to make this position unassailable was action by the Governor and Council precisely the reverse of the action it is conceded they are about to take. As it is, some other must be sought, which is difficult, as the Democrats have since 1876 vehemently reprobated a servile obedience to the letter of the law when this involved violation of its spirit.

The municipal elections in Massachusetts during the past fortnight were the first in which women taxpayers were allowed to vote for members of school-committees. They were everywhere treated with courtesy, and in Boston an order even prohibited smoking at the polls. In the country districts they were generally successful in electing or helping to elect some one of their sex, but in Boston they attempted to throw a disproportional weight in favor of their own candidates and lost them all. Partly this was due to a hostile feeling, and partly, we may surmise, to a frolicking humor on the part of the male voters. The importance of having a share in the voting so much exceeded that of having a woman on the committee, that it ought to have dictated a rather conspicuous policy of voting for "the best men" without regard to sex.

Talmage last Sunday made a vigorous assault on the minority of the Presbytery from the pulpit, in reply to a proposal from some members of his congregation that they should escape further persecution by withdrawing from the Presbyterian Church. He dealt with the matter in characteristic fashion by concurring in their account of the sufferings of the congregation, which, he said, had been put to heavy expense both by the trial and by other ecclesiastical assessments, and he intimated that if the matter went any further he would expose the "moral rottenness" of his persecutors, by means of information regarding them which certain sympathetic "gentlemen" had furnished him with. This has called out a protest, signed by the minority of the Presbytery, in which they treat his statement "as a tissue of falsehoods," and so far from his having suffered from assessments, ordinary or extraordinary, the ordinary assessments of his church are, they say, three years in arrears. His insinuation about "moral rottenness" they treat as "a slander of the most ignoble kind." In fact, if what they say is true, it is difficult to know how to characterize him, or to define the religion of the people who listen to him on Sunday. The prosecutors are now seeking to carry him before the Synod, which has just met at Jamaica, L. I. The Judicial Committee of this body has reported in favor of hearing the appeal, on the ground that the decision of the majority in the court below, on the charge of deceit and falsehood, was "in open conflict with the recorded testimony," and the grounds on which it was based were calculated "to bring religion and morality into contempt." One simple-minded brother, Judge Armstrong, moved to dismiss it on the ground that the reopening of it would "tend to disturb the peace and harmony of the Church." But then the Church does not exist for peace and harmony, but to get people to live rightly. It might be "harmonious" and yet be composed of a band of rascals.

It has been a quiet week in Wall Street. Enough gold arrived to raise the total specie imports since the resumption of specie payments to more than $83,000,000; and foreign exchange declined so that fresh shipments from Europe could be ordered at a profit. The decline in foreign exchange was not in consequence of a more liberal supply of bills drawn against the exports of grain, provisions, and cotton, for the speculation in these staples keeps the market prices higher in this country than in Europe, but because there were more bills forthcoming against securities shipped by bankers. The currency demands from the interior on the New York money market were large during the week, and the surplus reserve of the New York banks was reduced a little more than $2,000,000. At the Stock Exchange speculation drooped and was dull. The two most important pieces of news which came to light were (1) that the managers of the Wabash system of roads have entered a syndicate formed to complete the Texas Pacific Railroad to a junction with the Southern Pacific, now being built by the owners of the Central Pacific Railroad; and (2) that the St. Louis and San Francisco Railroad have entered into an arrangement with the Atchison, Topeka, and Santa Fé Railroad to extend their line to San Francisco under the old Atlantic and Pacific Railroad charter, which is owned by the

first-named company, and which has a land-grant exceeding forty millions of acres. It is therefore likely that within three years there will be two more Pacific railroads. The market for silver bullion in London declined to 52½*d.* to 52⅝*d.* per oz. The bullion value of the 412½-grain silver dollar was 0.8778 at the close of the week.

Mr. Gladstone has in his speeches in Scotland fully developed the Liberal policy as he understands it. He makes the usual criticisms on the foreign policy of the Government, with which everybody is now familiar. Coming to home policy, he placates the Scotch by admitting that the Church should be disestablished if the majority desire it, and that Scotland had not got her fair share of representation in 1868. As regards Ireland, he advocated an extension of the sphere of local government through some sort of provincial assemblies, and admitted that there was no objection in principle to the legislature's buying land to set up peasant proprietors, though this admission was made in talking of Scotch agriculture. Entails and settlements of land he heartily denounced, and also the custom of primogeniture. The chief reason he gave for disliking settlements has brought down some ridicule on him. It was not that they tied up land so that no one had at any time either the power to improve it or complete interest in its improvement, but, what few or none had ever thought of before, that they "introduced an unnatural relation into the constitution of that primary element of society, the sacred institution of the family," by allowing the father to join the son in making provision for the son's children. The enthusiasm of the Scotch for him seems to have increased steadily. Probably no man in public life has had such a greeting in Great Britain. To find a parallel for it one has to go to Ireland in O'Connell's day. His attack on the ministerial finance in his last speech in Edinburgh was most destructive, and in this field his worst enemies do not deny his authority.

The authentic history of the failure of the attempt to get Germany into another bi-metallic conference is that Bismarck was so disgusted and annoyed by the account which Mr. W. D. Kelley gave of his interview with him, that he refused absolutely to see Mr. George Walker, who came as an accredited American negotiator, but turned him over to Count Bülow, his assistant, who paid Mr. Walker in phrases. We presume Mr. Walker is now satisfied that there never was any good ground for the story that Germany was ready to go back to the double standard or silver standard, industriously as it has been circulated here. Kelley's narrative came just in time for the Maine election. We knew it was a poetic narrative, but did not know whether it had any basis in fact; but we believe Bismarck does not even credit him with poetry. Kelley has been keeping very quiet ever since, but he ought to be hunted down by a couple or two couples of reporters and made to spin another explanatory yarn.

The dispute between the clergy and the Government in Belgium over the schools has taken a curious turn. The Pope wrote a letter of advice to the bishops, repeating in substance what he had said to the Belgian envoy, but its existence was for some time kept secret. Finally it had to come out, and then the Archbishop of Malines met it by a pastoral which, coming from an Infallibilist, is strange reading. It says the Pope is not infallible in the way some newspaper editors and members of parliament think he is. He is "not infallible when he expresses simply his own thoughts, but only when he defines, as head of the Church, the truths contained in the deposit of revelation, in the Scriptures, and in tradition. He is not infallible when he judges questions purely personal, but he is infallible when he judges questions of doctrine which touch faith or morals." But surely the question whether a man will be damned or ought to be damned if he sends his child to a certain school is not a personal question, but a question of doctrine, and if the Pope does not speak on it with great, if not infallible, authority, who can? The Belgian bishops have been giving the Pope a good deal of trouble lately. The Bishop of Tournay has been a little insane, and when an administrator of the diocese was sent to relieve him he resisted his entrance to the seminary, and the administrator tried to force the door, but the bishop held his own, and at the last accounts had not surrendered.

The Beaconsfield Ministry are again troubled by the state of affairs in Afghanistan. The murder of the envoy was, of course, a terrible disappointment, but they cheered up under the ease with which General Roberts captured Kabul, as if the capture of Kabul had ever been thought or found a difficult matter. When he was installed there, and had hanged a number of persons accused of complicity in the murder, they announced gravely that he was "practically Amir of Afghanistan." The fact was that he held the ground he camped on and no more, as now plainly appears. They sent at the beginning of the campaign a set of regulations for newspaper correspondents which the Prussian staff would not have ventured to promulgate, and which no writer with any self-respect would live under, being determined apparently to have this war, at least, carried on without hostile criticism, and the result is that there is no independent observer at General Roberts's headquarters. Had there been, the British public would probably not have been surprised to learn that a heavy Afghan force, of all arms, estimated at twelve thousand, had appeared on Wednesday last on the heights above Kabul. A combined movement against them by cavalry and light guns, under General Macpherson, to take them in the rear, and by infantry, under General Massey, to take them in the front, had miscarried on that day, the cavalry arriving too soon, charging bravely, and retiring with the temporary loss of four guns. On Friday, General Baker attempted to storm the heights above Kabul and failed; he succeeded, however, on Saturday, driving the enemy from all his positions. The accounts of the fighting are, of course, brief and official, but they reveal the facts that the Afghan combination was a strong one, and was unusually well led, and had taken the offensive after Macpherson's first repulse.

That Baker's victory on Saturday was a barren one is now shown by the subsequent intelligence that General Roberts had not only abandoned the heights, but had evacuated the position at Bala-Hissar and given up the city, and retired to the fortified cantonment at Shirpur, two miles to the north. There he is now cooped up by a force estimated at 30,000 men, under Mohammed Jan. Reinforcements are accordingly being hurried forward from India. The tribes are reported as gathering to Kabul from every direction. The governor of Herat is marching to it also. The worst of it is that winter snows must within a short time block the passes. In fact, the season thus far appears to have been an unusually open one. The resemblance between this invasion and that of 1839 has thus far been curiously maintained.

A ministerial crisis has arisen in Spain which promises a good deal of trouble. The resignation of Martinez-Campos, for reasons of which no clear account has yet appeared, but which seem to have been made up partly of the dissatisfaction of the Radicals with his emancipation bill for Cuba and partly of Conservative intrigues, has been followed by the formation of a new one under Canovas del Castillo, who made his opening statement in the Chamber on Thursday last. He ascribed the downfall of Campos to the form of the bill for economic reforms in Cuba, and declared vaguely that he would himself shortly submit other proposals of a more satisfactory nature. This did not satisfy the Constitutionals, who asked for further explanations, which the Minister declined to furnish, saying that he had to go to the Senate, but would shortly return. This so offended the Constitutionals that seventy of them have withdrawn from the Chamber and refuse to return. The Minister, at the latest accounts, refuses to explain or apologize further, and the crisis grows more grave. Campos has spoken, but does not seem to know more about the causes of his resignation than anybody else. If one may judge from the cable despatches, the Constitutionals have nominated a sort of committee of safety to follow the matter up.

SECRETARY SHERMAN AND THE LEGAL TENDERS.

SECRETARY SHERMAN has made an exposition of his plan of keeping $300,000,000 of Government notes afloat as a permanent part of the circulation after depriving them of their legal-tender quality. His reason for advocating it is that "it is both politic and right for the United States to maintain in circulation a carefully-limited amount of United States notes, always redeemable in coin, supported by ample reserves in coin, and supplemented by the circulating notes of national banks." Government notes, he maintains,

"are in some form or another an essential part of the national currency, and the Government alone cannot maintain intact a coin reserve sufficiently large to support such a currency at par with coin. The saving of interest on the notes would more than compensate the cost of such a reserve. Banks and corporations cannot alone do it, for when such a reserve as is necessary is scattered over the whole country among 2,000 banks it would be attacked in detail, and the failure of a few banks would impair confidence in and destroy the whole system. Banks can properly and ought to supply a large portion of the currency to meet the ebb and flow of business, but to make assurance doubly sure the Government must hold in its vaults, under all the safeguards of the Sub-Treasury laws, a coin reserve, and one ample enough and concentrated beyond the reach of private speculation to meet any probable demands that could be made upon it. When it does this I do not see why it ought not to have the benefit of the saving of interest on so much of the public debt as is represented by United States notes."

There is a certain obscurity here which we wish he had cleared up. The banks, of course, could not be counted on to meet the demand for gold created by the issue of $300,000,000 of Government paper; but no one would ever suppose that they could. Mr. Sherman assumes that his issue of Government notes is "politic and right," which is the very point in dispute, and proves it apparently by declaring that the banks could not keep up the reserve of gold sufficient to keep these notes at par, which nobody ever doubted. If it be expedient for the Government to undertake the functions of a bank of issue it must, of course, keep its own reserve in coin. But is it expedient?

The only reason he gives for thinking that it is expedient is the following: After the repeal of the legal-tender clause, and the authorization of contracts either in gold or paper (which exists already),

"We should then," he says, "have a sound financial system based upon coin, but so arranged that the amount of coin in the country would be utilized to the utmost extent of safety. As I said to you, a national-bank system pure and simple could not do this, because the coin reserve would be distributed among two thousand banks, and instead of a great reservoir accessible to all we should have only a great number of little ponds. On the other hand, a circulation of Treasury notes alone would hamper industrial enterprise by a lack of the elasticity which a free banking system so judiciously and safely secures. Combine the two as I have suggested and you have stability, elasticity, and safety united, and the possibility of an unsafe inflation is prevented by the fact that, Treasury notes being no longer a legal-tender, there can be no inflation of them, because, when redundant, they would flow in for redemption in coin. The limit of $300,000,000 fixed by the Resumption Act I consider to be perfectly safe."

The national-banking system is a system "based on coin," for the simple reason that when greenbacks cease to be legal-tender the banks may be compelled to redeem in gold, and will have no more difficulty in doing so than they now have in redeeming in greenbacks. It is "sound" because behind the banks stands the Government, holding security for the payment of the bank-notes in gold, so that an over-issue of such notes, resulting in suspension of specie payments by the banks, is impossible, and Mr. Sherman's theory that "the failure of a few banks would impair confidence in and destroy the whole system" is, therefore, absolutely baseless. The law provides ample security against their failure as regards their notes. It is only depositors who can possibly suffer from their bad management. His assertion, too, that the Government would, through his plan, supply a great reservoir of coin "accessible to all," needs a good deal of explanation or limitation. No reservoir of coin is or can be "accessible to all"; it is only accessible to those who hold the notes which the coin is intended to secure. It makes no difference whether this reservoir consists of two thousand small ponds or one great lake, as long as it can be got at by noteholders, and the system by which the holders of bank-notes can draw on it is at present perfect. In fact, Mr. Sherman's admission that the banks would have to be relied on to supply that elasticity of the currency which industrial enterprise needs, is a surrender of his whole case. Elasticity of the currency means a state of things in which not only can a trader obtain more paper when he needs it for his home uses, but can turn his paper into gold readily when he needs the gold for foreign exchange. If he can do this through the banks, and through the banks only, the bank reservoir of gold is all-sufficient. The analogy of the Bank of England is misleading because it enjoys a monopoly of paper issues at the great financial centre, and the holders of paper, therefore, when they need gold *must* go there, and it can do what Mr. Sherman does not propose that the Treasury should do here—namely, increase or diminish its paper issues according to the demands of the market. In fact, when we analyze his scheme, all it amounts to is that it would be a good thing for the Government to make a fixed addition to the currency of $300,000,000, and thus save the interest on about half that amount of its own indebtedness. The connection of the scheme with the safety of the paper in circulation is wholly fictitious. If this $300,000,000 were withdrawn the vacuum would be filled up at once by the national banks, if the country needed the money, and the bank circulation thus supplied would be secured in the very manner in which Mr. Sherman proposes to secure the Government notes—namely, the pledge of the Government to redeem it in coin in case of the failure of the banks to do so. If, on the other hand, the country did not need this amount, it could be returned for redemption to the banks just as readily as to the Treasury by those who needed the gold. In fact, the plan is so vague and cloudy, and bears on its face so many defects, that one cannot avoid the feeling that it is no more a finality with Mr. Sherman than his talk about silver before the Congressional Committees two years ago—that is, that it is simply one of the devices by which he humors the politicians or entices them on to what he has more remotely in view, but is afraid to propose openly and directly. It may be that this mode of bringing the country back to sound finance is more effective than telling the honest truth would be, but it is one which everybody cannot be expected to adopt, and which we, for our part, do not believe in. On the contrary, we think it debauches public opinion and lowers the tone of public life.

His "reservoir" of coin would differ, too, from all other banking reserves in the world in being liable to destruction or diversion to other uses by the votes of a body which has repeatedly and in the most solemn manner placed on record its contempt for the experience accepted and acted on by the commercial portion of the civilized world, and has treated the opinions of those who make finance a business, in all civilized nations, as the devices of cunning speculators for the plunder of the poor. The resumption of specie payments has really been brought about almost in spite of Congress. The Act under which it has taken place was passed because the bulk of both parties did not believe it could be executed, and it probably would not have been executed if the extraordinary succession of bad harvests in Europe and good harvests here had not, in combination with the high tariff, in a measure forced the greenbacks to par by pouring gold into the country in unprecedented volume. That Secretary Sherman skilfully took advantage of these favoring circumstances we do not deny, but we do deny emphatically that there is anything in the connection of Congress with the matter to warrant the belief that it would be restrained either by doctrine or feeling from hereafter meddling either with a great coin reserve or with a fixed amount of Government notes. If the legal-tender character were now taken away from greenbacks, and the issue of legal-tender notes in time of peace were declared by the Supreme Court unconstitutional, undoubtedly the chief temptation to increase the volume of greenbacks would be gone; but no such

decision would lessen the temptation to suspend specie payments during any commercial crisis, or to repudiate the whole issue. The very existence of the Government notes has filled the heads of politicians with currency schemes to a degree before unknown in American history. A very large number of members of Congress think of nothing else, and keep their imaginations open for every financial absurdity which is invented in any part of the world, and only a small number have the training or experience or modesty which qualifies them even to discuss such subjects. As long as there is an immense body of Government paper in existence which is as good as gold in the market, and behind it an immense sum in gold lying idle in the Treasury, these men will never take their eyes or their minds off either one or the other. They will fill the land with schemes for getting at it or "utilizing" it, or giving the poor man a chance at it, or preventing it from enriching "the money kings" and the speculators. They will inject declamation about it into every party platform, make up issues out of it for every election, and fill every winter with debates over it. We grant that, as Mr. Sherman says, they are not likely to get any legislation through which would seriously damage the public credit, but they are certain to keep legislation constantly pending which would alarm the business world, impair confidence, promote gambling in all sorts of securities, and make financial folly the main staple of our politics, to the exclusion or serious detriment of healthy thought and action on other and really important subjects.

The creation of the national-banking system was, next after the removal of the slavery cloud from the political horizon, the best result of the war. It has worked and is working admirably. It promises to supply all the wants of the country as regards a stable and sound and elastic paper currency, and probably none of the strange devices in politics to which Mr. Sherman thinks it advisable to resort is stranger than his present attempt to discredit it by representing it as likely to break down in a panic by over-issues of notes. He of course knows that the banks cannot break down in this way; that their danger lies in excessive discounts; and that a non-elastic currency of fixed amount, such as he proposes that the Government should issue, would at such a crisis afford no relief. In the period of inflation which usually precedes such a crisis the Government paper would be all afloat. Suppose the crisis to come and banks to collapse, what relief could the Treasury then give? The answer to this question goes to the bottom of the Secretary's plan and of the reasoning by which he supports it.

PRESIDENTIAL "GERRYMANDERING."

ACCORDING to the *Herald's* Washington correspondent a scheme for dividing the electoral vote of this State next year is being seriously considered by Republican Congressmen, and in some quarters finds a good deal of favor. As things look now, the thirty-five votes of New York will decide the Presidential election of 1880. The number of electoral votes required to elect is 185. The South casts 138, and these the Democratic candidate is sure to get. New York and New Jersey have 44, which with the 138 Southern votes would give the Democrats 182. Oregon or California or Indiana might easily make up the required number. The Democrats might fairly consider it very hard luck if they lost all those States. New York, of course, they count upon carrying, because all the recent votes in the State elections have shown large Democratic popular majorities. But there is one way in which this electoral slate could be completely broken. If the New York electors were to be chosen by Congressional districts instead of on a general ticket, the result, judging by the present complexion of the State, would be that, instead of New York going "solidly" Democratic, three-quarters of its electors would be Republicans. This would make the election of a Republican President almost certain.

We should not be at all surprised to see a vigorous attempt made to carry the plan into execution, for to the men who now control the destinies of the Republican party in this State and to Stalwart Republicans throughout the country it is one which must have many attractions. It is not illegal, since the State may appoint its electors in any way it sees fit; it would undoubtedly be carried through by the Legislature if the Conkling-Cornell managers ordered it done. It would exasperate the Democrats, and very likely lead them to do something very injudicious, and almost certainly bring out some Southern speech-making of the sort which just now constitutes the best capital the Republican Stalwarts have. It would, moreover, be a bold *coup* in the somewhat desperate game that this wing of the party are now playing for the retention of power; for it must be remembered that within the past month or two the struggle between the two parties has, so far as the Republicans are concerned, become almost entirely a contest for the possession of the Administration during the next four years by what they themselves touchingly describe as the "Old Set"—*i.e.*, the band of hardened political gamesters who surrounded Grant during his second term. The new device for "fixing" New York bears all the marks of their workmanship, and we think we may venture to predict, without much fear of error, that it will have the cordial support in New York of every Republican who helped to nominate the present Governor of the State, and the opposition of every one who opposed his nomination.

It is hardly worth while to waste time in discussing the fairness of the plan. Republicans who support it will not pretend that it is fair, but merely that it is a less unfair way of securing the vote of a State than the Democratic methods of intimidation and extermination. Of course, they will argue, if all elections were conducted in a perfectly just manner all over the country, there would be serious objections to adopting a new method of appointing electors in a single State so as to secure the success of the party which by an accident happened to have the temporary control of the Legislature of that State. But then things are not managed fairly. What do we see the Democratic party doing in the South? Have they not in half a dozen of the most important Southern States actually disfranchised entire populations, and transferred the electoral machinery to their own hands by frightening the peaceful and law-loving Republican negro away from the polls with bludgeons and shot-guns? If such things can be done in Southern States, it seems to become almost a sacred duty to use all legal means to "fix" any Northern States of which we may have temporary control. Moreover, when we consider what the composition of the Democratic party is throughout the country, its support of the rebellion and slavery, its opposition to the reconstruction measures, its wild schemes of inflation and repudiation, the extra session, the Potter Committee, etc., etc., it does seem as if almost anything was justifiable which should prevent the Government from falling into their hands.

As a method of forestalling the vote of a State the plan is by no means a novelty. In 1800, when the Federalist party was on the point of losing the Presidential election of that year, Hamilton proposed to Jay, then Governor of New York, to call the outgoing legislature together in order to effect the choosing of electors by districts, instead of directly by the new legislature, as was then the mode. The arguments by which Hamilton supported his proposal bear a striking likeness to those by which the Stalwarts now endeavor to recommend their scheme. "In times like these," he says, "in which we live, it will not do to be over-scrupulous. It is easy to sacrifice the substantial interests of society by a strict adherence to ordinary rules." He points out that the Anti-Federal party is "a composition, indeed, of very incongruous materials, but all tending to mischief," and adds that "in proportion as the true character of the party is understood is the force of the considerations which urge to every effort to disappoint it, and it seems to me that there is a very solemn obligation to employ the means in our power." The Anti-Federals were the "bad men" of 1800, just as the Democrats are those of to-day. Jay's endorsement on Hamilton's letter, "proposing a measure for party purposes which I think it would not become me to adopt," and the immediate abandonment of the scheme show what a queer, punctilious set of statesmen had control o the country then. It was hardly the endorsement that a states-

man like Mr. Cornell would probably make on a letter, say, from Wm. E. Chandler or Eugene Hale making a similar proposal.

The revival of this scheme by the Stalwarts throws a curious and almost comical light upon the discussions of electoral reform in Congress and elsewhere during the past three years. It has been conceded by every one who has considered the question that our electoral system is not satisfactory, and a number of plans have been brought forward to correct its defects and bring it nearer an ideal system. Election by districts and election by popular vote, with all possible variations of detail, have been proposed, criticised, put into the form of bills and joint resolutions. Elaborate essays have been written on the subject in the press, and elaborate speeches have been made on the subject in Congress. But whenever the matter has come up for practical settlement, hitherto, the insuperable difficulty has been that any scheme for a change has been suspected of being a partisan device for affecting the next Presidential election, and the mutual doubt and distrust of the politicians on both sides at Washington have prevented any action being taken. But now, just as a Presidential campaign is about to open, the matter is taken up, not this time by idealists and doctrinaires, but by "practical men," who have considered the subject in all its bearings. Instead of beating about the bush with arguments in favor of this or that view of an ideal electoral system they go straight to the root of the matter, and, with that unerring sagacity which distinguishes the practical man from the dreamer, they discern at once that the way to settle the "electoral problem" is to "fix" the State in which you happen to have control of the Legislature six months ahead.

With the Stalwart politicians who have revived it it would be, as we have suggested, idle to discuss the merits of the plan. But it has lessons for that large mass of the Republicans whom the Stalwart managers generally count upon as facile dupes, but who have in the recent election in this State proved their independence of machine dictation. Independent Republicans can hardly fail to see with what danger to public security and the stability of affairs such plots are fraught. Popular irritation and disgust with a party in possession of the Government are sure to be aroused by them, no matter whether they are sanctioned by the letter of the law or not. With the great mass of the voting population the present electoral system is the only one they know anything about. That the States formerly appointed electors in several different ways, and have always retained the abstract right to do so, makes no difference. For fifty years there has been only one way, to which the customs, traditions, and political arrangements of the country have adapted themselves. To change this by a radical alteration of method, affecting the whole country together, and introduced after mature discussion and deliberation, is one thing; to change it in particular localities, with a view to affecting the fortunes of this or that party, is another. It is one which is seen and felt to be intended to make the election itself a farce. After the election of 1876, the danger to the quiet of the country consisted not so much in the chance that an attempt would be made by the leaders of a defeated party to seize the Government, as in the widespread feeling that the political machinery in certain States had been tampered with for the express purpose of effecting a particular result. It makes very little difference, so far as the effect on the popular mind is concerned, whether the trick is done by a Returning Board, acting under forms of law in Louisiana, or by a sudden change of the electoral system through the Legislature in New York. The impression created in both cases is the same—that the election itself is an empty form, which is made to produce whatever results the dominant party for the time being chooses—much as plébiscites were managed under the Empire in France, when the way in which the question was put determined the answer that was given. We do not anticipate for a long time any actual danger to the public peace from the tricks with the suffrage to which the managers are gradually accustoming us. But we cannot shut our eyes to the fact that the time may very soon come when, after an election decided in the midst of great popular excitement, by means of some brilliant device such as it is now proposed to resort to in New York, local discontent may take the form of violent outbreaks, requiring to be put down by the strong hand. The effect of such outbreaks is, of course, in the long run, to disgust quiet people with the very name of elections, and to pave the way for that sort of quiet which is secured by having none at all.

If the Democrats could be expected to learn much from their enemies, this scheme with regard to the vote of the State would have an important moral for them. If it is carried out, it depends for its success upon the voting strength of the two parties remaining as they now are. To defeat it there is only one way open—to nominate a candidate for President who will draw off heavily from the Republican side. With a commonplace candidate they have, of course, no chance of doing this. Such a candidate will represent to the voters of the State nothing but the same political tendencies, ideas, and passions which Congress has been representing in the eyes of the whole country for the past two years. To say that the mass of Republican voters at the North, including Independent Republicans, doubt and distrust these, is to describe their feelings very mildly. As long as the issue to be decided at the next Presidential election is between the *two parties*, we should expect to see party lines remain very much as they are now, and with this State "fixed" the Democrats would have little chance of carrying the country. But a contest between the Republicans led and represented by the Stalwarts, and the Democrats led and represented by a candidate with character, convictions, and principles, would be a different matter. Against an opposition of this sort it would be as impossible for the "Old Set" to "fix" any electoral vote as the old Ring found it to "fix" this city after the respectable classes once discovered that they had been mistaken in supposing that perpetual Tweeds and Sweenys were a necessity of municipal government.

DEMOCRATIC "JOURNALISM."

APROPOS of our remarks in our issue of last week, an entertaining illustration of the way in which the Democratic party is served by its press appears in a late number of the Albany *Argus*, one of the oldest Democratic papers in the country, and in many ways one of the best. The leading article has for its title "Calumniating Parties as a Whole," and the text is "one of the silly sentences" of the *Nation*—viz., "The Democratic party is the party of ignorance." After vigorously denying the truth of this proposition, and showing its "flippancy" and "impertinence," the writer declares that this "slur" on the Democratic party "is on a par with a rake's estimate of the sex of his mother, something neither to be resented nor refuted, simply because it is self-evidently false and ineffably foul," and also "because men do not employ a battery of artillery to bombard a flea." He does, however, resent it vigorously. He goes on to show that though it is "natural" that expressions like the *Nation's* "should postpone in many minds the conception of journalism as either a reasonable or respectable calling," nevertheless this view is "regrettable and unjust." But this is not the worst consequence of the *Nation's* language. It also "tends to break down the securities and conventions of journalism by leading persons to trace the libel, not merely to the paper which prints it, and to stop there, but to the man who owns and edits the paper, and to accord him that social ostracism or personal chastisement which, for such an assertion in society or before an audience, he would challenge and receive." In other words, our disrespectful treatment of the Democratic party "as a whole" may lead to an increase in the number of assaults on editors, beginning with one on the editor of the *Nation*, besides causing him to be cut in society by sensitive Democrats. The writer then points out that impersonal editorship has "obligations as well as advantages"; that "to be respected it must not only respect itself, but respect the rights and feelings of whole factors in the country"—whatever this may mean; and he maintains—somewhat obscurely, however, for his English is peculiar—that to libel a class or party is a worse offence than to libel an individual, because there are so many individuals in the party—this making the libel "enormous"; and he predicts that if we continue "fatuously to provoke it" a "rude reminder that a libel is dangerous in proportion as it is large" will be "administered" to us "one of these days." He then severely criticises the state of the law which provides no penalty for libel on "whole classes and parties," but leaves it to "natural and social and personal forces"

which means, we presume, earthquakes, "ostracism," and assault and battery. If this is correct, we must say the law *is* atrociously defective. The remainder of the article is equally alarming, and, in fact, points more and more plainly to the plan of making editors respectful to the Democratic party by means of corporal punishment:

"The State says in effect: 'The offences too large for judicial regulation are left to the public manhood to deal with.' The journalism of wholesale defamation is gravely interested in whether the majority of the American people, or impulsive persons in political sympathy with that majority, will for ever tolerate the systematic abuse to which the majority is treated. If the theory that that abuse will be for ever tolerated should be a delusion and some 'able editor' should find his person violently abraded, he would possibly also find that a jury of the period, with sundry 'of the party of ignorance' on it, would declare that the abuse of assault was less than the abuse of assertion. A 'reform' in that much of 'journalism' would follow to a certainty; for the epicene gentry never let their phrases put them in peril or their syllables interfere with their safety—when they are aware of it."

If this threat is carried out, "the loud lament and dismal miserere" of the Republican editors undergoing their chastisement will fill the land, for there is hardly one who does not occasionally use uncivil language towards "whole factors in the country." But then the process will hardly give the Democrats a majority at the polls. We commend the *Argus* article to the perusal of those who are puzzled by the constancy with which the North remains Republican.

DAUDET'S 'ROIS EN EXIL.'

PARIS, Nov. 28, 1879.

THE 'Kings in Exile' is the title of a new novel by M. Alphonse Daudet, the author of 'Jack,' of the 'Nabab,' and other books.* It seemed to me that in 'Jack,' which is so far his best novel—even better, in my appreciation, than 'Froment jeune et Risler aîné'—Daudet had attempted to become a sort of French Dickens. There is a vein of humanity, of tenderness, of love for the poor, the despised, the suffering, in 'Jack' which was very charming and very peculiar. But M. Daudet has changed his manner. He has become less humane and more Parisian. He himself calls his 'Kings in Exile,' on the title-page, a "roman parisien." Paris is indeed essential to his new heroes. In the present work he has undertaken to show what becomes of the fallen potentates of the world, of the whole world, in this terrible crucible of Paris. It was a bold attempt. We Parisians are somewhat *blasé* in respect to kings and emperors in exile or in disguise; but it was not easy to describe their lives without writing a libel or a pamphlet. Daudet was obliged to choose types, and he has appended to these types stories which are here familiar to all. His work would have been hardly worth noticing if it had been nothing better than a collection of articles put together from the *Figaro*. We have our daily *menu* of scandals. We recognize very well the characters of the * * or the initials of the newspapers. Everybody knows the princes whom Daudet alludes to here and there, but it seemed difficult to construct a drama of scandals which are only fit to amuse a club for an evening.

What Daudet has really meant to show and to paint is the contrast between the princes who believe in themselves and those who no longer believe in themselves. It is immaterial whether they are or are not in exile. There are great kings and emperors sitting on their thrones who do not believe in their own royal or imperial mission, who have no monarchical faith or creed, who play their part without understanding it, without believing in it. They are actors; and it is wonderful to see how much interest most princes and sovereigns have taken in actors and in actresses. They feel instinctively that there is a certain sort of brotherhood between them. They also are on the stage, and they also like to become men again behind the scenes. Daudet's title ought to be, not 'Kings in Exile,' but kings who don't believe in themselves. To such kings, of course, like the hero of the novel, the Prince of Illyria, exile is a terrible trial, and exile in Paris a most dangerous experiment. They find themselves in the most revolutionary city in the world, a city where every stone speaks of some insult offered to royalty. The Prince of Illyria, who is a Slav, a child in character, a sensual youth, finds himself one day stranded in this Paris. He has no longer any duties; he has only vices and instincts. To him a revolution has been a deliverance. He plunges at once into the abyss. He is like the butterfly before a brilliant light. This noisy, deafening, brilliant, smiling Paris is the Circe who will turn him and his friends into swine. He has nothing to defend himself with—no profession, no work, no hope, no thought. The few remnants of his past, the shadow of etiquette which a few devoted friends keep up, the homages of old faithful followers, become odious to him. What he wants is liberty. He is free for the first time in his life.

You will conceive at once that such a character furnishes the writer with the elements of a drama; for, if the Prince of Illyria is a renegade from monarchy, if he abhors in his heart those monarchical principles which have assumed the shape of monarchical duties, the Princess, his wife, is a true queen. She is a devotee of the monarchical faith; she is unbending; she believes in herself, in her rights, in the rights of her husband, in the rights of her young child, Zara, with an ardent, unselfish, religious faith. In the contrast of these two characters you have all the drama; and it must be confessed that the contrast is drawn in the novel with much ability, and sometimes with much beauty. The Queen is really the man. She fought the last battles for the King; she preserves in all their purity the forms, the traditions, the phantoms of the past; she is impersonal; she is a character; she is a type. He cares only for pleasure; she cares only for greatness. He is courageous, but only on the battle-field; she is courage itself, heroic, ready to give life, fortune, everything for the cause. She is ready to ascend the scaffold as quietly as Marie Antoinette. She never has a doubt. She lives in this modern, turbulent, noisy, impudent, insolent Paris as she would in a cloud. The mud of the streets cannot touch her.

It is impossible here to describe all the accessory characters, which are very numerous. Some of the followers of the little court of Illyria, transported to Paris, are very touching in their fidelity, some are half touching and half comical. The true hero, after the Queen, is a Frenchman, a plebeian, the tutor of the Queen's little child. It seems that Daudet has really known a person of this sort, a royalist Gambetta—I mean the Gambetta of old times, who lived in the Quartier Latin, and was always ready to pour out to his friends torrents of easy and imaginative eloquence. Élysée is the name of this tutor; he is a royalist; he has the same religion as the Queen. The faith which was distilled in her veins in infancy, which is born in her through the inscrutable mystery of hereditary instincts, this same faith has been adopted by the poor student. In his coarse clothes, with his ungainly appearance, his unkempt hair, his violence, he is still in perfect harmony with the calm, austere, majestic Princess of Illyria. They feel alike, they see alike, not only on points of principle and of politics—on all points. They have the same notions of honor, the same supreme contempt for the mere glitter of rank, of fortune. Of course, Élysée falls in love with the Princess; he conceals his love in his heart, and feels it to be almost a madness and an insult to his ideal. "Je suis un ver de terre amoureux d'une étoile," as Victor Hugo says. Élysée is a very original character, and not an impossible one. There is an old vein of royalism in France which is not always found in the aristocratic classes; you will find it sometimes, to your great surprise, where you least expect it—in a peasant, in a poor clerk, in an *épicier;* and the very name of *épicier* in France seems to forbid any disinterested sentiment.

The most Parisian characters of the work, taking the word in the bad sense, are those intriguers who attempt to ruin and disgrace the Prince of Illyria, to drag him by the most diabolical means to an abandonment of his hereditary rights, and to a complete renunciation of them. This struggle is the story of the book. The King is protected by the Queen, by Élysée, by a few devoted followers; his enemies choose as their instrument a man called "Tom Levis" in the book (anybody in Paris could give you the real name). Tom Levis is a speculator; he cares for nothing but money; he deals in apartments, pictures, thrones, revolutions, medals, loans; he wants the commission which has been promised him if the Prince, covered with debt and threatened with disgrace, signs his renunciation. He is determined to ruin the Prince; a very easy task with such a prince in such a city as Paris, and with such an ally as Sephora. Sephora is a type; she is the cold daughter of Israel, who fulfils *her* mission in dishonoring the sons of men, especially when they are Christians. She is a sort of partner of Tom Levis, and finishes what he has begun. They are both vultures. And what prince in exile or not in exile has not had his vultures? When you hear of such or such a one arriving in a city you can name at once, almost with certainty, the vultures who will appear with him at the theatres, at the clubs. The world in all countries has its vultures, who feed on carrion, on weak and stupid youth, on inexperienced folly, on hungry passions. The princes of finance have their vultures as well as the princes of the blood.

Sephora is admirably drawn in the book; she does her part with a serenity which has something appalling; she is working for her family;

* 'Rois en Exil. Roman Parisien. Par Alphonse Daudet.' New York: F. W. Christern.

she really likes nothing but her dirty, gregarious home, where there is no question except of buying and selling. The Prince, driven almost mad by her frigidity and her insensibility, makes her a countess, gives her a palace, tries to make a queen of her. She despises him, and feels nothing but contempt for the poor fool, whom she leads, step by step, to that fatal renunciation—that is, to dishonor. When the crisis comes the dishonor is complete. It does not come quite as Sephora wished—the Queen saves the King once more ; but when he starts for Illyria, to place himself at the head of the friends who are conspiring for him, Sephora contrives to keep him one day too long. By her means the conspiracy is discovered, and the friends of the unworthy prince are tried by a court-martial. The end of the story is almost too painful. The Queen herself is finally divided between her regal duties and her maternal love. Zara, who is everything to her since Christian has dishonored himself—the poor, sickly Zara—is taken by his mother to a great physician. He is threatened with blindness ; an operation might save him from it, but it would endanger his life. If he is blind he cannot be king ; if the operation is performed he will probably die. "Règne ou meurs." The poor mother cannot find the strength to sacrifice her child : "Qu'il vive ! qu'il vive !" And there is the end of a race. The Princes of Illyria will disappear, others will occupy their place.

The book is singularly clever ; it is full of life. I have, of course, only touched a few points. There would be much to criticise in Daudet's style. He is in literature what our "impressionists" are in painting ; he is sketchy ; his descriptions make you think of the wonderful drawings of the new school. But drawings are not pictures. They want finish ; they seem to have no durability ; they are mere instruments ; they ought not to be the end. Still, I would not find too much fault with Daudet. We live so rapidly that sketches are perhaps enough for us. The school of Zola produces such horrible novels that it is something to find one which, after all, leaves a strong, healthy impression. This impression is very clear : the "kings in exile" are poor creatures who have ceased to believe in themselves. A king, a minister, a priest, a servant of the people, must understand himself. He cannot divide his life into two parts, and believe that he can think differently on the stage and behind the scenes. Kings and princes must be in earnest, as well as soldiers or priests. We do not allow a bishop to forget his see ; we cannot allow a public man to forget his public character. A deep moral lies hidden under the frail and colored envelope of these "Kings in Exile," a moral which can be applied to all human beings : for we are all of us "kings in exile," and, to use the beautiful words of Lamartine,

"L'homme est un Dieu tombé qui se souvient des cieux."

Correspondence.

POPULATION IN THE UNITED STATES.

To the Editor of The Nation :

Sir : In connection with a paragraph in your last issue touching the undeveloped resources of the United States, permit me to call the attention, especially of your English readers, to the article "America" in the 'Encyclopædia Britannica.' After a careful estimate it arrives at the conclusion that, "if the natural resources of America were fully developed, it would afford sustenance to 3,600,000,000 of inhabitants." While the United States contains only a little more than one-fourth of the area of North and South America, it has nearly one-third of the arable land. If, then, the estimate of the 'Britannica' be correct, the natural resources of the United States, fully developed, are capable of sustaining a population of nearly 1,200,000,000—equal to the present estimated population of the globe.

This estimate seems extravagant until we remember that even such a population would give us but three hundred and sixty-four persons to the arable square mile, while England to-day has about three hundred and eighty-nine. Josiah Strong.

Sandusky, O., Dec. 8, 1879.

THE VENUS OF MILO.

To the Editor of The Nation :

Sir : In the interest of the public I claim your courtesy to make known a new source of information regarding the statue of a so-called "Venus" owned by France. An unassuming publication has been issued by an individual to whom the following invitation, emanating from the French legation at Athens, was addressed in 1847 :

"Come to-morrow, whether disengaged or no, and breakfast with us at Patitia. You shall be placed at table beside Mr. Brest, our consul at Milo, the first man who *saw* the beautiful Venus on her antique pedestal."

The story rehearsed then and there by the discoverer of the statue, before a numerous company of diplomatists, art-students, and tourists, was noted down in subsequent private interviews accorded to M. Doussault, architect by profession, and now author for this occasion only. The documents thus obtained, with additions of drawings executed under the direction of Mr. Brest—showing the ground-plan and elevation of the ruins which contained the statue—are worthy of attention from all to whom the question of the Venus of Milo is not irrevocably closed by some patented invention of their own. I subjoin the title of M. Doussault's curious pamphlet,* of which I hold a copy, which is wholly at your service. M. F. C.

Boston, Dec. 13, 1879.

THE MANUFACTURE OF OUTRAGES.

To the Editor of The Nation :

Sir : The following paragraph, cut from the columns of the New York *Tribune* a week or more ago, is going the rounds very generally of the Northern country Republican press :

"The exodus of the negroes from the Southern States to Kansas is attributed by a correspondent of the leading English journal to the unheard-of cruelties and oppressions to which they are subjected by the planters. An instance of the atrocities is cited. A respectable colored man went to Kansas at the beginning of the exodus, worked diligently, saved money enough to buy a little building plot, built a hut, went back to Mississippi for his wife and family, and was seized, dragged from the house, and both his hands were cut off ! He was then told, with fearful oaths, to 'go to Kansas now and work for your family and make a fortune !' The poor maimed man has returned with his wife and little ones. Another instance is even more heartrending. A young man who, after working hard in Kansas for some months, laid by $100, went back to marry and fetch his bride. The very night after his marriage he was dragged from the house, both hands and arms were cut off above the elbows, and he was left to bleed to death."

Now, on its very face this whole statement is so palpably a lie that one wonders at the *Tribune's* consenting to give it an appearance of authenticity by reproducing it. Think of a man with both hands cut off preserving physical strength sufficient to travel from Mississippi to Kansas ; and strangest of all, that in these days when the newspaper man is alive everywhere for items, no one chronicled his journeyings ! Where is the poor maimed man now ? If he was to be found in Kansas, anywhere, or at any time, could it be doubted that the Stalwarts would have overlooked the opportunity to make votes by putting him on the political platform as a spectacle in every closely-contested State ? In face of such an exhibition Blaine and Chandler would have been nowhere. But there have been, according to the English correspondent, two such horrible cases of mutilation. Prudently, in the second case, the victim was allowed to die ; but if a single person, intelligent enough and with a will to write to the press, actually knew of such a transaction, does it stand to reason that an occurrence which throws all the Chisholm and Dixon outrages into the shade, would escape investigation, and that its details would not have been read throughout the land ?

What, then, is the object, and what the political morality, of intelligent editors who give place in their columns to such calumnies against the people of one section of the Union ? The answer is sufficiently obvious. W.

New York, December 8, 1879.

[This "story" first appeared in the London *Daily News* some weeks ago in a letter from Mr. Allen, the Secretary of the British Anti-Slavery Society, who said it had been sent him by "a friend" in Kansas. He believed it and commented on it with proper horror. We marked it for notice at the time, but subsequently overlooked it. Of course, apart from its intrinsic improbability, the failure of the Stalwart papers to take it up is fatal to it. A colored man with two hands lopped off would have been worth any money in the late canvass, and would be used all this winter to prevent discussion of the currency question and throw discredit on civil-

* 'La Vénus de Milo : Documens inédits. Par C. Doussault, Architecte.' Paris : Paul Ollendorf, éditeur, 28 rue de Richelieu. 1877.

service reform and justify the gerrymandering of this State in preparation for the Presidential election. In fact, he would be used for all sorts of purposes. Mr. Blaine would never let him out of his sight, and Mr. Conkling would carry his photograph, and they would produce him in debate to "stir up Ben Hill." One of the remarkable things in the evolution of "the story" is that each Stalwart paper is getting to have its own "murders," and to keep silent about "murders" discovered by rivals. The use made of the Chisholm case by the *Tribune* was, in fact, fatal to any combination in the business.—Ed. Nation.]

To the Editor of The Nation:

Sir: I have been a pretty constant reader of your paper for a long time, and agree with most of its views, so I rarely feel called upon to write letters about its utterances, as I see a large fraction of the great American people are in the habit of doing. But one such letter, which I have just read for the first time, though you published it several weeks ago, seems to need a little response.

Though I do not live in Maryland, I have many friends and connections in that State, and spend a certain amount of time in it every year, besides having constant advices from its most conservative portions. I have long been of the opinion that in States farther South political outrages have frequently occurred, and I have thought it not unlikely that in some cases they might have decided elections; but the total absence of anything of the sort from my observation and experience in Maryland had made me adopt various ingenious theories to explain the cause of the difference. The *fact* of orderliness was too obvious to be questioned.

I was more than astonished to find in a recent copy of *Harper's Weekly* one of Nast's sulphurous cartoons which was calculated (by a skilful use of one or two trivial incidents, real or supposed) to give the impression that a reign of terror existed in this quietest of States; and now it seems that your correspondent writing from New York has devoted his energies to the same work. I do not know what may be the effect of such representations on others, but they have cast discredit for me on the whole batch of Southern outrage reports. When men place one State in a wrong light, what certainty can I have that they are not treating every other in the same way when their ends can be served thereby?

Suppose there *was* a disturbance at Elkridge Landing, do not such things continually occur in cities like New York and Philadelphia during exciting elections? Men must change their nature, or grow much wiser, before these election rows entirely cease in any State. Your correspondent's letter is based apparently on no other foundation of fact than this probably overrated incident, which seems to be little known in the State where it occurred; yet he proceeds to make broad charges about intimidation in Maryland, which, I have no doubt, are essentially untrue. He asserts that Anne Arundel County is systematically "roughed" at every election, so that a four-hundred Republican majority is annually changed into a much larger Democratic majority; but he takes good care not to touch upon the fact that almost the only palpable evidence of "roughing" at the last election was the murder at the polls of a white Democrat by a colored Republican. Again, he omits to tell us how it comes to pass that Talbot County (in sight of Anne Arundel) often gives Republican majorities of from four to a dozen. Can it be that the Democratic leaders prefer to buy or bull-doze four hundred voters rather than four? Or are we to believe that all the weak-kneed Radicals have gathered in a single county? If a mass of Republican voters operates as a magnet for savage Democratic bull-dozers, why is not their attention turned effectively to the lower Western-shore counties, where colored majorities still seem to produce their supposed natural effect? The statements will not bear examination from any point of view, and, further, it is proverbially hard to convince a man against the evidence of his own senses.

I am not a bigoted partisan nor a blind admirer of the Southern character. I often offend my friends of that section by my plain speaking about their faults. But the worst possible way to convince a man that he errs or sins is to rail at him as a monster of villany, and impute to him crimes which he knows (and knows you know) he never committed. It is true that Southerners, like children, are under the dominion of their passions to a greater extent than a Northern-reared man can readily imagine. I have often been both amused and shocked to see how some utterly insignificant trifle would transport a man who was generally considered as wise and well-balanced. They are altogether too ready to set down anything done on impulse in the category of unavoidable accidents. But it is only fair to say that the greater number of these explosions do not operate outside of very narrow limits, and rarely go beyond words; that they hardly ever have any predetermined or systematic character; that they accompany a tone of mind which disdains offences against property or truth; and that the impulsiveness which prompts them prompts no less readily all manner of acts of good-will. So that, on the whole, Maryland is no worse than States farther north.—Yours truly,

W. H. Babcock.

513 Seventh Street, Washington, D.C., Dec. 11, 1879.

To the Editor of The Nation:

Sir: If you do not deem the subject of "Maryland bull-dozing" exhausted, perhaps you will find space for this response to the communication from Mr. Edward J. Shriver (whose name is erroneously printed Shrizer), which appeared in your issue of December 4. According to Mr. Shriver, the accusations of "Democratic slaughter of negroes" and "repeating," at our last election, do not "rest upon partisan or doubtful authority in the least." As to the general charges I submit the following extract from the Baltimore *American*, the only avowedly Republican daily in this city, and the recognized organ of the party throughout the State. Mr. Gary being the Republican candidate for governor, and Mr. Hamilton the Democratic candidate, the *American* spoke as follows the day after the election:

"Against the strong current of popular sentiment which ran in favor of Mr. Hamilton, Mr. Gary, with all his tact, ability, and popularity, could not make any headway. So far as the personal attention of Mr. Gary himself could extend, his canvass was admirable. His own behavior on the stump was marked by the fairness and honesty which belong to his nature, and everywhere that he appeared he produced a most favorable impression, and gained the good-will and esteem of his hearers. But great as was his personal popularity and able as was his canvass, it availed nothing against Mr. Hamilton's popularity, and the deep rooted prejudice of the majority of the voters of the State against the Republican party—a prejudice which the reputation of some of those who appeared on the stump in Mr. Gary's interest was not calculated to decrease."

So much for "partisan testimony" from Mr. Shriver's own partisan newspaper. As to the specific mention of Col. Charles Marshall, with the implication (ingeniously substituted for direct assertion, which might have ensured too prompt refutation), that he witnessed "slaughter of negroes" and prevented "repeating," you will see, by the enclosed "interview," clipped from the Baltimore *Telegram*, that the colonel denies having seen or interfered with either "slaughter" or "repeating," or having any knowledge that either was attempted at the Elkridge precinct, where he met Mr. Shriver; and that all the wrong Col. Marshall saw was a charge made on a party of negroes by some white roughs, who fired revolvers in the air and at the ground, which occurrence was entirely over before the polls were opened or the election had commenced; and, finally, that the whites concerned left the place immediately after the affray, and, to the best of Col. Marshall's belief, never returned, being overawed by the strong disapproval of their conduct manifested by the majority of the bystanders, Democrats as well as Republicans. Mr. Shriver figures up Anne Arundel as a Republican county, on the usual Stalwart assumption that every negro is of necessity a life-time Republican. One word as to the election of 1875. Your present correspondent was officially employed by both sides to make stenographic reports of the testimony taken in a contest for seats in the Legislature for the Second District, which grew out of that election. This district comprises several of the most troublesome wards of the city, and the evidence showed conclusively that both sides had armed their "roughs," anticipating a close fight; that collisions had resulted, and that the Irish Brigade, as usual, was too much for the noblest valor of the colored troops. Every negro arrested on that day had a revolver on his person. The proceedings may involve a reflection on republican institutions, but do not appear to bear more heavily on one party than on the other.

Will you permit me to offer a suggestion in this connection? If, as the Stalwarts allege, a few dozen white men can, by terrorizing, disfranchise thousands of negroes, does not this prove the negro to be unworthy the privilege of the ballot? To use United States soldiers for the "protection" of such a shabby fellow is certainly contrary to the spirit of our institutions, and already we hear talk of a change in our form of government for the sake of making such employment of the military regular and lawful. Might it not be better to adopt the ideas so ably urged by Hon. Montgomery Blair, and disfranchise the African at once? Such a measure would diminish the Southern representation in Congress, and for ever put an end to the waving of the "bloody shirt." Thus sectionalism would vanish, and future political contests, North and South, would turn

altogether upon questions of administration, such as engrossed the attention of our statesmen in that happy period "before the war." Would not such a consummation be cheaply purchased at the price?

Very truly yours,

J. T. RINGGOLD.

OFFICE OF THE TELEGRAM, BALTIMORE, December 9, 1879.

[Would it not be an odd proceeding to disfranchise a whole class of voters, and a very large one, because they do not want to fight with deadly weapons at the polls when they go to vote, in the presence of the police and the militia and with the courts sitting? Would not this cause of disfranchisement cover a large and highly respectable body of white voters? How many middle-aged business men, lawyers, professors, and ministers would ever attempt to exercise the franchise if they had to make their way to the polls revolver in hand, and run the risk of having to engage in single combat with a rough? No doubt timidity, or inability to use overwhelming physical force to execute the law, is a fatal disqualification for government on the part of a majority in an independent State; but no Southern State is independent, and in all but three the negroes are in a minority, and we have, therefore, no more right to call on them for the display of martial ardor when they go to the polls to vote than when they go to the savings-bank to make a deposit.—ED. NATION.]

TO THE EDITOR OF THE NATION:

SIR: It is necessary that I should appear somewhat egotistical in order to explain why I seek to join the noble army of martyrs who each week immolate themselves upon your sharp pen. I am a Southerner; I also am a Democrat—one by inheritance and by conviction. For the opinions or criticisms of most political papers I have a great contempt, as I know that those which damn our virtues and those which extenuate our vices are both moved by the same power—money. But when a paper which has earned a reputation for great candor regarding the party with which it has aligned itself, and for fairness toward the opposing one, and which is supported by the cultured and liberal of both parties, quietly assumes that Southerners are, and always have been, "brutal," and that the Democratic party is essentially the party of ignorance and corruption, I feel compelled to say something; not as one having authority, but simply as an ordinary citizen reporting what he sees and thinks.

In number 751 of the *Nation*, upon the first page (335), in speaking of the Grant "boom" at the South, you say that the Southerners resist negro ascendency in their "old, wild, brutal way." Now, when you say "old," I am afraid that you have tacitly adopted the idea disseminated by the book-makers of the North in ante-bellum days, and have in your mind simply a *general* impression of wildness and brutality. For obviously you could not mean that we resisted wildly and brutally "negro ascendency" in old times, as there was none then to resist. I am assuming that you have not had personally much experience of the manners and state of society at the South in times of slavery. If I am right, then I believe that you would not, upon the interested testimony of Northern Abolitionists, have reached a conclusion which would justify so harsh and so sweeping an expression as the one quoted, had it not been for the violent occurrences which have come to your notice since the war. Regarding these I wish to make the following suggestions:

1. To a considerable extent the political organizations of the Democratic party at the South have not reflected the true sentiments of the Southern people. At the close of the war, seeing that the State governments were placed in the hands of negroes and carpet-baggers for, as they supposed, an indefinitely long period, a large proportion of those who had previously participated in politics withdrew altogether from a contest with such ignoble opponents. This allowed, in many instances, the control of the political machinery of the party to pass into the hands of a bad class of men. Subsequently, when, stung into action by repeated grievances, the first-mentioned class of persons went again into the political field, with a poetic justice which to a satirist would be very enjoyable they found that unless they had military renown to help them they were obliged to take subordinate positions. From this has flowed most of the corruption and violence. Candor obliges me to say that intimidation, as such, *without actual violence*, has been looked upon with much indifference by all classes of Southern Democrats. Appeals to the fears or the pocket (by refusing employment) were found so much more efficacious with the negro and carpet-bagger than refined arguments based upon the ethics of American politics, that the temptation to use them, or to allow their use, was very great. But the real employment of physical injury or pain, or of other violence, has not been tolerated by them as a community. As to the fraudulent practices, I do not seek to excuse them on the part of the Democrats by pointing to those which kept the Republicans in power for ten years, and which gave them a President in '76, but will merely say that in their practical effect upon the elections they are more than counterbalanced by the false "swearing in" of negro voters who are not of age, or are non-residents and not entitled to register.

2. Northern people do not understand upon any other theory than that of violence how negroes can vote the Democratic ticket, whereas the process is a very simple one. The patronage of the State governments was, of course, absorbed by carpet-baggers and their rings. All could not be provided for, and so there was the usual dissension. The Democrats, taking advantage of the real good feeling which often exists between the whites and blacks, and also of that affection of the employee for the employer which is so well understood by Republican administrations, turned these discontents into the Democratic ranks.

3. Many portions of the South are thinly settled, and in such regions we always find a "word-and-a-blow" sort of society, as will be seen in the Western States, and even within five hours' ride of Philadelphia, a Republican stronghold.

4. In protecting Democratic negroes from the assaults or insults of Republican negroes the whites would frequently be drawn into conflicts, and their superior courage generally made them victorious. These, of course, were set down as outrages, pure and unadulterated.

5. Owing to the comparative immunity which negro criminals had with the court officers, or more especially with the juries of the carpet-bag rule, there were a great many instances of personal violence by the negroes, and the whites were in an apprehensive state. Hence persons were rather apt to seek with their own hands that redress which they knew the law would not afford. Unfortunately, too, their apprehensions prevented their sifting deliberately the evidence against the person towards whom their vengeance was directed.

6. The negroes are known by those well acquainted with them not to give great value to an oath, and there were easily to be found among them those who would swear what unscrupulous and designing persons wished them to.

7. Being impressed with the idea of the existence of this mysterious Ku-klux, even the truthful in their testimony were inclined to magnify into importance unimportant things, and to connect incidents which had no real connection. How far this can go may be shown by the familiar illustration that it has not been long since the Puritans of Massachusetts upon such testimony were burning as witches helpless old women.

8. The many occasions in which a given crime at the South is presented to the Northern public, each time perhaps in a different form, beget an impression of frequency of occurrence which is far from accurate.

9. Perhaps the greatest source of "Southern outrages" is the imagination of Republican political orators and editors. This has been so frequently pointed out in the columns of the *Nation* that I will content myself with giving a recent instance. A man named Parr, being at Binghamton, N. Y., wrote to the *Republican*, a newspaper of that city, that a man named Bodeman, who was a Republican candidate for the office of sheriff in Putnam County, Fla., had been warned to withdraw; that not doing this, he had been murdered; that he (Parr) and two Northern men—Wm. Clarke, a plumber, of Jacksonville, Fla., and J. M. Adams, his bookkeeper—were upon the coroner's jury, from which they were finally ejected for refusing to bring in a false verdict. He went into the greatest detail, and gave, with an air of precision, the date of the election as being the 6th of February, 1879. He also said that, at an election held in Jacksonville, March 4, 1879, with a black population of six thousand, the Republicans were only allowed three hundred votes. The following matter was sent in refutation: As to the murder, the office of sheriff is not elective in Florida. No election took place in February. A mass-meeting was held at Pilatka, the place where the occurrence took place, and the whole thing was denied by the citizens. Wm. Clarke came out in a letter to a Jacksonville paper and denied any knowledge of the matter; that he had not been in Pilatka for three years, and had never been upon a jury in his life. His bookkeeper, Adams, did the same. As to the Jacksonville election there was none in March, and at the one nearest that date the Republicans elected their entire ticket. Judge Randall, Chief-Justice of Florida and a Republican, wrote to the Binghamton paper and denied it. *Yet the paper said Parr was a reliable man, and*

adhered to its story. In these suggestions for thought I have not attempted any elaborate proof. For this, as for the obtaining of a more healthy state of politics, the course so constantly urged by the *Nation* is the best: let Republican orators come to the South and see for themselves.

II. As for the charge made by "J.," and assented to by the editor of the *Nation*, that the Democratic party is essentially that of ignorance, and one from which reform cannot be expected, I can only allow myself a few words. "J." connects Democracy with ignorance by saying that the Irish day-laborer is always a Democrat, and that "his name is legion and his ignorance is Egyptian darkness." This is brilliant rhetoric, but not exact. We will offset the Irish vote by the negro. By the census of 1870 there were 4,870,364 negroes and 1,855,827 Irish. But, supposing that the invariable stupidity of the land of Burke, Sheridan, and Charles O'Conor should cling to the blood, the number of Irish and those with an Irish parent would amount to (estimated) 3,700,000, leaving still a balance against the Republicans of over a million. That which attached the Irish laborer to the Democratic party was its resistance to a measure of religious intolerance which belonged to the dark ages rather than ours. On the other hand, the Republican party—which, I judge from "J.'s" remarks, is the true and only child of the Federal, the Whig, and the American parties (is there no other door at which it can be laid ?)—boasts as its only great political measure (other than our high tariff) the placing into unlimited political power and trying to give social equality to a race which in its native country has remained for dim ages without civilization, as brutal as the brutes with which they wage an equal war. Although "J." does not say so, he would, no doubt, make the South add to the ignorance of the Democratic party. Well, in that bric-à-brac sort of culture which the wooden-nutmeg millionaire of New England is accustomed to display we have always, perhaps, been lacking; but in real culture and refinement we are not so far behindhand. But perhaps the census-taker will go for more than bare assertion. In 1860 Georgia had 32 colleges (these, of course, indicated a large number of preparatory trainers) and 3,302 pupils, with a white population of 593,088, while Massachusetts, with a population of 1,231,066, had 8 colleges and 1,733 pupils. In South Carolina there were 14 colleges, 1,384 pupils, and 301,304 whites; while in Vermont there were 3 colleges and 173 pupils to a population of 315,098. Upon the abstract question of conservatism the inference is in favor of the Democracy, which is that of the greatest agricultural interest. Operatives are radical and money is timid, not conservative. Upon the financial question alone the party is tainted, and that has been from a want of commercial and financial knowledge in the local leaders. Can you ignore or deny the fact, Mr. Editor, that up to the war the Democratic party was more honest and had fewer thieves in high places than the Republican since its accession to power? On what ground do you deny the power of pure government to that party which holds Bayard as its favorite leader, and grant it to one which, after ten years of scandal, represents the church by Beecher and the state by Blaine? FLORIDA.

[By "old wild, brutal way," we meant the way in which, before the war, the discussion of slavery and cognate questions was prevented at the South—that is, by threats of personal violence on the part of mobs, sometimes called "committees of citizens." This may have been necessary to the protection of the social system established by law; but it was none the less "wild and brutal," looked at from the standpoint of civilized states. The method has been revived since the war for the prevention of negro ascendency in States threatened therewith by regular elections. It is, of course, aggravated by what our correspondent must admit is, if not a Southern custom, a common Southern practice—of killing persons with whom you have private quarrels.

Our correspondent's figures in regard to the higher education are purely fallacious. Does he really believe there is any comparison except in name between the colleges of Georgia, or of any State having thirty-two "colleges," and the eight of Massachusetts?—ED. NATION.]

Notes.

D. APPLETON & CO. have brought out in very readable style and in paper covers the translation of the first volume of Mme. de Rémusat's 'Memoirs,' translated by Mrs. Cashel Hoey and John Lillie.——'Outlying Europe and the Nearer Orient,' by Joseph Moore, jr., is in the press of J. B. Lippincott & Co, together with 'Under the Tricolor; or, The American Colony in Paris,' by Lucy Hamilton Hooper.——Lockwood, Brooks & Co, Boston, will issue immediately 'The Ponca Chiefs,' a narrative of the tribe's dispossession of the Missouri lands belonging to it.——The *Atlantic* portrait for 1880, in the series already begun with Longfellow, Bryant, Lowell, and Whittier, is of Dr. O. W. Holmes, whose seventieth birthday his publishers, Houghton, Osgood & Co., celebrated with so much *éclat* on the 10th inst. As a likeness we are almost inclined to regard it as Mr. Baker's greatest success.——Dr. Elizabeth Blackwell's 'Counsel to Parents on the Moral Education of their Children' (New York: Brentano) is a work as difficult, for obvious reasons, to review as to compose. The writer's well-known professional standing will secure her the attention of the thoughtful, and deservedly so; on the other hand her sex is a drawback to the satisfactory treatment of the main topic of the book, though by no means depriving it of all value.——Harper & Bros. publish this week Mr. Dorman B. Eaton's report, referred to in the President's message, on the 'Civil Service in England,' to which Mr. G. W. Curtis furnishes an introduction. They also add Pattison's 'Milton' to the "English Men of Letters."——Charles Scribner's Sons will have ready in January 'The Emotions,' by Dr. James McCosh; 'Socialism,' by Dr. T. D. Woolsey; and the 'Autobiography of Prince Metternich,' edited by his son.——Howard Challen, Philadelphia, sends us his alphabetical 'Record of the New Books published June–October, 1879,' arranged by author, title, and subject, with price annexed. It should be useful to somebody. ——The two features of the *Magazine of American History* for December are a full account of the battle of Buena Vista, by Ellen Hardin Walworth, and some highly interesting correspondence between Jared Sparks and Colonel Benjamin Tallmadge, of Connecticut, in relation to the circumstances of André's capture and execution, with which Colonel Tallmadge was intimately concerned. A portrait of André, a view of the house from which he was led to the scaffold, and a map of the Hudson showing André's route, illustrate the text.——A young Englishman bearing the Teutonic name of Fleuss has invented a method of staying under water in a diver's suit without connection with the upper air for breathing. Dr. B. W. Richardson communicates to *Nature* of November 20 his observations of this remarkable performance, of which he is unable to reveal the secret. He predicts great results from the discovery.——We have received Nos. 1-3 of the bi-monthly Bulletin of the St. Louis Public School Library. The list of additions is annotated after Mr. Cutter's example, and, so far as it goes, helps to solve the problem how to regulate the reading of school-children.——Notes from Rome, furnished by Signor Rodolfo Lanciani to the *Athenæum*, relate the progress of the "new Tiberine Museum," which was located in the conservatories of the old botanical gardens near the Palazzo Salviati, on the Lungara, only three months since. The monthly average of coins fished from the Tiber reaches twelve hundred, but they belong mostly to the popes of the last two centuries, and are held to have come from the dirt-heaps, collected from the streets or private houses, thrown into the river above Ripetta and near the Church of S. Giovanni de' Fiorentini. There are four halls filled with works of art worthy of any of the great European museums now visitable; but the most signal attraction is afforded by the set of frescoes from a Roman house at La Farnesina, arranged in the same order in which they were painted and discovered. The first room displays a red ground, the second a black, and the third a white; the surface of the whole set exceeds eight hundred square feet.——From the same paper we learn of a proposed new monthly bibliographical review to be started in Paris on January 10, with the title *Le Livre*. Its peculiarity is that it will rival in paper and ornamentation the best modern art-journals.——The Thirteenth Annual Exhibition of the American Water-Color Society will open at the National Academy of Design on February 2, and close on February 28, 1880.

—At the librarians' conventions held this year at Boston and Manchester three papers were read, on the classification of books on the shelves, that were by no means in the beaten track; but for originality of suggestion not one of them could compare with an article in a late number of *Il Buonarroti*. The author, who signs G. P., after dilating on the usual objections to classification—that it can never be perfect; that the boundary-lines of many subjects are indistinct, that books which treat of many subjects, as they can be put in only one place, must of necessity be missing under all the other subjects; that new subjects are springing up like mushrooms every day, to the utter confusion of any system and the great bewilderment of classifiers (in what catalogue a century old, asks he, will you find statistics, philosophy, political economy, sociology,

hygiene, education, and he might have added biology, microscopy, comparative physiology, comparative mythology—in fact, all the comparatives ?); and, finally, that scientific collocation demands extravagant space—finds the escape from all these difficulties where the just vanishing generation thought to find the remedy for the evils of classed catalogues, viz., in the alphabet. Arrange your books alphabetically, he says, and the whole problem is solved. No more shall the unfortunate librarian cudgel his brains to know where to put a new book ; no more shall the baffled reader curse the stupidity of the librarian, who did not put the book where the reader could have found it. The library shall be its own catalogue. So far there is little novelty in the plan. We in America have several libraries arranged in this way: the New York Mercantile, for example, and the State Library at Albany—libraries not, we believe, considered to be specially conveniently arranged for students. The novelty is this : G. P., in order, apparently, to restore the learned and scientific flavor which is lost by discarding classification, proposes to break up his alphabet chronologically, dividing his books by the centuries in which they were written, and even by the decades. Every student, thinks the confiding author of this plan, knows nearly when the book he wants was written. The whole course and tendency of modern thought is to the historical treatment of all subjects ; why not make the library not merely its own catalogue but a history of literature in itself ? Indeed, a chronological arrangement is, after all, the most logical. The difference between Dante, the poet, and St. Thomas Aquinas, the theologian, is much less than between St. Thomas Aquinas and Strauss, or Dante and Leopardi. This concluding argument is ingenious and not without force ; and yet we fear that when G. P.'s scheme shall have been carried out, and some large library has arranged its books in decades, it will be found that, whatever were in past times the defects of subject-classification, the unsatisfactoriness of the new system will be greater, and the last state of the classifier and the reader will be worse than their first.

—The number of Americans who by their lives or by their character are suited to become subjects for the historical novel and drama is so small that a patriotic writer of either kind must read with envy Legouvé's "souvenirs" lately delivered at the Institute, which leave the impression that in the fine days of romanticism Scribe and he had but to stretch forth their hand to pluck plots from the tree of history. What have we to compare with Henry IV., with Francis I., with Adrienne Lecouvreur, merely to begin a long list ? Perhaps we may get a morsel of comfort from the discovery made by another Frenchman, who finds much more in Madame Bonaparte than American and English critics have seen. The latter, so far as we have observed, perceive in her an utterly worldly, scheming, vulgar, avaricious, cold-hearted woman. M. de Varigny denies nothing of this, but finds something admirable in her courage and persistence. "If she had been allowed to wear a crown she would have defended it with a manly energy. Prince Gortchakoff was not mistaken : 'With that woman on the steps of the throne the overthrow of the Empire would have given us much more trouble'; and Talleyrand added: 'What a queen she would have been !' Napoleon did not know her. He was mistaken in thinking that his brother had made a misalliance" Here, perhaps, is a hint for some future Scribe or Delavigne. Unluckily for him, although there is character enough, events were wanting. After all, though she might furnish a striking scene, she would make but a sorry heroine. And what could a patriot do with one of the least American of women ?

—In its notice of Pole's 'Philosophy of Music' the London *Examiner* asserts that "Dr. Hullah was quite right in his protest against the attempt (now an accomplished success) to force upon the musical student a knowledge of the physical and physiological laws which underlie his practice"; that a system under which Beethoven or Mendelssohn would have failed to pass for a degree must be erroneous ; and that the theory of music is part, not of music itself, but of physiological psychology, and therefore of much greater interest to a psychologist than to a musician. That the theory of music as expounded in the works of Helmholtz and his followers is a branch of physiological psychology must, of course, be granted ; but that is no reason why students of music should not be obliged to make themselves familiar with it. A musician, too, ought to be ashamed to play all his life on a horn or a violin and not know how tone-vibrations are produced, in what manner they affect his ear, and how or why one instrument differs from another in the quality or timbre of its tone, or why one violin or voice is better than another. All these and a thousand equally interesting things are explained by Helmholtz, and his reasoning is so simple and clear that it can be adapted to the comprehension of every student who has had an ordinary education. It might, therefore, be expected of the humblest member of an orchestra that he should have some elementary notions of the science as well as the art of music. It will stimulate his dormant intellect, and, notwithstanding the ridiculous current notions about music for the head and music for the heart, and the superiority of the latter and its independence of the former, it will be found that, given the same man, the more he cultivates his intellect the more his performance will "speak to the heart."

—In determining whether physiological acoustics and æsthetics should be taught to musical students it must also be borne in mind that not all are destined to become humble members of an orchestra. Some become instrument-makers, some teachers or composers, and others critics and historians. Instrument-makers will find revealed the acoustic laws which their predecessors *unconsciously* followed in their slow and laborious experiments by which, in the course of time, good wind and string instruments were produced, and they will be able to continue these experiments with a full *consciousness* of their aims and means, gaining thereby as great an advantage as the horticulturist by his careful artificial selection gains over the unconscious natural selection of the vegetable world at large in producing more and more beautiful and varied plants and flowers. Composers, in their turn, will learn to their encouragement that music is an experimental art ; that it has passed through various phases of development ; that advances in it were always due to bold innovations on the part of the great masters ; and that they, therefore, need not be afraid to express their ideas, if necessary, in a new form, however much they may be insulted for it by ignorant grumblers who imagine that music consists solely of a series of fixed laws, which must never be transgressed. Critics, again, will become less partisan and violent when they have once fully grasped the idea that the notions about genial melody, intelligible harmony, unprepared discords, and noisy instrumentation are all matters of relative culture, and have in course of time undergone a great many modifications; that even our whole modern system of scales, harmonies, and major and minor modes is not irrevocably based on any laws of nature or necessitated by the anatomical structure of the ear (thus excluding other possible musical systems). More important than any of these points is the following consideration : A great many questions relating to musical theory and æsthetics are still involved in great darkness. What is needed to solve them is a body of accurate observations and facts. Nobody can furnish these except intelligent, trained musicians, versed in scientific methods.

—Mlle. Marimon selected "Dinorah" for her second appearance at the opera, and gained the same brilliant success which she so richly deserved in her début in "Sonnambula." All the tact and grace of two such eminent artists as Mlle. Marimon and Sig. Galassi are needed to enable a cultivated audience to endure the insipid and tedious insignificance of a work like "Dinorah." The libretto is, of all the absurd subjects which composers of opera have delighted in selecting for their music, the most ridiculous. The music is utterly devoid of interest, merit, or character. It is difficult to explain why so worthless an opera has not disappeared long ago from the operatic stage. We could not pay a higher compliment to Mlle. Marimon than by saying that she really succeeded in inspiring some interest in the antics of the doleful heroine. The *pièce de résistance* was of course the "Shadow Song," which she rendered with wonderful brilliancy. Signor Galassi was an excellent *Hoel*, and Signor Runcio deserves credit for the great pains he took in lending something like grace and dignity to the vapid part of *Corantino*. On Monday Mlle. Marimon appeared again with the same cast in "Sonnambula," and excited the same enthusiasm as before.

—A young pianist of unusual merit made her appearance before a New York audience in an otherwise uninteresting concert given by the Arion Society, in Steinway Hall, on Saturday last. Miss Anna Bock, who received her first musical education in this city from Mr. Max Pinner and Mr. Ferdinand von Inten, left this country about four years ago a promising child and has returned an accomplished artist, having studied first under Liszt, in Weimar, and afterwards in Stuttgardt under Lebert, the most eminent teacher of pianoforte playing in Europe. Miss Bock had selected a programme which displayed all her excellent qualities to the fullest extent. She played Weber's brilliant Polonaise in E major, to which Liszt has set a characteristic orchestral part, with great fire. The extremely difficult passages of the Chopin Impromptu were mastered with perfect grace, and the "Valse Caprice," by Tausig, was a marvel of execution. We hope to have an opportunity of hearing Miss Bock again under more favorable auspices.

—Gilbert and Clay's "Princess Toto" was brought out at the Standard Theatre on Saturday, Mr. Clay conducting the orchestra in person. The house was crowded, and the opera met with a very fair reception. It is difficult to judge from the first night's performance how far it will prove a success, particularly as the music, upon which it must stand or fall in the long run, is of a kind that a first hearing hardly enables one to criticise. Of course here and there, as when the Indians make their appearance, it is of a highly popular and "tuney" sort, but there are not many airs in it of a distinctly catching character, and we are not likely to hear any of the songs whistled in the streets or ground out by one-armed soldiers on hand-organs. Mr. Clay has, in fact, always written his music for musical people, rather than for the general public, and such a favorite song as "She Wandered down the Mountain side" is, after all the years it has been sung, chiefly a favorite among *cognoscenti*. All this being conceded at the outset, there is no question that "Princess Toto" is the work of a composer of great skill and taste, or that it is full of beauties which entitle it to a long run. The choruses are all strong and effective, and several of the airs sung by *Prince Doro* and *Princess Toto* very charming. The acting and singing were very unequal. Mr. H. C. Campbell, as *Doro*, is, if we are not mistaken, a graduate of Niblo's, where he has been singing opéra-bouffe airs in "Enchantment." He has only a tolerable voice, and a merely tolerable voice will not do for the part. It is unnecessary to criticise his acting, as he made little or no effort to act. Miss Braham took the part of *Toto;* she has an excellent voice and acted with great spirit. Miss Jarbeau, who seems to be equal to greater things, took that of her attendant very well; and Mr. Wren made *Prince Caramel* decidedly amusing. Mr. Paul as a sham Indian was an immense hit; indeed, the Indian part of the opera was perhaps the success of the evening. "Princess Toto" may be described as a psychological extravaganza. The plot turns upon the mnemonic failings of the princess, who, with the best intentions in the world, cannot remember anything, and consequently acts on the impulse of the moment. Of course this affords the opportunity for a good many amusing situations, but Mr. Gilbert has not made the libretto as funny as his performances in "Pinafore" had led us to expect. *King Portico*, for instance, is intended to be funny through the incongruity between his royal love of decorum and the situations into which he is forced. But (at least, as represented by Mr. Montgomery) he certainly was not very comical. With an opera written by a composer of Mr. Clay's standing, however, the libretto is of secondary importance. The chief thing is the music, and the reception with which this met on Saturday was certainly most cordial. "Princess Toto" had a long run in England, and this augurs well for its future here.

BENEDICT ARNOLD.*

FRANKLIN wrote to Lafayette of Arnold: "Judas sold only one man; Arnold three millions. Judas got for his one man thirty pieces of silver; Arnold, not a half-penny a head. A miserable bargain! especially when one considers the quantity of infamy he has acquired to himself, and entailed on his family." The patriot's hatred of the crime, joined with the philosopher's contempt for the folly, touched the key-note of execration that has deepened through a century.

Palliation is the limit of the author's attempt in composing this Life, and it fails utterly. He errs in implying that the fame of Arnold's earlier services is clouded by his crime, no less than in using those services as a covert plea for indulgence to his memory. There are two Arnolds in history. The soldier who made the marvellous march through wintry deserts to Quebec, who led without command the obstinate battle of Bemus Heights, and fought a Viking's fight at Valcour, is as distinct in men's minds as if he were another being from him who betrayed Washington's friendship, and conspired to sell West Point—from the barbarian who ravaged Virginia, the renegade who burned New London. Up to that September equinox of 1780 General Arnold is a chief actor in the most heroic and desperate passages of the early years of the war. That day his life crossed the line and declined, as the sun into winter, to darkness and dishonor. Yet the infamy of his later career has not at all biassed our best historians towards injustice to his merits while he remained true to the country; and it is neither logical nor fair to plead his services in extenuation of his guilt.

Of course Arnold's biographer condemns his treason, but it is with more of pity than of hearty indignation. Now, it is just that pity which it is dangerous to encourage in this day of lax political morality. A generation for which the shining examples in the Revolutionary era of probity and pristine virtue are losing their force does not need to be taught unwholesome lessons of tolerance for its greatest criminal. It is right that his military fame, while he remained faithful, should be cleared of aspersions cast on it by jealousy or enmity; and it is right, too, that for the evil he did, this nation should be for ever his enemy and his implacable judge. The sham sentiment that weeps because the laws of war could not spare André may rear a superfluous pillar that celebrates other things than his remains or his memory, sincerely and fitly cared for where he rests. It is not to be endured that any one should take from the height of the monument of infamy which Arnold built for himself.

The writer may not intend the task of rehabilitating Arnold—scarce any one would be bold enough for that. Yet by enlarging on his good traits, by exaggerating his provocations, and shading away his faults of character, the biographer takes the attitude and produces the effect of an apologist. Arnold's dominant qualities were the soldier's. He was ambitious, brave, profuse. He lacked, however, the soldier's chief virtue—discipline. His qualities controlled him, they were not controlled by him. His courage was always reckless, his ambition fed by insatiable vanity; his passion for display hurried him into debt and temptation. Besides, he was vindictive, opinionated, and violent. For such a character the best or the worst career may be predicted, according as it is bent by the circumstances which it fails to control. The unfolding of its simple elements offers no psychological puzzle. Its strength is every-day strength; its faults, coarse ones. There is no place for subtle analysis, balancing motives, tracing how far the mind imposed on itself, or amid what conflict of imagined duties it decided wrong. Arnold's treason was absolute, conscious, brutal. Disappointed, crushed by debt, stung to the quick in his self-opinion, the only doubt about it, which will never be cleared up, is whether he was more the seduced or the tempter.

Except to save himself from pecuniary ruin, and to gratify his vanity by the promised rewards of rank and influence, there was no reason why Arnold should betray his country. It cannot be denied that he was treated with injustice; but reparation had been made him as far as possible. Better soldiers have borne worse wrong and remained true men. His disproof of the malicious charge of fraud in disposing of the goods seized at Quebec left his military renown there all the brighter. He overcame the partiality that withheld his rightful precedence of rank, and after his gallantry in the campaigns against St. Leger and Burgoyne had wrung from Congress his commission as senior major-general, the memory of wrong suffered should have perished with the offence. No generous spirit would have nursed it. The Executive Council of Pennsylvania framed grave charges of misconduct against him, which dwindled on the trial by a military court into proof of certain venial errors, followed by a sentence of "imprudent and improper conduct." The official reprimand that Congress imposed on Washington the duty of administering on that occasion spoke in terms so mild and so mingled with praise that censure turned to compliment. In truth, Arnold's wrongs were wounds inflicted by personal enemies on his egotism. Small soldiers were jealous of him, and small political intriguers traduced him. He suffered nothing that should have touched, much less corrupted, a noble soul. No national reprobation stained him; his State was proud to honor him; the army trusted and admired him; Washington was his friend, and the second place in command might have been his. How flimsy, then, is the pretence that his grieved honor grasped at revenge!

The attempt to show how Arnold might have justified his conduct to himself on the ground of the country's true interest is even more feebly sustained. Arnold's intellect was as vigorous as his moral principle was weak. He knew precisely the causes, range, and necessary result of the war. Though born a colonist, his nature hated subordination, and he had fought for independence too desperately and successfully to leave any question in his own mind as to divided allegiance, or any real doubt that the new order of things must in the end prevail. As a soldier he knew thoroughly, even then when the quarrel seemed in equal poise, the resources of America, and the military inefficiency here of the crown. His draught of an impracticable project for retaining the colonies peaceably, prepared for the king after he reached England, reads like an afterthought, a composition of invented proofs that his treason, if successful, might have led to peace. The imaginary conversations with Robinson and with André, in which he poses as a Monk and is flattered as a Marlborough, are ludicrously incongruous with the reality of the situation. Marlborough played the traitor to two princes, the heads of two parties, but he never tried to strangle the liberties of his country. Monk restored the peace the nation clamored for, by restoring the regular succession when

* 'The Life of Benedict Arnold. By Isaac N. Arnold.' Chicago: Jansen, McClurg & Co. 1880.

Cromwell's death threatened England with anarchy. There is no parity between Arnold's position and theirs—his deed differs from theirs as parricide differs from policy.

Family letters and manuscripts yield material from which the biographer draws some new details of the last twenty years of Arnold's life. They illustrate but do not vary its often-told story: that the ministry asked and rejected his counsels; that a command in the army, earnestly sought, was steadily refused, for obvious reasons; that he maintained his lavish and ostentatious habits, and, to mend his fortunes, engaged again in trade, removing to New Brunswick, but returning soon to England. His duel with the Earl of Lauderdale, whom he challenged for calling him in Parliament an apostate, is related at length. Once more he sailed as a merchant-adventurer for the West Indies, where he rendered the Government, then at war with France, useful services, receiving in reward a large grant of Canada lands. In vain he again implored a military command, then "sought excitement in desperate adventures to restore his shattered fortunes," and at last, in 1801, died "in bitter distress, in self-reproach, in poverty." The tradition that in his last hours he called for his old American uniform, and muttered, "God forgive me for ever putting on any other," is more effectively introduced, though it seems to rest on no better foundation than the various imaginary conversations the author indulges in.

We should be reluctant to suppose that, besides drawing on his fancy, the author had suppressed any facts within his knowledge that might throw light on Arnold's character. There are two circumstances, however, familiar to those among us who have made researches on the subject, which should have weight in forming a judgment upon it. Allusion is made to the charge that Arnold, while at New Brunswick, caused his own stock of goods to be burned, in fraud of the insurers. Now, this accusation was made by Monson, his partner in business; and there existed last year at St. John's the judicial record of an action for libel, brought on that ground by Arnold, terminating with a verdict in his favor for two-and-sixpence. With regard to the complicity of Mrs. Arnold in her husband's guilt, which the author indignantly denies, it is certain that Colonel Varick, his aid, though at first persuaded of her innocence, afterwards changed his opinion, becoming satisfied that she was acting a part at the time of his flight.

A good many generations must pass before Arnold's career can be made to serve as the topic of a literary *tour de force*, such as has been ingeniously exerted to kalsomine Catiline or to deodorize Lucrezia Borgia. A book on such a subject should be written for only one of two objects—either as a passage in history, to help philosophy teach the world warning by a dark example, or as a family memoir, to paint an ancestor's redeeming traits, and so relieve his name from part of its odium. The author fails in both these objects by not distinctly grasping either, and endeavoring to blend reprobation with vindication. Now, the vindication of Arnold is impossible—not because plain Anglo-Saxon sense has judged him in both nations for a hundred years, but because the unquestioned facts of his life compose an offence against the fundamental laws of honor and truth that secure society. Among any people, in any age, his crime would be glaring and unpardonable—it was a crime against humanity. Any attempt to dwarf it strikes from our history the signal page that records retribution for wickedness. If meant as a pious effort to wipe off the stain that clings to the third generation, the book should have been printed for private circulation. Even for this purpose it tells too much. A memoir composed for that laudable end might depict Arnold's heroism on this side the ocean, his affectionate and energetic work for his family on the other, and fill the gap between with a few uncolored sentences recording his fall. That passage in his life is to be turned from, not dwelt on, by descendants who would honor him. "Non ragioniam di lor, ma guarda e passa."

The typography and mechanical execution of the volume are excellent, barring a misprint or two of dates, and an original touch of spelling bestowed on Trumball, Rediesel, Tarlteon, and the Mischienza. The first part of the book is blemished by many errors of grammar and careless constructions, from which the remainder is more free, perhaps because it contains a larger proportion of transcribed passages.

ILLUSTRATED GIFT BOOKS.

WE have already, without attempting to classify them, noticed some of the books designed for the holiday season. It will be convenient here to group and discuss a few more. First in point of elegance and costliness, yet not dear, is the richly bound and lavishly illustrated 'Venice: Its History, Art, Character, and Modern Life,' from the French of Charles Yriarte (Scribner & Welford). This quarto volume, of three hundred pages and upwards, is meant to lie on the table as one of the ornaments of the room, to be opened for the sake of its pictures, to be read piecemeal, as curiosity impels or leisure permits. In one sense it is a superb guide-book. But it goes deeper than the mere indication of what there is worth seeing in Venice, what the city is famous for, why it has such a fascination for strangers from every clime. The chapter (under Art) on Typography, for instance, is a blank to the ordinary visitor; so is that on Medal Engraving, with a sketch of a catalogue of Venetian medals; the Archives of Venice are not open to every one as they are to M. Yriarte. The architecture, painting, sculpture, the glass and mosaics are more common property, but here, as throughout, the special merit of the illustrations is that they are drawn from rare sources; *e.g.*, for the interesting chapter on lace and costumes the Bibliothèque Nationale and the unrivalled collection of M. Ambroise Firmin-Didot have furnished the most curious and instructive old prints. The account of the Doge of Venice is notably adorned in this manner on a very large scale. See the view of St. Mark's Place at the marriage of the sea, and the reproductions of Jost Ammen's engravings. The history of Venice is summarily disposed of, to the general chapter being added the episodes of Vittor Pisani, Marino Falieri, and Daniele Manin. M. Yriarte is by preference an antiquarian and art connoisseur, and his researches entitle him to speak with authority, while the literary gift of the *feuilletoniste* makes him always a charming companion. The second part of the book treats of the Venice of to-day, and is as readable as a magazine article.

'The Homes of America,' edited by Mrs. Martha J. Lamb (Appletons), is a small quarto, in which a running account of some old and modern dwellings of celebrity is interspersed with anecdotes and historical allusions not without interest. The "Colonial Period" and the "Later Period" between them take up a little more than half the volume, and that half, being not necessarily a mere reporter's account of the houses of "our first citizens," can really be read with pleasure. The venerable and most interesting Phillipse Manor House, now the City Hall of Yonkers, but still unaltered and unmodernized in the main; the Van Rensselaer Manor House at Albany, still in the direct line of succession and still perfect; Gunston Hall, Stratford House, and Mount Vernon in Virginia, and a score of other curious old buildings, North and South, are mentioned here, and of each a picture is given. The book makes no attempt to be a treatise on the architecture of these buildings, nor are any plans given, nor anything like descriptions of them. A chatty account of the men who built them, and the men most famous among those who lived in them, is the extent of the antiquarian study attempted. In the Later Period we find Mr. Jay's house at Katonah, and the Morris mansion at Morrisania; Alexander Hamilton's house, "The Grange," in this city of New York, and Mr. Longfellow's house, "somewhat back from the village street," at Cambridge, together with other dwellings and groups of trees, and, unfortunately, some interior views. The subject is becoming too nearly contemporary, already, not to be mixed up with flattery and graceful "tributes" to well-known families. But of course this grows worse when the "Modern Period" arrives, and the villas and mansions of the last forty years, which may be roughly classified as hideous, less hideous, and simply unremarkable, become the theme of eulogy. Probably we have described the book sufficiently. Its value is rather as a series of scraps of family history than in any other way. The woodcuts are of very different degrees of goodness; some seem to be taken direct from photographs, others are from drawings, probably. All, no doubt, are of fair general accuracy.

Mrs. Hemans's popular poem, "The Breaking Waves Dashed High," issued by Lee & Shepard, is printed in the usual Christmas style, on one side of the page, and with as many illustrations as possible (sixteen to ten stanzas), so that a number of the pictures seem to be of doubtful application. Between the "stern and rock-bound coast" of the poem and the miles of yellow sand of the reality the designer has not hesitated to defer to the poet, and has stated in three separate pictures her conviction that there are rocks in the poem, whatever one finds at Plymouth. The question gets complicated, however, in the picture representing the *Mayflower's* boat and Mary Chilton in it about to land. There's a black crag in the distance of no geographical verity. In general the designs are of no particular value or interest, but the engraving is simple and good.

'The Yo-Semite,' from the same publishers, is the title of a poem, by Wallace Bruce, of fourteen stanzas, containing more exclamations and excitement than significance. We are troubled about the first two stanzas, which have neither subject nor predicate, within them or elsewhere—*e. g.*:

I.

"Waiting to-night for the moon to rise
O'er the cliffs that narrow Yo-Semite's skies;
. . . . . .

II.

Alone in a temple vast and grand
With spire and turret on every hand—
. . . . . .

III.

But the darkling touches dissolve, and now
The moonlight touches El Capitan's brow,
And the lesser stars grow pale and dim,"

and so forth. Actually, that is the construction. As for the illustrations, Mr. Smillie gives us fifteen pen-and-ink drawings of scenes in and near the Yo-Semite Valley, which have been reproduced by the Moss photo-engraving process. It is evident that the book-illustration of the future will be more and more frequently of this sort. It is time that the artists who like to furnish designs for books (and we wish they all did—or all the good ones, at least) began to consider especially the style and handling necessary to produce a good effect. In these little pictures the composition is nearly always good, always varying, and always artistic; but we cannot like the way in which foliage and mountain sides and distant waterfalls and rainbows are represented. Let the reader take a weak magnifying-glass to almost any tree, and he will understand our meaning. *Almost* any, we have said. There are one or two exceptionally well-drawn pieces.

Mr. S. G. W. Benjamin's 'Art in America: A Critical and Historical Sketch' (Harper & Bros.) is divided into six chapters, of which the first deals with early American art; the three following are each entitled "American Painters (1828–1878)"; the fifth has sculpture for its subject, and the last considers the "Present Tendencies of American Art." There is no attempt to give biographical accounts of artists. Even the dates of birth and death are not given, except in a few instances in the course of the essay. The book is simply an account of what strikes the author as most noteworthy in the past history of the fine arts in this country, and he has cast it all in the form of a continuous narrative. In this way readableness is secured at the expense of ease of reference, and also at the expense of positive clearness of statement; for, if exigencies of space allow only ten lines in all to the work of one artist, and if the essay-style adopted requires the remarks upon that painter or sculptor to flow pleasantly on, and lead easily into what is to be said about another, then the author must have a very clear sense of what he wants to say about each, unless content to produce a mere parlor-table book without character or significance. There is still another and even greater difficulty in the way of success in such an undertaking as this: the practical impossibility of maintaining an even tone of criticism. The men to be talked about are alive and at work, they are the author's contemporaries and among them are his friends; many of his ideas upon art and his conclusions as to relative merit and standing have come from conversation with them; it is simply impracticable to sum up the record of the life and work of one's neighbor and comrade with the coolness and impartiality of mind which are difficult to preserve even in the discussion of the arts of other times and lands.

For these reasons our expectations are not large when we take up a book like the present one. Of necessity, it is to be compared with the more ephemeral books of the year. But, as it is examined, it proves to be more judicious in its tone and more sound in its conclusions than was to be expected, or than the magazine articles out of which it is made up seemed at the time. Actual blame or strongly depreciatory language would, perhaps, be out of place in so brief a summary. Where so few words can be given to each artist the worst ought not to be said about him, because full explanation is impossible. The author had to limit his fault-finding to suggestions that all is not as it should be, rather than to say boldly that things are as they should *not* be. And in this difficult labor of proportioning praise and implying blame we find that Mr. Benjamin has done well, and has shown some power of delicate discrimination and soundness of judgment. The book is a model in its material and make-up. Especially good is the paper, the same throughout, for full-page cuts and letter-press, smooth but not too glossy, and of an excellent tone. The woodcuts are of all degrees of merit, like the work they represent.

'Landscape in American Poetry,' by Lucy Larcom, which the Messrs. Appleton issue, is well enough explained by its title, if we add that it contains some forty woodcuts from drawings by Mr. J. Appleton Brown, engraved by Messrs. Anthony, Linton, Harley, Lauderbach, Bobbett, and Andrews. The author, or editor, displays considerable ingenuity in her work of selecting the landscape pictures and even allusions of American poets, from Bryant and Lowell to the least eminent of the minor bards, and the only criticism we care to make upon it is to regret the occasional magniloquence of her style. For many of Mr. Brown's drawings a good word may be said, especially of those which are studies from nature; his imaginative sketches strike us as somewhat commonplace. The whimsicality of their presentation—in ovals, clover-leaves, semi-circles, and so on—is perhaps a gift-book exigency, or assumed to be by the publishers. The table of contents gives no clue to the engraver of any particular drawing, but we hazard the conjecture that the expert will be able to identify Mr. Linton's work, and only experts are interested in the matter perhaps.

CHILDREN'S BOOKS.

MR. W. H. G. KINGSTON'S name is familiar to the younger portion of many households, and at his best this somewhat uneven writer is to be welcomed for what he brings. We doubt if he has made a better offering than his 'Notable Voyages, from Columbus to Parry' (New York: Geo. Routledge & Sons). This book is the result of no little labor, for it involved an abridgment of Irving's 'Columbus,' of Dampier's and Cook's ample narratives, if we should mention no others. But we must mention, to give an idea of the contents, Vasco da Gama, Magellan, Drake, Cavendish, Schouten and Lemaire (the rounding of Cape Horn), and Parry. From the South Seas to the frozen serpent of the North scarcely any part of the globe is left untouched by this collection, and the lesson in geography therefore is considerable, if only the atlas be kept open as the reading proceeds. But it will not be, and Mr. Kingston would have increased the parents' obligation to him by at least providing skeleton route-maps. Pictures have not been withheld, and are mostly of good quality. The text fills nearly 600 pages without being set in a type trying to the eyes.

'Zigzag Journeys in Europe; or, Vacation Rambles in Historic Lands,' by Hezekiah Butterworth (Boston: Estes & Lauriat), introduces the youthful reader to the "Zigzag Club," an association of six boys composing the first class in "Master Lewis's" school, and describes the trip they took in England and France in the company of their teacher during their summer vacation. At every important town stories are told relating to its history or traditions, and the book is profusely illustrated with spirited and effective woodcuts, many of them full-page illustrations. The plan is a good one, and is well and entertainingly carried out. As specimens of the stories told we will mention "The White Ship," "Joan of Arc," "The Wise Men of Gotham," "The Story of the Dauphin." We note also Tommy Toby's unlucky venture at going a-shooting in Sherwood Forest, in memory of Robin Hood. The inside covers contain good, clear maps of the countries visited. There seems this year to be an unusual number of gift books containing elegantly illustrated tales from history—a gratifying sign of the times.

Since our notice of 'Pocahontas' in the series called "Famous American Indians," edited by Edward Eggleston and Mrs. Lillie Eggleston Seelye, and published by Dodd, Mead & Co., a new volume has appeared, viz., 'Brant and Red Jacket.' It has been derived from the best sources, and for trustworthiness and absorbing interest merits the same commendation as the previous work. There is an excellent portrait of Brant.

In Susan Coolidge's 'Eyebright' (Roberts Bros.) all the traits of this vivacious and careful writer reappear. To those familiar with her books, and they are many, we need say no more. For ourselves we wish we could chronicle in this one a nearer approach to the ideal child's book than was made by its predecessors. That Susan Coolidge has not an eye single to her little audience, and seeks not their amusement or profit and their applause alone, but is more or less conscious of aiming at parental approbation, and gives frequent opportunity for reading between the lines, we see again in 'Eyebright.' We might give numerous instances if it were worth while. The trouble is with the author's point of view, and will our preaching mend that? Meantime, girls, and perhaps boys, will read 'Eyebright' with avidity, we shall be told, and we concede it in advance.

The fifth volume of Miss Alcott's 'Aunt Jo's Scrap-Bag' (Roberts Bros.) consists of short stories that have, apparently, appeared elsewhere in juvenile periodicals. They are of the class which confirm our distrust of such publications as wholesome family reading. Against the unreal and sentimental writing in them the child has no protection from month to month. Gathered into a volume the judicious parent can avert it—when it is too late.]

Last week we had something to say of Mr. Ascott Hope's attempt to turn Mother Goose into prose expansively. In Mrs. Clara Doty Bates's 'Child Lore' (Boston: D. Lothrop & Co.) we have the reverse of this. Aladdin, Silver Locks and the Bears, Tom Thumb, Jack and the Bean Stalk, Bluebeard, Little Red-riding Hood, and kindred tales are put into verse and interlarded with Mother Goose. The result justifies us in preferring the original, as in Mr. Hope's case. Here is a bad specimen, when better might have been selected, it is true; but we must keep the standard high for the rising generation:

"Once on a time there was a man so hideous and ugly
That little children shrank and tried to hide when he appeared;
His eyes were fierce and prominent, his long hair stiff like bristles,
His stature was enormous, and he wore a long blue beard—
He took his name from that through all the country round about him—
And whispered tales of dreadful deeds but helped to make him feared."

Extraordinary metres require extraordinary pictures to match, and these are not wanting.

Mr. R. Caldecott's 'Picture-Book' is increased by the addition to "The House that Jack Built" and "John Gilpin" of "The Babes in the Wood" and Goldsmith's "Elegy on the Death of a Mad Dog" (Routledge). The Gilpin will probably remain the favorite, and the artist has shown a grievous want of taste in treating humorously the tragedy of the Babes; but the Mad Dog is mirth-provoking enough.

The Print Collector: An Introduction to the Knowledge Necessary for forming a Collection of Ancient Prints. By J. Maberley, with an Appendix containing Fielding's Treatise on the Practice of Engraving. Edited, with Notes, an Account of Contemporary Etching and Etchers, and a Bibliography of Engraving, by Robert Hoe, jr. (New York: Dodd, Mead & Co. 1879. Square 8vo, 336 pp.)—Maberley's 'Print Collector' was published in London in 1848. It is an essay on the subject of print-collecting, as it was in the author's time, and is readable, amusing, and suggestive; so that it is not without its use even now. A much more methodical and a very recent treatise, Wilshire's 'Introduction to the Study and Collecting of Ancient Prints,' includes many and long quotations from Maberley, whom the later author evidently looked upon as a sayer of neat sayings—one who could put things cleverly; and that is about his rank as a writer. His account of the blunders a young collector is likely to make, and his complaints of the sufferings to which the owner of fine prints must submit when he shows them to his friends, are funny, and are also full of hints for those who can take hints. His work, apparently reprinted in full, takes up rather more than half of the volume before us. Of the Appendix fifty pages are devoted to Fielding's Treatise on the Practice of Engraving, but without the illustrative specimens of the original. This is a tolerably full account of the chief processes in use, and for the most part clear and intelligible. A far better account of the subject might be written or compiled from different sources, but perhaps none better exists all ready to the hand. The article "Engraving" in the new (unfinished) edition of the 'Encyclopædia Britannica' is very much more clear and on the whole more trustworthy, but is of necessity brief. In the multiplication of art-books nowadays a thoroughly satisfactory account of all the different ways of preparing originals from which to print copies may be looked for any day; and, meantime, there are numerous special treatises on the different processes. The appendix includes also a list of Albert Dürer's engraved work, and one of Rembrandt's etchings. The only reason for the appearance here of these lists is that this volume may be bought by persons who have no other books on engraving, and who may possibly wish to study the works of those very famous artists without purchasing others; but this reason seems insufficient in view of the cheap little hand-books which now give all this information. Even the "Illustrated Biography" series gives in its 'Rembrandt,' at a dollar and a quarter, the list of his etchings; and the Dürer volume when published will no doubt do as much.

The editor's share in this reprint, besides some few notes to the Maberley treatise, tending to bring down the application of the author's remarks to the present day, is to be found in what remains of the appendix. There is mention of a few modern etchers: Méryon, Daubigny, Millet, and ten others, besides Turner in connection with 'Liber Studiorum.' In the case of some of these, brief lists of well-known works are given, but incomplete in a curious way, as if made long ago; thus, of Haden, none of fifteen or sixteen exceedingly important etchings of the last three years is named, and under Fortuny the eighteen etchings of the recent posthumous set are not alluded to. The tone of criticism is moderate and appreciative. The work is closed by a Bibliography of Engraving, which, though incomplete, is sufficiently full to be useful, and is accompanied by very intelligent remarks upon the different books named. It is unfortunate that the whole book should be disfigured by typographical errors, and this is more especially the case in this Bibliography, where a hasty glance shows eight in one page. Apart from this the book is rather unusually comely, with good print and paper, and a pleasant appearance of care in the manufacture.

L'Art, revue hebdomadaire. 1879. (Paris: A. Ballue; New York: J. W. Bouton.)—*L'Art*, which is undoubtedly looked on by the greater number of its beyond-seas subscribers as a picture-book, is more accurately an advanced and almost prophetic record of those critical impressions which take form in studios, which flout the fixed opinions of academies, and are the undercurrent going to construct the æsthetics of the future. During the current year this journal has as usual given free expression to the uncompromising views which have been so distasteful to Institute members and have planted such uneasy thorns in the arm-chairs of Academicians. It will none of Ingres, for example. It recognizes in vol. xvi. that fixed unrighteousness which was imputed to him by Delacroix—"that radical vice, the absence of heart and soul and reason, of everything connected with the *mortalia corda;* that capital defect which leads a man merely to satisfy vain curiosity, and make Chinese work—just what he makes, in all but the simplicity, which he lacks above all." It goes to one of the insurgent pupils of Ingres, Amaury Duval, for anecdotes; how the scholars in his atelier were instructed to put on blind-halters when they penetrated the Rubens galleries of the Louvre on their way to the Raphaels; how the master cried, upon the election of Delacroix to the Academy, "Behold the wolf in the sheepfold!" and how he called upon a student to throw open the windows after a visit of Delacroix to see the "Homer," with the exclamation, "It smells of sulphur here!" One of the contributors, Paul Leroi, a realist who feels for Ingres's successors a hate which Delacroix himself could not have improved upon, satirizes a member of the Institute for complaining the other day of Lepage's "Les Foins," when the picture was proposed for purchase by the Government, "that it had in it nothing of École de Rome." The same assistant, in volume xvii., ministers to the journal's already lusty hate of Cabanel; refers to that artist's "impossible portrait of Mr. Mackey," and cites the acquisition of his "Thamar" by the Luxembourg with a "horresco referens!" It will break few American hearts that *L'Art* does not accept the likeness of an American millionaire; but it appears, from this distance across the water, that its eternal disparagement directed against the painter of the "Florentine Poet" is polemical rather than judicial, and that in its comparative estimate of that artist and of certain new-comers *L'Art* may be less sagacious in striking the note of the future than it would desire to be.

The somewhat iconoclastic spirit of the journal is revealed again in its protest against iconoclasm. The peace of those respectable institutions which pillage the world of sculptured portals and *jubés* with no thought but of their own aggrandizement, is rudely shaken by the current series of articles on "Vandalism," with notes, dates, and facts about the hard bargains that have been driven; the latest grievance, stated in vol. xviii., is the suppression of the Indian Museum at South Kensington. But *L'Art* is a live force in the matter of constructive as well as destructive criticism. It makes it its business to detect the new movements in opinion, and it is not often behindhand in the discovery of significant ones, nor ungenerous in giving such its effectual support. The merits of certain German painters, as Gebhardt and Leibl and Lonbach and Menzel, form the greatest discovery made at the late Exposition, and *L'Art* has taken up these worthies; its vol. xviii. gives a wonderful Holbein-like drawing of an old lady's head by Leibl, and engraves Lonbach's likeness of Dr. Döllinger; vol. xvii. shows an allegory of gluttony incisive enough for Dürer—Menzel's vision of a lady gormandizing at a ball in full dress.

Alongside of the discoveries of modern excellence which are made and bruited in studios go those wayward discoveries of old masters which agitate them so madly from time to time; a few years or months ago it was Franz Hals who was unveiled with great pomp as if he had never been seen before; a few years before, Hobbema and Van der Meer; now it is Tiepolo who is the ruling passion, and the clever painter of the decadence is demonstrated like a theorem by Signor Molmenti in vol. xvii.; indeed the illustrations to his article exhibit specimens, of nook-and-corner decoration on small scale especially, which prove Tiepolo to have had few rivals in the knack of purely ornamental adjustment; but to comprehend Tiepolo, indeed, without the trouble of travelling, we must familiarize ourselves with the photographs, not unknown in studios, of some of his Venice work, where emulation of Veronese seems to have been exalted and rewarded in him to the very verge of equality.

Besides the proclamation of inedited Germans, the Exposition served to launch into French celebrity certain merits of English art and American art. The analysis of American painting belongs to past volumes of *L'Art*, and we have duly noticed it; that of English painting has been prolonged into the present year. Apart from the complacent mistakes in nomenclature always to be expected of French critics ("Oppy" for Opie, vol. xvi. p. 45, "David" applied as title to Leighton's "Eastern Slinger," and "The Stage-Office" to E. A. Abbey's scene of British officers cajoled by a patriotic American lady), the notices of both branches of Anglo-Saxon contribution were discerning and thorough. It has occurred to us that a difference is obvious in the treatment of the two nations, the art of neither of which has until now obtained serious Continental recognition. We could fully express this difference only at a great length, and prove it only by multiplied citations; but what we fancy is discernible may be summarized in little space. In the treatment of the American exhibit—and we are thinking now of the *Gazette* as well as of *L'Art*—there is a sudden yielding to astonishment, an obvious incredulity of good proceeding out of Nazareth; and the reiterated compliments have a flattering air of conviction and almost of mortification. In treating the English exhibit, though the reiterated compliments are not wanting, there is a drawing-room manner, a sense of obligation, a suspicion of opinion overpowered by policy, which is not reassuring in criticism. This untrustworthiness clings to all the Paris reviews, though throughout Duranty's articles in the *Gazette* there is much poking of fun, in the old French style, and, in *L'Art*, Tardieu saves appearances by his honest blows at Mr. Watts's "symbolic pictures," and De la Tour comes out with frank dislike of English gold spandrels for water-color effects, and of Mr. Gregory's water-color saints. Despite this occasional assumption of doughty candor, the tone towards British art is transparently labored and mannered, with a constant parade of the virtue of magnanimity; but this is our reading of the whole tenor of a course of articles, and plenty of passages could be found that would seem to conflict with it. It is not of such remote consequence as might seem, on our assumed theory that subscribers here do not read the journal; reviewers read it, and the candid recognition of American success in *L'Art* has been spread about by our press, until an evident strengthening of confidence or pride in native art has ensued in the art-supporting class.

For the department in which this excellent review is supposed to address itself most successfully to its foreign patrons, the gallery of etchings and rare cuts, there has been a sufficiency of good things in the past three quarterly numbers. Rajon's etching of Bonnat's portrait of Victor Hugo; Koepping's of the lovely portrait of a young maiden, by Rembrandt, in the *salon carré* of the Louvre; and that from Le Blant's picture of "Rochejacquelin" in the last Salon, with woodcuts from Duez's triptych and Gervex's "Return from the Ball," are in the last quarter; during the year there have been noticeable plates in aqua-fortis after Ribot's "St. Sebastian" in the Luxembourg, by Monziès; after Delacroix's "Tasso in the Mad-house," by Flameng; after Lepage's "October," or the potato-gatherers, by Le Couteux; and after Jules Dupré's "Hay-wagon," by Chauvel. The quality of the illustrations improves on the whole rather than deteriorates, and the general vivacity and merit of a splendid enterprise are constantly asserted with living force. We need hardly reiterate our opinion that in taking up the British notion of a quarterly, the French have wonderfully bettered their instruction. No literary quarterly was ever so splendid a mirror of current literature as this artistic quarterly is of contemporary art. We are glad that American approval is one of the props on which the periodical depends, and, in present international conditions, should approve of a still more liberal list of American subscriptions going to the support of the artists, writers, and publishers who create the work and now keep it up in times of commercial straitness.

The Evolution of Man. A popular exposition of the principal points of Human Ontogeny and Phylogeny. From the German of Ernst Haeckel. 2 vols. 12mo. (New York: D. Appleton & Co. 1879. Pp. xxxviii. 464 and xviii. 504; many cuts and colored plates.)—Since this treatise reached our table we have seen a paragraph in one of our leading scientific periodicals regretting that there was no English version of the great German naturalist—so little known does this very timely and acceptable translation appear to remain. Haeckel does not make exactly summer seaside reading in any language; even advanced specialists have some terms of his own invention to master before they can fully understand him; and to read him intelligently in the original requires perfect familiarity with German, as well as some scientific training. For this author, notably among the masters of the subject of Evolution, declines to furnish brains to those for whose benefit he presents his long array of facts, to whose intelligence he submits a cogent argument, and for whose timidity, ignorance, or prejudice he has nothing but scorn. We therefore call attention to this English translation of the "Anthropogenie, oder Entwickelungsgeschichte des Menschen," as practically indispensable to the great body of workers and thinkers in this country who are either obliged to keep abreast of the subject, or are desirous of knowing more or less of the positions which Haeckel in Germany and Darwin in England have thus far reached.

These two are names of the recognized leaders of the theory of Evolution in Europe; we wish we could link them with one from this side of the water, but no American prophet of comparable rank has yet arisen. There is the strongest possible contrast between the two, in temperament and in manner, though they start from similar premises, follow parallel tracks of thought, and look to the same goal. The cooler, if not clearer and wiser, head of the Englishman foresaw certain consequences of the logical extreme of his views; with knowledge of human nature, and with kindly consideration for its weak points, he paved the way for the doctrine with such consummate diplomacy that men who conceded every postulate had no idea of the final syllogism, till the 'Descent of Man' showed them to what they had insensibly been brought; and then it was too late to recede. If this be comparable to a siege by slow advance, to successive reduction of outer works and final starving of the garrison, Haeckel's impetuous onslaught may be likened to a cavalry charge, bearing all down before it, excepting those who incontinently get out of the way, taking refuge in the castles of tradition, authority, and precedent, if not also in some of those which Haeckel would consider to be of Spain. As a matter of policy—as bearing upon the spread and the rooting in men's minds of the views of which he is so powerful a champion, Haeckel's "attitude" is undoubtedly unwise; but his brilliant onslaught is backed with such an army of occupation, by such solid columns of facts and figures, officered with such clear and cogent reasoning, that his potency is no less successful than Darwin's own. But, smothering the admiration which Haeckel's genius compels, we repeat that such a course is impolitic: no curl of the lip nor raising of the eyebrows comports well with the exalted position this author has won; for scorn and disdain are affronts which human nature resents precisely in the measure it deserves them. It is exactly our weak or sore spots that hurt most when pricked; and many who shrink from the surgeon who flourishes his knife and cautery might be induced to submit were gentler means proposed for the same end. But Haeckel would compel assent where Darwin would persuade belief.

However, we have discussed the principles of the doctrine of Evolution, as presented by various authors of repute, too often in these columns to need here to go over such ground. That the general question is fully before the public; that the subject is one of the most profound, most momentous, and most nearly touching the self-interest of every thinking human being; that the philosophy of this generation is incompatible with much that is unthinkingly held to be clear, vital, and sacred in human belief, is perfectly well understood. Respecting the book in hand, we need only witness that it is a faithful and able version of the original, and that its sufficient study should enable any one to appreciate the argument with which Haeckel defends his views of the descent of man, and to become familiar with the facts upon which the author reasons. Haeckel appears to have written in this instance not for his peers, but for the public; not to increase but to diffuse knowledge; and certainly less to discuss and analyze the principles of Evolution than to state what the doctrine teaches, explain it fully to laymen, illustrate it in a manner best suited to their comprehension, and then apply it, with all his wealth of resource, to the particular *crux* of the origin of the human species; well knowing that thousands of intelligent persons accept these truths, yet decline to bear that cross. Such is this work of Haeckel's; and we are satisfied that it loses little at the translator's hands. Here and there we find an obscurity requiring us to reread or reflect upon a sentence; but we dare say the German student is no better off. To learn the peculiar significance of fifty or a hundred new words is no great task; and this accomplished, any one may undertake Haeckel with composure if not with confidence.

Those who for any reason do not care to measure Haeckel at full length will find in Mr. Lester F. Ward's brochure a masterly digest of the whole matter. It is Haeckel in a nutshell; a lucid and concise statement of the leading facts, a clear presentation of the argument, and a logical conclusion; being, therefore, no less practically useful than highly commen-

dable. The three papers which make up this pamphlet of 64 pages, published by E. Stern & Co., of Philadelphia, originally appeared in the April-June numbers of the *Penn Monthly* of this year. One gives the "General History of the Doctrine of Descent"; another is devoted to "Ontogenesis," and the third to "Phylogenesis."

Studies of the Greek Poets. By John Addington Symonds, author of 'Sketches and Studies in Southern Europe,' etc. In two volumes. (New York: Harper & Brothers. 1880.)—*Euripides.* By J. P. Mahaffy, A.M., Fellow of Trinity College and Professor of Ancient History in the University of Dublin. In "Classical Writers," edited by John Richard Green. (New York: D. Appleton & Co. 1879.)—Mr. Symonds's essays have been before the public in the English edition for several years, and have been well received, but as they will now be seen by many persons for the first time, we may speak of the book as if it was a new one. The American edition is a real improvement on the English original in its lighter, handier form, the occasional additions, and especially the rearrangement of the essays in the chronological order of their subjects, whereby the book may now do duty as a history of Greek poetry. But the author does not offer his book for such a use, nor yet as a contribution to Greek scholarship. The preface to the earlier volume in the English edition, which we think ought, in justice to the author, to have been reprinted in the new edition, disclaims any such pretence, and anticipates criticism for extravagance of style and frequent repetition. "To bring Greek literature home to the general reader, and to apply to the Greek poets the same sort of criticism as that which modern classics receive," is the avowed aim of the author, in the first part of which he succeeds much better than in the second. Particularly in the more obscure corners of the subject the book will be valuable—viz., the gnomic and lyric poets, the fragments of the dramatists, the so-called Anthology, the poem of Hero and Leander. These chapters all contain interesting matter not to be found elsewhere by the English reader. The whole book bears witness to the author's keen sense of the beauty of nature, particularly in those aspects which attracted the attention of the Greeks of old, to the quickness of his imagination in picturing a scene or action as it lies in a poet's words, and to the catholicity of his taste. He has caught, moreover, the secret of being interesting, and exciting one's desire to know more of the subject he presents. With these popular qualities Mr. Symonds unites a great familiarity with Greek poetry and what has been written about it, as well as an admirable skill in translating.

The principal faults of the book are the extravagance of its style and the lack of discriminating criticism. The former is most strikingly shown in the chapter on Pindar. It is particularly unfortunate in this case, for he is so difficult an author and so unfamiliar to most readers that the most careful analysis and the coolest discussion of his thoughts and methods of expression are what is needed. One is led to suspect, from the baldness of the translations in this chapter and the complaint of his difficulty, that Mr. Symonds has never thoroughly familiarized himself with Pindar as with other poets, perhaps from want of sympathy. He repeats, we notice, the common mistake of ascribing to Horace the astounding statement that Pindar's odes are "without metrical structure," when a glance at the passage in Horace (Odes iv. 2, 10) would have shown him that the phrase refers to the dithyrambs, not to the epinikian odes. As to the other matter, one wearies a little of almost unvarying laudation of the Greek poets continued through nine hundred pages. He feels that he is defrauded of the due perspective and the desirable mingling of light and shade, and is inclined before he gets through to distrust somewhat the judgment of his guide. Upon Mr. Symonds's opinion of the utter obsoleteness of the Christian theology and view of life we shall make no criticism here, except to say that the intrusion of it into the book seems ill-advised.

Mr. Mahaffy's little book on Euripides, one of the first to appear of a new series called "Classical Writers," contains perhaps the best work he has yet published. It is simple and unpretentious in style without being dry, and presents fully all that need be told about the poet with clear and complete accounts of his plays. Of the character of Euripides as an artist and his influence as a public teacher, which has always been a puzzling question, Mr. Mahaffy gives a view agreeing in general with that expressed in Curtius's History of Greece, and which probably comes nearest the truth—that, living in a time of wonderfully rapid and violent transition, he was all his life unable to make a definite choice between the two conflicting tendencies, the old and the new, and that his plays reflect this vacillation of his mind. There is nothing, we believe, in English which will serve so well as an introduction to the study of his plays as this little book. We should wish, however, that the ten pages given up to a chronological table had been used rather for fuller discussion of some of the finest plays, such as the "Bacchæ," or for some such excellent translations as Mr. Symonds gives from the "Orestes."

A Popular Guide to the Terms of Art and Science. By C. Bankes Brookes. (Philadelphia: J. B. Lippincott & Co. 1879.)—*An Illustrated Dictionary of Scientific Terms.* By William Rossiter. (New York: G. P. Putnam's Sons.)—Mr. Brookes' guide we find to be very unsatisfactory. The author states that his object is to enable a non-professional or non-scientific person to find the technical terms used in the arts and sciences by merely knowing the popular words relating thereto, and to translate into popular language technical terms which he may need and not understand. When a student sees or hears a technical term which he does not understand he naturally goes to a dictionary where he will find the technical term translated into popular language. Why should he desire to become pedantic by translating the popular expressions into scientific expressions? The treatise of Mr. Brookes might be useful to a student of logomachy, but we fail to see that it affords any aid which Worcester or Webster cannot give in a much more liberal way.

Mr. Rossiter does not profess to have made a complete and exhaustive dictionary. We are surprised to find so much aid given to a student in so small a space.

BOOKS OF THE WEEK.

Anson (Sir W. R.), Principles of the English Law of Contract	(Macmillan & Co.)	$2 60
Appleton's Dictionary of New York and Vicinity, swd	(D. Appleton & Co.)	30
Barrows (Mrs. W.), Little Pilgrim Question-Book	(Cong. Pub. Co.)	
Bruce (W.), The Yo-Semite: a Poem	(Lee & Shepard)	1 50

The Art of Cooking.

A SERIES OF PRACTICAL LESSONS.

By Matilda Lees Dods, of the South Kensington School of Cookery. Edited by Henrietta De Condé Sherman. 12mo, cloth extra, $1 25.

Miss Dods has won very general and hearty commendation for the interest and the practical character of the instruction given in her lectures and classes, and a very wide circle is unquestionably waiting for her book.

Some comments on Miss Dods's Lectures.

"The thoroughness of her preparation for the work which this experience has afforded is seen in the marked success of the experimental lessons that she is now giving. They are so clear and methodical, her manipulation is so deft and easy, and the dishes produced are so excellent, as to win the praise of all who hear her."—*New York Times.*

The Nation.

NEW YORK, THURSDAY, DECEMBER 25, 1879.

The Week.

THE Governor and Council of Maine issued certificates of election on the 18th inst. to the Legislature they had chosen, and it will stand when assembled—House: 58 Republicans, instead of 90 as elected, and 78 Democrats, instead of 61 as elected; Senate: 20 Democrats and 11 Republicans, the Republican majority of 7 having been more than reversed. The Republicans of the State have been very much excited over the matter, but have already managed to arrange systematically for the expression of their indignation by means of public meetings throughout the State, as, it will be remembered, the Democrats thought of doing throughout the country three years ago. Senator Blaine made a long speech at one of these meetings at Augusta on Friday, in which he stated the grievance of his party very forcibly, though he did not explain what the laws of Maine prescribe in such cases, nor how they have been violated by Garcelon and the Greenbackers. Instead, he announced the amount of taxes paid by the disfranchised cities; declared that of the thirty-seven cases of counting out "there was not one of which the law did not provide and direct the mode of correction," and that so many cases had not occurred in all the fifty-nine previous annual elections of the State; called attention to the fact that the "fatal defects" were all on one side; and advised vaguely "a great popular uprising" at once. He also made this reference to the Louisiana analogy, which is worth reproducing: "This was the law; whether wise or unwise was not for us to determine. But it was the law, and the enforcement of that law defeated Mr. Tilden and elected President Hayes."

It is curious to notice the similarity between this point of view and that taken by Garcelon in his card to the public published the next day. In this he says that he and his fellows took for their rule of action "compliance with the requirements of the constitution and the law without fear or favor," and that if the result is different from that claimed just after the election "it is owing in part to the fact that the claim was unfounded, and in part to the carelessness of municipal officers in making their returns." He sets forth the provisions of the constitution and the different statutes bearing on elections (save that which has direct reference to his own duties, according to a subsequent criticism of his letter by Mr. Blaine); says they are "plain and unmistakable"; that in following them the Council have obeyed not only their own judgment but "the advice of their duly appointed legal officer, aided by the best legal talent in the State"; and concludes by remarking in a consolatory tone that after all the next Legislature (Fusion quorum) is the final arbiter of the election of its own members. In one point the Governor's defence seems decidedly weak: it does not explain how it happened that there were just enough "fatal defects" to elect a Fusion quorum. But we confess that this could only be satisfactorily explained by a person with the quick appreciation of extraordinary coincidences of the elder Mr. Weller. What the Republicans are going to do beyond holding indignation meetings has not yet appeared. Senator Hamlin joins Blaine in counselling a "great popular uprising," but what shape it is to take, or what it is to do when uprisen, no one seems to know any better than any one did in 1876 what Mr. Watterson's 100,000 Democrats were to be assembled for.

The House passed before adjournment the Military Academy Appropriation Bill, but did nothing else of consequence. The new rules, from which so much is expected, were reported, and an early day fixed for their consideration. A resolution proposing an amendment to the Constitution for the control of trade-marks by Congress was referred to the Judiciary Committee. In the Senate Mr. Morgan, of Alabama, introduced a joint resolution providing for the national repossession of land-grants bestowed on railroad and telegraph companies that have failed to comply with the conditions of the gift. The number of acres involved is 123,000,000. Mr. Morgan also made an ineffective speech in favor of maintaining the character and present volume of the greenbacks, and the full restoration of silver to equality with the gold coinage. But the event of the week was the adoption of a resolution proposed by Mr. Voorhees, of Indiana, which appoints an investigating committee to report on the causes of the negro immigration northward, with special reference to allegations of "unjust and cruel conduct" on the part of the whites. Besides the mover the committee as constituted consists of Senators Vance of North Carolina, Pendleton of Ohio, Windom of Minnesota, and Bell of New Hampshire—a good sectional distribution, with, of course, a Democratic majority.

The debate on this resolution was the most earnest and profitable of the session, and it is a pity that it could not have been reported in full by the Associated Press. A very moderate tone prevailed, and party lines were not observed in the vote, though many Southern Democrats supported the enquiry expressly to avoid furnishing political capital by seeming to fear its consequences. Mr. Voorhees at one end of the present line of migration, and Mr. Ransom, of North Carolina, at the other, seemed possessed with the idea that Indiana had been selected for party purposes; and the Southern members generally were disposed to believe that the movement had something to do with the next census and Southern representation in Congress. Their speeches were, however, the best and most obviously sincere, and Mr. Hill's and Mr. Ransom's showing of the progress in education, comfort, and acquisition of property made by the colored people of Georgia and North Carolina since the overthrow of the carpet-baggers was neither fairly nor adequately met. The suggestive fact that at the time when the blacks had their "political rights" the money to educate them was squandered on corrupt legislators, and that now when, according to the Stalwart view, those rights are forfeited they have their full share of schools and full security in their earnings, and their place in the jury-box, is one which ought to affect the popular judgment of the existing situation at the South.

Only two Senators, Messrs. Jonas, of Louisiana, and David Davis, held the enquiry to be beyond the competence of Congress, but this opinion seems to be ill-founded. Mr. Windom wanted to empower the Committee to propose a remedy for the injustice they would probably discover, but the majority preferred not to anticipate the question what Congress could do about it. The general cause of the negroes' restlessness is, of course, a simple desire to better themselves; the choice of Kansas and of Indiana is explicable on grounds having no relation to political intrigue. This, we may be sure, the Committee will find out, and also that the more ignorant blacks have put faith in unauthorized and mischievous promises of Government or private organized aid, and have thus been unsettled in a greater degree than they would have been by their oppressive circumstances. These last, again, will in many States and localities prove to be due to bad, and perhaps unjust, systems of credit and employment and legislation; and in giving further publicity to these evils the Committee, acting as a mouth-piece for the blacks, will probably render their chief service. The South is more and more sensitive to Northern public sentiment, and needs the light of exposure from that quarter as an aid to reform.

It is very hard to form an estimate worth printing about the condition of the Grant movement. Its promoters have been unusually active during the past week, and have claimed the election of Don Cameron to the chairmanship of the National Committee a s

a decided indication that they will control the Convention which is to meet at Chicago. This, on the other hand, is strenuously denied by the Sherman and Blaine men, who say that Cameron owes the place to a number of small causes, but mainly to his energy and wealth and experience. It must be noted, however, that in any view the selection of a politician of his stamp from Pennsylvania shows how firmly the managers still rely on the sort of tactics which have brought on the party all the grief and shame which have yet befallen it. The choice of Chicago, however, as a place of meeting, and of a hall that holds eight thousand people, is an immense gain for Grant. The "boom" is strong in that city, and an eight-thousand convention must be a "yelling convention," and more or less in the power of strong-voiced men in any part of the building. In a deliberating convention General Grant would undoubtedly be a weak candidate, and the shrewder men really feel this; but can the Chicago Convention be a deliberating convention?

It is more and more plain that General Grant feels that he is on the track, and is being put through the "preliminary canter," with his consent. Mr. McKee, the original promoter of the "boom" at the West, and editor and owner of its chief organ, the St. Louis *Globe-Democrat*, has just died, which will be a great loss to it. He was very prominent in the famous whiskey thievery of 1875, in which Babcock and McDonald figured, and was convicted of complicity and sentenced to the penitentiary for two years and a fine of $10,000, but was pardoned in six months. He has for the past year been very vociferous for Grant. The "boom" has plenty of such men among its supporters, but none owners of successful newspapers.

Weak-kneed Congressmen of both parties will enjoy the holiday recess all the more because of the motion submitted to the Supreme Court on Monday by Senator Edmunds, in his capacity of counsel for the plaintiff in the made-up Chittenden-Butler suit to determine the validity of the legal-tender of greenbacks. The case stands on the calendar as No. 779, Augustus D. Juilliard, plaintiff in error, *vs.* Thomas S. Greenman, defendant in error. Mr. Edmunds asked for its advancement, and if it could be argued and decided adversely to the legal tenders this winter it would relieve both parties of a burden which they will find it difficult to carry in the next Congress. The Court, however, would probably prefer that Congress should dispose of the matter itself, as it must indicate in some shape or other where the discretion is to be lodged that is to decide when the emergency has arisen which is to authorize the issue of legal-tender notes. The Court got over this in the Hepburn *v.* Griswold case by the aid of the general admission that the war was an unmistakable emergency calling for the exercise of all the powers Congress had. But would the Court decide that war constituted the only emergency which would warrant an issue of legal-tender paper, or that Congress might declare anything it pleased the needed emergency?

The grounds of the motion in detail, as presented by Mr. Edmunds and his colleague, Mr. William Allen Butler, were as follows: That although the case is between private parties and relates to an every-day transaction, the question involved is a vital one for the currency; that the validity of the act of May 31, 1878, which forbids the further retirement of the legal-tender notes, and requires them to be reissued after redemption, is directly called in question by the issue raised in this action, along with "the whole power of Congress to create or maintain the legal-tender quality of United States Treasury notes in time of peace"; that the importance of the case is further proved by the recent message of the President, and the reports of the Secretary of the Treasury and the Comptroller of the Currency, as well as by public sentiment, of all which the Court may properly take cognizance; that the least possible hardship would result from a decision denying the legal-tender quality at a time when business is prosperous and greenbacks are at par, and that this is a powerful argument against postponing the consideration of the case, or allowing it to take its turn; finally, that the question is assumed to be an open one, not embraced in the decisions of the legal-tender cases 12 Wallace, 457–681. From the preliminary argument, which we have not mentioned, it would appear possible for the Court to shirk the issue by declaring the motion not within the rules; but it is to be hoped they will not avail themselves of it. That courage is wanting in the legislative branch is no reason why the judicial should avoid a public duty.

Every indication that the Southern leaders begin to perceive the hollowness of the alliance between themselves and the Democratic party at the North is encouraging. The Grant "boom" at the South, so far as it reflects this awakening sense, is a good symptom. What is wanted, however, is not a man to stand by and rally around, but a set of principles forming a real and not a sham platform, and in the support of which the South can freely ally itself without regard to existing party lines. This has been well expressed in a recent letter addressed by Congressman Aiken, of South Carolina, to the Augusta *Chronicle*. He is unable to discover any principle in the Democratic party except opposition to the Republican tendency to centralization, and this vanishes when personal interests are at stake, as in Tammany's giving the game to the Republicans at the late election here. He advises the South to detach itself from the "Juggernautic car of Northern Democracy," to abstain from President-making, and to await the formation of a new Union party which will bear some other name than "Democratic."

The principal exportable articles—cotton, breadstuffs, and provisions—continue higher in the domestic than in the foreign markets, so that the supply of commercial bills continues small, and the rates for bankers' bills on London rule above the figures at which gold can be imported. The influx of foreign gold has therefore ceased, and the arrivals of lots previously started from Europe amounted during the week to only $689,000. The total specie imports for the year amount, however, to $83,740,000, of which $77,489,000 have arrived since August 1. Notwithstanding these large arrivals of foreign gold, the demands for money throughout the country for legitimate purposes and for speculation have been sufficient to keep the rates for money loans fully as high as a year ago; and the New York banks find even greater difficulty than then in keeping up their reserves. Currency has not yet begun to return to New York from the interior, although ordinarily the current, at this date, is strongly towards the Atlantic cities. The revival of business in every department, in all parts of the country, together with the speculative spirit that prevails, furnishes the explanation of this strange condition of affairs. At the Stock Exchange, the early part of the week was notable for the depression of stocks and bonds; before the week closed, the depression gave place to buoyancy. Congress has taken its holiday recess without making any provision for a further refunding of the public debt; the Committee of Ways and Means still standing for a 3½ per cent. bond and the Treasury for a 4 per cent. bond to replace the $791,000,000 of 5 and 6 per cent. bonds which will begin to fall due December 31, 1880, and which will all mature by June 30, 1881. Silver in London fell from 52⅝*d.* to 52⅜*d.* and returned to 52½*d.* per oz. Here the bullion value of the "buzzard dollar" at the close of the week was $0.8778.

The trial of Dr. Talmage before the Synod ended in a dismissal of the complaint by a majority of twenty-six to thirteen. The minority, if the newspaper report be correct, were all ministers; the majority was composed of ministers and elders equally. What renders the case remarkable or important is that there was, we believe, no dispute about the facts. The sole question before the Synod, as before the Presbytery, was whether the facts constituted "falsehood and deceit," and that the twenty-six ministers should be sharply divided on a question of this sort is an extraordinary and by no means edifying circumstance, particularly as, judging from the published testimony, there would not have been any difference of opinion on the question between an equal body of what are called

"men of the world"—that is, simply honorable men making no profession of religion. The verdict was cast, too, immediately after Talmage had made two statements in his pulpit of undoubted mendacity—one about the assessments on his church and the other about the "moral rottenness" of his accusers. The result was apparently reached partly through love of "harmony" on the part of the majority, and partly through a sort of lachrymose dislike to be unpleasant to anybody or to "embitter sentiments," which seems to be a prominent feature in Brooklyn theology. When the decision was announced, Talmage arose and with the utmost coolness declared his willingness to meet "these brothers" who believed him guilty of "falsehood and deceit," and whom he had just been accusing of "moral rottenness," "half way, or more than half way," and went on to propose a reconciliation tableau, which would have been very repulsive, and we are glad to say, both in the interests of religion and morality and common decency, did not come off, "the brothers" having the manliness not to respond to his advances. He also exhibited himself to the thirteen ministers who had just pronounced him a liar and cheat as "a sinner saved by grace."

The news from Afghanistan shows the situation there to be substantially unchanged. General Roberts, with whom some communication seems to have been had by flash-signals, appears to be safe in his cantonment. Although he is on substantially the same ground as General Elphinstone's force in 1841, and seems to have retreated to his quarters somewhat precipitately—witness the reported murder of stragglers and wounded on the way—he is vastly better off. He has a good stock of provisions within his lines, which Elphinstone had not; and his magazine is within the lines too, which Elphinstone's was not. Moreover, he is a vigorous and able commander, and his force has not been demoralized by reverses, as Elphinstone's was. His breechloading rifles, too, kill at 1,000 yards, while Elphinstone's muskets were not good beyond 300 yards, and had to reply to the jezails, which were effective at 500 yards. So he will probably hold out well, if the Sepoys do not begin to die of cold, which is very likely, as his supplies of fuel must be scanty. General Gough is moving down to his relief with from four to five thousand men, but he has to get through the Khoord-Kabul and Jugdulluck passes, both frightful ravines, with the Ghilzai tribe operating on his flanks, and the snow lying heavily. He may accomplish this feat successfully, as Sir Robert Sale accomplished it at the same season in 1841; but it is difficult. All is quiet on the Kandahar side, but no trouble in Eastern Afghanistan has ever been anticipated.

The Government and their newspaper organs are now saying that there is nothing alarming in the situation, and indeed that it is what was to have been expected, because the tribes, being now released for three months from their agricultural labors, have naturally taken to fighting to pass the time, and will disperse in spring. This would be a plausible view if the invasion had taken place merely for the purpose of chastisement. But as it has been undertaken for the purpose of erecting in Afghanistan a "strong and friendly government" dependent on Great Britain, and is costing enormous sums to an exhausted treasury, the escape of the expeditionary force from total destruction can hardly be called a satisfactory result of the first year's fighting. Besides this, it must be remembered that the Afghan hatred of foreigners and infidels, always passionate, has been doubtless intensified by the hanging, shooting, and village-burning of the last six months. These little operations have been intended as wholesome "punishment," but, as Sir John Kaye pointed out in his history of the last war, they are not taken as punishment in a country in which the vendetta is a sacred duty and custom, but as an injury inflicted by an enemy which every man feels under a solemn obligation to avenge when and how he can.

Another test of the relative strength of the Liberals and Conservatives has been applied in England, in the election at Sheffield of a member to succeed the late Mr. Roebuck, who had turned "Jingo" two years ago, and had been rewarded with a Privy-Councillorship—an empty honor, it is true, but one of the kind that Lord Beaconsfield thinks much of. The contest has been extraordinarily severe and the excitement very great, but the Liberals carried the day by 14,062 to 13,584, a majority of 478. The election is mainly important as what is here called "a straw," the Liberal candidate having resigned another seat for the express purpose of making the fight, and the Conservative candidate having the local influence of his cousin, Lord Wharncliffe, who is a great proprietor in the neighborhood. The Afghan trouble is likely to tell heavily against the Ministry all through the winter, even if it do not end in positive disaster, because it opens up an indefinite prospect of fighting and expense, instead of what was promised—a cheap and speedy improvement of the frontier. Mr. Gladstone's Scotch speeches, too, will probably exert powerful influence, and the Turkish cloud grows blacker and blacker.

The French Ministry has at last succumbed and handed in its resignation. It was made clear in the late debates and interpellations that it had no homogeneous majority to rely on, but was dependent in every division on the kindness of some one section of the Left and Left Centre, and lately has even been under obligations to the Centre. It was consequently at the mercy of any one of four or five small cliques. M. Waddington's personal characteristics, too, were unfortunate. His voice is weak and his manner impassive, and he has too much of the English phlegm to hold a French audience. His late defence, therefore, good as it was in substance, was so defective in delivery as to produce a very inadequate impression. M. Grévy has tried to get M. Freycinet, the present Minister of Public Works, to form a new combination, and as we go to press it is reported that, after a first refusal, he has consented The fact appears to be, however, that there is no chance of anything permanent before Gambetta consents to form a cabinet, and no politician of prominence cares to take an *ad-interim* position. Whether Gambetta will consent depends, doubtless, on his own opinion as to the ability of the Republican party to bear him without heavy loss in the country. He is the idol of the main body of the party, but there is in France a very large body of Independents, or outsiders, who are easily frightened, and Gambetta's political capacity has been in no way shown so well as in his unwillingness to alarm them.

Many of the recent European complications have been very curious, owing to the strange races and institutions they have brought into prominence. The British war with Abyssinia eleven years ago was one of these, but since the death of King Theodorus in the ruins of his palace we have heard little or nothing of the country. It now reappears again as the dominion of a certain provincial prince Kassa, who allied himself with the British against his suzerain and then succeeded him. When he got on the throne he called himself "King of Kings of Ethiopia." Since then, hearing doubtless of the legend of mediæval Europe, he calls himself King John of Abyssinia, and says he is a direct descendant of Prester John. In 1875 his pretensions brought him into collision with the late Khedive, who meditated the annexation of Abyssinia entire, but only took certain provinces. But in 1876 King John beat him in the field, and then the Khedive fell into financial difficulties and had to leave the King alone altogether. Since then John has grown more bumptious, and now demands back his lost provinces, and also the cession of the port of Massowah on the Red Sea, or else that it be made a free port. The new Khedive sent Gordon Pasha to negotiate with him, but he keeps Gordon as a kind of prisoner. More than this, he also keeps in custody a Catholic vicar-apostolic named Massaia, who was residing in the country. The Abyssinians have always been Christians of the Coptic denomination, but at the beginning of the century the royal family became Catholic and ordered a general change in the same direction. Then they changed back, and now the King of Kings, hearing of the Russian successes in Turkey, thinks of joining the Greek Church, and has locked up the Catholic vicar, about whom the Pope is said to be very uneasy.

MAINE AND LOUISIANA.

TO characterize adequately the performances of the Democratic Governor and Council in Maine in exercising the functions of a Returning Board would require very strong language. The whole defence they make—that the law obliges them to exact rigid conformity to certain rules in examining the election returns—is demolished by two facts. One is that the errors and omissions which they have discovered and used occur only in towns and districts in which the Republicans have a majority, and it passes belief that none should have been discovered or discoverable in towns and districts in which the Democrats had a majority. The other is that a law of 1877 permits the Governor and Council, when canvassing the returns, to correct such errors and omissions by comparison with the record, and they refuse to avail themselves of this permission, on the ground that the law is unconstitutional. But it is a well settled and necessary principle of American jurisprudence that every law is to be deemed constitutional until a competent tribunal decides otherwise, and on this point the Governor and Council refuse to take the opinion of the court, thus raising a presumption of bad faith of the strongest kind. They have no more right to declare a law unconstitutional than any other man in the State; and if they can refuse to avail themselves of a permissive act on this ground, they can refuse to obey a mandatory one. In short, there is a high degree of probability that they have been guilty of fraud in examining and correcting the returns, and there is absolute certainty that they have been guilty of a gross abuse of discretion in their manner of correcting them. The indignation their performance excites in Maine and throughout the country is not surprising, and it is by no means confined to Republicans. The affair is calling forth also hearty denunciation in leading Democratic papers. We do not need to point out the effect it is likely to have on Democratic fortunes next year.

It has had one parallel, and only one, and this one is worth recalling because it may help to arouse men of all parties to the danger of familiarizing the country with doubtful and unscrupulous uses of power by the party in power. Nothing is more contagious in political contests than examples of recklessness by those who happen to have the machinery of law in their hands, because nothing of the kind ever takes place without furnishing the other side a precedent or suggestion of greater or less force. A very few such precedents would, if allowed to pass unchecked, create a practice of playing tricks with election returns which would speedily make elections a mere form intended to register a prearranged result. This state of things has already come to pass as regards the nominating machinery. The honest, sober, and patriotic portion of the community who are not "inside politics" will have to bestir themselves if they mean to prevent the managers of both parties from bringing it to pass with regard to the electing machinery also. The Louisiana Returning Board in 1876 was chargeable with the same fatal moral disqualification for the exercise of "judicial functions" in passing on election returns as the Maine Returning Board—for so we may call Governor Garcelon and his Council—in that it was made up exclusively of members of one party. In private life this circumstance makes honest men put in a judicial position more than usually scrupulous and cautious, and even reluctant to act. The Louisiana Returning Board, however, were glad of it, for they disregarded the law which directed them to have at least one Democrat among their number, and this in spite of the fact that a Congressional Committee had in 1874 convicted these same men of fraud in counting the votes. The Maine Board, too, is in nowise abashed by the fact that its members all belong to one party; in fact, it seems to have drawn courage from the circumstance, although it has not gone as far as its prototype in refusing to admit a Republican to the Board, because the law does not require it. The Louisiana Board was reasonably suspected of fraudulent designs from the beginning, and the opposite party sent, as in Maine, a committee to watch it and ask for an inspection of the returns, and for the rigid observance of the following fundamental rules, which are as applicable to the canvassing of votes as to the trial of disputes about property: "Nobody should be judge in his own case; both sides should be fully heard; questions of law should be decided on established principles, questions of fact by the ordinary rules of evidence; the trial of disputed questions should be public; the impartiality of the judges should not only exist but be *manifest*." The Maine Republicans, in their protest addressed to the Governor and Council, have urged these rules on their adoption in even stronger language than that in which the Democratic Visiting Statesmen urged them on the Louisiana Returning Board. In both cases they have been completely disregarded. In both the Boards substantially acted as judges in their own cause, and decided for their own benefit. They both examined the evidence as to questions of fact and decided points of law in secret. The Louisiana Board, indeed, allowed the evidence of intimidation to be attached to the returns after they were received, contrary to the provisions of the law. Both Boards selected the districts in which they would throw out the returns to suit themselves, and both threw out enough to give their own party the required majority. In Louisiana the Board totally declined to give any reasons for its decisions; in Maine it gave reasons, but they were so lame that the production of them argues an unusual degree of shamelessness.

As to the appearance of impartiality, neither seems to have given itself the slightest concern about it. The Louisiana Board, however, was composed of men of lower character, and therefore more in need of having their impartiality made manifest, than that of Maine. We wish the Louisiana case was in no other respect worse; but it was aggravated by the claim of the Republican Visiting Statesmen, in their report to the President, that these justly-suspected persons, who had been convicted of fraud already by a Congressional Committee and whose private standing in the community was very low, should not only have the monstrous power of throwing out whatever returns they pleased on any evidence they chose to treat as sufficient, but should have had the still greater power of inserting in the returns the votes which they might decide would have been cast if the election had been fair. This sounds, after the lapse of three years, almost incredible, but we are faithfully reproducing the recommendation of the report. To crown all, these persons and almost every one of their underlings and aids immediately received offices of considerable value in the public service from the very persons for whom they had secured a majority. This touch is wanting and must be wanting in Maine, but we do not say it would be wanting if the circumstances permitted it.

The best and only excuse for comparing these two frauds now is, that they throw light on each other. The plea of some Democrats—not many, we are glad to say—that the former justifies or palliates the latter, is simply a fresh illustration not of the guilt and shame of both, but of the amount of mischief such occurrences work. The cheating in Louisiana probably did the country no harm by the disposition it made of the Presidency. In fact, the revelations of the past three years make it plain that it did a great deal of good, in saving the Government from a régime which would probably have been very disreputable. But it did incalculable mischief, to which we endeavored to draw attention at the time, in familiarizing the community with the idea that it is of more importance to elect your own man than to satisfy your opponents that he has been elected fairly. This is the fundamental idea of what is called "Mexicanism." The fundamental idea of Anglo-Saxon liberty is that no election has ended well which the beaten party does not believe to have been honestly conducted. The preservation and growth of this liberty in the United States have been due to the care which has been taken to cherish and strengthen this idea, and to the success with which it has on the whole been upheld and practised until now. It received a very severe blow at the last Presidential election. A long step towards Mexicanization was taken when that thoroughly Mexican politician, the late Zachariah Chandler, went to work to see that his candidate got the place, no matter what the Democrats thought about it.

It is characteristic of the Democrats that the mode of righting

this wrong, of which they complain so much, should be the perpetration of another wrong of the same character for a paltrier prize. It is true the Maine performance is widely condemned and in strong terms by the Democratic press, but there is no little chuckling over it, as fair retaliation, among such Democratic politicians as do not see the effect it is likely to have on the prospects of their party. There is no way under heaven, however, in which one party can punish the cheating of another effectively but by practising purity itself. The only telling retort the Democrats can make to Republican frauds or errors is the retort of good example; and nothing seems to go so hard with them as this. For ten years they have tried to meet every Republican folly and shortcoming by something worse in the same direction. We presume Governor Garcelon and his Council have been crying "fraud" for the last three years as vigorously as anybody, and yet they seize the first opportunity of imitating Madison Wells and his colleagues. But if we could only have had on the other side, also, in 1876 a little of that passion for fair dealing, that fierce hatred of the very appearance of chicane, that sensitive shrinking from the very shadow of suspicion, of which Mr. Blaine and other Republican moralists now offer such splendid examples!

SUBSIDENCE OF THE SILVER CRAZE.

THE benumbing report of the Republican caucus committee at Washington, recommending that there be no legislation of any kind this session upon the currency, includes the silver question as a matter of course, and leaves a burden upon the Treasury and a tax upon the people of at least two million dollars per month, which somebody and some political party must answer for—probably in the next campaign, certainly in some future one. The conclusion of the caucus committee is the more reprehensible since the uselessness of the silver coinage has now been proved to the satisfaction of some of its most pronounced supporters. The Warner Bill of last session is dead by the logic of events even more than by the obstinacy of Senator Bayard; and the Silver Bill itself—the provision of law which requires the purchase and coinage of that metal to the extent of two millions per month—has ceased to be an object of affectionate interest except to the few who think that their consistency and their position as public teachers are involved in maintaining it. A bill to suspend the coinage either temporarily or indefinitely would command a surprisingly large vote in spite of the asphyxiating resolution of the caucus; and even if it should not pass now, public opinion would be prepared for its passage at an early day. The coinage of silver dollars cannot go on much longer. The sooner it is stopped the less money will be lost to the taxpayers.

The public opinion of Europe is evidently against another international conference in the interest of bi-metallism. The London *Economist's* statement that the project has been abandoned by our Government may be premature, but it is probably not far wrong. The replies given by England, France, and Germany to the special commissioner of the United States last summer have not been communicated to the public, but it is known that they did not sustain the confidence based upon Mr. Wm. D. Kelley's report of his diplomatic feats at Berlin. Indeed, Mr. Kelley's ardor seems to have been somehow dampened, for he is now quoted as lukewarm on the subject of the dollar of the fathers, and as favoring a suspension of the coinage of it. Possibly his motive for stopping the coinage is to crush England under the weight of the monthly supply of silver which we now kindly dispose of by burying it in the vaults of our Sub-Treasury. If so, we must say that England exhibits surprising indifference to our policy, for the *Economist* actually suggests the very course which Mr. Kelley is said to favor, and which Mr. Halstead shamelessly advocates. It says that "as there is now no hope of silver being rehabilitated by joint action of the Powers, the absurdity of coining money which nobody will take must become apparent." It says nothing about the misery and destitution threatening the British Empire as a consequence of our ceasing to coin silver. But perhaps we are doing Mr. Kelley injustice. Perhaps he has no dark designs against the Old World, but sincerely believes that the dollar of the fathers is now sufficiently abundant, being equal to one dollar per head of the sons and daughters of the Republic if they should ever become bold enough to draw them out of the Treasury.

The Republican caucus committee having voted a general extinguisher upon currency questions, their action may be taken to include the further prosecution of search for friends of bi-metallism abroad. If financial measures are to be suppressed generally let this one share the fate of the others. Whatever polite phrases may be exchanged between governments on this subject there is not the remotest chance of our ever getting beyond phrases and into the category of acts, because it is impossible for governments, either singly or unitedly, to prescribe what shall be an equivalent. If an ounce of gold is the equivalent of a given article of merchandise, while sixteen ounces of silver are not an equivalent for the same thing, statutes and treaties cannot make the sixteen ounces equal to the one ounce. The utmost they can do is to compel persons who have made bargains and contracts heretofore on the expectation of gold and gold values to accept silver and silver values instead. They cannot compel the making of new contracts on the sixteen-to-one basis if that is not the actual commercial basis, and if it is the actual commercial basis no treaty is needed. Nor can they compel people to handle and carry silver to any great extent if they do not like it. The modern commercial world does not like silver, and Americans, it is safe to say, like it least of all. We use less silver per head than England, France, or Germany, notwithstanding its abundance among us, and every man or woman who receives a silver dollar, whether of the trade or "buzzard" variety, views it with suspicion and passes it off in preference to any other kind of dollar in circulation. The only advantage it possesses is that it is less exposed than other money to the depredations of burglars, few of whom will consent to steal it at par or take any risks whatever on account of it.

The various projects mooted to compel the national banks to receive silver dollars on deposit have faded away. There never was any real substance in any of them. The banks, including those of New York and Boston, have been ready to take silver on deposit to as great an extent as the depositors would agree to receive it back in payment of checks. More than this they could not do even if they would. No legal penalties can force them to do or attempt the impossible. What a bank receives it must pay out. If depositors are not willing to have their checks paid in silver, they cannot expect the banks to load themselves with it. If they are willing, they have only to sign an agreement to that effect in order to have their silver received and stored to the extent of the bank's capacity to take care of it. Any legislation compelling a bank to receive silver without reference to the depositor's willingness to take it back, could only result in a surrender of the bank's charter and its reorganization under State laws. It is not the least of the signs showing that the silver craze is rapidly abating, that we hear nothing more of those fantastic schemes to punish the banks for their alleged discrimination against silver.

Even the claims of the silver-miners are less talked of than heretofore. During the past eighteen months we have presented a curious spectacle to the world. Some thousands of our people have been digging silver out of the bowels of the earth which the Government has paid for, put its stamp upon, and consigned immediately to the bowels of the earth again. The silver subjected to this novel treatment is for all practical purposes just where it was before the miners took hold of it. If it should ever be wanted we should know where to find it, but it never will be wanted except to sell at its bullion value. In the direst depression of the iron trade nobody was bold enough to propose that the Government should buy and bury two million dollars' worth of pig-metal per month. That is what we have been doing for the silver-miners, and they cannot expect that we shall continue to do so always. A century or two ago the British Parliament was petitioned to buy and store the surplus woollen goods on the market in order to stimulate trade and

give employment to labor and capital. The wisdom of the period was engaged upon the subject a long time, and it was finally determined to deny the prayer of the petitioners, but to require that all corpses be buried in woollen shrouds. A similar compromise might be effected with the miners, if they should prove troublesome, by requiring that all coffins be furnished with silver handles. But to do the miners justice we must acknowledge that they had little share in passing the Silver Bill, and have as yet shown no great anxiety to keep it on the statute-book. Senator Jones has made a good deal of noise on the subject at one time and another, but his influence has been insignificant compared with that of the Blands and Warners, the Ferrys and Voorheeses, the Medills and Halsteads. The wisest of them must see that in the long run the price of silver will be regulated by the commercial demand for it, and not by an artificial demand like that of the Secretary of the Treasury, who goes into the market as an automaton to buy what he has no use for. If they do not perceive this truth, the public ere long will perceive it and act upon it.

Correspondence.

CONCERNING A NOTE IN DEXTER'S 'AS TO ROGER WILLIAMS.'

To the Editor of The Nation:

Sir: In July, 1651, John Clarke, John Crandall, and Obadiah Holmes, members of the Baptist church in Newport, R. I., visited an aged brother of the church, William Witter, who lived in Lynn, Mass., and who, on account of his advanced age and his consequent inability to visit his brethren at so great a distance, had requested this interview. They arrived at Witter's house on Saturday; and on the following day, in the forenoon, with the members of Witter's family and four or five strangers, they united in a private religious service. During this service the three Newport Baptists were arrested by two constables, and two days after they were sent to the prison in Boston. July 31 they were brought before the court. Mr. Clarke was fined twenty pounds; Mr. Crandall was fined five pounds; Obadiah Holmes was deemed worthy of severer punishment and was fined thirty pounds. In each case the money was to be paid or else the condemned was to be "well whipped." The fines of Clarke and Crandall were paid by their friends, as Clarke says, "without my consent and contrary to my judgment." Upon Holmes, who, like Clarke and Crandall, refused to pay the fine, the alternative sentence was executed. In an account of this affair, which Holmes soon sent to prominent Baptists in London, occurs the following paragraph, the italics, which are our own, being used for a purpose which will appear later:

"And as the man began to lay the strokes upon my back, I said to the people, 'Though my flesh should fail, and my spirit should fail, yet my God would not fail.' So it pleased the Lord to come in, and so to fill my heart and tongue as a vessel full, and with an audible voice I broke forth praying unto the Lord not to lay this sin to their charge; and telling the people that now I found he did not fail me, and therefore now I should trust him for ever who failed me not; for in truth, as the strokes fell upon me, I had such a spiritual manifestation of God's presence as the like thereof I never had nor felt, nor can with fleshly tongue express; and the outward pain was so removed from me, that indeed I am not able to declare it to you, *it was so easy to me that I could well bear it; yea, and in a manner felt it not*, although it was grievous, as the spectators said, the man striking with all his strength (yea, spitting in his hand three times, as many affirmed) with a three-corded whip, giving me therewith thirty strokes. When he had loosed me from the post, having joyfulness in my heart, and cheerfulness in my countenance, as the spectators observed, I told the magistrates, '*You have struck me as with roses*'; and said moreover, 'although the Lord hath made it easy for me, yet I pray God it may not be laid to your charge.'"

On page 121 of his 'As to Roger Williams,' published in 1876, the Rev. H. M. Dexter, D.D., refers to this whipping of Holmes, merely mentioning, however, the fact that Holmes received thirty stripes. But in a note he adds:

"Arnold thinks he was 'cruelly whipped' (*Hist. R. I.* i. 235). But Clarke says: 'It was so easie to me that I could well bear it; yea, and in a manner felt it not'; and that he told the magistrates after it was over: 'You have struck me as with Roses' (*Ill Newes*, etc., 22)."

It will be seen, on comparing the language of this note with the extract from Holmes's narrative, given above, that the author of 'As to Roger Williams' is in error when he tells his readers, "Clarke says," etc. But this is a matter of small importance. The gross misrepresentation of Holmes's statement, which this note contains, is the notable thing. The purpose of the note is plain. Arnold "thinks," says Dr. Dexter, that Holmes was "cruelly whipped." But there is another view which we may take of this affair; indeed, there is evidence which shows that the punishment was made easy by the magistrates, who, as Dr. Palfrey ventures to hope, sought to vindicate the majesty of the law at little cost to the delinquent. But, according to Dr. Dexter's note, upon what is this view of Holmes's punishment based? Manifestly upon the statement of Holmes. Yet an examination of this statement—and we have quoted the paragraph in full in order that the reader may make this examination for himself—discloses the fact that the punishment, according to Holmes's narrative, was most severe, and that, if Dr. Dexter had quoted the whole paragraph, if indeed he had finished the sentence from which his first quotation is taken, it would have appeared that Arnold was right; while the sentence from which the second quotation is taken shows that the punishment was made easy, not by the executioner, but by the Lord, who did not withhold his support in the hour of his servant's trial.

The writer, in an editorial which appeared June 21, 1876, in *Zion's Advocate*, a religious paper published in Portland, Maine, called attention to this singular perversion of Holmes's language. To this criticism, which was noticed in several other papers, Dr. Dexter replied in the *Congregationalist*, August 1, 1877—more than a year afterward. In this reply he said: "I said Clarke because I meant Clarke, as I was referring in general to Clarke's book (*Ill Newes*) which contained Holmes's letter. The oversight which I committed was in neglecting to add in parentheses the name 'Holmes' after 'he,' thus: 'and that he (Holmes) told,' etc." The note as thus amended would read thus:

"Arnold thinks he was 'cruelly whipped' [*Hist. R. I.* i. 235]. But Clarke says, 'It was so easie to me, that I could well bear it; yea, and in a manner felt it not'; and that he (Holmes) told the magistrates after it was over: 'You have struck me as with Roses' (*Ill Newes*, etc., 22)."

It will be seen that Dr. Dexter's only anxiety in this correction is to make it appear that Holmes is speaking without substituting Holmes for Clarke. The garbled statement is allowed to stand. An "oversight," it is true, was committed in the preparation of this note, but it was not in omitting important parts of Holmes's statement by which the reader is misled, but in omitting Holmes's name after "he"!

Recently a new and cheaper edition of 'As to Roger Williams' has appeared. In a notice of this edition which appeared in the *Congregationalist*, Dr. Dexter's paper, there is a new emendation of this note in 'As to Roger Williams.' The writer, presumably Dr. Dexter, says: "The only inaccuracy alleged against it ['As to Roger Williams'] is founded upon the fact that on page 121 (in note 478), in citing from Clarke's *Ill Newes from New England*, etc., the author wrote: 'Clarke says, "It was so easie to me that I could well bear it," etc.,' when he should have written: 'Clarke makes Holmes say: "It was so easie to me that I could well bear it";' Holmes being the party concerned, and not Clarke, who was describing what occurred. This slight oversight was freely confessed and publicly corrected as soon as discovered." The note as thus emended reads as follows:

"Arnold thinks he was 'cruelly whipped' [*Hist. R. I.* i. 235]. But Clarke makes Holmes say: 'It was so easie to me that I could well bear it; yea, and in a manner felt it not'; and that he told the magistrates after it was over: 'You have struck me as with Roses' (*Ill Newes*, etc., 22)."

It will be seen that even in this second emendation no attempt is made to correct the misrepresentation of Holmes's statement which the note contains. Having said Clarke because he meant Clarke, and having at length discovered that this was a "slight oversight" after all, Dr. Dexter now endeavors to correct the note by saying: "Clarke makes Holmes say." But plainly this correction leaves the note in a more objectionable form than at the first; for not only is the reader misled, but Clarke is now made to appear as the garbler of Holmes's words, when, in fact, as a reference to Holmes's statement will show, it is Dr. Dexter himself, and not Clarke, who *makes* Holmes say, by omitting a part of his statement, what he did not say. Indeed he who runs may read that Clarke was not "describing what occurred," as Dr. Dexter affirms, but simply allowing Holmes, by the insertion of his long letter in *Ill Newes*, to tell his own story.

We are also told that "this slight oversight was freely confessed and publicly corrected as soon as discovered." By "slight oversight" Dr. Dexter means his use of the words, "Clarke says," instead of "Clarke

makes Holmes say." As we have already shown, in his first notice of this criticism, and more than a year after the criticism was made, Dr. Dexter wrote, "I said Clarke because I meant Clarke, as I was referring in general to Clarke's book, which contained Holmes's letter." His correction "Clarke makes Holmes say," for "Clarke says," appeared during the past summer!

This is a "slight" matter, etc., it is true. It is not, however, a slight matter that the garbled statement "it was so easie to me," etc., in opposition to Arnold's view that Holmes was "cruelly whipped," is allowed to remain in 'As to Roger Williams.' That the quotation from Holmes in note 478 grossly misrepresents him is discoverable at a glance; but while Dr. Dexter has made two attempts to get the names right in the note, he has made no attempt to let the fact appear that the sentences quoted from Holmes give the reader of his book an entirely false impression. It should be remembered that 'As to Roger Williams' was written with the avowed purpose of correcting erroneous conceptions. An examination of this note and a review of Dr. Dexter's efforts to correct it, however, are not calculated to inspire confidence in Dr. Dexter's general fidelity as a historian. Indeed, in rising from our examination of this note and our review of Dr. Dexter's efforts to correct it, we find his own words in the preface of 'As to Roger Williams' mingling with our thoughts: "I must be allowed to think that any historian who shall go on to reproduce the former slanders in the face of the demonstration of their true character herein offered, must—unless he refute it—fairly be condemned as paying better fealty to indolence or prejudice than to the truth." H. S. B.

PORTLAND, ME., Dec. 18, 1879.

REASONS FOR BEING A DEMOCRAT.

TO THE EDITOR OF THE NATION:

SIR: In your apparent search for the motives of men in belonging to the Democratic party, you have said nothing of tariff-reform and the next Presidential nominee. Revising the tariff seems to me not only the most important national issue, next to that of the currency, but the most probable one. There are doubtless many young men who became Democrats because two of the three leading dogmas of the Democracy were hard money and free-trade. They have found tradition, backed by common sense, too weak to keep the party sound on the money question, but they think Mr. Bayard's resolution a hopeful sign of returning sanity among his followers, and they believe that a Democratic Congress will do more for free-trade than a Republican one, partly because of tradition, partly because of reason, partly because we can elect a President without the vote of Pennsylvania and the Republicans cannot.

We must be positive to succeed, and ought to be positive whether we succeed or not. Mr. Tilden was nominated and elected President because he had administered the affairs of New York most ably, and because he had well-known and strong and right beliefs on national themes—the currency, civil-service reform, State-rights (*i.e.*, the right of local government), and free-trade. His chance of re-election to the office out of which he was legislated would be better if he had continued to identify himself with two or three great political issues instead of with one small one. Free-trade is a much better cry than fraud.

Mr. Bayard's political beliefs are as well known and as strong and as right as those of Mr. Tilden. He has maintained them as steadily. If the Democratic party is wise enough to nominate him, I do not see how the group of Liberal Republican newspapers which the *Nation* heads, and the many Liberal Republicans whom the group represents, could avoid, or could wish to avoid, supporting him as against Grant or Blaine.

The facts that the Democracy is the party of free-trade, and that its possible nominee for the Presidency is Mr. Bayard, seem two very good reasons for being a Democrat.

Respectfully yours,

ALFRED BISHOP MASON.

CHICAGO, Dec. 14, 1879.

[On both these subjects our correspondent seems to be entering the domain of prophecy.—ED. NATION.]

THE MAINE JUGGLING.

TO THE EDITOR OF THE NATION:

SIR: The extraordinary result of the canvass of the votes cast at the recent Maine election gives rise to a number of questions, for answers to which your readers will look rather to the *Nation* than to any other source. The ostensible reason for the result reached by the State officers is, that certain formalities required by law were not complied with in the case of the rejected returns. If such wholesale rejection of votes for these reasons were common occurrences, of course the matter would be readily explained. But how does it happen that the same result has never been known before? The following are the questions, an answer to which is necessary to a clear understanding of the subject:

1. Are the requirements of the Maine election laws exceptionally minute and exacting? If so, how did it happen that the same difficulty has not been met with before in canvassing the votes in this State? If not, how does it happen that other State elections are not constantly affected in the same way? In a word, what is there exceptional in the laws or customs of Maine which has brought about this result?

2. Was there an extraordinary number of blunders on the part of the returning officers in the Maine election?

3. How did it happen that the mistakes were all on the Republican side, so that their corrections all tended to the advantage of the Democrats? Is this not a fortuitous combination of circumstances without precedent?

4. What is the general tenor of law and precedent respecting the canvass of votes in which some formality has not been complied with? For instance, if the law requires that an officer shall make up his returns on a certain day, and he fails to do it until the day after, is there any law or custom which prescribes that his returns shall be thrown out? Such mistakes must be of constant occurrence, but we seldom hear of them. If it were decided that such votes must be thrown out, how easy it would be for men sympathizing with one party to nullify majorities against them by simply waiting over a day or omitting some minute requirement.

N. S.

WASHINGTON, December 22, 1879.

THE TRUTH ABOUT MARYLAND.

TO THE EDITOR OF THE NATION:

SIR: As I was counsel in the contested election of 1875 for the Second Legislative District of this city, I deem it my duty to inform you that no person named J. T. Ringgold (or of any similar name) "was officially employed by both sides to make stenographic reports of the testimony taken in" that contest. The testimony in question was taken throughout by Mr. S. M. Stiles, of Philadelphia, and Mr. Ringgold (if there is any such person) had no connection whatever with the cause. His allegation, "Every negro arrested on that day had a revolver on his person," is a gross misstatement. I have at my office a *verbatim* copy of the evidence at the service of any one who chooses to examine it, which includes the depositions of numerous policemen and records the arrest of many negroes, but not one of the latter is said to have been armed.

I remain, sir, yours respectfully, CHARLES J. BONAPARTE.

BALTIMORE, December 22, 1879.

[Mr. Ringgold's letter was written on paper bearing the imprint of the newspaper-office from which it professed to emanate, with his name as editor, if we remember aright. We beg our readers to observe that this is now the fifth letter we have printed on the subject of the late Maryland elections. If arriving at the facts in a given case is so difficult when the locality is so near to the North and so populous as Baltimore, with what caution ought we to receive statements of what takes place, say, among the swamps and bayous of Louisiana.—ED. NATION.]

CHRONOLOGICAL CATALOGUING.

TO THE EDITOR OF THE NATION:

SIR: There is an error in the paragraph of your last number, p. 423, in calling "original" the plan of some one in *Il Buonarroti*, so far as he proposes a chronological arrangement of books on the shelves. There are at least two libraries known to me in which this is done in some fashion. In the Philadelphia Library books are primarily divided into four classes, folios, quartos, octavos, duodecimos, and then all books as they come in are arranged consecutively according to date of accession. This varies from an absolute chronological arrangement, because all newly acquired books may not be newly published books. At the University Library, Cambridge, England, for a certain portion of the library, a perfect chronological arrangement is carried out, all books published in 1863, for in-

stance, standing together. The scheme is not a bad solution of the difficulty which the receipt of *all* books under the copyright act casts upon a scholarly collection like that controlled by Mr. Bradshaw, himself an erudite scholar. From this mass of copyright accessions the fit books for the usual classifications are selected and assigned as their purchases would be. This, however, leaves much the larger bulk, which is simply arranged by years as received, and numbered under the years, so that a title in the catalogue showing 1859–72 points at once to the seventy-second place under that year. There might be many worse plans under the circumstances.

JUSTIN WINSOR.

HARVARD COLLEGE LIBRARY, Dec. 19, 1879.

Notes.

GINN & HEATH, Boston, will have ready next month a translation of Bender's 'Brief History of Roman Literature,' by Profs. Crowell and Richardson of Amherst; and 'Remnants of Early Latin,' by Prof. F. D. Allen, of Yale—both text-books.——Edward Stern & Co., of Philadelphia, publishers of the *Penn Monthly*, will begin on January 3, 1880, a supplement called *Weekly Notes*, consisting of comments on current news, and obtainable either separately or in connection with the *Monthly*. ——We are informed that the *American Hebrew*, of this city, is now publishing weekly a translation of the Talmudic book on 'Idolatry,' by Rabbi De Sola Mendes, the first ever made into English.——An attempt "to help solidify the Yale influence which centres about New York City," and to increase the membership of the local Yale Alumni Association, has been made by this organization through Mr. Lyman H. Bagg, in a handy pocket 'Directory of New York Yale Men.' A list of nine similar associations is given in this pamphlet, and the addresses of the class secretaries from 1816 to 1878.——Among a number of worthy artistic journals the *Portfolio*, edited by Mr. Hamerton, is still the best issued in our language. The editor is the first who has written in English with absolute dispassionateness and competent appreciation when the claims of English and Continental art were to be pitted together, and he has employed etchers without living superiors to furnish the plates which form so exquisite a cabinet in the collected numbers. As the size of these plates is of importunate moment to those who collect and store art-works, we ought to say that Mr. Hamerton has hit a felicitous medium.——A few late arrivals of children's books must take their New Year's chances so far as mention here is concerned. Mrs. Molesworth's refined and gentle fancy invents a number of fairy tales with the alluring caption of 'The Tapestry-Room' (Macmillan), and Walter Crane furnishes the illustrations. Harriet Martineau's "historiette," 'The Hampdens,' has been reproduced in a pleasant form by Geo. Routledge & Sons, with designs by Millais. This is not a book for the youngest, but rather for children well in their teens. It deals, of course, with the stirring times of the English Revolution. Mr. B. P. Shillaber's 'Cruises with Captain Bob on Sea and Land' (Lee & Shepard) consists of an old salt's yarns to his young friends, and will be sure to interest and instruct the reader. "Mrs. Partington's" humor pervades the book, but not obtrusively. 'The Otsego Chronicles,' by Mary B. Sleight (A. D. F. Randolph & Co.), is a moral tale containing numerous sound maxims like this: "No woman has a right to lead a man on to a declaration unless she means to accept him"; or this: "Cousins do sometimes marry, but it is not a prudent thing to do."—— The fashion of Christmas annuals has in England survived a decade since the death of Dickens, who set it, but the flavor of holly and mistletoe and enforced jollity characteristic of his work in this line is passing away; in the latest attempt it is wholly imperceptible. 'The Stage-Door: Stories by those who enter it' (Geo. Routledge & Sons) is a collection of poems, tales, and personal reminiscence written by dramatists and actors; the papers of the former are light even for a publication of this kind; those of the latter are lighter still. The one contribution of any force is Mr. W. S. Gilbert's "Comedy and Tragedy," which he announces is to be used as the basis of a play. The initial portraits have a certain value. Another English yearly pamphlet is 'Tom Hood's Comic Annual,' which, as it has been briefly described, "is not now Hood's and never was comic." Its only contribution of value this year is a charming poem by Mr. Austin Dobson, a little out of his usual vein, but with his usual finish. On this side the water, *Puck* has put forth an "Annual," which is cleverly, and of course humorously, illustrated.—— Prof. R. Bonghi, we learn from the *Athenæum*, has just completed a translation into Italian of Plato's entire writings, which he proposes to publish by subscription. This achievement is a fresh proof of Signor Bonghi's varied intellectual ability.——The *Californian* is the title of a new review published by the A. Roman Publishing Company of San Francisco, and recalling in its general manner and aim the *Overland Monthly*. It promises well enough for us to wish it a more permanent success than its predecessor, though there is something distinctly amateurish about some of the contributed articles, and perceptible traces of the practised Bohemian in its trifles, which justify its assertion that it is to be "thoroughly Western in its character and local to this coast in its flavor." Its salutatory is a model of modesty, and announces that it "has no apology to offer for its existence" and "claims no aching void in the literary world which it is especially qualified or commissioned to fill."

—The second number of the *American Art Review* confirms the impression produced by the first one, and makes it evident that there will be a great deal of solid information, and that of a sort which our public needs, in the new periodical. The more permanent matters are treated of in the body of the number, the more temporary in the different "Chronicles" at the end. Thus, the American Art Chronicle, which occupies five of these large pages, and in smaller type, too, than that of the body, gives a long account of the Springfield (Ill.) monument to Abraham Lincoln, its present condition, how much it is costing, whence the money comes, and the like; fourteen other monuments finished, begun, or proposed are described and discussed; the newly-born Chicago Academy of Fine Arts, its nature, and the way it came to "arise from the ashes" of the Chicago Academy of Design, are fully considered; in short, we do not know where else to go for such information as is given here, and in a certain sense it is indispensable. We have lived without it, but how? If this chosen and sifted news proves trustworthy, and free from the inaccuracy of detail which is inseparable from the daily press (for who ever saw an account in a morning paper of anything in which he was personally concerned and did not find it full of little blunders?), the *Review* will find friends who cannot spare it, if only on this account. Of body articles, one by Mr. Perkins tells about the researches and discoveries at Olympia, of which the temple-architecture is second only to the best, and the sculpture second, perhaps, to none. A notice of the late William Hunt, apparently the first of a series, and headed "Personal Reminiscences," is naturally rather friendly and obituary than critical. It contains two admirable woodcuts by an engraver whose work we begin to look for with eagerness, Mr. Andrew. We have read with pleasure a really thoughtful paper by the editor, Mr. Koehler, expressing more hope than all of us can feel for the near future of the fine arts. The announcement of a very important discovery, for it is pretty much that, in Oiron faïence, is translated from a German periodical. The most significant piece of criticism in the number is contributed by Mr. Ware in his second paper on the Washington Monument.

—The *North American Review* for January is introduced by an article on "The Interoceanic Canal," by M. de Lesseps, which, at this date, certainly calls for no particular comment. Of Mr. Parkman's reply to the five critics of his former article on Woman Suffrage, this may also be said perhaps, though we ought to call attention to a certain acidity of humor which characterizes it, and illustrates, we should say, Mr. Parkman's entire competence to deal with his opponents, so far, at all events, as the asides of dialectics are concerned. For instance, nothing could be neater than this at the close of his paper: "We do not like to be on terms of adverse discussion with women, or with men who represent them, and we willingly leave them the last word if they want it." The second part of Mr. Froude's "Romanism and the Irish Race in the United States," too, will probably be very successful in irritating persons who take sides strongly against Mr. Froude. It is not otherwise especially noticeable, but it shows that his great skill in stirring up the bile of Irishmen has no whit abated, but has rather been refined and polished to the extremity of effectiveness by constant practice. Part second of Mr. Mills's paper on "The Permanence of Political Forces" is given; an article on "The Metaphysics of Science," designed to show that there is a "realm of legitimate thought deeper than the data of physical science," is contributed by Professor Alexander Winchell; and Mr. Stoddard reviews "Recent Poetry." Mr. Henry James, Jr., has a critical article on Sainte-Beuve apropos of his recently published correspondence, which is quite in the vein of one of Sainte-Beuve's own "Portraits," and is, both in breadth of view and in nicety of perception, much more than a hap-hazard and hasty contribution to the literature of American criticism. More of such articles, even at the sacrifice of diaries of "Public Men" and

similar sensations, would be relished, we feel confident, by not a few readers of the *Review*.

—The *Atlantic* begins its forty-fifth volume with a larger page, larger type, paper without gloss, and sixteen more pages than it has had hitherto—all improvements, especially the new paper, which permits the magazine to be read at night with comfort and safety, as the old did not. The only change noticeable in the character of the contents is an apparent tendency towards making more of literary criticism than heretofore. The old department "Recent Literature" is, for this number at least, abandoned, but there are no fewer than five different articles on current books; one taking up recent novels, another holiday books, another Webster's Speeches, a fourth Gilman's Chaucer, and a fifth Daudet's 'Les Rois en Exil' and Gualdo's 'Un Mariage Excentrique.' Mr. Howells begins a new story entitled "The Undiscovered Country," which is to run through six more numbers, with a very real account of a spiritualistic séance, the medium of which promises to be interesting as the heroine. In the opening instalment, little more than the introduction of the characters is accomplished, but it is safe to infer from the way in which this is done that Mr. Howells is sure of his ground. Some very readable "Reminiscences of Washington," relating to the period of John Quincy Adams's administration, are given by an anonymous contributor, who gossips about almost everything that occurred and every one who figured at the national capital between 1825–1829, and from whom more of the same sort is promised during the year. Mr. White discourses of "Habits of English Life"; Charles Egbert Craddock contributes a Western story that has verisimilitude; there is a review of the pictures at the Hunt Memorial Exhibition, by an enthusiastic admirer, and "The Bonanza Farms of the West" is an interesting account based on personal inspection and various statistics. Of the conclusion of "Thirty-seven Hundred and Fifty-eight" we make as little as we could of the beginning last month, and to many readers we feel sure that it will remain a mystery. An essay on "Equality" reviews the political history of the doctrine, and discusses at length its justice and practical wisdom, setting out rather theatrically with the "undeniable principle," in italics, "All men are created unequal"; what follows is not difficult to construct, or would not be if it were a little more definite. The poetry is contributed by Holmes, Whittier, W. W. Story, and Harriet Prescott Spofford. Dr. Holmes's verses are, if we may say so without invidiousness, considerably the best; on the other hand Mrs. Spofford's "Intermezzo" contains this stanza:

> "Oh, how beautiful you are, my love!
> How your heart bounds with its tender yearning!
> How upon your lips, your cheeks, your eyes,
> The fragrant flame of your full life is burning!"

—*Harper's* for January opens with Keats's "Eve of St. Agnes," with nine large and carefully-studied illustrations by Mr. Abbey, all of which exhibit this artist's versatility, though some fall below his highest level. Mr. Frank Mayer follows with a light discourse on "Old Baltimore and its Merchants," accompanied by his own clever designs. A chapter on the reformatory epoch which marked the end of the third and the beginning of the fourth decade of the century in this country gives a rapid glance at American socialism, "come-outerism," second-adventism, the doctrine of non-resistance, the newer schools of medicine—Thomsonianism, homœopathy, hydropathy—temperance, Grahamism, woman's rights, phonography, etc., etc.; and each of these movements is illustrated with a portrait of a representative man or woman. Some of the very best engraving of the number is to be found among these likenesses—for example, Parker and Pierpont. Mr. A. A. Hayes, jr., continues his papers on Colorado with a very readable account of the sheep-raising industry, and again essays a balance-sheet for the benefit of the adventurous. Perhaps the best-organized truant system in the country is described in the article on "Compulsory Education in Brooklyn," which, however, needs to be followed up by personal investigation if one seeks to be fully informed on the subject. There is a striking difference in the truant type of countenance as conceived by Mr. Sol Eytinge, jr., and his associate for this purpose, Miss Jessie Curtis. A better service at perhaps less expense would have been rendered by careful portraiture of one or two rows of heads fairly selected from the Attendance Schools and the Truant Home. M. de Lesseps's career as Minister at Rome in 1849 is briefly sketched by Mr. Edwin de Leon, with the aid of a fine portrait. Lastly, we shall mention, for its useful information palatably set forth, Mr. John Habberton's "First Families of the Atlantic," to wit, the cod, mackerel, herring, and other food fish of the eastern American waters, whose peculiarities and habits have been fully described in the little-read report of the award of the Fisheries Commission.

—Mr. James, in the January *Scribner's*, concludes his "Confidence" by happily averting a tragedy and setting his foot on the national proclivity to divorce. In the present instalment of "The Grandissimes" we have vaudouism and blood-letting and more of the tender passion, and still, as we said in the beginning, one's head is giddied by the genealogical mazes of this remarkable family. Close beside this Louisiana romance the editor has placed a realistic account of the Acadians of the same State. Apparently they should not be thought of as a remnant of the exiles of Grand-Pré; at least the writer, Mr. R. L. Daniels, thinks they are not "passing away" except where the Yankee presses too closely on them; but physically they have deteriorated through excessive intermarriage, and being ignorant and priest-ridden and listless (though not idle) they are not highly valuable citizens, albeit seldom guilty of criminal offences. What we have found most suggestive in Mr. W. H. Bishop's "Young Artists' Life in New York" is his statement of the effect on themselves and on the stay-at-homes of the return of the native proficients from foreign schools. They find here a greater picturesqueness than they had dreamed of, sufficient facilities, if a little dear, for the artist life, and a position of authority awaiting them which they accept formally in professorships and informally by taking the initiative in all movements. It is a disappointment to find a great gap between the first and the second series of extracts from the Journal of Henry J. Raymond. From the Webster period we are transported perforce, the Journal itself being deficient, to war-time and the Fredericksburg campaign. It is still highly interesting reading, as showing the fatal nearness of the Army of the Potomac to the political capital, and the disastrous want of harmony between General Burnside and his subordinates. It will be strange if these extracts do not give rise to some controversy. Among the lighter papers is Mr. T. W. Higginson's "Revolutionary Congressman on Horseback" (William Ellery, one of the signers of the Declaration); Mr. William C. Church speaks with abundant knowledge of "American Arms and Ammunition"; and a paper on the "United States Life-Saving Service," by Mr. J. H. Merryman, probably does not presume too much on the willingness of magazine readers to listen at any time to well-written discourses on the dangers, discipline, and beneficence of this often-described institution.

—An anonymous writer contributes to *Lippincott's Magazine* for January a paper entitled "Forty Years Ago; or, Some Past Dangers to American Liberties." The past danger of slavery is the chief one considered, though those which forty years ago were thought likely to result from foreign immigration, Roman Catholic influence, "practical infidelity," and popular misrule, are also touched upon. The paper, indeed, is a review of the political situation in this country in 1840 and thereabouts, interspersed with reminiscences, and written sufficiently *currente calamo* to interest even the general reader in the condition of popular thought and the growth of a great popular movement, at what is now seen to have been one of the momentous periods of American history. Another serious article is a review of the international copyright question by Prof. Wm. F. Allen, who argues that the author's right of property in his own works rests "upon a consideration of the interests of both authors and the community," and proceeds upon that basis to discuss the controversy recently conducted in *Macmillan's Magazine*, favoring the view there taken by Mr. Conant, and defending his plan in the main against the English critic who attacked it. The rest of the number is light enough. The author of "Dorothy Fox" begins well a serial story entitled "Adam and Eve," and "Ouida" contributes an Italian sketch called "Umiltà," prettily conceived and effectively executed, though it is not altogether novel, and it has all the unmistakable ear-marks of "Ouida." For example, here is a speech made by the hero: "Make your girl come with you, or as sure as the figure of Christ hangs on yon cross I will wring her tongue out of her throat and nail it on your own house-door." It is needless to say that the girl goes with him, confesses that she has told a lie, everything is cleared up, Umiltà set free, and "Ouida" sees her "again go up between the stems of the pines in the glow of the lights amidst the cyclamens"—which means that she is out for a walk. The story would be better if it were shorter, but, as she remarks in the course of it concerning the recitations of Italian peasants, "Ouida" has "the defect of the uneducated—endless repetition."

—It may be something of a *tour de force* to convert so grave and compact a book as M. Rambaud's 'History of Russia' into a popular history, but the real want of a continuous and complete narrative to serve as a setting for

the various sketches of Russian affairs now so frequent, may justify the attempt. The original we have already reviewed at length (No. 722 of the *Nation*). The first volume (out of three) of a translation by L. B. Lang, edited and enlarged by Nathan H. Dole, and published by Estes & Lauriat, Boston, comes down to Peter the Great. The third will carry on M. Rambaud's work from 1872 to the present time. The translation is fair as such things go. It has not the crispness of a spirited literal rendering, nor yet that ease and unity of effect which can give to such work a style of its own. It is hard to account for a preference which constantly substitutes remote and involved constructions for the simple straightforwardness of the French. The title-page premises "enlarged," but it would have been more just to M. Rambaud to indicate when and where. Chapter ii., for instance, has two or three pages inserted to the exclusion of as much of the original. The simpler spelling of the Russian words is a step in the right direction. An adequate transliteration for English eyes is still a desideratum.

—The current number of the *American Journal of Mathematics*, which is published under the auspices of the Johns Hopkins University, contains an account of a fundamentally new phenomenon in electricity, not explicable by anything hitherto known. The definition of the new action is not yet certainly made out; but it appears to be that if we say that the direction of a galvanic current is from the negative to the positive pole, then a magnet tends to deflect the current within the conductor in the same direction in which it tends to turn the conductor itself. This fact will be a complete surprise to physicists, and its importance to the theory of electricity can hardly be overestimated. The discoverer is Mr. E. H. Hall, assistant in the Laboratory of Professor Rowland, to whose encouragement and assistance the discovery was in a large measure due. It may justly be said that no discovery equally fundamental has been made within the last fifty years. Discoveries so novel have usually been in some degree the result of accident; but in this case elaborate and very delicate experiments were undertaken to ascertain whether or not any such phenomenon could be observed. The new force is exceedingly feeble, so that we cannot predict any practical applications for it.

—The same number of the *Journal* contains several other important papers, including three by the celebrated algebraist Sylvester. All of these afford salient examples "of the importance of the part played by the *faculty of observation* in the discovery of pure mathematical laws." There has been, perhaps, no other great mathematician in whose works this is so continually illustrated as in those of Professor Sylvester. An example of a mathematical proposition known to be true many years before any one succeeded in producing a demonstration of it, is the familiar fact that on any possible map, however complicated, the different countries may be distinguished from those which adjoin them by painting them in only *four* different colors. This has been known for a long time, but the first proof of it is given in the present number of the *Journal* by Mr. A. B. Kempe, well known for his investigations into linkage. The number also contains an explanation of the "curved ball" of the base-ball players, and a method for representing a space of four dimensions.

—Mlle. Marimon's appearance in Donizetti's "Figlia del Reggimento," which was given last Friday for the first time this season, was the leading event of last week's Italian opera. The prima donna gained the same popular success as in "Dinorah" and "Sonnambula." She sang the brilliant part of *Marie* in excellent style, and acted with finished grace and perfect taste. She was very well supported by Mr. Mapleson's company. The opera was well put on the stage and may be numbered as one of the few successes which Col. Mapleson has gained this season. Signor Del Puente was excellent as *Sulpizio*, and Signor Runcio was a very fair *Tonio*. Repetitions of "Dinorah," "Sonnambula," and "Aïda," in which last-named opera Mlle. Ambre is exceedingly interesting, filled the remaining evenings of the week.

—Since his return from a tour in the country Mr. Joseffy has given a series of pianoforte recitals in Chickering Hall, which in every respect fully sustain the high opinion that we formed of him at his first appearance. His programme, though rich in itself, is not of a very varied character, the principal numbers being always taken from the compositions of the most modern school; yet he has given such excellent proofs of what he can do with Bach and Handel, and other masters of the old school, that we should be glad to hear more of the beautiful productions of the fathers of pianoforte music. Beethoven, too, is sadly conspicuous by his absence from Mr. Joseffy's programmes, although the latter's superb rendering of the E flat Concerto, the greatest composition for pianoforte ever written, has convinced us that he is perfectly qualified to interpret the best works of the classical school. Mr. Joseffy is advertised to play in the third Philharmonic concert. We hope he will surprise and delight his audience with some great composition in which he has not been heard here.

—The programme of the second concert of the New York Philharmonic Society was, with the exception of some slight difference in the vocal numbers, the same as that performed at the Brooklyn Society's concert last Tuesday week. It was a programme of a peculiarly harmonious and consistent character, and Mr. Thomas must have been in very good humor when he selected a series of orchestral compositions of so bright and cheerful a character as those performed on Saturday last. The first number, Beethoven's festival overture, "Consecration of the House," which was composed for the occasion of the opening of the Josephstadt Theatre in Vienna, where it was performed for the first time in 1822, is at all times a delightful introduction to a symphony concert. The second orchestral number was a novelty: Prelude, Menuet, and Fugue, by Hugo Reinhold. This pretty little composition produced, even at first hearing, a most agreeable impression. It is full of graceful harmonies and pleasing melodies sure to take with a general audience, but we can safely predict that the work will not secure a lasting place on the programmes of our classical concerts. It is weak, lacking in originality and character, and, as it is for string instruments only, the absence of the fine and graphic effects of light and shade produced by the wind instruments is keenly felt. The menuet, for instance, with the trio which follows, is a charming little piece of filagree work, but it becomes positively tedious at a second and third hearing of the endless pianissimo and pizzicato passages. The third movement, the fugue, is decidedly the best of the whole work; it is more manly and broad in conception, and affords some relief to the sweet monotony of the first two movements. Mr. Thomas's string orchestra was admirable in every movement of the composition. After Mr. Reinhold's humdrum phrases Schumann's beautiful First Symphony (B flat, Op. 38) came like a spring morning, and was received with the same delighted enthusiasm which it always excites. Mr. Thomas's superb rendering fully deserved the warm appreciation of his audience. Wagner's stately introduction to the "Meistersinger," given with a spirit of dignity and intelligence that would gratify even the exacting caprices of the great master himself, brought a delightful evening to a worthy close. The vocalists of the concert were Mlle. Valleria and Sig. Galassi. Mlle. Valleria selected imprudently the celebrated scene from the second act of "Oberon," "Ocean! Thou mighty Monster!" which is altogether above her natural and acquired abilities. She must draw her line at Gounod's "Faust"; she cannot go a step beyond. She was less ambitious and far more fortunate in her choice at Brooklyn, where she sang Mendelssohn's "Infelice" in a very acceptable manner. Sig. Galassi sang the "Evening Star" from "Tannhäuser" as perhaps no living Italian artist could interpret the spirit of chaste simplicity of this noble composition.

—It is so important to our stage, as well as to our fine arts, that a measure of historical correctness should be introduced in the accessories, instead of the glaring faults now patent in everything the scene-painter or the historical painter sets his hand to, that a work such as Racinet's 'Costume Historique' arrives like a peculiar blessing (New York: J. W. Bouton). M. Racinet's assiduity and knowledge are proved and indisputable. In the seven numbers of 'Costume' now issued we have noticed but one case in which his archæological care has been imposed on, and that is in the reproduction in the fourth number of a so-called painting from the Baths of Titus, representing an ancient bathing-scene, which has been proved to be an invention of the sixteenth-century architect, Rusconi, by J. Marquardt ('Handbuch der römischen Alterthümer'). The twenty parts which will complete the work, seven having now appeared, will contain five hundred plates, mostly printed in suitable colors and metals, and each of these plates presents on an average about ten human figures, so that several thousand costumes, from the rarest and most authentic documents, will be in the possession of the art-lover who owns the work. In the seventh number are to be seen Bertelli's analyses of Venetian dresses, wherein the waist was lengthened and the feet supported on lofty pattens, concealed in the skirts, explaining the apparition of little-headed giantesses in some of the paintings of Veronese (for further examples of which see Charles Yriarte's 'Venice'); also an interesting page of a dozen or more "Nuremberg eggs," or antique watches. It is easier to say that the costumes are of every age and country than to particularize their surprising variety of period and nationality. The work is com-

piled with elegance and with conscience, and is interesting to nearly all, indispensable to many.

—A luxurious affair, *Le Trésor Artistique de la France*, which has come to a temporary or final pause at its twelfth number, exhibits an artful and mysterious application of photography; by means of an enamel glaze, beneath which colors are flushed over the underlying surfaces of gold or silver, the representation of Cellini jewelry or Limousin enamel is given with a perfection and delicacy not before approached. Mr. Christern represents the publication, which really needs the full explanation of this wonderful style of reproduction at the hands of the inventors to remove the suspicion of alchemy or black art. The treasures represented really seem to be created over again.

NILS ADOLF ERIK NORDENSKIÖLD.*

THE subject of this notice is known to American readers chiefly as the indefatigable head of the Swedish expedition which in the present year has accomplished the Northeast Passage by sea, and, in the *Vega*, is at this writing engaged in completing the circumnavigation of the continents of Europe and Asia. Few, except special students, may be aware that success in this extraordinary voyage was hardly needed to entitle him to the first place among living explorers of the Polar region; or that, measured by solid scientific contributions to general and detailed knowledg eof the Arctic basin between Baffin's Bay and Bering Strait, his record is wholly unparalleled by that of any other traveller. Accounts of the nine different Arctic expeditions in which Prof. Nordenskiöld has taken part during the last twenty years have appeared and become familiar to those interested in Arctic matters. That they are less known to the general reader is accounted for by the fact that they have chiefly appeared in the Swedish and German languages, or been summarized in geographical journals. It is, therefore, with no little satisfaction that we welcome the appearance of a translation by Alexander Leslie of extracts from the above-mentioned publications, giving in a condensed form the essential facts and most interesting results made known through these expeditions, with some illustrations and maps, preceded by a semi-autobiographical sketch of Nordenskiöld himself. The matter of the volume is so interesting, even to those not especially devoted to Arctic matters, that the reader finds the singular clumsiness of the translation, numerous typographical errors, and the for the most part inferior illustrations, chiefly noticeable because unusual in the publications of the Messrs. Macmillan, and insufficient to interfere seriously with his enjoyment of the text. For the various expeditions our readers are referred to the work itself, the space at command being perhaps more suitably utilized in laying before them a short account of the man.

Nils Adolf Erik Nordenskiöld (pronounced Nord'enshölt), the third child of Nils Gustaf Nordenskiöld, was born at Helsingfors, the capital of Finland, Nov. 18, 1832. He came of a race distinguished since the latter part of the seventeenth century for daring endeavor and scientific acquirements. Among them were mining engineers, soldiers, alchemists, scientific farmers. One, who in 1743 had the audacity to propose perpetual peace between Christian nations to the Empress of all the Russias, died excommunicated by the clergy of Finland; another, a chemist and abolitionist, died at Sierra Leone from injuries received from the blacks during an attempt at colonization, undertaken with the view of forming a free negro state. The family was ennobled in 1751, and Colonel Adolf Gustaf Nordenskiöld, of the next generation, built on his property of Frugord, in Finland, a peculiar residence, the central portion of which contained a large hall with a gallery, around which were arranged collections of natural history. A sepulchral mound in the park surrounding the house formed the last resting-place of several members of the family. The atmosphere of old Norse days pervaded Frugord, and cannot have been without influence on the lives of those sons of the race who, like Adolf Erik, were reared there.

Nils Gustaf, the father, a distinguished mineralogist, was Councillor of State and Chief of the Mining Department of Finland, to the development of which and to scientific mineralogy he devoted thirty years of study and travel. His son, while yet a boy, became an indefatigable collector of minerals and insects, and often accompanied the father in his geological journeys. From the care of a private tutor he passed to the gymnasium at Borgo, whose freedom from discipline permitted him during his first year to distinguish himself "only by absolute idleness." Subsequently, however, his self-respect came to his rescue, and a still larger measure of freedom, granted by his parents without reproach for previous deficiencies, resulted in industrious and successful study. Trouble between the authorities and students of the gymnasium having arisen in the eventful year of 1848, young Nordenskiöld, with many others, left the school. In 1849 he entered the University of Helsingfors, and passed his candidature examination in 1853, after which he undertook a mineralogical journey with his father to the Ural, a further excursion through Siberia being rendered impracticable by the breaking out of the Crimean War. On his return he entered with zeal into chemical and mineralogical studies, obtained his degree as licentiate in 1855, and began in the same year to publish original researches in his favorite branches and also upon natural history. Several appointments carrying a small salary rewarded his exertions.

At this time the condition of Finland, from a Russian point of view, was anomalous. Her affections bound her strongly to Sweden. A perfect freedom in expression of opinion was universal, while conspiracies and secret societies were unknown. The rigid rule of old Russia had never been put in force in Finland. When, therefore, a disciplinarian of the true Russian type was, on the outbreak of war, assigned to the Governor-Generalship of Finland, his unfamiliarized ear heard only plots and treason in the careless words of rollicking students warm with wine. A detected spy, himself a student, soon found the university too hot to hold him. Imprudent words at a later frolic brought about among other results, a scapegoat being required, the dismissal of young Nordenskiöld, who proceeded by way of St. Petersburg to Berlin, where he became a worker in the laboratory of Rose, and formed the acquaintance of many eminent men of science. Returning to Finland in the summer of 1856, he was awarded a stipend for a tour of study through Europe. Before departing he was to attend the "Promotion Festival," at which he was to receive the degree of M.A., with the first place among those entitled to it; and of doctor, with the second place in that list. At the invitation of the young graduates a deputation from the Swedish universities of Upsala and Lund, consisting of a professor and five eminent younger academicians, was to be present at the festival. These guests from the dear mother country were received with words of honor and welcome, whose warmth to the Russian Governor-General smacked but too strongly of treason, which existed only in his own imagination. This Count von Berg, a stranger to the country he governed, never was able to comprehend the co-existence of the despotic rule of Russia and the habit of freedom, centuries old, which then actually prevailed in Finland. An imprudent speech at a banquet given to the departing guests, denounced as treason by Von Berg; retirement to Frugord, and finally to Sweden, assisted by an old passport; a judgment, hasty and possibly illegal, depriving Nordenskiöld of the right ever to hold office in the university, followed in quick succession.

This was the turning point in his life. Received by the illustrious Mosander with great cordiality, although the latter highly disapproved of the liberal views which had brought such trouble upon the young student, Nordenskiöld devoted himself to earnest study, and in 1858 began his career of Arctic adventure by taking part in Torell's first expedition to Spitzbergen. A subsequent visit to Finland, and an unsatisfactory interview with Von Berg, led to his exclusion from his native land until a change of governors took place. This was of the less consequence, since it had been understood before leaving Stockholm that he was to return there to take the place at the Riks-Museum left vacant by the death of Mosander. In consequence of his exertions the mineralogical cabinet under his care has become one of the most considerable in Europe. In 1861 he took part in Torell's second expedition to North Spitzbergen. On his return, the removal of Von Berg permitted him to revisit Frugord, where his mother had passed away, the opportunity of soothing her last moments having been denied her son.

In July, 1863, he married Anna Mannerheim, daughter of ex-President Count Carl Mannerheim, of Finland, a lady whose good sense, varied accomplishments, and strength of character combined to make the union most happy and congenial. In 1864 he led an expedition fitted out by the Academy to Spitzbergen, with a view of measuring an arc of the meridian and completing Torell's survey of 1861. In 1868, aided by the Government and by Oscar Dickson, the Mæcenas of Sweden, he carried a small iron steamer to the highest latitude known to have been attained in the eastern hemisphere by any vessel; also bringing back rich collections. With a view of preparing for future journeys, he undertook, at Mr. Dickson's cost, a voyage to Greenland in 1870. As the son of a native Swedish nobleman, soon after being naturalized in Sweden, he sat in the House of Nobles, and became the Liberal representative of Stockholm in

* 'The Arctic Voyages of Adolf Erik Nordenskiöld, 1858-1879.' Pp. xiv. 447, 8vo, maps and cuts. London and New York: Macmillan & Co. 1879.

the Diet from 1869 to 1871. In 1872 he led a new Polar expedition to Spitzbergen, wintering there in imminent peril of starvation from the detention of the provision-tenders with their crews, and from having to relieve a large number of shipwrecked walrus-hunters. In 1875 he made his way with little difficulty to the Yenisei in a small sailing-vessel, which was sent back, while Nordenskiöld and several companions ascended the river to Yeniseisk and reached home by an overland journey, after having opened a commercial route of the greatest importance to Northern Siberia. In 1876, after visiting America in the capacity of a juror at the International Exhibition at Philadelphia, he repeated the journey to the Yenisei and returned to Europe by sea. In July, 1878, he sailed on the voyage which culminated during the past summer in the accomplishment of the Northeast Passage.

The results of all this activity are unparalleled. The least important of his voyages has been more productive than the immense expeditions of Belcher and Nares, in all that goes toward increasing our knowledge of the conditions and products characteristic of the Arctic seas. Even in geographical research the fruits have been great, while no time has been lost in theorizing about an open Polar Sea or paleocrystic formations. Nordenskiöld's career has been throughout a striking exemplification of the success of scientific methods urged on by well-directed energy and the fire of individual enthusiasm trained, but not subdued, by long experience. To those enjoying the privilege of his acquaintance, appreciation of his work is heightened by the personal charm of a *bonhomie* and freedom from conventionality left untainted by that self-estimation which might be so readily pardoned in one who, like Adolf Erik Nordenskiöld, may be said to have formed a habit of success.

RECENT NOVELS.*

IT has rarely been our lot to read two sillier and more vulgar books than 'Vic' and 'Mr. Phillips's Goneness.' What greater waste of type and paper can there be than to print such stuff—the chronicles of the drunken employees of a country printing-office, a poor boarding-house, and of love (so-called) and matrimony founded on nothing and coming to nothing. 'Vic' is more melodramatic, more impossible, more *flash*, but as vulgar as futile. Better to "listen to the flapping of the fire," to discuss the thermometer, to collect bent pins, better any quiet method of wasting one's life than to read such books. "The Danbury *News* Man" has done better things. Nobody excels him in his descriptions of hens or of house-cleaning; but we recommend long abstinence from pen and paper as the beginning of a cure. Before he dies he may again have something to say.

'The Tribulations of a Chinaman' is a very lively extravaganza, and, as the scene is laid at our antipodes, we are not so much shocked with the topsy-turvy quality which inheres in this sort of book. The moral is definite, but so skilfully wrapped up in absurdities of all sorts as not to be offensive to the lightest reader.

Christian Reid is a voluminous writer of romances which apparently find readers. It would probably puzzle a foreigner making his first acquaintance with English literature through her novels to imagine in what part of the English-speaking world they had their origin, and we have often wondered to what country or province and to what age such a foreigner would probably assign them. They belong really to a world of their own. It is a world in which there are fine old estates the owners of which are travelling about in search of amusement, letting their places go to rack and ruin, flirting desperately, fighting duels occasionally, and behaving generally in a thoroughly frivolous manner, until a casual meeting with the heroine changes their whole nature and makes them serious men and devoted lovers, and, after all sorts of misadventure and unhappiness, fortune smiles on the happy pair at the end of the volume. It is a world, moreover, in which there are "gentle belles" to fall in love with the wandering heirs at the same time the wandering heirs fall in love with them, and to suffer in the quiet, patient way in which gentle belles suffer through nine-tenths of this volume. It is a world in which "fast" young women, just grown up, receive young men in "boudoirs," carry on numerous flirtations, and engage, disengage, and re-engage themselves at pleasure, and altogether do what they please. It is a world in which ideas of romance peculiar to the last century seem to be very inharmoniously mingled with the hard realism of the present day; in which we never feel sure whether the author has derived her experience of life from reading Sir Walter Scott or the *Herald's* Newport correspondence. There is only one quarter of the globe which could produce such a novel as 'A Gentle Belle.' For fear of fomenting sectional strife we will not mention it by its geographical designation, but merely say that it is neither in Europe, Asia, Africa, nor Oceanica. The plot of 'A Gentle Belle' is simple enough, though it is intended by the author to be complicated. Vincent Dering, dying at Florence, leaves behind him a young and beautiful daughter, Alma. Just as her father was lying at the point of death, Dare Singleton, the son of an old friend, not knowing the condition of Mr. Dering, had called at the Dering villa, and is invited in to witness the old gentleman's will. This is the beginning of the acquaintance between Dare Singleton and Alma. By her father's will Alma is to live half the time with her sister, Mrs. Hamilton, a designing woman of the world and a particular friend of the hitherto "flirtatious" Dare, and half the year with some relatives named Digby. Singleton falls in love with Alma, while Mrs. Hamilton determines that she shall make quite a different marriage. For the purpose of breaking up Alma's growing interest in Dare her sister "exposes" an old flirtation of his with one Ida Palfrey. Ida has been playing fast and loose with Alfred Lennox, and appearances are rather against Dare, whose behavior, it must be confessed, is far from exemplary. Meanwhile Gerard Digby, who the experienced novel-reader sees from the first is too good and noble to live very long, falls in love with Alma, and Lennox and Singleton fight a wholly unnecessary duel, and Alma, believing Singleton faithless, engages herself to Digby. After the duel Singleton disappears and roams over the world, and at length his yacht is driven upon the coast in a storm; Digby loses his life in saving that of his rival, the lovers are reconciled, and Mrs. Hamilton, who is convicted of having purposely destroyed a letter which would have prevented any misunderstanding between them, is utterly discomfited. A husband is found for Ida Palfrey in Philip Lindsay, and so the story ends. It is not a powerful or engrossing tale, but, as illustrating the danger of flirtation and the power of true love, and enforcing the sanctity of private correspondence, may be read with profit.

A love story, with the scene laid in Syria among the missionaries, is rather a novelty in literature. The heroine, Irene Grant, a good but poor girl, goes out with Mr. and Mrs. Payson to labor among the missionaries, and comes back after a few trifling adventures as the wife of Hubertsen De Vries, of Albany. This is the sum and substance of the story, though there are, of course, other characters—a poker-playing consul, of the sort that it is the fashion now to put into novels, ignorant of all languages, customs, laws, and religions but his own, but getting along well enough in any country to which he may be accredited through his imperturbable good-humor and kindliness. The consul, it should be said, falls in love with Irene, as does also Dr. Macklin, who is more natural and life-like than some of the other characters in the book. There are a good many people connected with missionary life who are virtuous, but tedious, as is also much of the descriptive writing of the author. Saada, the little Syrian girl whom De Vries succeeds in making miserable in an interval of his love-affair with Irene, is rather an attractive sketch. We regret to say that the author's sentiments are not as patriotic as they should be. What are we to say of this?—"I suspect also that in our American society there is no young gentleman so grand and so redoubtable in the eyes of a poor girl as the young gentleman who has a great deal of money. No matter for native dignity, for conscious worth of character, for noble or even sacred purposes in life. They all seem to fail, alas! and to hide diminished countenances in presence of a fact which appeals to the natural desires and strong needs of feminine nature." There must be some mistake about this.

Mrs. Edwardes is the author of several clever novels, of which the best is 'Ought We to Visit Her?' She showed in that a great deal of cleverness, managed her story well, discriminated her characters so that they could be identified by other means than the recurrence of the same name (a feat by no means universal with female novelists), and generally succeeded in exciting an interest in her tale which she sustained to the end. Without meaning to speak positively, we shall, as a tribute inspired by a recollection of her previous tales, suggest that 'Vivian the Beauty' is probably the worst story that Mrs. Edwardes ever wrote. It relates to the loves of a little English girl living in Schloss Egmont, in one of "the

remoter valleys of the Höllenthal," and her German instructor, Wolfgang, who in the end turns out to be no other than Paul von Egmont, the heir of the great Egmont estate. The story is very hastily constructed, and there are many points in it which we should like to have cleared up were it not for a lack of interest in knowing what the result would be. Mrs. Edwardes introduces into her story a London beauty of the "professional" variety, who expresses her admiration of things by exclaiming, "How quite too awfully jolly!" and, on hearing Talleyrand mentioned, begs that "if the great Talleyrand—whoever that venerable duffer may be—is still alive," her entertainer will "have him over to Schloss Egmont." Vivian may be shortly described as grossly rude, vulgar, envious, deceitful, "loud," and lacking everything that makes a woman attractive except physical beauty. But we are unwilling to believe in her existence. Mrs. Edwardes has taken her not from real life, but from the "fashionable weeklies."

Notwithstanding the title, 'Castle Foam' is a serious work of fiction, with a plot of the most elaborate character, founded apparently upon some Russian historical incident or legend. It is not easy reading, though it must have been hard writing, owing to a difficulty the author has in appreciating the effect of motives on the human character, and a defective education in ethics and criminal law. A great deal of the story hinges upon the consequences of the murder of Count Kramareff by a young soldier. The young man clearly killed Count Kramareff because Count Kramareff was just about to kill him; and, however unfortunate, the act was justifiable homicide under the laws of all civilized states and in the forum of morals. No doubt, in Russia at the time, it placed the soldier in an awkward predicament, but it need not have caused him much remorse. The best thing in the story is the love episode of Kathi-Chichkini and the prince. The ramifications of the plot are difficult to follow, and must have involved an enormous amount of misdirected labor on the part of the author.

'The Markets of Paris' is called M. Zola's favorite novel, and the reason for his preference is not far to seek, since it is, so far as our acquaintance with his books goes, the most successful and the subtlest study he has made of one of those colorless characters which offer few or no salient points to most students of life, but whose delineation always tasks the highest powers of the novelist of the first class. The heroine, Lisa, belongs to the Macquart branch of the Rougon-Macquart family—with different members of which all of M. Zola's books are concerned—and unites in herself her father's selfishness and her mother's industry; she may be called, in fact, the embodiment of the reasons which led to her parents' marriage. Her "enlightened self-interest" assures her that it is in the orderly paths of life that comfort dwells, and it is only by the unwisdom of disorder, weakness, poverty, and sin that so poignant a passion as anger is aroused in her. Her husband's brother, an escaped exile, suddenly reappears one day. Lisa is at once ready to divide with him the inheritance which her husband received from his uncle, and is displeased at the arrangement between the two brothers which leaves it all in her hands and gives Florent a home with them. Her dislike of her brother-in-law begins with her aversion to any one who has suffered such hardships; that he has suffered unjustly, and that his character is noble, only emphasizes her general sense of a hopeless muddle where everything should be clear. His willingness to live without work, although he does not spend a tithe of what belongs to him, increases this aversion by offending her sense of the necessity of work in any well-ordered life, and in one way and another she forces him to accept a position under the government which he hates as his persecutor. He is drawn into a revolutionary society, which she discovers, and, frightened for the safety of her family, she denounces him to the police, who are already in possession of her story through anonymous letters from the neighbors. Florent is transported, and Lisa quiets her conscience by reflecting that her course was open, and that her brother-in-law had already been denounced, and above all by the return to the quiet and orderly life that had been interrupted. There is nothing contemptible in Lisa, it is to be remarked. She is one of the elements of society, and a product of civilization; though an incarnation of selfishness, from sheer force of selfish wisdom she escapes the patent failings of characters superficially similar; she has, indeed, the garnered worldly wisdom of ages, and might be offered to Mr. Mallock as an example of the passion with which "honesty is the best policy" may be worshipped, or to some of his critics as an example of the tragedy such a character develops when brought into contact with a life ordered by ideas which, however completely they may prefigure the wisdom of the future, nevertheless threaten the comfort secured by the wisdom of the past. Like the rest of his books, 'The Markets of Paris' shows M. Zola committed to a theory of novel-writing, but, unlike some of them, it shows his ability, when he is at his best, to sink his theorizing in an acute and dispassionate study of life and character. The details of the story, aside from the development of its principal character, are even slighter than is usual with him.

As a work of construction 'The Conquest of Plassans' is much more deft and elaborate, though here as elsewhere with M. Zola the pleasure to be derived is gratification at the solution, or at least the adequate presentation, of a problem, social and individual. The character study here, however, though highly refined, is subordinated to the exigencies of a plot with reasonable rigor. No abstract of it can give the play of opposing motives in its different personages, but we may indicate these in a brief outline: An ambitious and arrogant priest, a tool of the Empire, is sent to Plassans to win over the town to the Government. His first conquest is over the simple minds of the Mouret husband and wife, the former of whom belongs to the Macquart and the latter to the Rougon branch of the Rougon-Macquart family. Side by side with the action of the story runs the development of the family antagonism between these two, Mouret and Marthe, due to the wife's unconscious love for the priest. This love is disdained and dreaded; but she is a necessary tool to the Abbé Faujas, and he uses her to gain control over Plassans. Through her love and his mother's acquisitiveness he is gradually installed as the head of the Mouret family, and his sister and her husband take up their abode in the house and begin a system of general pilfering. Marthe's constitutional hysteria is aggravated by the life of excitement she leads; her nervous convulsions, in which she beats and injures herself, give rise to the suspicion that her husband intends to murder her; and Mouret himself, who inherits the weak physical nature of their grandmother—Mr. Spencer would be charmed with M. Zola—becomes so frightened and moody that their friends hurry him into an insane asylum. The abbé's plots are successful, and he is able to return the Government's candidate. Marthe is spurned by him, and after a visit to her husband her weak nerves succumb at the terrible sight of his insanity, and she dies that night. Mouret manages to escape, returns to his old home, and, finding it in possession of the Faujas people, burns it to the ground in a frenzy, and perishes with the priest in the flames.

'The Last Athenian' is an historical novel that recalls in some sort both 'Hypatia' and Bulwer's classic romances. It is probably fully as accurate a reproduction of certain features of the fourth century as Kingsley's work is of Neo-Platonism, and its Swedish authorship is perhaps accountable for its superiority to such works as 'The Last Days of Pompeii' in simplicity and straightforwardness. It is in effect an exaltation of the Donatists and Novatians over the Roman Church, and the exceedingly slight love-story is sacrificed to the development of a republican philosophy of Christianity, which is the point of the book. Its bulk is swelled—to an extent which induces sympathy and admiration for the translator—by numerous platitudes and a fulness of trite description which remind one of the criticism of the Japanese on the French Salon: "These pictures are of course intended to instruct the children; show me your best—where the imagination is excited by a suggestion."

'The Prehistoric World' may pass for a historical novel also. It will, probably, have some difficulty in finding its audience, since, on the one hand, students of the bearings of the great scientific discoveries doubtless prefer to construct their own pre-historic romance; and, on the other, the ordinary omnivorous reader, who could easily be interested in a strictly scientific work, is hard to catch with facts arranged on the thread of a romance which drags as a story, and in which he is unable to sift out the fact that may be held to, from the invention of the novelist's fanciful license. The book is divided into three separate stories: 'The Parisians of the Stone Age,' 'The Age of Polished Stone,' and 'The Age of Metals,' of which the last is much the most interesting.

Mrs. Wister's translations from the German are better known by her name than by those of their several authors, and a new translation by her is as sure of a welcome as if the merits of the original were already notorious. 'In the Schillingscourt,' by E. Marlitt, has the usual elements of the older German novel of the present day; the grave and stern hero main-

'Castle Foam; or, the Heir of Meerschaum. A Russian Story. By H. W. French.' Boston: Lee & Shepard; New York: Charles T. Dillingham. 1880.
'The Markets of Paris. By Emile Zola. Translated by John Stirling.' Philadelphia: T. B. Peterson & Brothers. 1879.
'The Conquest of Plassans.' Same author and publishers.
'The Last Athenian. From the Swedish of Victor Rydberg by William W. Thomas, jr.' Philadelphia: T. B. Peterson & Brothers. 1879.
'The Prehistoric World. From the French of Elie Berthet by Mary J. Safford.' Philadelphia: Porter & Coates. 1879.
'In the Schillingscourt. From the German of E. Marlitt by Mrs. A. L. Wister.' Philadelphia: J. B. Lippincott & Co. 1879.

tains an agreeable and lively game of fencing with the haughty heroine, till it is finished on the last page by a happy marriage. In this instance a complication results from the circumstance that the hero is already married to a woman selected for him by his father because of her wealth, but this is easily arranged by the *deus ex machinâ* of a divorce. It is noticeable that discussion of all sorts, from Socialism to decorative art, is beginning to push its way into the regions of such pure romance as Marlitt's stories, with the effect of making them more unreal and far less agreeable.

'In Prison and Out' might have been a study of life among the poor of London, but is, instead, a story which we owe to the imagination of the author, having but a slight hold on reality. David Fell is forced, through his mother's poverty and his own ignorance of any useful art, to beg for their support; he is arrested under the Vagrant Act and hastily condemned to three months' imprisonment, and upon his release he is recommitted for two years upon a false charge, to which the fact that he is a jail-bird gives weight. From that time on he becomes one of the "dangerous classes," and finally ends his life in prison. What might have been done to save him is shown by the example of another boy who steals the money of a poor man who has befriended him and who refuses on humanitarian grounds to prosecute him. The boy is pushed along by one friend and another, becomes captain of a ship, and adds insult to injury by marrying David's sister, the story ending in a general happiness that it is plain we don't deserve. The melancholy truth is, however, that both boys became thieves, the girl went to the bad, and old Euclid and his daughter, after the loss of their money, had to come on the parish for the coffins which it was their sole ambition to furnish for themselves. A course of Zola may at least be confidently commended to "Hesba Stretton."

Three good stories which have heretofore appeared in *Lippincott's Magazine* are published anonymously under the title of 'Women's Husbands.' The first is 'The Barber of Midas,' in which the course of true love is obstructed by the curiosity and meddlesome fussiness of a man who is intended to show that these traits are not exclusively feminine ones, and who fulfils the mission not too obtrusively. 'The False Prince' portrays the struggles of a snobbish man to hide his vulgar antecedents. In 'Narcissus,' the third and best, the hero alienates by his self-worship the woman whom he loves, and marries her who only reflects his image. The latter dies, but he loses his second chance from the same cause, and passes his life in unsatisfied longing for he knows not what.

Miss Olney's novel may be divided into two distinct parts as regards excellence of workmanship. The coquette in her different influences upon the men who surround her, though not strictly novel, is nevertheless thoroughly well done; but the contrasted heroine, who is intended to be everything that is good and high, is often absurd, from her introduction as a child of eleven in command of a large house and a retinue of servants, including her grandfather, to the complication of her marriage, the misunderstanding of which is unnaturally and disagreeably prolonged.

There is nothing very remarkable to notice in '"A Man's a Man for a' That"' except the extravagance of its naïveté. The struggling young hero masters Greek in three months, is graduated at Harvard, and immediately acquires a law practice which brings him in the pittance of eight thousand dollars a year; but as he is the son of a farmer, society, of course, shuts its doors in his face. He marries the daughter of a banker ruined by the Portland fire. This young lady, fresh from enforced school-teaching, finds her husband's income of ten thousand dollars in a country where they have no society very restricted, and when their son is born their condition is so pitiable that the authoress has to relent and unearth from the ruins of the Portland fire a safe containing a will which enriches them by a million, and puts them beyond the reach of absolute want. Somehow or other, too, the social ban that has been crushing them is raised.

'Di Cary' is almost as ingenuous in its own way. It is a story of the South since the war, in which Yankee thrift is much praised and the necessity for something like it in the Southern gentleman broadly hinted at. The Yankee always appears with his tool-box, and casually gives the Southerner a practical lesson to the effect that a stitch in time saves nine by mending every bridge they pass over, accompanying his work the while by a lecture upon its usefulness. We note some rare toilets: one young lady wears a silk waist and tulle bonnet and fan on horseback, and the heroine receives a morning call in a blue lawn dress "fresh from the ironing-table," with a wreath of roses on her brow.

'A Fool's Errand' is a political story, dealing with what is in general indefinitely described as the Southern problem. The Fool fights through the war, and having faith in the Union, and believing that with the end of the war has come a settlement of all differences with the South, he goes thither to live, hoping to restore his lost health. Then come the incidents of reconstruction: the social attitude of Southern people toward the Northern man among them, the rise and decline of the Ku-klux outrages, the present prejudices which are to be overcome and overcome only by systematic, thoroughgoing, popular education. A movement in this direction the Fool thinks must begin at the North, as the South has always been heartily opposed to it. The story is given only to float the political and social study which the book really is, and which is pursued with great candor and no small discrimination, and evidently has an empirical basis.

'Old Friends and New' is a collection of Miss Jewett's stories, most of which have already appeared in the magazines. They are all gracefully done, and 'The Lost Lover' and 'Madame Ferry' may be especially commended for the delicate fancy they illustrate.

'Constance Winter's Choice' is one of the better stories of a very poor class; it will probably be shunned by all who know "the railway novel" when they see it, but nevertheless it is entirely possible to finish it if one begins it in a very idle hour.

The Life and Works of Gilbert Stuart. By George C. Mason. With selections from Stuart's Portraits reproduced on steel and by photogravure. (New York: Chas. Scribner's Sons. 1879. 4to, pp. xii. 286.)—In form and appearance this is an amateur's book, in the best sense: *vrai livre d'amateur.* It is not often that such books appear in America. Although the plates, all but two, are photogravures only, yet the excellent character of the process when properly carried out, its accuracy of reproduction, and the artistic look of the prints, prevent any cheap or makeshift appearance. The two prints not photographic are, the one an etching in simple line, the other an engraving, and the impressions from both are fine. The book is beautifully printed, with paper such as it is a pleasure to see, and has a seemly cover in grey cloth with lettering in brown and red. On the whole there has not been so elegant an American fine-art book since Mr. Loubat's 'Medallic History of the United States,' though it lacks, indeed, what the latter had—original engravings of great value and unusual character. The contents have to do, fortunately, with one of the few American artists whose reputation is a dignified one. Gilbert Stuart is long enough dead to be an old master already. The massive and somewhat splendid character of his portraits associates itself with the costume of our forefathers, with the high rank and reputation of many of his sitters, and especially with the memory of Washington, in a way to make his works and himself peculiarly important to all Americans. A chapter of our early national history is to be found in this book. We open, for example, upon portraits of Washington and his wife, of General Gates and General Knox, of Chief-Justice Jay and Madame Bonaparte.

Half of the volume is devoted to what is called, modestly, "A List of Stuart's Works." It is a list only in the sense that it is alphabetical and in nowise classified; but the full description of the pictures and the men and women who sat for them, with dates and memoranda which it must have taken great labor to get together, make it a catalogue of a rather unusually complete sort. The Washington portraits are not included in this list, but stand by themselves, the discussion of them forming a separate chapter of thirty-five pages. Another chapter treats of the portraits of Stuart himself by different persons. Still another contains a very few letters addressed to him by famous people of his time. His own alleged remarks on art (printed in the *Crayon* for March, 1861), and said to have been printed in a broadside by James Bogle, the portrait-painter, form one brief chapter, and the first part of the book is occupied with an account of his own life and character. This last forms a very interesting, brief memoir, with great store of anecdotes, of which, to be sure, there are many to choose from. It would seem that there is little material for a complete biography; which is to be regretted, for Gilbert Stuart lived

---

among famous people, both in England and in America, and was a pleasure-loving, society-seeking, outspoken, opinionated, and brilliant man, whose life and adventures would be worth having.

Especially noticeable in this book is a certain tone of independent judgment, difficult to maintain when discussing pictures in private hands, the knowledge of which can be gained only by favor of the owners. It seems to us that no person ought to take offence at anything said here, and yet the relative value of the pictures, in the writer's judgment, seems to be made clear. His success in so delicate a matter makes one wish there were more positive analysis and criticism of Stuart's work ; of this the reader will find very little, and nothing final and satisfactory.

Tyrol and the Skirt of the Alps. By George E. Waring, Jr. (New York : Harper & Brothers.)—It was entirely worth while publishing in book-form the series of papers which Mr. George E. Waring, Jr., contributed to *Harper's Magazine* last year under the title "Berg und Thal." They now make a volume of 171 large pages, admirably printed, and illustrated with some sixty-odd woodcuts. It may be briefly described as the record of the journey indicated in its title by an observant tourist who has the faculty of noting what he sees and of judging it dispassionately. We fail to find in it any trace of the book-making spirit, a negative virtue rare enough in works of the kind to be specifically mentioned. The reader's attention is asked for the professed subject of the work and not for the personal experiences and emotions of the traveller. There is enough of incident, however, to give reality and, in spots, vivacity to the narrative, and now and then a little philosophizing, such as, for example : "I have sometimes wondered whether the real snob may not be the ultimate development of that incipient feeling which the best of us must recognize among the emotions with which we greet a stranger coming to the vacant seat beside us" ; but this is infrequent enough to indicate Mr. Waring's consciousness that this means of infusing piquancy into a book of travel is not so much his forte as are observation and report. The book might be read in connection with Grohmann's 'Tyrol and the Tyrolese,' we suggest, for it is much more than a holiday gift-book (though it is that, too), and has the solid quality of instructiveness. To this end it would have been even more valuable if it had been more explicit, and had not assumed so much geographical and other knowledge in the reader ; an outline map, such as could have been easily supplied, and, perhaps, an itinerary would have been useful additions—helps in which 'A Farmer's Vacation' was less deficient. The illustrations are not only in good taste but they illustrate the text, and, what is more, the text does not ignore their existence.

*** Publishers will confer a favor by always marking the price of their books on the wrapper.*

AMERICAN SCIENCE SERIES.

JUST READY.

Packard's Zoology.

Large 12mo, $3. Copies to teachers for examination with view to introduction, $1 50, postage paid.

UNIFORM WIFH THE ABOVE :

Newcomb & Holden's Astronomy.

Large 12mo, $2 50.

HENRY HOLT & CO., NEW YORK.

NOW READY.

Cincinnati's Beginnings :

BEING THE

EARLY HISTORY OF THE CITY AND THE MIAMI PURCHASE.

From hitherto unpublished documents.

By FRANCIS W. MILLER.

Large 12mo, cloth, gilt, extra, $1 75.

*** This is the most important work yet published relating to the history of Cincinnati ; it gives the early events in the settlement in the words of the settlers themselves, and explodes many of the old theories that have hitherto been looked upon as facts.

Sent by mail, post-paid, on receipt of price.

PETER G. THOMSON, Publisher,
CINCINNATI.

DORCHESTER

Polytechnic Academy,

DR. NEVERASOLE, Principal.

By the late Warden of Racine College,

The Rev. JAMES DEKOVEN, D.D.

This intensely interesting and amusing story will be greatly enjoyed by the friends of the beloved De Koven, while those who knew him only as a great preacher and theologian will read it with interest, as showing another phase of the character of this wonderfully gifted man. It is a book for old and young ; and its cutting sarcasm will add to the interest of its perusal.

Paper cover, price 75 cents ; cloth, $1 25.

The trade supplied by

L. H. MOREHOUSE, Publisher,
Office of the *Young Churchman*, Milwaukee, Wis.

Remnants of Early Latin.

Selected and Explained, for the Use of Students, by Frederic D. Allen, Professor in Yale College.

The object is to bring together, in small compass and convenient shape for reading, the most remarkable monuments of archaic Latin, with enough explanation to make them generally intelligible. This material has been hitherto accessible only in large and expensive books, ill suited, for the most part, to the learner's wants. Part First contains the text of about 150 inscriptions, beginning with the oldest coins and coming down to about Sulla's time. There is no intention of teaching palæography ; the inscriptions are printed in small letters without any attempt at reproducing the appearance of the originals. A single lithographed fac-simile is given as a sample. In Part Second specimens of the oldest prayers formulæ, and laws—material which has come down to us from a high antiquity through literary channels—are collected. The remains of the Twelve Tables are included here. No literary matter has been admitted. All the selections are illustrated by a succinct commentary, and in a short introduction the leading peculiarities of the early language are enumerated. The book is meant primarily for students, but it is hoped that others may find it useful as a convenient handbook. An index has been added.

Ready January 8. Sample copy, $1.

GINN & HEATH, Publishers,
Boston, New York, and Chicago.

Teachers of Mathematics,

Before forming new classes in Geometry, should examine Wentworth's new work.

Since its publication two years ago it has been adopted by nearly three hundred colleges and preparatory schools.

"It is the best geometry for schools I ever saw."—*Dr. Thos. Hill, ex-Pres. of Harvard Univ.*

"It stands the test of use in the class, and gives the best of results."—*C. A. Waldo, Instructor in Math., Wesleyan Univ.*

"I regard it as an especially attractive book to students, and welcome it among books of its class as thoroughly honest and founded on the only method suited to the successful teaching of elementary geometry."—*A. S. Hardy, Prof. of Math., Dartmouth College, N. H.*

"We have used Wentworth's 'Geometry' from the time of its publication, and are so completely satisfied with it that it does not now seem that any other book is ever likely to take its place."—*J. B. Sewall, Prin. Thayer Acad., Braintree, Mass.*

Descriptive circular free to any address.

GINN & HEATH, Publishers,
BOSTON, NEW YORK, and CHICAGO.
